## PREFACE

Transport represents a crucial sector of the economy. This publication provides an overview of the most recent and most pertinent annual transport-related statistics in Europe. It covers the European Union and its 27 Member States (EU-27) and, as far as possible, the current EU candidate countries, the EFTA countries and the United Kingdom. As in the reference period (1990–2019) the United Kingdom was part of the European Union, aggregates for the EU-28 are presented whenever possible.

The content of this pocketbook is based on a range of sources, including Eurostat, international organisations and associations, national statistics and, where no data were available, own estimates. Own estimates have mainly been produced to get an idea of the EU total. At the level of individual countries they are merely indicative, and should by no means be interpreted as official data.

In particular, the Commission services would like to thank the following organisations and associations for their valuable contributions and to acknowledge that they agreed to the use of their data:

- European Automobile Manufacturers' Association (ACEA)
- FlightGlobal
- International Road Federation (IRF)
- International Transport Forum (ITF)
- International Union of Railways (UIC)
- United Nation Economic Commission for Europe (UNECE).

The publication consists of three parts:

- (1) a general part with general economic and other relevant data;
- (2) a transport part covering both passenger and freight transport, along with other transport-related data;
- (3) an energy and environmental part with data on the impact the transport sector has on energy use and the environment.

Most of the tables have data up to 2019; where available, more recent data have been provided.

The tables of this pocketbook can also be found on the Europa website at: [https://ec.europa.eu/transport/media/media-corner/publications\\_en](https://ec.europa.eu/transport/media/media-corner/publications_en)

Many tables on the internet contain more data than could be presented in this pocketbook. The reference sources are more detailed in the Excel tables presented on the internet. Some tables may be updated online before the publication of the next paper version.

Eurostat, the main data provider, can be accessed directly on the internet at: <https://ec.europa.eu/eurostat/data/database>

EEA, the data provider for the environmental part, can be accessed directly on the internet at: <https://www.eea.europa.eu/>

Comments on this publication and suggestions for improving it are appreciated. They should be sent to [move-transport-data@ec.europa.eu](mailto:move-transport-data@ec.europa.eu)

## Statistical overview – EU transport 2.1.1

### Gross Value Added:

With around EUR 624 billion in gross value added (GVA) at current prices, the transport and storage services sector (including postal and courier activities) accounted for about 5 % of total GVA in the EU-27 in 2019 <sup>(1)</sup>. It should be noted, however, that this figure only includes the GVA of companies whose main activity is the provision of transport (and transport-related) services and that own account transport operations are not included.

### Employment:

In 2019, the transport and storage services sector (including postal and courier activities) in the EU-27 employed around 10.5 million persons <sup>(2)</sup>, some 5.4 % of the total workforce <sup>(3)</sup>. Around 52 % of them worked in land transport (road, rail and pipelines), 3 % in water transport (sea and inland waterways), 4 % in air transport and 27.5 % in warehousing and supporting and transport activities (such as cargo handling, storage and warehousing) and the remaining 14 % in postal and courier activities.

### Household expenditure:

In 2019, private households in the EU-27 spent EUR 964 billion or roughly 13 % of their total consumption on transport-related items.

Around 28.5 % of this sum (around EUR 274 billion) was used to purchase vehicles, around half (EUR 523 billion) was spent on the operation of personal transport equipment (e.g. to buy fuel for the car) and the rest (EUR 167 billion) was spent for transport services (e.g. bus, train, plane tickets).

### Goods transport:

In 2019 total goods transport activities in the EU-27 are estimated to amount to 3 392 billion tkm. This figure includes intra-EU air and sea transport but not transport activities between the EU and the rest of the world. Road transport accounted for 52 % of this total, rail for 12 %, inland waterways for 4.1 % and oil pipelines for 3 %. Intra-EU maritime transport was the second most important mode with a share of 28.9 % while intra-EU air transport only accounted for 0.1 % of the total.

### Passenger transport:

In 2019, total passenger transport activities in the EU-27 by any motorised means of transport are estimated to amount to 6 038 billion pkm or on average around 13 498 km per person. This figure includes intra-EU air and sea transport but not transport activities between the EU and the rest of the world. Passenger cars accounted for 71.6 % of this total, powered two-wheelers for 1.9 %, buses & coaches for 8.1 %, railways for 7 % and tram and metro for 1.4 %. Intra-EU air and intra-EU maritime transport contributed for 9.7 % and 0.3 % respectively.

