ALL SCIENCES ACADEMY

Proceeding Book of 4th International Conference on Scientific and Academic Research ICSAR 2024

July 19-20, 2024: Konya, Turkey

PROCEEDING BOOK OF 4TH INTERNATIONAL CONFERENCE ON SCIENTIFIC AND ACADEMIC RESEARCH ICSAR 2024

PROCEEDING BOOK OF 4TH ICSAR 2024:

19 – 20 July 2024

Konya, Turkey

Publication date: 25.07.2024

Publisher: All Sciences Academy

All Sciences Academy

Publication of record for individual papers is online in the ASP Digital Library: as-proceeding.com. This website is used to distribute the articles into various databases. For citing online articles please use ISBN.

INTRODUCTION

We had the great honor of organizing the ICSAR 2024. It was truly a great pleasure for us togreet a lot of participants from many different countries attending ICSAR 2024! We firmly believe that the conference will become an important international event in the field of cross-industry discussion about innovations in Academic Studies.

ICSAR 2024 was organized by All Science Academy located in Konya, Turkey.

Three cooperating organizations supported the two-day conference. There were 426 papers accepted for presentation at ICSAR 2024, contributed from different countries. We had plenary speeches and several well-known scientists and experts, to give invited talks at differentsessions.

The purpose of ICSAR 2024 was to provide a forum for the participants to report and review innovative ideas, with up-to-date progress and developments, and discuss novel approaches to the application in the field of their own research areas and discuss challenges of doing science.

We sincerely hope that the exchange of ideas on doing research, science and improving education will help the participants, and international cooperation sharing the common interest will be enhanced.

On behalf the Organization Committee of ICSAR 2024, we would like to heartily thank our cooperating organizations for all they have done for the conference. We would also like to thank the authors for their contribution to the proceedings; the participants and friends of ICSAR 2024, for their interest and efforts in helping us to make the conference possible; and the Editorial boards for their effective work and valuable advice, especially the ICSAR 2024 secretariat and the ICSAR 2024 staff, for their tireless efforts and outstanding services in preparing the conference and publishing the Proceedings.

Conference Chairs XX
Scientific Committees XXI
Document of Academic Incentive XXII
Document of International Conference XXIII

Table List of Content

Content of Full Papers

Page No	Title	Authors	Country	Submission ID
1-8	Generative Artificial Intelligence (GenAI) Literacy Scale: Validity and Reliability	Sahin Gokcearslan, Hatice Yildiz Durak, Mustafa Serkan Gunbatar, Nilufer Atman Uslu, Aysun Nuket Elci	Turkey, Turkey, Turkey, Turkey, Turkey	Submission 1212
9-15	SAE1050 İmalat Çeliğinin Farklı Soğutma/Yağlama Koşullları Altında İşlenmesinin Enerji Tüketimi Üzerine Etkileri	Emine ŞAP	Turkey	Submission 1221
16-36	Data Warfare: Emerging Threats to US Election Integrity	Abdelkrim Dekhakhena	Algeria	Submission 1253
37-47	NH4SCN Additive Assisted Vertically Aligned Efficient 1,5-Diamino Naphthalene Based Two-Dimensional Dion Jacobson Phase Perovskite Solar Cells	Murat EBİC	Turkey	Submission 1264
48-54	Denial of Nationality: A Form of French Racial Discrimination Against Algerian Muslims in Colonial Algeria (1830-1962)	Abdelhafid Guebaili	Algeria	Submission 1269
55-60	Mesleki Eğitim Merkezlerindeki Öğrencilerin Yabancı Dil Eğitimine Yönelik Algıları	Büşra Keskinsoy, Hasan Yücel Ertem	Turkey, Turkey	Submission 1270
61-67	Ortak Sınavlarda Açık Uçlu Soruların Kullanılmasına İlişkin Öğretmen Görüşleri	Funda Özbay, Hasan Yücel Ertem	Turkey, Turkey	Submission 1271
68-73	Nükleer Tıp Merkezlerinde Oluşan Nükleer Malzemelerin Kullanımı ile Atıklarının Kontrolü ve Bertarafı	Mehmet Mücahit EKEN, Salih ÖZER	Turkey, Turkey	Submission 1272
74-82	Neuromorphic Computing For Handwriting Pattern Recognition	Ijibadejo Oluwasegun William, Mubarak Altamimi	Republic of Benin, Turkey	Submission 1273
83-99	NÜKLEER GÜÇ SANTRALLERİNİN TEKNİK ÖZELLİKLERİ VE YAPISI: AKKUYU NGS ÖRNEĞİ	Hamza ALAHMAD, Edip TAŞKESEN	Turkey, Turkey	Submission 1277
100-105	Prospects for modernizing energy supply in the Republic of Uzbekistan: Introduction of modern technologies and sustainable development	Amurova Natalia Yurevna	Uzbekistan	Submission 1284
106-117	Arslandede Plütonunun (Doğu Pontidler) Jeolojisi ve Mineral Kimyası	Zikrullah Samet GÜLOĞLU, Abdullah KAYGUSUZ	Turkey, Turkey	Submission 1292
118-124	Integration of modern monitoring and control technologies into the energy infrastructure of the Republic of Uzbekistan: Prospects and economic benefits	Amurova Natalia Yurevna	Uzbekistan	Submission 1301
125-131	Cıvata Bağlantılarının Performanslarının ve Güvenilirliğinin Geliştirilmesi	Erol Feyzullahoğlu	Turkey	Submission 1305
132-141	Malware Detection using different Machine Learning Models using Random Search and Different Features Subsets	Muhammet Tan, Metin Zontul, Halit Bakır	Turkey, Turkey, Turkey	Submission 1306
142-145	PEM YAKIT PİLİ HÜCRESİNDE PdZr2/C ANOT KATALİZÖRÜN AKTİVİTESİ	Arzu EKİNCİ, Ömer ŞAHİN	Turkey, Turkey	Submission 1310
146-152	Implementing a Stock Price Prediction Model with Deep Neural Networks	Halit Çetiner	Turkey	Submission 1317
153-162	The premise of targeting nicotinic acetylcholine receptors for treating cancer	Ermira Jahja Hodo	Albania	Submission 1323
163-168	Determining the Effect of Energy Production and Consumption of Turkic Republics on Carbon Emission with Panel Data Analysis Method	Fuad Selamzade, Yusuf Ersoy, Ali Tehci	Turkey, Turkey, Turkey	Submission 1328
169-172	The relationship between soil and some endemic plant communities belonging to the Caryophyllaceae family growing naturally around Karakuyu marsh (Afyonkarahisar)	Ahmet Serteser	Turkey	Mail Submission 1
173-180	Tubular Surfaces under Möbiüs Transformation S	Filiz Ertem Kaya, Süleyman Şenyurt	Turkey, Turkey	Mail Submission 3
181-184	Investigation of specific heat capacities of hafnium oxide (Hg02) using Einstein-Debye approximation	Zafer Doğan, Tural Mehmetoğlu	Turkey, Turkey	Submission 1325
185-187	Study of electrical conductivity of Titanium diboride in the wide temperature range using classical and quantum mechanical methods	Zafer Doğan, Tural Mehmetoğlu	Turkey, Turkey	Submission 1326
188-203	Kabakyatak intruzyonunun (Kürtün/Gümüşhane) tüm-kayaç jeokimyasal özellikleri	Abdullah Kaygusuz, Alaaddin Vural	Turkey, Turkey	Submission 1331
204-215	Derinoba-Kayadibi Plütonlarının kökensel ilişkisinin jeoistatistiksel İrdelenmesi	Abdullah Kaygusuz, Alaaddin Vural	Turkey, Turkey	Submission 1333
216-225	Water quality and organic pollution in Fierza Lake	Ilirjana Osmani, Arben Haziri, Aferdita Camaj, Bledar Murtaj,	Kosovo, Kosovo, Kosovo, Albania, Albania	Submission 1343

		Aurel Nuro		
226-231	Evaluation of Erosion Resistance of Fine-Grained Soils in The Context of Clay Factor Affecting Cohesion Intercept	Sadettin Topçu, Evren Seyrek	Turkey, Turkey	Submission 1357
232-236	Role of 24-EBL on Pollen Germination and Pollen Tube Growth in Blackberries	Sultan Filiz GÜÇLÜ, Fatma KOYUNCU	Turkey, Turkey	Submission 1359
237-245	Değerli maden üretiminde insan güvenilirlik analizleriyle risklerin değerlendirilmesi	Nurgül Zengin, Ertuğrul Ayyıldız	Turkey, Turkey	Submission 1368
246-249	HEART MONITORING DEVICE: Electrocardiography	Arafa MAHAMAT YOUNOUS, Modou CEESAY, Mutlu Tekir	Turkey, Turkey, Turkey	Submission 1373
250-255	Yarn Design as an Influencing Factor on the Tensile Properties of Sports Materials	Ivana Salopek Čubrić, Barbara Zrno	Croatia, Croatia	Submission 1377
256-264	Hydrothermal synthesis and photocatalytic activity evaluation of ternary metal oxide MgO/ZnO/Co3O4 nanocomposites	Safia HARRAT, Mounir SAHLI, Khaled Chetehouna, Abdelhakim SETTAR, Stephane BERNARD, Leo Courty	Algeria, Algeria, France, France, France, France	Submission 1386
265-271	Diyabet Tedavisinde Kullanılan Beksagliflozin'in Moleküler Yapısının Kuantum Kimyasal Yöntemle İncelenmesi	Bülent DEDE, Güvenç GÖRGÜLÜ	Turkey, Turkey	Submission 1387
272-276	Protein Metabolizması Bozukluklarının Sağlık Üzerindeki Etkileri: Fenilketonüri (PKU) ve Çölyak Hastalığı	Özen Sökmen, Ayşe Neslihan Dündar	Turkey, Turkey	Submission 1388
277-281	Şarap ve Fransız Paradoksu	Özen Sökmen, Ayşe Neslihan Dündar	Turkey, Turkey	Submission 1389
282-292	Modular Construction and Bioclimatic Strategies: A Sustainable Approach to Building Design	Klodjan Xhexhi, Besnik Aliaj	Albania, Albania	Submission 1394
293-296	Nitrate Residues in Drinking Water of Rural Areas and Daily Intake by Human	Ayse Dilek Atasoy, Ahmet Ferit Atasoy	Turkey, Turkey	Submission 1397
297-304	Beyin Tümörlerinin Bilgisayar Destekli Tespiti: Derin Öğrenme ve Makine Öğrenmesi Yaklaşımları	Hilal Güven, Ahmet Saygılı	Turkey, Turkey	Submission 1406
305-314	AN APPROACH BASED ON COMBINING DEEP LEARNING MODEL AND ENSEMBLE TECHNIQUE IN AIDS CLASSIFICATION	Nida CANPOLAT, Şengül DOĞAN, Türker TUNCER	Turkey, Turkey, Turkey	Submission 1407
315-323	Modal parameter differences of TBDY-2018 and RYTEIE-2019 regulations in the blended brick wall model	Furkan Günday	Turkey	Submission 1408
324-332	Modal parameters of the blended brick well model according to TBDY-2018 and RYTEIE-2019	Furkan Günday	Turkey	Submission 1409
333-341	Termal Şok Çevrim Sayısının DX54D Çeliğinin Mikroyapı ve Tane Boyutuna Etkisi	Sadi İlmi Yüksekbaş, Ali Günen	Turkey, Turkey	Submission 1416
342-349	Effect of Fly Ash and Wood Ash on Setting Times and Compressive Strength of Cement Paste	Melek AKGÜL, Serkan ETLİ	Turkey, Turkey	Submission 1417
350-359	Emerging Trends in Free Space Optical Communication: Photonics Integrated Circuits and Lithium Niobate Technologies	Lokesh Kumar, Naveed Saqib, Imdad Hussain	Pakistan, Pakistan, Pakistan	Submission 1419
360-367	Enerji sektöründe Kadınlar; cinsiyet eşitliği ve temel sorunlar üzerine kısa bir değerlendirme	Nazan Yalçın Erik	Turkey	Submission 1428
368-376	Yenilenebilir Enerji ve Küresel İklim Değişikliği Etkisindeki Küresel petrol piyasalarında Güncel Durum ve Geleceğe Yönelik Öngörüler	Nazan Yalçın Erik	Turkey	Submission 1429
377-380	Selecting the Optimal Features of the Mushroom Data using Genetic Algorithms	Ahmet Yilmaz	Turkey	Submission 1434
381-385	Applications of the Knapsack Problem: Part 1-Expensive Cargo Airline Dispatch	Okkes Tolga Altinoz	Turkey	Submission 1438
386-389	Effective Filtration Properties of CBRN Nanofiber Filters Designed by Electro-spinning Technique	Irem Mukaddes BILGISEVEN, Serdar KARAKURT	Turkey, Turkey	Submission 1440
390-393	Adli Ebelik	Feride Çevik, Ebru Ertaş	Turkey, Turkey	Submission 1443
394-399	Düşük Oranlarda Yumurta Kabuğu Tozunun Epoksi Kompozitlerin Mekanik Özelliklerine Etkisi	Gökhan Demircan	Turkey	Submission 1446
400-403	Equivalent Circuit Model of Two Symmetrical Split Ring Resonators based Microwave Sensor Design	Cem Gocen, Merih Palandoken	Turkey, Turkey	Submission 1448
404-409	Cytotoxic Effects of Macrovipera Lebetinus Venom and Protein Fractions on Colorectal Cancer Cells	Sude KOCABIYIK, Aziz AVCI, Nazan UZUM, Serdar KARAKURT	Turkey, Turkey, Turkey, Turkey	Submission 1449
410-417	YALIN TASARIM YAKLAŞIMI İLE ÜRETİM HATTI ORGANİZASYONU	Korel ÜNSAL, Adnan AKKURT	Turkey, Turkey	Submission 1450
418-426	Classification of Android Malware Using Random Forest Approaches	İbrahim Çetiner	Turkey	Submission 1455
427-434	The Mediating Role of Corporate Image and Job	Zübeyir ÇELİK, Reha	Turkey, Turkey, Turkey	Submission 1458

