METHODOLOGICAL NOTES

1. Characteristics of the survey

Process of the Slovak statistics harmonization with the statistics of the European Union involves realisation of sample surveys in the field of earnings statistics. During 2012 the Statistical Office of the Slovak Republic carried out the Structure of Earnings Survey (SES) in the SR 2011. It followed after similar surveys that had been conducted for the years 1996 - 2010. Its methodology, being developed on the basis of EUROSTAT's recommendations, is linked directly to the Council Regulation (EC) N° 530/1999 concerning structural statistics on earnings and on labour costs, the Commission regulation (EC) N° 1738/2005 concerning the definition and transmission of information on structure of earnings, the Commission Regulation (EC) N° 698/2006 concerning quality evaluation of structural statistics on earnings.

The main objective of the survey is the judgement and evaluation of the structure and differentiation of earnings. The data are classified by occupation, profession, economic activity and by particular personal characteristics (gender, age and education). Relationship between paid monthly earnings (gross and net) and settlements of insurance and taxes is also followed.

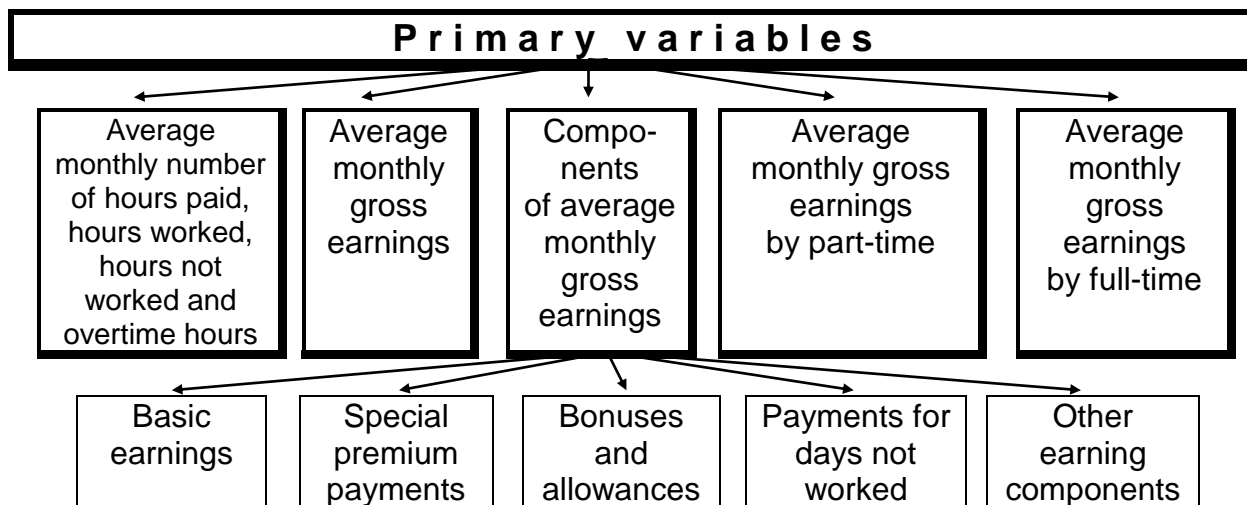

2. Defining and the structure of variables

The results of the survey, which are intended for the users in the Slovak Republic, could be also used for international comparisons. This requirement was taken into consideration in the process of inputs defining. Particular items were selected in order to ensure the information needs of the following the Eurostat's requirements.

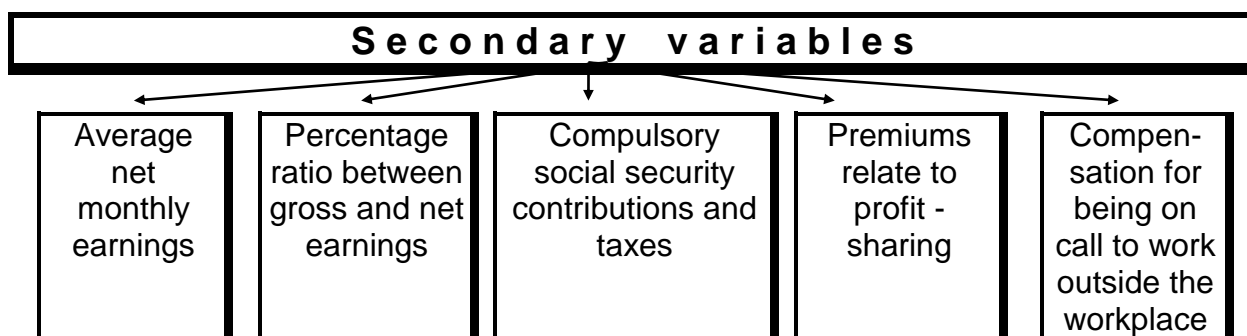

Submitted publication provides the following information about the data on:

- more detailed structure of earnings, share of the basic and motivation components of remuneration,
- differentiation of earnings among particular occupations and professions,
- earnings level classified by gender, age and education,
- paid earnings within particular occupations,
- level and structure of earnings by components within particular occupations,
- differentiation of earnings by main groups of employees at different age, qualification and gender.

Structure of primary variables:

Structure of secondary variables:

Partial differences in the structure of earnings in comparison between the Slovak Republic and the European Union result from the specific character of the Slovak wage system. Deviations should be removed after co-ordinating of the Slovak wage policy with the European Union. In this publication the structure of earnings (Slovak tables) corresponds mainly with demand of the Slovak users. Eurostat requirements are covered in another version of the table (EU tables¹) with outputs fully comparable with Community statistics on the level and structure of earnings on the basis of list of variables published in the Commission Regulation (EC) N° 1738/2005.