- NB:**
- (<sup>1</sup>) The transport share amounts of 4.6 % of total GVA if postal and courier activities are not included. Estimations based on Eurostat National Account (2018 data).
  - (<sup>2</sup>) Figures on number of persons employed in transport, total workforce and shares per mode based on Eurostat Labour Force Survey (age 15-64 years).
  - (<sup>3</sup>) 4.6 % of total employment if postal and courier activities are not included.

## 2.1.1 Statistical overview – EU transport

### Safety:

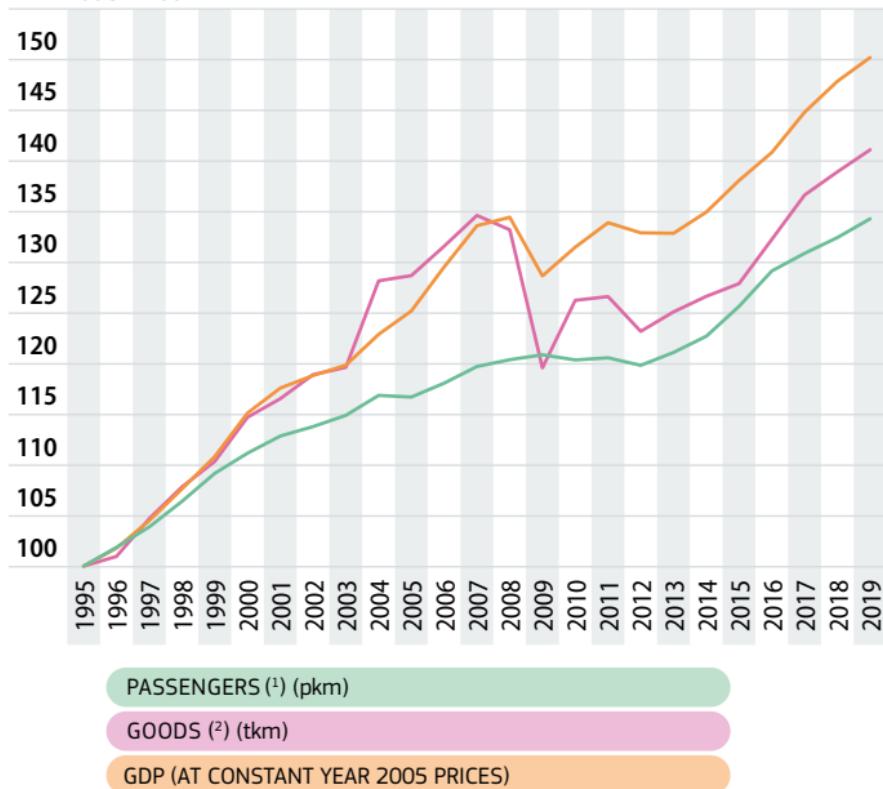

- Road: 22 763 persons were killed in road accidents (fatalities within 30 days) in 2019, 2.4% less than in 2018 (when 23 331 people lost their lives). In comparison with 2001, the number of road fatalities was lower by more than half (-56%).
- Rail: 16 passengers lost their lives in 2019; this figure does not include casualties among railway employees or other people run over by trains.
- Air: No life was lost in 2020.

**NB:** UK, IE, CY and MT drive on the left hand side of the road, the other Member States drive on the right hand side (Sweden since 3 September 1967).

Signs in UK are in miles per hour.

The reported speed limits refer to general circumstances. Different speed limits might apply in residential or pedestrian areas, on the basis of weather conditions, the time of the day, the vehicle driven, the season, the visibility or unless otherwise stated by traffic signs. The higher figure shown in the 'outside built-up areas' column generally refers to the speed limit on dual carriageways that are not motorways.

**Speed limits:** BE:70 km/h outside built-up areas in the Flemish Region; 30 km/h in Brussels; DE: Motorways: No general speed limit, recommended speed limit is 130 km/h (more than half the network has a speed limit of 120 km/h or less).