	Satisfaction in the Effect of Internal Marketing on Employee Performance	SAYDAN, Bulut DÜLEK		
435-451	Diminishing Linguistic Taboos in Pakistani Society: A Descriptive Analysis	Mamoona Shahzad, Azhar Pervaiz	Pakistan, Pakistan	Submission 1463
452-457	Green Synthesis and Characterization of Selenium Nanoparticles	Gülsüm ORUÇ, Çiğdem GÖKÇEK SARAC, Serdar KARAKURT	Turkey, Turkey, Turkey	Submission 1466
458-463	Kapsayıcı Liderlik Stratejilerinin Çalışan Adanmışlığına Etkisi	Nermin Kişi	Turkey	Submission 1468
464-470	Statistical Analysis of Changes in Numbers of Teacher, Student, and School in Turkey: A 2000-2023 Case Study	Tunahan Turhan, Cengiz Gazeloğlu	Turkey, Turkey	Submission 1475
471-475	Ebelik Mesleğinde İletişimin Önemi	Ebru ERTAŞ, Feride ÇEVİK	Turkey, Turkey	Submission 1476
476-481	Çimentolu Harçlarda Agrega İkamesi Olarak Atık Kahve Telvesinin Kullanımı	Ahmet Ferdi Şenol	Turkey	Submission 1478
482-486	Çocuklarda Akıllı Telefon Kullanımı ve Dijital Göz Yorgunluğu	Fatih AYDOĞDU	Turkey	Submission 1480
487-499	Emerging Ecologies and the Nascent Paradigm: Reconceptualizing Architectural Design in the Current Interregnum. The New that cannot be Born	Valerio Perna	Albania	Submission 1481
500-507	Water quality of Shkumbini River, Albania, evaluated by physical-chemical parameters and nutrient content	Vanela Prifti, Flora Qarri, Pranvera Lazo	Albania, Albania, Albania	Submission 1482
508-514	Integrating Haar Cascade, CNN and SVM for Advanced Facial Recognition	Fayek Maarfi	Algeria	Submission 1494
515-519	Facial Recognition: Employing Histogram of Gradients and Support Vector Machines	Fayek Maarfi	Algeria	Submission 1495
520-526	Biyopolimerler ve Önemi	Orhan Kelleci, Süheyla Esin Köksal	Turkey, Turkey	Submission 1498
527-533	Karışık Meyve Sularında Pestisitler ve Sağlık Riski Değerlendirmesi	Senar Aydın, Mehmet Emin Aydın	Turkey, Turkey	Submission 1499
534-550	Mathematical Modeling and Thin-Layer Drying Characteristics of Pre-Treated Breadfruit (Artocarpus Altilis) Chips	Waliu A. Adebayo, Kehinde A. Taiwo, Onome Okeremeta	Nigeria, Nigeria, Nigeria	Submission 1527
551-553	Yapay Zekâ ve Dijital Materyallerle Desteklenmiş Çevre Eğitimi Dersinin Çevre Öz Yeterliklerine Etkisi	Ece Ceren ÖZER, Semra BENZER	Turkey, Turkey	Submission 1529
554-559	Fen Eğitiminde Yapay Zekâ Kullanımı	Ece Ceren ÖZER, Semra BENZER, Recep BENZER	Turkey, Turkey, Turkey	Submission 1530
560-564	Assessing Turkey's Sustainable Competitiveness with Border Neighbors: An Integrated LODECI-ARTASI Approach	Ahmet Çalık	Turkey	Submission 1535
565-569	The Impact of Fracture Orientation on Particle Transport Behaviour	Bouragaa Kheira, Bennacer Lyacine, Ahfir Nasre-Dine	Algeria, Algeria, France	Submission 1537
570-576	Öğretmen Adaylarının Özel Eğitimde Aile Eğitimi Dersi Kapsamında Gerçekleştirdikleri Aile Eğitimi Oturumuna Yönelik Deneyimleri	Şeyda Yıldırım Parlak, Cemil Parlak	Turkey, Turkey	Submission 1542
577-585	Damage of extra bismuth impurity on crystalline quality of Bi-2223 advanced superconductors	Mustafa Burak Türköz, Ümit Erdem, Tahsin Turgay, Gürcan Yildirim	Turkey, Turkey, Turkey, Turkey	Submission 1543
586-594	CNC Program Development: Principles and Practices for Programming a Clutch Hub Turning Process	Violeta Krcheva	North Macedonia	Submission 1544
595-602	Inspection of flux pinning capability and microstructural properties of Bi2.1+xSr2.0Ca2.1Cu3.0Oy ceramics	Mustafa Burak Türköz, Ümit Erdem, Tahsin Turgay, Gürcan Yildirim	Turkey, Turkey, Turkey, Turkey	Submission 1545
603-609	The Importance of Carbon Footprint Measurement for Environmental Sustainability	Betül ALTAY TOPCU, Sevgi SÜMERLİ SARIGÜL	Turkey, Turkey	Submission 1554
610-618	KCL çamuruna eklenen çeşitli tarımsal atıkların çamur özelliklerine etkisinin incelenmesi	Ebrahim Thabit Mohammed ALADRAN, İnci TÜRK TOĞRUL	Turkey, Turkey	Submission 1569
619-625	Pektinin Kayıp Önleyici Malzeme olarak Kullanımının İncelenmesi	Ebrahim Thabit Mohammed ALADRAN, İnci TÜRK TOĞRUL	Turkey, Turkey	Submission 1570
626-636	A Study on the Flexural Response of Core-Shell Sandwich Panels: Impact of Core Structure Design Using Finite Element Analysis	Beyza Nur Tosun, Khaled Alkhatib, Mirsadegh Seyedzavvar, Cem Boğa	Turkey, Turkey, Turkey, Turkey	Submission 1574
637-643	Işıklı Gölü'nün (Çivril, Denizli) Hidrojeokimyasal İncelemesi	Abdullah Ay, Şehnaz Şener	Turkey, Turkey	Submission 1576
644-650	Gıda ve Kozmetik Ürünlerinde İçerik Bilgisi ve Anlaşılırlığı Sunan Mobil Uygulama	Ethem AĞCA, Umut Fikri SANTUR, Serhat AK, Çiğdem ACI	Turkey, Turkey, Turkey, Turkey	Submission 1577
651-656	Towards Smart Cooking Technologies: Machine Detection of Onion Burn During Cooking	Bilge Han TOZLU	Turkey	Submission 1584
657-662	Küreselleşme Sürecinin Demokrasi Üzerine	Serdar YAY	Turkey	Submission 1596

	Etkisine Yönelik Bir Değerlendirme			
663-671	Analyses of X-Ray Diffraction and Hirshfeld Surface of complex (di-aqua) bis (pyridine-3-carboxamide) di (2 nitrobenzoato) zinc(II) monohydrate	Ersin Acar, Necmi Dege	Turkey, Turkey	Submission 1598
672-679	Sınıf Öğretmeni Adaylarının Matematik Eğitiminde Örüntülerin Önemine İlişkin Görüşlerinin İncelenmesi	İlkim Zülal ÖLMEZ, Özlem ÖZÇAKIR SÜMEN	Turkey, Turkey	Submission 1600
680-693	Türkiye'de Bilgi İşlemsel Düşünme Konusunda Yürütülmüş Lisansüstü Tezlerin İncelenmesi	İlkim Zülal ÖLMEZ, Özlem ÖZÇAKIR SÜMEN	Turkey, Turkey	Submission 1602
694-702	Röle Koordinasyonu ve Yük Akışı Analizi: Fotovoltaik Elektrik Dağıtım Şebekelerinde İnceleme	Yusuf Ali YÜCEL, Doğan ÇELİK	Turkey, Turkey	Submission 1605
703-708	The Mediating Role of Brand Attitude in the Effect of Brand Credibility on Brand Purchase Intention	Reha SAYDAN, Zübeyir ÇELİK	Turkey, Turkey	Submission 1612
709-714	Aprocitentan behavioral pattern in Molecular Docking Revealed with Molecular Dynamics	Güvenç Görgülü, Bülent Dede	Turkey, Turkey	Submission 1615
715-731	Sınıf Öğretmenlerinin Empatik Beceri İle İlgili Görüşlerinin Belirlenmesi	Semanur Öter, Mustafa Uğraş	Turkey, Turkey	Submission 1628
732-738	An Automation Application For Users To Manage Their Medication Inventory And Patient Information	Emre AVUÇLU, Ayşe ELDEM, Zeynep GÖKDAĞ	Turkey, Turkey, Turkey	Submission 1638
739-744	A Web-Based Application For Security And Crime Reporting System	Emre AVUÇLU, Ayşe ELDEM, Dilara KILINÇ	Turkey, Turkey, Turkey	Submission 1643
745-754	Monitoring Cutting Tools During Machining of 316L Stainless Steel Using Dimensional Analysis of Chips	Roumaissa Bouchama, Abdelhakim Cherfia	Algeria, Algeria	Submission 1648
755-759	Data on Facial Skin Tumors, Tirana - Albania	Panajot Papa, Admir Jançe, Kristo Papa, Anila Jançe	Albania, Albania, Albania, Albania	Submission 1652
760-763	Breastfeeding in Albanian Women with Silicone Gel Breast Prostheses.	Panajot Papa, Admir Jançe, Kristo Papa, Anila Jançe	Albania, Albania, Albania, Albania	Submission 1653
764-778	Şanzıman Dişlilerinde Topoloji Uygulaması, Analizi ve Çevresel Etkileri	Yusuf Buğra Curuk, İdris Cesur, Beytullah Eren	Turkey, Turkey, Turkey	Submission 1658
779-783	Wax Deposition during the Transportation of Waxy Crude Oil	Rachid Boucetta, Oussama Benhacene	Algeria, Algeria	Submission 1659
784-789	Investigation of the Apoptotic and Anticarcinogenic Potential of Hypericum perforatum in Thyroid Cancer at the Molecular Level	Gizem ALTUNKAYA, Serdar KARAKURT	Turkey, Turkey	Submission 1663
790-796	Basınçlı sulama sistemleri uygulamaları	Samet MORAY, Harun KAMAN	Turkey, Turkey	Submission 1671
797-804	Türkiye'de tarımsal sulama ve su potansiyeli	Samet MORAY, Harun KAMAN	Turkey, Turkey	Submission 1672
805-809	Effect of ZrB2 and Nd2O3 Ceramic Additives on Electrical Properties of Pure Copper	Rüstem Yılmazel, Tuncay Şimşek, Muharrem Pul	Turkey, Turkey, Turkey	Submission 1673
810-814	The Brief Review of Data Imputation Methods in The Presence of Missing Observations	Adile Tatlıyer Tunaz	Turkey	Submission 1675
815-820	Performance Evolution of Support Vector Machine, Random Forest, K-Nearest Neighbors and Neuron Network Algorithms According to Happiness Score	Adile Tatlıyer Tunaz	Turkey	Submission 1676
821-824	Yapay Zeka ve Bilim Dalları ile İlişkisi	Ayhan Esi	Turkey	Submission 1677
825-827	Zero Truncated Poisson Regression Model: A Mini Review	Adile Tatlıyer Tunaz	Turkey	Submission 1678
828-833	Time-Dependent Killing Kinetics of Silver Nanoparticles Synthesized Using Helichrysum italicum	Fatma Beyza Akın, Karakaş İ., Hacıoğlu Doğru N.	Turkey, Turkey, Turkey	Submission 1689
834-839	İç Anadolu Bölgesindeki Jeotermal Suların Hidrojeokimyasal Özellikleri ve Kullanım Olanakları	Eda Aydemir Polat, Şehnaz Şener	Turkey, Turkey	Submission 1690
840-847	Deep Learning Approaches for Sugarcane Disease Diagnosis:A Comparative Study of DenseNet121 and MobileNetV3	Fahrettin Aka, Sedat Metlek	Turkey, Turkey	Submission 1707
848-855	Deep Learning in Medical Imaging: EfficientNetB0 vs. Inception v4 for Knee Osteoarthritis Detection	Ekrem Eşref Kılınç, Sedat Metlek	Turkey, Turkey	Submission 1708
856-861	AISI 1040 Çeliğinin Kuru Tornalanmasında Yüzey Pürüzlülüğü, Kesme Kuvveti ve Kesme Sıcaklığı İncelemeleri	Ayşe Sena Yamaner, Bahar Sayın Kul	Turkey, Turkey	Submission 1709
862-869	Frezeleme İşleminde Hava Soğutmalı Ortamın Takım Aşınmasına Etkisi	Mustafa Kuntoğlu, Kübra Kaya, Rüstem Binali	Turkey, Turkey, Turkey	Submission 1712
870-875	The Effect of Global Warming on Animal Welfare in Sudan	Wadah Elsheikh, İlknur Uçak, M. Cüneyt Bağdatlı	Sudan, Turkey, Turkey	Submission 1719
876-880	Economic Developments in Agricultural Production of Pakistan	Maliha Afreen, İlknur Uçak, M. Cüneyt Bağdatlı	Pakistan, Turkey, Turkey	Submission 1726