3. Defining Population

Population consisted of all legal subjects with one and more employees, registered in the Business Register, which were recorded in the Registers of organizations and establishments kept by the Statistical Office of the Slovak Republic. The set covers profit and non-profit organizations (incl. enterprises) in all economic activities of the Slovak Republic. As of January 1, 2011, the sample frame comprised 60 230 legal statistical units.

¹ EU tables are not included in this publication

4. Procedure of sample creating

The sample was created by using of the **statistical method of a random sample within stratum** with the estimated number of inactive units. The source for data processing was the register of active and inactive reporting units.

The first subset of the sample included reporting units which provided data required in the Structure of Earnings Survey and the Labour Cost Survey in the previous year.

With the aim to get convenient sample scope and proportionality the second subset was made on the basis of three stratifying attributes as follows: economic activity, regions and size class.

Quantification of the sample for 2011:

- 6 863 units from the 2010 survey (the first subset),
- 746 units selected by stratifying attributes (the second subset),
- of which: 339 units with 500 and more employees were selected exhaustively.

On the basis of the above mentioned calculations 7 609 statistical units were selected.

Classifying attributes:

- economic activity SK NACE Rev. 2,
 - region NUTS 3,
 - size class by the number of employees,
- were used to generate condensed codes in the process of the sample creation.

All statistical units with 500 and more employees were included into the survey with regard to influence of these big-size organisations on economic development in the Slovak Republic.

The sample was created by means of the **method to define sampling rates for each stratum (area field) - “power method”**

$$CS1_h = CS1 * \frac{CP1_h * CA * \sqrt{(1 - CA_h)}}{\sum_k CP1_h * CA_h * \sqrt{(1 - CA_h)}}$$

- Where:
- CS1 - the number of organizations in the sample
 - CP1 - the number of organizations in the sample frame
 - CA - the rate of active and inactive units
 - k - the number of stratum
 - h - index of stratum

5. Data collection and processing

Data collection and processing were carried out by the processing organization TREXIMA under the supervision of the Statistical Office of the Slovak Republic. The data was collected via electronic mail. Reporting units selected and recorded required data from the enterprise databases in connection with personal and wage programs. The survey was carried out in 7 609 reporting units. After completion of the input data and making of the formal and logical controls the data for 7 102 organisations were included in processing. A total response rate represents 93.7%.

Within a file of the reporting units there were in total 1 077 215 employees who represented 49.1% of the total number of employees in the Slovak economy (57.3% in the case of employment without tradesmen) in the reference year.

The survey covers all economic activities by SK NACE Rev. 2. Out of the total number of employees in the sample 30.4% represents manufacturing, 11.1% public administration and defence, 9.9% wholesale, retail trade, 8.5% transportation and storage, 7.2% human health, social work activities, 6.9% education, 4.5% administrative, support service activities, 3.1% professional, scientific and technical activities, 3.1% construction, 2.9% information and communication, 2.9% financial, insurance activities, 2.3% agriculture, forestry and fishing, 1.8% water supply, 1.6% electricity, gas, steam, 1.2% arts, entertainment and recreation, 0.8% accommodation and food service activities, 0.7% other service activities, 0.6% mining and quarrying and 0.5% real estate activities.

From the viewpoint of the territorial division the sample was classified by regions what corresponds to NUTS 3. In the sample 23.6% of employees worked in Bratislava region, 12.7% in Košice region, 11.6% in Žilina region, 11.4% in Trenčín region, 11.3% in Nitra region, 10% in Trnava and Banská Bystrica region, 9.4% in Prešov region.

With the aim to cover all size classes of units (by the number of employees) was the EUROSTAT's required covering of units with 10 and more employees extended by the small organizations with less than 10 employees.

Data processing was realised by means of the specific software with a complex of calculations and checks. The aim was to ensure printing of the required output tables.

6. Data extrapolations to the population

The aim of result recalculation was obtaining objective information about structure of wages in whole national economy of the Slovak Republic.

Data recalculation was made by point estimation method.

The basic formula of point estimate:

$$W = \frac{N}{n}$$

where: W - weight of unit in the survey
n - number of all records in sample
N - number of records in register

Recalculation coefficient was represented by ratio of whole Slovak Republic data and sample data in relevant group. Stratification criteria used was:

- size group (number of employees)
- economic activity (SK NACE Rev. 2)

Calculation of recalculation coefficient in “i” group:

$$\text{COEF1}_i = [\text{number of records in register SR}]_i / [\text{number of records in sample}]_i$$

Recalculation database originate from recalculation (multiplying) companies in “i” group by “i” recalculation coefficient. Value of recalculation coefficient was limited to the maximum level 35. Analyze of register was necessary before weighting. Analyze consists of: register comprehension as a whole, determination of statuses (activity - attribute S4), sphere (business, non-business - attribute FORMA), determination of state assets (attribute ESU95), organization largeness (POCP), economic activity (HLSKNACE) and so on. Concerning the fact that sample was made for both groups together - business and non-business, weighting was made together too.

The data for public administration refer to the municipal offices. Differences in sums and ratios resulted from rounding data off. Tables content statistical symbol as follows:

- “ - “ in the place of a number denotes that the phenomenon did not occur
- “ I “ it is not possible to publish the figure because of its individual character
- “ 0 “ the phenomenon occurs in the sample, but its value is below 0.1 when rounded off in a standard manner