ES: different speed limits apply on non-urban roads according to the presence of hard shoulders, or if the vehicle is equipped with a trailer or dangerous goods.

**Blood alcohol limits:** in many countries, special (more restrictive) rules apply to novice (i.e. new, unexperienced) and professional drivers.

**NB:** An articulated vehicle consists of a road tractor coupled to a semi-trailer. A road train is a goods road motor vehicle coupled to one or more trailers. Different limits apply in case the vehicle is equipped with specific tyres or road-friendly suspensions, performing combined transport operations, for national and international traffic, for specific axle configurations, in case of trailers, or for carrying specific types of goods or containers. For a more complete country overview please consult the International Transport Forum website.

(¹) Only for air suspension or similar, and ABS (Anti-lock Braking System).

(²) Under specific conditions EMS (European Modular System) combinations may have a maximum length of 25.25m and maximum mass of 60t.

(³) For vehicles registered in an EEA member country.

(⁴) 5 axles = 44 t; 6 axles = 56 t; 7 axles = 60 t,

8 axles 64-68 t (restrictions for ADR), 69-76 t (not for ADR).

(⁵) 5 axles = 46 t, 6 axles = 64 t, 7 axles = 64 t.

(⁶) Increased values are applicable for certain types of transport.

(⁷) On some roads the permissible maximum weight is 74t.

**NB:** Air and Sea: only domestic and intra-EU-27 transport; estimates for air and for sea based on Eurostat data. The time series for maritime activity from 1995 to 2004 and for aviation activity from 1995 to 2007 have been recalibrated by DG MOVE in line with the new EU-27 figures to avoid break in series. Following methodological changes, the times series (2005–2019) for maritime activity were backwards revised. Road: national and international haulage by vehicles registered in the EU-27 until 2004, from 2005 onwards the activity performed by European drivers within the EU territory.

**NB:** Data are not harmonised and therefore not fully comparable; in most countries, only pipelines longer than 40km are included. Data refer to oil pipelines.

DE: from 1995 onwards: only crude oil (i.e. no refined petroleum products).

DK: crude oil including water.

NB: Air and Sea: only domestic and intra-EU-27 transport; estimates for air and for sea based on Eurostat data. The time series for maritime activity from 1995 to 2004 and for aviation activity from 1995 to 2007 have been recalibrated by DG MOVE in line with the new EU-27 figures to avoid break in series. Following change in the methodology, time series on maritime activity was revised.

**NB:** Data are not harmonised and therefore not fully comparable. 2018 data may be provisional. Data sometimes include activity of foreign vehicles performed within the country, therefore EU aggregates might be affected by double-counting. Generally vans are not considered in this table, but there may be exceptions.

FR: passenger-km include transport activity on the territory of vehicles not registered in France. Includes foreign vans. Due to change in the methodology data revision back to 2012.

UK: data refer to Great Britain only; include pkm by vans. Road estimates for the period 2010-2018 have been revised.

DE: includes DE-E: 1990 = 90.3. In 2021 revision of 2017 and 2018 data. 2019 provisional figures.

CH: includes activity of foreign vehicles in the country.

**NB:** Data are not harmonised and therefore not fully comparable. 2018 data may be provisional.

Data sometimes include activity of foreign vehicles performed within the country, therefore EU aggregates might be affected by double-counting.

CS: 1990: 43.4.

ES: break in series between 2013 and 2014 and between 2016 and 2017 due to a change in methodology.

FR: includes tram transport activity at province level, and tram transport in the Île-de-France until 2000.

It also includes occasional bus transport in the territory of France performed by foreign buses.

In 2020 revision of data from 2012 onwards following change in the methodology.

AT: the times series includes an estimate for trolleybuses.

UK: GB data +1.5 bln pkm throughout to account for Northern Ireland. Road estimates for the period 2010-2018 have been revised.

CH: includes activity of foreign vehicles in the country.

PL: includes long-distance transport and estimated data for urban transport.

NL: the time series from 2010 estimates the share of bus transport over the aggregate 'bus/tram/metro' published in the OVIN Travel Survey. Previous years' estimates have been retrofitted until 2010.

Since 2018 new methodology.

NO: includes scheduled bus transport; 2015-2018 data were adjusted in 2020 due to changes in the underlying statistics.

SE: 2019 time series break due to change in the methodology.