881-885	Effect of Different Ratio of Boric Acid Addition on Some Physical and Mechanical Properties of Particle Boards	Abdullah İstek, Cennet Burcu Sıradağ, İsmail Özlüsoylu, Mehmet Emin Ergün	Turkey, Turkey, Turkey, Turkey	Submission 1728
886-894	Yaşam Döngüsü Analizinin Üniversitelerin Çevresel Etkilerini Hesaplama Metodolojisi Olarak Kullanımı: Literatür Analizi	Nisan Nasif, Ahsen Akbulut Uludağ	Turkey, Turkey	Submission 1729
895-899	AHP ile Otomobil Seçimine Yönelik Bir KDS	M. Hanefi CALP	Turkey	Submission 1733
900-910	Sürtünme kompozitlerinde AHP-ARAS Hibrit yöntemi ile ideal dolgu malzemesinin belirlenmesi	Sait Aras	Turkey	Submission 1741
911-918	"Electronic and Optical Properties of			
BaNb2O6 Compounds: Theoretical Study"	Mohanad ASAFI, Murat AYCİBİN	Turkey, Turkey	Submission 1743	
919-923	Some Factors in Shanghai's Rise to the Top of the PISA Exams	Murat ÇETİNKAYA	Turkey	Submission 1744
924-930	QBlade Kullanılarak NACA 1518 Uçak Kanadı Profiline Sahip Yatay Eksenli Rüzgar Türbin Tasarımı	Gizem İrem SEYİS, Mehmet SEYHAN	Turkey, Turkey	Submission 1746
931-939	6 Different Equivalent Circuit model analysis of rGO/TiO2/PEDOT nanocomposites for Supercapacitors	Murat Ates	Turkey	Submission 1747
940-945	Effective communication as a function of the quality of electronic education	Nebojsa Denić, Ivana Bulut Bogdanović, Kostadinka Stojanović	Serbia, Serbia, Serbia	Submission 1752
946-953	Toz Metalurjisi Yöntemi ile Üretilen Fe-C-Nb-V-Cu Mikroalaşım Çeliğinin MQL Destekli İşlenmesinde Kesme Parametrelerinin Yüzey Pürüzlülüğü Üzerine Etkisinin Analizi	Hüseyin YILMAZ, Mahir AKGÜN, Mehmet Akif ERDEN	Turkey, Turkey, Turkey	Submission 1769
954-963	Hafifletilmiş Şanzıman Dişlileri ile İçten Yanmalı Motor Performansının İyileştirilmesi: Topoloji Optimizasyonu ve Gerilme Analizi	Ali Eren Ceylan, İdris Cesur, Beytullah Eren	Turkey, Turkey, Turkey	Submission 1778
964-972	DNA Interlayered Heterojunction Device Fabrication and Characterization: Application of Ferula halophila	Merve Kara, Deniz Ulukuş, Murat Yıldırım	Turkey, Turkey, Turkey	Submission 1777
973-978	Plastik Sanatlarda Maksimalist Yaklaşımlar	Seda DİLAY, Sibel ÇELİK	Turkey, Turkey	Submission 1788
979-986	Analyzing Market Basket Data Using the Apriori Algorithm	Muhammed Taha Berberoğlu, Elifnaz Demir, Hüseyin Aydilek, Mustafa Yasin ERTEN	Turkey, Turkey, Turkey, Turkey	Submission 1792
987-990	Hormone Application in Berries	Fatma ALAN, Ayşen Melda ÇOLAK	Turkey, Turkey	Submission 1793
991-1019	[2] Muhammad Quraish Shihab (Arabic: محمّد قريش شهاب; Muḥammad Qurayš Šihāb; born 16 February 1944) is an Indonesian Muslim scholar in the sciences of the Qur'an, an author, an Academic Scholar, and former Minister of Religious Affairs in the Fourth Development Cabinet (1998).	Bengi Şentürk, Nağme Ebru Karabağ	Turkey, Turkey	Submission 1799
1020-1032	The Impact Of Foreign Aid On Economic Growth In Mena Countries.	Houda Nebbate, MAHMUT ZORTUK	Turkey, Turkey	Submission 1802
1033-1046	Dünya'da ve Türkiye'de Mobilya Sektörü Dış Ticaretinin İncelenmesi	Muhittin Adıgüzel, Mesut Şengüler	Turkey, Turkey	Submission 1815
1047-1054	Some New Simpson Type Inequalities for Multiplicative s-Convexity	Serap Özcan	Turkey	Submission 1828
1055-1059	A Note on Midpoint Type Inequalities for Multiplicative Integrals	Serap Özcan	Turkey	Submission 1829
1060-1066	SYNERGISTIC EFFECT OF ADDED MO AND TI ELEMENTS ON THE MICRO STRUCTURE AND WEAR PROPERTIES OF 316 L STAINLESS STEEL PRODUCED BY TM METHOD	Mohammed Faraj Ali Abu SHAALAH, Harun ÇUĞ, Mehmet Akif ERDEN	Turkey, Turkey, Turkey	Submission 1832
1067-1071	Innovative Metamaterial-Based Antenna for Blood Glucose Measurement	Fikret Alpay Tekşen, Volkan Akdoğan, Muharrem Karaaslan	Turkey, Turkey, Turkey	Mail Submission 4
1072-1082	Derin öğrenme ile Yolcu Duraklarında İnsan Yoğunluğunun Tahmin Edilmesi	Şafak GÖKSU, Ahmet ALKAN	Turkey, Turkey	Submission 1617
1083-1089	Proposed Smart School System with Fiber-to-the-x Network	Auwalu Usman, Shamsu Abdulkadir Adam, Auwal Salis Yunusa, Abdu Isah	Nigeria, Nigeria, Nigeria, Nigeria	Submission 1662
1090-1098	Investigation of the Electrochemical Performance of Silver-Coated Copper Alloy	Ilhan Celik, Muhammet Ozdemir	Turkey, Turkey	Submission 1808
1099-1102	Civic Participation in Local Governance – a Case from an Albanian Municipality	Petrit Dollani	Poland	Submission 1821
1103-1114	Good agricultural practices in the function of sustainable agriculture	Katerina Kareska	North Macedonia	Mail Submission 2
1115-1126	SUSTAINABILITY AND INNOVATIVE	Akinwale Omotola, Ayomide	Nigeria, Nigeria, Nigeria	Submission 1226

	PERFORMANCE OF NIGERIAN MULTINATIONAL ENTERPRISES	Oluwatola, Joshua Oluwatola		
1127-1131	RISK UNDER CONTROL: INTERACTIVE CASE TECHNOLOGIES IN LIFE SAFETY EDUCATION	Borisova E.A.	Uzbekistan	Submission 1369
1132-1138	ENERGY SOAR: UZBEKISTAN ON THE PATH TO CLEAN ENERGY	Borisova E.A.	Uzbekistan	Submission 1370
1139-1149	CHALLENGES AND DEVELOPMENT OF THE INSURANCE MARKET IN ALBANIA ON THE POST PANDEMIC PERIOD	Zamira Veizi, Robert Çelo	Albania, Albania	Submission 1433
1150-1163	SOLAR ENERGY POTENTIAL OF KARAMAN, ŞANLIURFA AND MERSİN PROVINCES LOCATED IN DIFFERENT REGIONS IN TURKEY	MUSTAFA ORUÇ ATALAY, Fikret AKIN ERDEM	Turkey, Turkey	Submission 1692
1164-1171	Digital Image Analysis in Determination of the Structural Parameters of Fancy and Conventional Yarns	Ivana Salopek Čubrić	Croatia	Submission 1699
1172-1174	MODELING AND EXTRACTION OF ESSENTIAL OIL FROM BIOMASS USING GREEN SOLVENT	Linda Loucif Seiad, Naouel Berouane, Hassina Boussak, Soraya Demim	Algeria, Algeria, Algeria, Algeria	Submission 1714
1175-1186	Detecting the Undetectable: A new approach to the Blind Spot Detection for Trucks and Buses	Afaq Ahmad, Muhammad Uzair Khan, Muhammad Zia, Muhammad Lais, Saadia Tabassum	Pakistan, Pakistan, Pakistan, Pakistan, Pakistan	Submission 1767
1187-1197	Optimizing Solar Energy Harvesting through Advanced Solar Tracking Systems	Afaq Ahmad, Arif Aziz, Muhammad Zia, Muhammad Uzair Khan, Kaleem Ullah, Muhammad Asim	Pakistan, Pakistan, Pakistan, Pakistan, Pakistan, Pakistan	Submission 1803
1198-1205	İhracatta İstikrarsızlığın Ekonomik Büyümeye Etkisi: Türkiye İçin Ampirik Bir Analiz	Kadir Karagöz	Turkey	Submission 1540
1206-1213	Sosyoekonomik Gelişmenin Enflasyona Etkisi: Türkiye'den Bulgular	Kadir Karagöz	Turkey	Submission 1541
1214-1247	Revolutionizing Autonomous Driving: A Cutting-Edge Fuzzy Logic Control System	Zahid Hasan, Ammar Ahmed, Muhammad Zubair, Kashif Iqbal, Marium bibi	Pakistan, Pakistan, Pakistan, Pakistan, Pakistan	Submission 1616
1248-1252	Artificial Neural Networks (ANN) Model of SPTN Value for Sandy Soil	Zain Ali Shah, Naveed Ahmed	Pakistan, Pakistan	Submission 1727
1253-1261	BİTKİSEL ÜRETİM ENERJİ ANALİZİNDE KULLANILAN ARAÇLAR	Mevlüt Tavşan, Yusuf Dilay	Turkey, Turkey	Submission 1776
1262-1269	Sürdürülebilirlik İçin Derin Ötektik Çözücüler	Mehmet Pişkin	Turkey	Submission 1621
1270-1273	In vitro Breeding in Beekeeping	Dilek KABAKCI, Nuray ŞAHİNLER	Turkey, Turkey	Submission 1629
1274-1280	ENERAL SITUATION OF ORGANIC BEEKEEPING AND ORGANIC BEE PRODUCTS PRODUCTION	Nuray ŞAHİNLER, Dilek KABAKCI	Turkey, Turkey	Submission 1635
1281-1288	Evaluate The Performance Of Two Population-based Metaheuristic Algorithms In Finding Inverse Kinematic for a Target Point In a Free Environment	Amel DJEDILI, Ammar AMOURI, Ayman BELKHIRI	Algeria, Algeria, Algeria	Submission 1753
1289-1296	Importance and Overview of Digital Communication and Multimedia	Ayşenur Erdil	Turkey	Submission 1796
1297-1305	Empirical Evaluation of Factor Models of Asset Returns	Jakub Tabacek	Slovakia	Mail Submission 6
1306-1310	Cytotoxic Effects of PLGA-mir128-1-5p Nanocapsules on Lung Cancer and Investigation of Gene Activations on the Apoptotic Pathway	Elif BOZKIR, Serdar KARAKURT	Turkey, Turkey	Submission 1444
1311-1315	Investigation of Antioxidant Properties of Propolis Extracts Prepared in Different Solvents	Fatıma Zehra YILMAZ, Serdar KARAKURT	Turkey, Turkey	Submission 1445
1316-1320	Cytotoxic Effects of Pulsed Magnetic Field Exposure on Human Glioblastoma Cell Line Treated with Resveratrol and Themozoloid	Atike DOĞAN, Serdar KARAKURT, Çiğdem GÖKÇEK-SARAÇ	Turkey, Turkey, Turkey	Submission 1457
1321-1336	Farklı Sıra Arası Mesafelerin Bazı Aspir (Carthamus tinctorius L.) Çeşitlerinde Verim ve Verim Unsurları Üzerine Etkisi	Ali ERPAY, Özden ÖZTÜRK	Turkey, Turkey	Submission 1487
1137-1342	Plakanın Serbest Titreşiminde Öz değerlerin Galerkin Yöntemiyle Bulunması	Birkan DURAK	Turkey	Submission 1560
1343-1346	Modeling Melting Points of Polycyclic Aromatic Hydrocarbons: A QSPR Approach Using Multiple Linear Regression	DrioucheYoussouf, Ferfar Meriem, Bouakkadia Amel, Alem Samia, Haddag Hamza	Algeria, Algeria, Algeria, Algeria, Algeria	Submission 1646
1347-1355	Karbon Fiyatlandırılmasının Isı Pompalarının Birim Maliyetine Etkisi	Umut ERCAN, Muzaffer ALIM	Turkey, Turkey	Submission 1787
1356-1359	THE IMPORTANCE OF BEEKEEPING IN THE FERTILIZATION OF PLANTS	Nuray ŞAHİNLER, Dilek KABAKCI	Turkey, Turkey	Submission 1724
1360-1372	Statistical and Psychometric Analysis of a Test	Zhifka Meço, Erjola Kastrati, Aferdita Mehilli	Albania, Albania, Albania	Submission 1737
1373-1379	Impact of Microcredit on the Albanian Economy	Zhifka (Muka)Meço, Raimonda	Albania, Albania, Albania	Submission 1740