RO: includes interurban and international road transport, local public transport by buses and minibuses, and trolleybuses (since 2015). Data for 2019 for busses and minibuses and trolleybuses are provisional and don't include pensioners residents in Bucharest.

**NB:** (\*) Public Service Obligation (PSO) means a requirement defined or determined by a competent authority in order to ensure public passenger transport services in the general interest that an operator, if it were considering its own commercial interests, would not assume or would not assume to the same extent or under the same conditions without reward.

BE as of 2014, UIC data.

UK share of PSO excludes Northern Ireland. EU-27 shares of PSO estimated on the basis of the available data.

FR: includes RER trains exploited by RATP and Tramline 4; in 2018 the methodology has changed, data back to 2015 were revised; recalibration of time serie back to 1990.

CH: 2018 data revised. Drop caused by a change in the parameter reporting of a company.

**NB:** Significant underreporting of Paris airports. Data from airport websites (*in italics*) often include air cargo which in reality is transported by lorry. The figures from airport websites are therefore not always fully comparable with those collected by Eurostat. The extraordinary growth rate for the Leipzig airport in 2008 is mainly due to DHL moving its hub there during 2008.

**NB:** Data from main ports only (ports handling more than 1 million tonnes per year).

(\*) The total goods transported data may be less than the sum of inward and outward traffic due to the double counting of tonnes moved within the same country.

(\*\*) The share of intra-EU in total maritime transport may be underestimated in this table for CY and RO because a significant share of partner ports are 'unknown' and hence cannot be attributed to any geographical area.

**NB** (\*) Public Service Obligation (PSO) means a requirement defined or determined by a competent authority in order to ensure public passenger transport services in the general interest that an operator, if it were considering its own commercial interests, would not assume or would not assume to the same extent or under the same conditions without reward.

Total market share of all but the principal railway undertakings (as a percentage of passenger-km, in some cases as a percentage of train-km).

DK: not considering metro services after break in series.

**NB:** Persons killed are all persons deceased within 30 days of the accident.

Corrective factors have been applied to the figures which did not follow this definition.

As of 2015 TR includes people deceased within 30 days after the accident (break in series). As of 2018 PT includes data for Azores and Madeira.

For the NL, the number of fatalities registered by the police is under-reported and equates to around 85 % of the total number of fatalities published nationally (total in 2019 was 661).

## Glossary

3.1.1

**Conventional thermal power:**

Technology for the production of electricity by combustion. May or may not include biomass use, which is also considered a renewable source of electricity.

**Energy dependency:**

Energy dependency shows the extent to which a country relies upon imports in order to meet its energy needs. It is calculated using the following formula: net imports / (gross inland consumption + bunkers).

**Energy intensity:**

Energy intensity gives an indication of the effectiveness with which energy is being used to produce added value. It is defined as the ratio of gross inland consumption of energy to gross domestic product.

**Final energy consumption (FEC):**

Final energy consumption is the energy finally consumed in the transport, industrial, commercial, agricultural, public and household sectors. It excludes deliveries to the energy transformation sector and to the energy industries themselves, along with energy consumption in international maritime and air transport.

**Gross calorific value (GCV):**

The gross calorific value is the total amount of heat released by a unit quantity of fuel, when it is burned completely with oxygen, and when the products of combustion are returned to ambient temperature.

This quantity includes the heat of condensation of any water vapour contained in the fuel and of the water vapour formed by the combustion of any hydrogen contained in the fuel.

**Gross inland consumption (GIC):**

Gross inland consumption is the quantity of energy consumed within the borders of a country. It is calculated using the following formula:  
primary production + recovered products + imports + stock changes  
– exports – bunkers

**Net calorific value (NCV):**

The net calorific value is the amount of heat released by a unit quantity of fuel when it is burned completely with oxygen, and when the products of combustion are returned to ambient temperature.

This quantity does not include the heat of condensation of any water vapour contained in the fuel or of the water vapour formed by the combustion of any hydrogen contained in the fuel.

**Primary energy production:**

Primary energy production is the extraction of energy from a natural source. The precise definition depends on the fuel involved, as described below.