		Dervishi, Enxhi Aliaj		
1380-1386	Süt Sığırlarında Meme Özelliklerinin Süt Verimleri, Mastitis ve Somatik Hücre Sayıları Üzerine Etkileri	Sibel ALAPALA DEMİRHAN	Turkey	Submission 1749

Content of Abstract Papers

Page No	Title	Authors	Country	Submission ID
1	Advancing Scanning Electron Microscopy (SEM)Based Nanotechnology Research through Machine Learning Integration	HAFSI ZOULIKHA, KHANE YASMINA	Algeria, Algeria	Submission 1205
2	Electrical Features of Metal Transition Doped Electrolytes for Solid Oxide Fuel Cells	Najah Rhimi	Tunisia	Submission 1206
3	Enhancing Transparency and Trust in Electricity Theft Detection: Integrating Explainable AI with Deep Learning Algorithms	Hafiz Muhammad Azeem Akram	Azerbaijan	Submission 1207
4	Potential Use of Pistacia lentiscus Essential Oil as a Natural Food Additive: Antioxidant and Anti-Inflammatory Properties	Fatima DJENAD, Sabiha ACHAT, Yasmine ACHAT, Sabrina IDIR, Siham BEDDAR, Tassadit SAHKI	Algeria, Algeria, Algeria, Algeria, Algeria, Algeria	Submission 1208
5	Advanced techniques for RF signal detection via software-defined radio: Application in cellular frequency bands	Soufiane Tebache	Algeria	Submission 1209
6	Determine some of the functional requirements for Algerian football cadets according to the different playing positions	Agboubi Habib, Derbal Fethi	Algeria, Algeria	Submission 1210
7	Theoretical analysis of the frontier molecular orbitals, electrostatic potential and nonlinear optical properties of M-nitroacetanilide	Nour Eddine BENHARKAT, Abdelkader CHOUAIH, Nourdine BOUKABCHA	Algeria, Algeria, Algeria	Submission 1211
8	MicroRNA-Mediated Regulation of Signaling Pathways in Hepatocellular Carcinoma: Insights into Potential Therapeutic Targets	Yusra Zarlashat, Hassan Mushtaq, Shoukat Hussain	Pakistan, Pakistan, Pakistan	Submission 1213
9	Removal of antibiotics contaminants from aqueous solution using chitosan beads: Preparation, characterization and separation performance	Ledia MERSEL, Lamia MOULAHCENE, Mathias ULBRICHT, Ounissa SENHADJI-KEBICHE	Algeria, Algeria, Germany, Algeria	Submission 1216
10	Study of L-shaped walls with openings in Medium-Rise buildings subjected to high seismic	Salem Merabti	Algeria	Submission 1217
11	Inhibition of Calcium Carbonate Precipitation with a Green Inhibitor by the Critical pH Method	Rynad TERKI, Rachid KETRANE, Tony LOURTEAU, Polina VOLOVITCH, Jean LÉDION	Algeria, France, France, France	Submission 1218
12	DEVELOPMENT AND CHARACTERIZATION OF ANTIBACTERIAL AND BIODEGRADABLE FOOD PACKAGING FILMS BASED ON PLA AND OLEA EUROPAEA EXTRACT	Meniche Amel, Chibani Nacera	Algeria, Algeria	Submission 1219
13	Characterization of Al6Si2O13–Mg2Al4Si5O18 composites prepared by sol-gel technique	Ahcen Keziz, Meand Heraiz, Aya Latif	Algeria, Algeria, Algeria	Submission 1222
14-15	Incorporating Marble Waste into Cement Mortar Components	Oday Jaradat, Mahmoud Shakarna, Mohammed Khattab, Hisham Suleiman, Karima Gadri	Palestine, Algeria, Algeria, Algeria, Algeria	Submission 1223
16	Colossal dielectric response and non-Debye relaxation of mullite	Ahcen Keziz , Meand Heraiz, Aya Latif	Algeria, Algeria, Algeria	Submission 1225
17	Food Additives Used in Processed Meat Products and Their Effects on Health	Emel Cengiz Kaynakcı	Turkey	Submission 1228
18	Effect of initial concentration and pH on the removal of Paracetamol by adsorption process	Akacha Imane, Merzougui Abdelkrim, Bouzid khadidja	Algeria, Algeria, Algeria	Submission 1240
19	Effect of contact time and adsorbent dose on the elimination of Paracetamol using adsorption process	Akacha Imane, Merzougui Abdelkrim, Bouzid khadidja	Algeria, Algeria, Algeria	Submission 1241
20	Automatic Implementation of a New Stepover Distance for Efficient CPO Toolpaths in Pocket Machining	Elhachemi Bahloul	Algeria	Submission 1242
21	The Adobe (Earth Break)	Hammache Soumia	Algeria	Submission 1244
22	Analytical modeling of components based on carbon nanotubes (CNTFET)	Ahcen Keziz, Aya Latif, Djouani Ibrahim	Algeria, Algeria, Algeria	Submission 1245
23	Differential Thermal Analysis Of Mullite-Cordeirite Composites	Ahcen Keziz, Meand Heraiz, Aya Latif, Djouani Ibrahim	Algeria, Algeria, Algeria, Algeria	Submission 1246
24	Evaluating the Use of Marble Waste and Glass Fiber Reinforced Plastic Waste as Mineral Admixtures in Self-Compacting Concrete	Djeddou Manel, Amieur Mohamed, Chaid Rabah	Algeria, Algeria, Algeria	Submission 1247
25	Synthesis and molecular docking study of new (Z)-5-((2-chloroquinolin-3-yl)methylene)thiazolidine-2,4-dione derivatives	Ismahene Bazine, Rafik Menacer, Ramzi Maadadi	Algeria, Algeria, Algeria	Submission 1248
26	On a reaction-diffusion model applied to climate and pollution	Samiha Djemai, Salim Mesbahi	Algeria, Algeria	Submission 1249

27	Comparative Study of Power Supply Strategies for the Variable Reluctance Machine 12/8	Chouitek Mama, Fidouh Nedjwa	Algeria, Algeria	Submission 1250
28	Modeling Spatiotemporal Dynamics of Phytoplankton: A Nonlocal and Periodic Reaction-Diffusion-Advection Approach	Salim Mesbahi, Samiha Djemai	Algeria, Algeria	Submission 1252
29	Hybrid Deep Learning Approach for Signature Manuscript Authentication	Boucerredj Leil, Kechroud Karima	Algeria, Algeria	Submission 1255
30	Novel Approach to Signature Manuscript Recognition	Boucerredj Leil, Kechroud Karima	Algeria, Algeria	Submission 1256
31	Metal phosphate nanoparticles for the pyrroles synthesis	Berrichi Amina, Bachir Redouane	Algeria, Algeria	Submission 1262
32	Absorption spectrum of van der Waals heterostructure Ab-initio calculations	LOUAFI Widad, REZOUALI Karimr, LOUNIS Samir	Algeria, Algeria, Germany	Submission 1263
33	STUDY OF GENETIC DIVERSITY OF APPLE TREE IN THE DİFFERENT REGION OF AZERBAIJAN	Basti Asadova	Azerbaijan	Submission 1266
34	REGULATION OF GENE EXPRESSION IN EUKARYOTES	Basti Asadova	Azerbaijan	Submission 1267
35	Comparative Analysis of Machine Learning Classification Models in Predicting Cardiovascular Disease	Ladislav Végh, Ondrej Takáč, Krisztina Czakóová, Daniel Dancsa, Melinda Nagy	Slovakia, Slovakia, Slovakia, Slovakia, Slovakia	Submission 1268
36	Mean-field study of magnetic properties of CrNi3-like structure	Youssef Chegrane, Nabil Hachem, Mohammed El Bouziani	Morocco, Morocco, Morocco	Submission 1276
37	Optical Networking Innovations: Advancing 6G Wireless Communication	Lokesh Kumar	Pakistan	Submission 1278
38	Effect of Compression Index and Consolidation Coefficient on Settlement of Rectangular Foundation Resting on Clayey Soil	Emrah DAĞLI, Akın AYDIN, Batuhan BAYRAKTAR	Turkey, Turkey, Turkey	Submission 1279
39	Determination of Moisture Condition Values of Bentonite Material Mixed with Salt in Different Water Contents	Emrah Dağlı, Abdulmelik Fırat Kaya, Berat Türkal, İbrahim Aydoğan	Turkey, Turkey, Turkey, Turkey	Submission 1280
40	Modeling of the heating of neutral particles in a corona discharge	Ferouani Abdel Karim, Belhour Souad, Medjahdi Sarah Ines	Algeria, Algeria, Algeria	Submission 1283
41	Comparison of MMSE and ZF Adaptive Algorithms in the Multiuser Massive MIMO and OFDM System with Beamforming	Bouamama Reda Sadouki, Cherifi Abdelhamid, Amina Elbahri	Algeria, Algeria, Algeria	Submission 1285
42	Production and Characterization of Epoxy Resin-Based Biocomposites Reinforced with Citrus maxima Peel	Abayhan Buran, Murat Ersin Durğun, Ercan Aydoğmuş	Turkey, Turkey, Turkey	Submission 1286
43	Optimization and Characterization of Environmentally Friendly Biocomposites Reinforced with Solanum muricatum Wastes	Abayhan Buran, Murat Ersin Durğun, Ercan Aydoğmuş	Turkey, Turkey, Turkey	Submission 1288
44	Photovoltaic water pumping system using a BLDC motor under conditions of partial shade	Abderrahim ZEMMIT, Abdelouaoud LOUKRIZ, Khaled BELHOUCHET, Abdelghafour Herizi	Algeria, Algeria, Algeria, Algeria	Submission 1289
45	Green hydrogen generation using wind and solar power in water electrolyzers	Abderrahim ZEMMIT, Abdelouaoud LOUKRIZ, Khaled BELHOUCHET, Abdelghafour Herizi	Algeria, Algeria, Algeria, Algeria	Submission 1290
46	Designing of Hybrid Multi-Level Inverter for Photo VoltaicApplications	Sami Ur Rahman, Fazal Muhammad, Ihteshamul Haq, Muhammad Ismail	Pakistan, Pakistan, Pakistan, Pakistan	Submission 1291
47	Construction of nomographic dependencies for determining the characteristics of a jet pump	Denys Panevnyk	Ukraine	Submission 1293
48	The choice of a rational scheme for the use of an oil jet pump	Oleksandr Panevnyk	Ukraine	Submission 1294
49	Investigation of the Physical and Enhanced Photocatalytic Properties of Zinc Oxide Nanoparticles Synthesized Using Aspalathus Extract for Water Remediation Applications	Abubakar Dantani Meli, Mohamed Abdelmonem, Che Azurahanim Che Abdullah	Malaysia, Malaysia, UAE	Submission 1295
50	Biofuel Technology: A Review	Sümeyye Arslan, Zehra Gülten Yalçın, Mustafa Dağ	Turkey, Turkey, Turkey	Submission 1296
51	Isolation, Structural Characterization, and Antioxidant Assessment of Scabiosa semippaposa Salzm	Samia Bendamene, Naima Boutaghane, Abdulmagid Alabdul Magidb, Zahia Kabouche, Laurence Voutquenne-Nazabadiokob	Algeria, Algeria, France, Algeria, France	Submission 1297
52	Hirshfield Surface Analysis, Charge Density Study, DFT Calculations, and Molecular Docking of (Z)-3-N-(Ethyl)-2-N'-(3-methoxyphenyl imino) thiazolidine-4-one	Khaled Drim, Youcef Megrouss, Mohammed Amin Benaouda, Mansour Azayez, Salem Yahiaoui	Algeria, Algeria, Algeria, Algeria, Algeria	Submission 1298
53	Green Approach to Efficiently Remove Hydroxychloroquine Sulfate Using Cocoa Shell Activated Carbon: Investigating Equilibrium and Kinetics studies	Amel Hamadi, Nacera Yeddou-Mezenner, Hiba Kais, Zohra Bensaadi	Algeria, Algeria, Algeria, Algeria	Submission 1302

54	An infeasible interior-point algorithm based on a new kernel function for linear complementarity problems	Safa Guerdouh, Wided Chikouche	Algeria, Algeria	Submission 1304
55	FARKLI KIVAM SINIFLARINA SAHİP TAZE BETONUN İŞLENEBİLIRLİĞİNİ ÖLÇEN YÖNTEMLERİN KARŞILAŞTIRILMASI	Abdussamet ARSLAN, Ömer Faruk BALALAN	Turkey, Turkey	Submission 1309
56	A dynamic contact problem for electro-viscoelastic materials with friction	Aziza Bachmar	Algeria	Submission 1311
57	Sustainable Structural Lightweight mortar with Recycled Expanded Polyvinyl Chloride Waste Aggregate	N. Latroch, A.S. Benosman, A. Badache, M.Hacini, M. Mouli	Algeria, Algeria, Algeria, Algeria, Algeria	Submission 1312
58	Total antioxidant property of methanolic extract from a medicinal plant	Hadjer Sekhri Zeggar, Ahlem Karbab, Bekka Ayoub, Noureddine Charef	Algeria, Algeria, Algeria, Algeria	Submission 1314
59	Design of an improved control strategy based on Model Predictive Control for Dual-Stage Grid-Connected PV Systems using Two-Level Inverter	Abderraouf Touafek, Fateh Krim, Hamza Afghoul, Billel Talbi, Abdeslem Sahli, Abdelbaset Laib	Algeria, Algeria, Algeria, Algeria, Algeria, Algeria	Submission 1318
60	Enhanced A Network Performance using OSPF-SDN Integration: A Comprehensive Analysis	Lokesh Kumar, Naveed Saqib, Aqsa Ali, Imdad Hussain	Pakistan, Pakistan, Pakistan, Pakistan	Submission 1320
61	Kinetic model for orthophosphates adsorption on soil	KAIS Hiba, YEDDOU-MEZENNER Nacera, HAMADI Amel, BENSAADI Zohra	Algeria, Algeria, Algeria, Algeria	Submission 1321
62	Effect of porosity model on the free vibration analysis of functionally graded sandwich plates	Karima Bousmaha, Sid Ahmed Belalia, Sidi Mohammed Chorfi	Algeria, Algeria, Algeria	Submission 1322
63	Valorization of Wood Sawdust and Polystyrene Composite in Cement Mortar	Hassina Boussak, Fouzia Benoudjit, Linda Loucif Seiad, Soraya Demim, Naoual Berrouane	Algeria, Algeria, Algeria, Algeria, Algeria	Submission 1327
64	Influence of Soil Texture on Undrained Cohesion derived from Laboratory Vane Shear Measurements	Chalabi Youssouf , El hadj mimoune Arezki, Aissaoui Soufyane, Brixi Abderrahim	Algeria, Algeria, Algeria, Algeria	Submission 1329
65	AI-Based Methods for Denoising Partial Discharge Signals	Mohammed Ayoub Sahnoune, Boubakeur ZEGNINI, Tahar SEGHIER	Algeria, Algeria, Algeria	Submission 1330
66	Findings of Visual Evoked Potential Testing in Patients with Pituitary Non-Functional Microadenomas	Aykut Oruç, Kadriye Yağmur Oruç, Hakkı Oktay Seymen	Turkey, Turkey, Turkey	Submission 1354
67	Regression-Based Temperature Prediction Using Humidity and Pressure Data for Smart Factories	Merve Sayar, Merih Palandöken	Turkey, Turkey	Submission 1360
68	Monitoring and Mapping of Machine Learning Supported Sensor Data for Digital Transformation Transfer Laboratory	Gökçe İye, Merih Palandöken	Turkey, Turkey	Submission 1385
69	99% Efficient Medium-Voltage Power Electronic Traction Transformer for AC 25 kV/50 Hz Railway Grid	Mohamed Hichem Lahrech, Ahmed Chaouki Lahrech	Algeria, Algeria	Submission 1390
70	Identification and Location of Cracks in Conductive Material Using Eddy Current NDT	Bensalah Chattouh, Ahmed Chaouki Lahrech, Mohamed Hichem Lahrech	Algeria, Algeria, Algeria	Submission 1391
71	Passive surveillance of African swine fever in the Republic of Albania	Jorgen Dedja, Blerina Luke, Enkeleda Ozuni	Albania, Albania, Albania	Submission 1401
72	Now It's Their Turn to Speak Out: How Successful Are We in Tertiary Level English Teaching?	İlknur Kazaz	Turkey	Submission 1421
73	Enhancing Antimicrobial Efficacy of Cosmetic Preservative Using Ethanol Extract of Propolis	Vladimir Mihailović, Nikola Srećković, Nevena Mihailović	Serbia, Serbia, Serbia	Submission 1435
74	Otomotiv Süspansiyon Parçaları için Esneme Testlerinde Yapay Zekâ Tabanlı Aparat Seçimi	Muhammed Abdullah ÖZEL, Deniz BAL, Semih KÖSE, Mehmet Yasin GÜL	Turkey, Turkey, Turkey, Turkey	Submission 1437
75	Fonksiyonel Gıda ve Moleküler Gastronomi İlişkisi	Çiğdem KIZILGEÇİ, Sevim ŞAHİN	Turkey, Turkey	Submission 1452
76	Effects of In-Ovo Feeding on Poultry	Pınar TATLI SEVEN, Numan Yusuf AKTAŞ, Seda İFLAZOĞLU MUTLU, Miray Sıla ÇİÇEK, İsmail SEVEN	Turkey, Turkey, Turkey, Turkey, Turkey	Submission 1454
77	Cultural and technical condition of pastures in the research "objects" of the administrative-territorial district of Astara region	Sanubar Aslanova	Azerbaijan	Submission 1462
78	The species composition of the Paliuruseta-Sambucusetum-Cynodonosum formation found in the pastures of Astara region	Sanubar Aslanova	Azerbaijan	Submission 1464
79	Heat Exchanger Optimal Design Tool Based on AI	Mehdi OUADA, Billel MEGHI, Nadir BENAMIRA	Algeria, Algeria, Algeria	Submission 1335
80	Controllability Results for Second-Order Evolution Problems with Finite State-Dependent Delay and Nonlocal Conditions	Chahrazed Boudefla, Selma Baghli-Bendimerad	Algeria, Algeria	Submission 1336

81	Development of Treated Lignocellulosic Fibers for Enhancing Mechanical and Thermal Properties of Construction Composites	Kattia YALAOUI, ZEMBOUAI Idris, KACI Mustapha, Brahim Remila	Algeria, Algeria, Algeria, Algeria	Submission 1338
82	Repair Of Impact-Damaged Prestressed Concrete Bridge Girders With Composite Materials	Salim HAMLAOUI, Abdelhamid GUETTALA, Cherif BELEBCHOUCHE, Mohamed Lyes Kamel KHOUADJIA	Algeria, Algeria, Algeria, Algeria	Submission 1341
83	Synthesis of urethane acrylate oligomer (UAO) used for 3D printing	Benkacem Hasna, Bouchoul Boussaha, Benaniba Mohamed Taher, Lasmi Sofiane, Lamiri Leila	Algeria, Algeria, Algeria, Algeria, Algeria	Submission 1345
84	Impedance Modeling and Stability Analysis of Renewable Energy Sources with LCC-Based HVDC Power Transmission	Sarfraz Anwar, Syed Nasir Shah, Muhammad Zafar, Muddassir Ali	Pakistan, Pakistan, United Arab Emirates, Pakistan	Submission 1346
85	Breakthrough in Shear Viscosity Prediction: Superior Performance of ANN and Swarm Intelligence in Starch Suspensions	Mohamed Kouider Amar, Achouak Madani, Faiza Omari	Algeria, Algeria, Algeria	Submission 1349
86	Transport parameters of a homogeneous DBD discharge of the Ar - NH3 gas mixture	Barkahoum LAROUCI, Amar Benmoussa, Ahmed BELASRI, Soumia BENDELLA	Algeria, Algeria, Algeria, Algeria	Submission 1350
87	Ferrofluid flow through an annulus	Jaswinder Singh Mehta	India	Submission 1352
88	Maximum Power Point Tracking Based on FLC Using DC/DC Boost Converter for PV System	Kellal Cherif, Mazouz Lakhdar, Ouacel Abdelkader, Kouzou Abdellah, Matilde Pietrafesa	Algeria, Algeria, Algeria, Algeria, Italy	Submission 1353
89	Tuning the PI controller for optimum performance in a VSC based HVDC system	Kellal Cherif, Mazouz Lakhdar, Ouacel Abdelkader, Kouzou Abdellah, Matilde Pietrafesa	Algeria, Algeria, Algeria, Algeria, Italy	Submission 1355
90	Effect of milking frequency on the hygienic and nutritional quality of raw milk in the Mid-Northern region of Algeria	SILARBI Tayeb, LAABAS Saadiya, CHAHBAR Mohamed, TEFIEL Hakim, GADOUM Abdelkader, ABDELLAH Fatiha, HAMDEN Khaled	Tunisia, Algeria, Algeria, Algeria, Algeria, Tunisia, Tunisia	Submission 1356
91	A comparison of FEM and FIT techniques for the optical modeling methodology used in the new nanostructured hybrid STPV cells	Oussama Baitiche, Fathi Bendelala, Ali Cheknane	Algeria, Algeria, Algeria	Submission 1426
92	Design and Simulation of Logic Circuits Using Phase Change Materials in a Kagome Structure	Ibrahim CINAR	Turkey	Submission 1500
93	The Effects of Lycopene on Health and Fields of Use	Halil İbrahim Binici, Adem Savaş	Turkey, Turkey	Submission 1532
94	Süspansiyon Parçalarından Rot mili Parçasının Yağlama Operasyon Sürecinin Ürün Performansına Etkisinin İncelenmesi	Semih KÖSE, Muhammed Abdullah ÖZEL, Mehmet Yasin GÜL	Turkey, Turkey, Turkey	Submission 1479
95	DFT study and Spectral Analysis of a novel synthesized ketone derivative	SMATI Sabrina, BOUKABCHA Nouredine, MENAD Karima, CHOUAIH Abdelkader	Algeria, Algeria, Algeria, Algeria	Submission 1334
96	Processing of data from a PCR-RAPD genetic fingerprint by UPGMA (Unweighted Pair Group Method With Arithmetic)	LAABAS Saadiya, CHAALAL Hichem, SILARBI Tayeb	Algeria, Algeria, Tunisia	Submission 1358
97	Antimicrobial properties of thyme (Thymus vulgaris L.) essential oil	Amara Nacira, Amara Sabrina, Touati Souad	Algeria, Algeria, Algeria	Submission 1361
98	Therapeutic effect of curcuma longa L and geranuim rosat Pelargonium Graveolens essential oils against lead acetate-induced testicular toxicity	Nacera Boulila, Lynda Lakabi, Massinissa Madouche, Samira Oudahmane-Akdader, Assia Kamel, Menad Rafik, Ferroudja Bensaad-Medjdoub	Algeria, Algeria, Algeria, Algeria, Algeria, Algeria, Algeria	Submission 1363
99	Exploring the impact of allelopathic crops on surrounding competitorscometitors in Agricultural systems	Soltane Sabrine, Benmeddour Tarek	Algeria, Algeria	Submission 1364
100	Global and local stability analysis of a heroin epidemic model	Zirar Imane Hana, Lakmeche Abdelkader, Touaoula Mohamed Tarik, Helal Mohamed, Bensid Yazid	Algeria, Algeria, Algeria, Algeria, Algeria	Submission 1365
101	Fabrication Of Flexible Thin Film Substrates By The Extraction Of CNCs From Cellulosic Materials	Abdul Basit, Hafeez Anwar	Pakistan, Pakistan	Submission 1366
102	Enhancing Electricity Theft Detection in Smart Grids Using Temporal Convolutional Attention Networks and Variational Autoencoders	Hafiz Muhammad Azeem Akram	Azerbaijan	Submission 1371
103	Energy Efficiency in Gas Turbine Cooling: Techniques and Computational Fluid Dynamics Analysis Using ANSYS Fluent	Kamal ABOUELMAJD, Isamil LAGRAT	Morocco, Morocco	Submission 1375
104	Phase transitions in magnetic materials magnetic materials: Application to energy storage and heating systems	Abdelhak Boukhal, Youssef Chegrane, Nabil Hachem, Mohammed El Bouziani	Morocco, Morocco, Morocco, Morocco	Submission 1378
105	Control by AES spectroscopy and photoluminescence of Oxygen point defects in	Zakia.LOUNIS, M.Salah HALATI, Moussaab BELARBI,	Algeria, Algeria, Algeria, Algeria, Algeria, Algeria	Submission 1379