**Solid fuels: hard coal, lignite**

Quantities of fuels extracted or produced, calculated after any operation for removal of inert matter. In general, production includes the quantities consumed by the producer during the production process (e.g. for heating or operation of equipment and auxiliaries), along with any quantities supplied to other on-site producers of energy for transformation or other uses.

### 3.1.1

## Glossary

***Crude oil:***

Quantities of fuels extracted or produced within national boundaries, including off-shore production. Production includes only marketable production, and excludes any quantities returned to formation. Production includes all crude oil, natural gas liquids (NGL), condensates and oil from shale and tar sands, etc.

***Natural gas:***

Quantities of dry gas, measured after purification and extraction of natural gas liquids and sulphur. The production includes only marketable production, and excludes any quantities reinjected, vented and flared, and any extraction losses. The production includes all quantities used within the natural gas industry, in gas extraction, pipeline systems and processing plants.

***Nuclear heat:***

Quantities of heat produced in a reactor. Production is the actual heat produced or the heat calculated on the basis of the gross electricity generated and the thermal efficiency of the nuclear plant.

***Hydropower, wind energy, solar photovoltaic energy:***

Quantities of electricity generated. Production is calculated on the basis of the gross electricity generated and a conversion factor of 3 600 kJ/kWh.

***Geothermal energy:***

Quantities of heat extracted from geothermal fluids. Production is calculated on the basis of the difference between the enthalpy of the fluid produced in the production borehole and that of the fluid disposed of via the reinjection borehole.

***Biomass / wastes:***

In the case of municipal solid wastes (MSW), wood, wood wastes and other solid wastes, production is the heat produced after combustion and corresponds to the heat content (NCV) of the fuel. In the case of anaerobic digestion of wet wastes, production is the heat content (NCV) of the biogases produced. The production includes all quantities of gas consumed in the installation for the fermentation processes, and excludes all quantities of flared gases. In the case of biofuels, the production is the heat content (NCV) of the fuel.

***Pumped storage:***

Method for storing electrical energy at hydroelectric installations by pumping water between reservoirs at different altitudes.

***Renewable energy sources (RES):***

Renewable energy includes hydroelectricity, biomass, wind, solar, tidal and geothermal energy.

***Tonne of oil equivalent (toe):***

Tonne of oil equivalent is a conventional standardised unit for measuring energy, defined on the basis of a tonne of oil with a net calorific value of 41 868 kilojoules/kg.

1 ktoe = 1 000 toe

1 Mtoe = 1 000 000 toe

**NB:** (\*) The activity data used in GHG inventories to report international maritime emissions (emissions from bunker fuels) are not fully consistent with the energy statistics on bunker fuels for some years and countries.

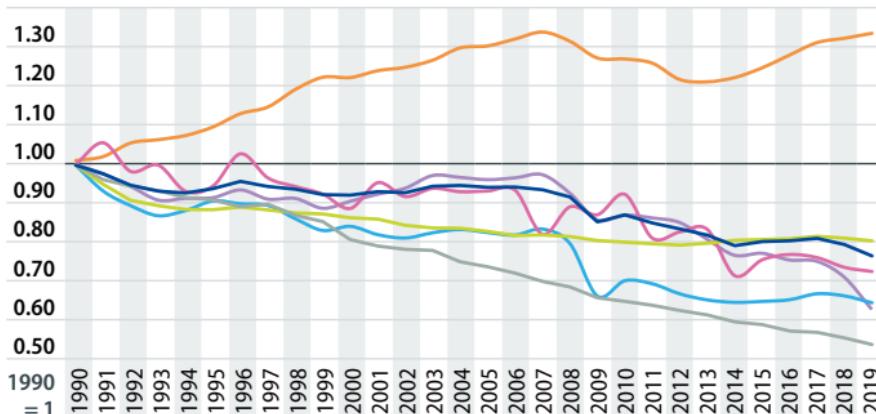

For EU-27, changes in international maritime emissions between 2010 and 2011 show inconsistencies with changes in energy statistics on bunker fuels.

**NB:** (\*) The activity data used in GHG inventories to report international maritime emissions (emissions from bunker fuels) are not fully consistent with the energy statistics on bunker fuels for some years and countries.

For the EU-27, changes in international maritime emissions between 2010 and 2011 show inconsistencies with changes in energy statistics on bunker fuels.