	SnO2 thin films	Malika ACHOURI, Djamel GHAFFOR, Chawki Zegadi		
106	Evaluation of Antibacterial Activity of Thymus vulgaris Extracts	Khiari Mohamed, Kechrid Zine	Algeria, Algeria	Submission 1383
107	On the regularity in Colomeau's algebra	Mohamed Helal, Mohamed El Amine Kherarba	Algeria, Algeria	Submission 1384
108	Machine Learning Supported Antenna Design for UHF RFID Applications	Emre Aksoy, Merih Palandöken	Turkey, Turkey	Submission 1524
109	Ochratoxin-A Toxicity in Broiler Birds and its Amelioration with N-Acetylcysteine Supplementation	Muhammad Imran, Muhammad Kashif Saleemi, Al-Hafiza Shafia Tehseen Gul, Aisha Khatoon, Mughees Aizaz Alvi, Muhammad Imran	Pakistan, Pakistan, Pakistan, Pakistan, Pakistan, Pakistan, Pakistan	Submission 1392
110	Three-Dimensional Analysis of Free Vibration of Sandwich Plates with Composite Laminated Face Sheets and a Porous Functionally Graded Core	A. Guenanou, M. Hachemi, M.S.E. Hamroun, F. Touahra, R. Chebout, K. Bachari	Algeria, Algeria, Algeria , Algeria, Algeria , Algeria	Submission 1396
111	Analysis of Porous Sandwich Plates FGM Subjected To Free Vibration	MERDACI Slimane, HADJ MOSTEFA Adda, BOUCHAFA Ali	Algeria, Algeria, Algeria	Submission 1410
112	AI-Powered Fault Detection in MPPT Algorithms Utilizing Artificial Neural Networks for Enhanced Photovoltaic System Performance	Abdelouadoud Loukriz, Mohamed Dahmani, Zine Elabadine Dahmane, Abderrahim Zemmıt	Algeria, Algeria, Algeria, Algeria	Submission 1411
113	Sıhhi Seramik Makinesi Milinin Statik Yük Altında İncelenmesi	Fatih Karpat, Mehmet Kıvanç Turan, Murat Mandıracı	Turkey, Turkey, Turkey	Submission 1516
114	Control Battery Storage Strategy in Stand-Alone Photovoltaic Systems: A Study Under Irradiation Effects	Layate Zakaria, Bahi Tahar, Lekhchine Salima	Algeria, Algeria, Algeria	Submission 1519
115	Servis Uygulamaları İçin Kural Tabanlı Proses Takip Yazılımının Geliştirilmesi	Cengiz SERTKAYA, Fidan Khalilbayli	Turkey, Turkey	Submission 1526
116	Microalgae Based Bioplastics and Their Utilization as Fertilizer	Wiem Jebahi, Bengü Özuğur Uysal	Turkey, Turkey	Submission 1533
117	Farklı Gedik Tiplerinden Kaynaklanan Ani Baraj Yıkılması Akışının Bir Binaya Etkisinin Sayısal Olarak İncelenmesi	Emrah Sevinç	Turkey	Submission 1551
118	Effects of Supplemental Feeding of Fenugreek and Fennel Seeds on Milk Production Properties in Assaf Sheep	Ömer Berk KARABACAK, Birol DAĞ	Turkey, Turkey	Submission 1563
119	Myofascial Release Exercises in the Treatment of Plantar Fasciitis: A Traditional Review	Mehmet SÖNMEZ	Turkey	Submission 1567
120	Free Vibration Analysis of Functionally Graded Nanoplates	Soufiane Benounas, Mohamed-Ouejdi Belarbi	Algeria, Algeria	Submission 1413
121	Bending Analysis of Functionally Graded Nanoplates	Soufiane Benounas, Mohamed-Ouejdi Belarbi	Algeria, Algeria	Submission 1414
122	Bending Analysis of Functionally Graded Sandwich Hyperbolic Paraboloid Shells with Different Boundary Conditions	Soufiane Benounas, Mohamed-Ouejdi Belarbi	Algeria, Algeria	Submission 1415
123	Hysteresis behavior of a graphene monolayer in the presence of a transverse crystal field	M. Salama, T. Mouhrach, N. Hachem, E.B. Choubabi	Morocco, Morocco,Morocco,Morocco	Submission 1420
124	Analyzing Fuzzy Differential Equations: Application of Tarski's Fixed Point Theorem to Establish Solution Existence and Uniqueness.	Bellabes Zineb, Naima Boussekine	Algeria, Algeria	Submission 1422
125	Polyamide-Graphene oxide: synthesis, characterization, and electrochemical properties for different applications	Assia Tounsi, Ouafia BELGHERBI, Leila LAMIRI, Boussaha BOUCHOUL, Meriem MESSAOUDI, Nourdinne BOUMAAZA, Farid HABELHAMES, Ahmed BAHLOUL	Algeria, Algeria, Algeria, Algeria, Algeria, Algeria, Algeria, Algeria	Submission 1423
126	Study of the effect of marble powder on the subsidence potential	Mohamed DACHER, Ouassila BAHLOUL, Samir BENMOUSSA, Chafai BECHTELLA	Algeria, Algeria, Algeria, Algeria	Submission 1424
127	Optimization of Robotic Manipulator Structure for Strawberry Harvesting Applications	Inas SAOUD, Asaad CHAHBOUN	Algeria, Algeria	Submission 1430
128	Bioethanol Production by Alcoholic Fermentation Using Saccharomyces cerevisiae and Valorization of Prickly Pear Juice Waste	FERROUDJ Nawal, BENSEFIA Chaima, KAHALERRAS Fatma	Algeria, Algeria, Algeria	Submission 1431
129	Influence of Urban Play Areas on Children's Social Integration in Cities	Marouane Samir Guedouh, Mohamed Amine Khadraoui, Soumaya Besbas	Algeria, Algeria, Algeria	Submission 1436
130	Numerical optimization of the workpiece positioning errors	CHAMI M, RAHOU M, SEBAA F	Algeria, Algeria, Algeria	Submission 1439
131	THE INFLUENCE OF THE ELECTRIC FIELD ON THE ELECTRONIC AND MECHANICAL PROPERTIES OF NONOTUBES	BAIRA Fayçal	Algeria	Submission 1447

132	Analysis of the mechanical properties of biopolymer - natural filler composite systems	Marcell János Tóth, Annamária Polyákné Kovács	Hungary, Hungary	Submission 1453
133	Flexural and thermal characterization of a lightweight clay and sawdust based compressed bricks	Belkacem MEZIANI, Mohamed Amin BOUZIDI, Chabane SI AHMED	Algeria, Algeria, Algeria	Submission 1459
134	Characterization and bioactivity of lepidium sativum seeds polysaccharide	Achat yasmine, Lefsih Khalef, Boulekbache Lila, Djenad Fatima, Beddar Siham, Idir Sabrina	Algeria, Algeria, Algeria , Algeria, Algeria , Algeria	Submission 1461
135	Plakanın Serbest Titreşiminde Öz değerlerin Galerkin Yöntemiyle Bulunması	Birkan DURAK	Turkey	Submission 1560
136	Modeling the Stability of Nanofluids Using Artificial Neural Networks and Investigating Their Effects on Thermal Conductivity	Fevzi SAHIN	Turkey	Submission 1571
137	İÇSEL PAZARLAMA UYGULAMALARI VE ÖRGÜTSEL BAĞLILIK İLİŞKİSİNİN İŞ PERFORMANSINA ETKİSİ: BARTIN ÜNİVERSİTESİ'NDE BİR ÇALIŞMA	Gizem BAYLANÇİÇEK, Selman KARAYILMAZLAR	Turkey, Turkey	Submission 1575
138	Microorganisms isolated from local soil as a tool for efficient bioremediation	Barbara Bertović, Monika Šabić Runjavec, Marija Vuković Domanovac	Croatia, Croatia, Croatia	Submission 1603
139	Artificial Intelligence Supported Optimization of Nanofluid Usage in PV Panel Cooling	Omer GENC	Turkey	Submission 1607
140	IMPACTS OF CLIMATE CHANGE ON THE PRODUCTIVITY OF TOBACCO CROP IN PAKISTAN	Haroon Khan, Ömer Süha Uslu, Osman Gedik	Turkey, Turkey, Turkey	Submission 1522
141	A multi-objective scheduling of renewable energy sources in a smart grid system	Rameez Hassan, Muhammad Bilal, Hasnain Ali Shah, Fazal Muhammad	Pakistan, Pakistan, Pakistan, Pakistan	Submission 1601
142	Migration Processes in Azerbaijan and their Effects on the Sustainable Development of the Enterprise Economy	Maryam Adli	Azerbaijan	Submission 1261
143	Numerical study of the effect of focusing the absorber relative to the mirror in a parabolic trough concentrator (PTC) on mixed convection	Hassene Boutelis, Dalila Titouna, Ammar Benderradji, Lazhar Serir	Algeria, Algeria, Algeria, Algeria	Submission 1344
144	Regional Consensus on Political Settlement to the Principal Conflicts in Afghanistan	Maria Adli	Azerbaijan	Submission 1460
145	Evaluation of The Nanotoxicity of TiO2-NPs on Wistar rats	Sara BOUZENZANA, Rachid ROUABHI, Tahar GOUDJIL, Abdellali BOUZENZANA	Algeria, Algeria, Algeria , Algeria	Submission 1465
146	An Innovative Program to Train Future Nobel Laureates Belonging to Türkiye and Pakistan	Syed Arif Kamal	Pakistan	Submission 1469
147	Water trapping Technical changes in barrier trap selectivity for the management of coastal lagoons	Zakaria Adjou, Djamila Boufades, Mustapha Miloudi	Algeria, Algeria, Algeria	Submission 1470
148	Experimental investigation of the efficiency of CO2 enhanced oil recovery (CO2-EOR) in sandstone cores from an Algerian oil field using NMR technology	Zakaria Adjou	Algeria	Submission 1471
149	Thermal and mechanical properties of lightweight mortar and its constituents at elevated temperatures	Mohamed sadak Merrakchi, Smain Benyamina	Algeria, Algeria	Submission 1473
150	Hidden Curriculum: Shaping Students' Character in Religious Studies	Doni Abadi Nababan, Tetty Suriani, Marlen Bailao, Joice Patty	Indonesia, Indonesia, Indonesia, Indonesia	Submission 1477
151	Experimental Analysis of High-Velocity Impact Damage in CFRP Laminates	Mustapha RABOUH, Kamel ZOUGGAR, Khelifa GUERRAİCHE	Algeria, Algeria, Algeria	Submission 1483
152	Modeling and Analysis of Impact-Induced Damage in Carbon Fiber Reinforced Polymer Composites Using ABAQUS	Mustapha RABOUH, Kamel ZOUGGAR, Khelifa GUERRAİCHE	Algeria, Algeria, Algeria	Submission 1484
153	Structural and tribological behaviour study of porous TiNiCu shape memory alloys processed by powder metallurgy method	Zineb Sadaoui, Latifa Kahloul, Soumaya Meddah	Algeria, Algeria, Algeria	Submission 1485
154	Existence for Caputo-Fabrizio Random Fractional Differential Equations	BEKADA FOUZIA	Algeria	Submission 1486
155	Effect of Crosslinkers on Swelling Behavior of Chitosan grafted Poly(Acrylic Acid) Hydrogel	Abir Derbali, Djallel Bouzid, Amel Sadji	Algeria, Algeria, Algeria	Submission 1488
156	Discontinuous Nonlinearities in Fractional p-Laplacian Problems: A Study of Solution Existence and Multiplicity	Hanaa Achour, Sabri Bensid	Algeria, Algeria	Submission 1489
157	Impregnation of an Ion Exchange Resin for a Pharmaceutical Application	DJERADA Thiziri, MOULAHCENE Lamia, SENHADJI Ounissa	Algeria, Algeria, Algeria	Submission 1490
158	Forecasting company failure using ensemble machine learning methods	Kaoutar El Madou, Moad El Kharrim, Mohamed El Merouani	Morocco, Morocco, Morocco	Submission 1491
159	STUDY OF THE ENZYMATICAL	Khaoula Menaiaia, Hana	Algeria, Algeria	Submission 1493

	VARIATIONS OF THE MOSS «LEUCODON SCIUROIDES L.»	Bouzahouane		
160	Ab-Initio Analysis of Structural and Mechanical Properties of Novel Lithium Tetrafluoroaurate (III) LiAuF4	Ishak Mebarkia	Algeria	Submission 1502
161	Improvement of fine Soil Properties with CKD for Road Project Applications	Zemouli Samira	Algeria	Submission 1507
162	Enhancing Earth Blocks with Alfa Fibers: A Sustainable Approach to Building	SI AHMED Chabane, BOUZIDI Mohamed amin, LILLOUCH Samir, MEZIANI Belkacem	Algeria, Algeria, Algeria, Algeria	Submission 1509
163	Enhancing Key Responses in Composite Bricks through Experimental Design Optimization	Boutaina Moumni, Karima Dokkar, Abdallah Oulmekki, Hayat Benmoussa	Algeria, Algeria, Algeria, Algeria	Submission 1510
164	Contribution to the study of a characterization of mining waste, case of poor iron ore from the El Ouenza – Tébessa mine	BOUZERIBA Hadjer, BOUZIDI Nedjima, IDRES Abdelaziz, LAALA Imen	Algeria, Algeria, Algeria, Algeria	Submission 1512
165	Flood Hazard Assessment and Mapping in Arid and Semi-Arid Regions of Algeria Case Study of Doucen City, wilaya Ouled Djellal	Djafri Sid Ali, Houria Athmani, Djouheina Boukehlifi Kouider, Sofiane Bensefia	Algeria, Algeria, Algeria, Algeria	Submission 1515
166	Enhancing the soils geotechnical properties by using plastic waste	Lina ZAIDI, Fatima Zohra BENAMARA, Messaouda BENCHEIKH	Algeria, Algeria, Algeria	Submission 1517
167	Study on the Effect of Metallic Ion Concentration on the Physical Properties and Thickness of Ternary FexNiyCuz Alloy Thin Films (X+Y+Z=100) Prepared by Electrodeposition	Ala. Boulegane, Ikhlas Bar, Hadia Almi, Abderrahim Hadj Larbi, Delloula Lakhdari	Algeria, Algeria, Algeria, Algeria, Algeria	Submission 1520
168	Study of Alpha-Amylase and Urease Inhibitory Activities of an Endemic Plant from the Genus Achillea	Renda CHAHNA	Algeria	Submission 1521
169	Picture Fuzzy B-spline Curve Approximation Model	Nur Azlida Ahmad, Mohammad Izat Emir Zulkifly	Malaysia, Malaysia	Submission 1528
170	Computational Analysis of Structural, Elastic, and Thermoelectric Properties of NbRhGe half-Heusler alloy Employing the Density Functional Theory Approach	Righi Aya, Bendahma Fatima, Labdelli Abess, Mechehoud Khedidja, Mana Mohamed, Achir Bilel	Algeria, Algeria, Algeria, Algeria, Algeria, Algeria	Submission 1534
171	Elimination with bio-coagulant the mixture of two dyes (malachite green and Gentian violet)	MOKHATI Aya, AISSOUS Bochra, FERROUDJ Nawal, BENALIA Abderrezzaq, DERBAL Kerroum	Algeria, Algeria, Algeria, Algeria, Algeria	Submission 1538
172	Bioplastics: A Green Approach in Materials for Green Environment	Nadia Akram	Pakistan	Submission 1547
173	Turbo Ventılate Selector Phosphate Rejects From The Processing Chain Of Djebel-Onk Mine - Tebessa (NE Algeria) : Characterization	LAALA Imen, BOUZIDI Nedjima, ELICHE-QUESADA Dolores, BOUZERIBA Hadjer	Algeria, Algeria, Algeria, Algeria	Submission 1549
174	On Minimum Distance Density Estimation	Bensaber Fatna, Benyahia Wahiba	Algeria, Algeria	Submission 1553
175	Comparative Study of K-Nearest Neighbors and Random Forest for Predicting Lung Cancer	Samira Tared	Algeria	Submission 1556
176	Random Forest for Lung Cancer Prediction	Samira Tared	Algeria	Submission 1557
177	NanoVaccines Design and Development	Abdelali BOUSSIF, Khadidja LEMOUI	Algeria, Algeria	Submission 1558
178	Valorization and characterization of citrus peel by product	Sabrina SAHI-BOUBEKRI, Ounissa KEBICHE-SENHADJI, Fadila HEMMACHE-OUGHLIS	Algeria, Algeria, Algeria	Submission 1559
179	Preparation of activated carbon based on vegetal waste: Application to adsorption, kinetic and thermodynamic study	Z. Mekibes, K. Khalili, M. Benzekri Benallou, N. Douara, N. Benderdouche, B. Bestani	Algeria, Algeria, Algeria, Algeria, Algeria, Algeria	Submission 1565
180	Comparative Hepatoprotective Potency of Green-Synthesized Moringa Nanoparticles in Ameliorating Oxidative Stress	Ayesha Rasool, Razia Noreena	Pakistan, Pakistan	Submission 1581
181	Green Synthesis and Characterization of Manganese Oxide Nanoparticles using Olive Leaf Extract: Thermal Stability and Phase Transformation Analysis	Abdelmalik Zemieche, Loubna Chetibi, Djamel Hamana, Slimane Achour	Algeria, Algeria, Algeria, Algeria	Submission 1583
182	Enhancement of the Efficiency of the CISSe/CdS/ZnO Solar Cell by optimization of the performances layers using SCAPS -1D	A. bayoud , S. Lachhab, A. Bliya, A.Raidou, Al Ibrahmi, L. Dlimi, S. el bahjaouy	Morocco, Morocco, Morocco, Morocco, Morocco	Submission 1590
183	A Review of Artificial Intelligence and Machine Learning Algorithms	Amine Bayoud, Abderrahim Raidoua, Soulaimane El Bahjaouy, Saadeddin Lachhab	Morocco, Morocco, Morocco, Morocco, Morocco	Submission 1592
184	Characterization and comparative study of the adsorption of toxic heavy metals lead and cadmium from aqueous solution using a chemically modified green waste of the Euphorbiaceae family	Terkhi Mohammed Cherif, Belhadji Kinza Amel, Terkhi Sabria	Algeria, Algeria, Algeria	Submission 1593
185	Experimental Assessment of the Effects of Building Materials on Wi-Fi signal 2.4GHz and	Sylhane Bytyqi	Kosovo	Submission 1595

	5GHz			
186	Polyaniline-Modified Iron and Copper Doped Cerium Oxide Nanocomposites for Enhanced Photocatalytic Degradation of Organic Dyes: Synthesis, and Characterization	MADI Kamilia, BENKOUACHI Oumnia Rayane, TAHRAOUI Hichem, CHEBLI Derradji	Algeria, Algeria, France, Algeria	Submission 1597
187	Mechanical characterization of recycled HD-PE Biocomposites reinforced with Esparto grass and natural Pozzolan	Bouchra Achour, Abdelkader Ziadi	Algeria, Algeria	Submission 1609
188	Modeling of a GaN-Based Betavoltaic Cell	Fayçal Bouzid, Ammar Haboussi, Mohamed Salah Halati, Samir Gouga	Algeria, Algeria, Algeria, Algeria	Submission 1610
189	Analytical Modeling of InGaP/GaAs Heterojunction Stacked on a Ge Tandem	Fayçal Bouzid, Ammar Haboussi, Mohamed Salah Halati, Samir Gouga	Algeria, Algeria, Algeria, Algeria	Submission 1611
190	Histopathological changes in the liver of adult rats following repeated exposure to methyl thiophanate	CHELBI Narimene, MALLEM Leila, ABDENNOUR Cherif	Algeria, Algeria, Algeria	Submission 1614
191	Identification and Improvement of Defects in the Forging Production Process of 1040 Steel Suspension Part	Kemal NURVEREN, Serkan ERİKLİLİ	Turkey, Turkey	Submission 1619
192	New Hotend Design for 3D Printers for Highly Efficient Filament Flow	Caglar SEVIM	Turkey	Submission 1620
193	High-Efficiency Buck-Boost Converter for Rapid Active Balancing of Lithium-Ion Battery Packs in Electric Vehicles	Assia Redouani, Kamal Zared, Najiba El Amrani El Idrissi	Morocco, Morocco, Morocco	Submission 1622
194	A Novel Mobile Speed ConvNeXt Model for Accurate Gallbladder Cancer Detection	Ishak Pacal	Turkey	Submission 1626
195	Treatment of textile effluents with EPS waste	Dahdouh Nadjib, Hafesa Haroun, Chaabane Toufik	Algeria, Algeria, Algeria	Submission 1627
196	Arıcılıkta İn Vitro Yetiştiricilik	Dilek KABAKCI, Nuray ŞAHİNLER	Turkey, Turkey	Submission 1629
197	Optimizing Greenhouse Management through IoT-Enabled Automation and Sustainability	Ibrahim El Khalil MEKKI, Mohamed Bilel BELHAOUARI	Algeria, Algeria	Submission 1631
198	Sustainable Wastewater Treatment: Kinetic Modelling and Microbial Strategies in Bioremediation	Monika Šabić Runjavec, Ivana Stojmilović, Marija Vuković Domanovac	Croatia, Croatia,Croatia	Submission 1632
199	Investigation of Drilling Operator Efficiency for Drilling and Blasting Operations in an Underground Lead-Zinc Mine	Tugce Ongen	Turkey	Submission 1634
200	ENERAL SITUATION OF ORGANIC BEEKEEPING AND ORGANIC BEE PRODUCTS PRODUCTION	Nuray ŞAHİNLER, Dilek KABAKCI	Turkey, Turkey	Submission 1635
201	Control of Single Degree of Freedom Magnetic Pendulum with Non-Linear Feedback Linearization Method	Huseyin Yildiz	Turkey	Submission 1637
202	Industrial economic performance indicators: an international comparison	Yasmine Hariti, Nacira Boukhezer-Hammiche	Algeria, Algeria	Submission 1649
203	Modeling of soil consolidation around tunnels-Case study of Algiers Metro	Ibrahim MAHROUG, Abdelhafid MAHROUG	Algeria, Algeria	Submission 1655
204	Enhancing wool dyeing with clove bud (syzygium aracmatics) based natural dyes via microwave treatment using a central composite design	Muhammad Yameen, Fariha Asghar, Shahid Adeel	Pakistan, Pakistan, Pakistan	Submission 1656
205	GG25 Dökme Demirde Karbon Eşdeğerinin Mikroyapı ve Mekanik Özelliklere Etkisi	Cevat Mehmetali, Gökhan Arıcı	Turkey, Turkey	Submission 1657
206	Evaluation of Sun Protection Factor Value and Antiaging Potential of Citrus clementina Hort. essential oil	Rukiye Boran Gülen	Turkey	Submission 1661
207	A techno-economic optimization of Renewable energy sources within a smart grid and battery system through evolutionary algorithms	Hasnain Ali Shah, Muhammad Bilal, Saddam Hussain, Rameez Hassan, Fazal Muhammad	Pakistan, Pakistan, Pakistan, Pakistan, Pakistan	Submission 1664
208	Exploring Phonological Processes in Child Language Development: A Comprehensive Study on Reduplication, Deletion, Consonant Cluster Reduction, Epenthesis, Diminutization, Coalescence, and Assimilation	Om Kumar, Tabish Mubeen	Pakistan, Pakistan	Submission 1666
209	Structure elucidation, and Combined Empirical-Computational studies of a hybrid chloride material with potential NLO properties	Ikram Jomaa, Noureddine Issaoui, Houda Marouani	Tunisia, Tunisia, Tunisia	Submission 1667
210	Design and Implementation of a Shunt Active Power Filter Based on Electric Vehicle Integration for Power Quality Improvement	Ahmed ELOTTRI, Lakhdar MAZOUZ, Abdellah KOUZOU, Nihel Bouthaina SALLAI, Ali TETA, Imad Eddine MOHAMMEDI	Algeria, Algeria, Algeria, Algeria, Algeria	Submission 1670
211	In Silico Study of Chalcone Reductase from Diverse Fabaceae Family of Pakistan	Kamishka Ifttikhar, Muhammad Akram	Pakistan, Pakistan	Submission 1674

212	DETERMINATION OF THE EFFECT OF AZITHROMYCIN ON UTERINE CYTOKINE LEVELS IN SEPTIC PREGNANT RATS	Gonca SONMEZ, Oznur TUFAN, Muhammed Hudai CULHA, Tugba Melike PARLAK, Burak DIK, Ayse ER	Turkey, Turkey, Turkey, Turkey, Turkey, Turkey	Submission 1681
213	Full Factorial design applied for the optimization of CdS thin films deposed by Chemical bath deposition technique	Sara BOULAHDJEL, Samira SALI, Souad BOUAFIA, Salim KERMADI, Lyes ZOUGAR, Hadjira LABECHE, Massaouda AYACHI	Algeria, Algeria, Algeria, Algeria, Algeria, Algeria, Algeria	Submission 1682
214	Towards the Optimization of Microstructure and Mechanical Properties of NbC-based Cermets	Abdul Basit, Asad Malik, Sadaqat Ali, Adeel Umer, Rafi-ud-Din	Pakistan, Pakistan, Pakistan, Pakistan, Pakistan	Submission 1684
215	Elucidation of a Cd(II) Complex: Synthesis, Structural Characterization, Hirshfeld Surface Analysis, DFT, and Spectroscopic Insights	Ikram Jomaa, Noureddine Issaoui, Houda Marouani	Tunisia, Tunisia, Tunisia	Submission 1685
216	Afetlerin Toplum Ruh Sağlığı Üzerindeki Etkileri ve Psikososyal Destek Mekanizmalarının Değerlendirilmesi	Büşra Sezer Türken, Beytullah Eren	Turkey, Turkey	Submission 1687
217	Enhanced Performance of CZTSe Solar Cells with Sb2Se3 Back Surface Field Layer: A SCAPS-1D Simulation Study	Izzeddine Belkacem, Souhila Bensmaine, Mousaab Belarbi, Chams El Hayat Merzouk	Algeria, Algeria, Algeria, Algeria	Submission 1691
218	A STUDY ON THE EFFECTS OF ARTIFICIAL INTELLIGENCE ON LEARNING COMPLEX FUNCTIONS THEORY	Hasan BAYRAM, Sibel YALÇIN TOKGÖZ	Turkey, Turkey	Submission 1695
219	Hazır Beton Santrallerinde Çalışan Personelin Mesleki Eğitimi Üzerine Bir Araştırma	Esra Gerger, Merve Abanoz, Rukiye Koçkar Tuğla	Turkey, Turkey, Turkey	Submission 1696
220	Comparative Design of Wind Power Plants Using Stepwise Regression, Forward Selection and Backward Elimination Methods for Maximum Energy Production	Melih Savran	Turkey	Submission 1697
221	Molecular Pathogenesis of Rheumatoid Arthritis: a review	Sara Ouari, Nadia Benzidane, Noureddine Bribi	Algeria, Algeria, Algeria	Submission 1701
222	Impact Analysis of a Firm EV Charging and Managed EV Charging on Battery Degradation in the Electric Utility Grid	Fouzia Brihmat, Cherif Larbes	Algeria, Algeria	Submission 1702
223	Effect of Europium doping on the microstructural and Optical properties of ZnO thin films	Tiour Faiza, Zougar Lyes, Sali Samira, Manseri Amar, Boulahdjel Sara, Kermadi Salim, Ayachi Messaouda, Chaib Zoubir	Algeria, Algeria, Algeria, Algeria, Algeria, Algeria, Algeria, Algeria	Submission 1703
224	Chenopodium Botrys Bitkisinden Gümüş Nanopartiküllerin Hazırlanması ve Kitosan Nanoliflerinin Yara İyileştirmede Kullanılabilirliği	Hatice ÇELİK, Nurullah ÇİFTÇİ, Gülşin ARSLAN, Fatih ÖZCAN, Uğur ARSLAN	Turkey, Turkey, Turkey, Turkey, Turkey	Submission 1718
225	Nitric oxyde NO and hydrogen peroxide H2O2 scavanging activity of Pistacia atlantica seeds	Younes DOUFFA, Nadjat AZZI, Nour El Houda BELABAS, Haifaa LAROUI, Thoraya GUEMMAZ, Karima SAFFIDINNE, Fatima ZERARGUI, Abderrahmane BAGHIANI	Algeria, Algeria, Algeria, Algeria, Algeria, Algeria, Algeria, Algeria	Submission 1721
226	Molecular Identification of Cladophora vadorum by Using DNA Barcode	Tehseen Hassan Awan, Muhammad Amir, Ghazala Yasmeen Butt	Pakistan, Pakistan, Pakistan	Submission 1722
227	Semi-rigid connections in steel structures	BOUBEKRI Amel, RAS Abdelouahab, BOUMECHRA Nadir	Algeria, Algeria, Algeria	Submission 1723
228	THE IMPORTANCE OF BEEKEEPING IN THE FERTILIZATION OF PLANTS	Nuray ŞAHİNLER, Dilek KABAKCI	Turkey, Turkey	Submission 1724
229	Enhancement of magnetic and electronic properties of two-dimensional FeF3 monolayer by 3d transition metal doping: A first-principles study	Norelhouda Salah, Hakima Yahi	Algeria, Algeria	Submission 1735
230	Self-Assembly of Anisotropic Ultrathin Metal Nanostructures for SERS Sensor Applications	Furkan Sahin	Turkey	Submission 1736
231	Magnetic properties of a mixed spin-3/2 and spin-3 ferrimagnetic Ising system in a graphene bilayer	T. Mouhrach, M. Salama	Morocco, Morocco	Submission 1738
232	Separation of water-soluble proteins from chickpea seed by thin-layer chromatography	Allala Ilham, Alem Karima, Khalfaoui Nour EL houda, Boumendjel Amel	Algeria, Algeria, Algeria, Algeria	Submission 1742
233	Alternative Electrode Production and Their Characterization for Welding High-Temperature Steels	Mehmet Akif AYAZ, Mustafa ACARER, Emin SALUR	Turkey, Turkey, Turkey	Submission 1745
234	Antioxydant activity of some honey samples added with dried fig	Mouhoubi Zina, Abel Zenati, Salim Ouchemouk	Algeria, Algeria, Algeria	Submission 1750

235	Degenerate sweeping process	Mouchira Mansour	Algeria	Submission 1751
236	CHARACTERIZATION OF PHOSPHATE ORE FROM DJEBEL ONK (TEBESSA, ALGERIA)	SI TAYEB Nor El Houda, CHAFI-SOUICI Zahia	Algeria, Algeria, Algeria	Submission 1754
237	DIMENSIONING OF SUPPORT SYSTEM OF A TUNNEL USING THE CONVERGENCE-CONFINEMENT METHOD: CASE OF TUNNEL T1 OF THE NEW ELECTRIFIED LINE BETWEEN BOUGHAZOUL AND DJELFA	TRIKI Ali, CHAFI-SOUICI Zahia, DIAF Badreddine, SI TAYEB Nor El Houda	Algeria, Algeria, Algeria, Algeria	Submission 1756
238	Digital Empowerment: The Evolution of Employment and Remote Work Opportunities	Momeena Mehdi	Azerbaiajn	Submission 1758
239	Numerical study of the stability of a tunnel during tunnelling - Case study of the Sidi Aich tunnel section	DIAF Badreddine, BOUKARM Riadh, CHAFI-SOUICI Zahia, TRIKI Ali, SI TAYEB Nor El Houda	Algeria, Algeria, Algeria, Algeria, Algeria	Submission 1760
240	Particle swarm optimization PSO Based MPPT Algorithm for Solar PV System using the Boost converter	Ouacel Abdelkader, M'hamdi Benalia, Kouzou Abdellah, Cherif Kellal, Matilde Pietrafesa	Algeria, Algeria, Algeria, Algeria, Italy	Submission 1762
241	A-TIG Kaynak Yöntemi ile St37 ve Strenx 960 Çeliklerin Mikroyapısal ve Mekanik Özelliklerinin İncelenmesi	Emre Kasım, Mehmet Fahri Saraç, İlyas Genç	Turkey, Turkey, Turkey	Submission 1768
242	DNA Interlayered Heterojunction Device Fabrication and Characterization: Application of Ferula halophila	Merve Kara, Deniz Ulukuş, Murat Yıldırım	Turkey, Turkey, Turkey	Submission 1777
243	Kernel Matrix Based Textile Image Categorization Using Machine Learning	Rıfat Aşlıyan, Ömer Kalfa	Turkey, Turkey	Submission 1785
244	The Relationship between Supply Chain Management and Total Quality Management: Impact on Business Performance and Productivity	Ayşenur Erdil	Turkey	Submission 1797
245	Modulated 3-D nanoflowers-like Cr-MOF/g-C3N4 for proficient oxygen evolution reaction	Muzamal Javed, Ayesha Saeed, Zahoor Ahmad	Pakistan, Pakistan, Pakistan	Submission 1810
246	ORTAOKUL ÖĞRENCİLERİNİN DOĞAL SAYILARDA ÇARPMA İŞLEMİ VE KESİRLERDE ÇARPMA İŞLEMİNDE PROBLEM KURMA BECERİLERİNİN KULLANDIKLARI BAĞLAM TÜRLERİNE GÖRE İNCELENMESİ	Fatmanur BAŞARAN, Yusuf KOÇ	Turkey, Turkey	Submission 1812
247	The Effect of Adhesive Content on the Properties of Molded Particleboards	Muhabbet Doğan, Abdullah İstek, İsmail Özlüsoylu, Mehmet Emin Ergün	Turkey, Turkey, Turkey, Turkey	Submission 1819
248	Study Of The Evolution Of The Fractal Dimension Of Soil Gains During Compaction	Aldjia Bouzeboudja, Bachir Melbouci, Houria Bouzeboudja	Algeria, Algeria, Algeria	Submission 1824

25.07.2024

19-20 Temmuz 2024 tarihlerinde MEET üzerinden çevrimiçi olarak gerçekleştirilen 4th International Conference on Scientific and Academic Research ICSAR 2024 konferansı akademik teşvik yönetmeliğinin 9. Maddesine istinaden "Tebliğlerin sunulduğu yurt içinde veya yurt dışındaki etkinliğin uluslararası olarak nitelendirilebilmesi için Türkiye dışında en az beş farklı ülkeden sözlü tebliğ sunan konuşmacının katılım sağlaması ve tebliğlerin yarıdan fazlasının Türkiye dışından katılımcılar tarafından sunulması esastır." kriterlerini sağlamaktadır. Toplam 426 adet bildirinin yer aldığı kongre iki gün boyunca çevrimiçi olarak gerçekleştirilmiştir.

Türkiye dışından toplam 26 farklı ülkeden (Fas, Cezayir, Endonezya, Özbekistan, Slovakya, Filistin, Ukrayna, Kuzey Makedonya, Azerbaycan, Benin, Hindistan, Kosova, Malezya, Pakistan, Arnavutluk, Nijerya, Birleşik Arap Emirlikleri, İtalya, Hırvatistan, Macaristan, Sırbistan, Moldova, Polonya, Almanya, Tunus, Fransa) katılım sağlanmış olup, 426 adet bildirinin 241 (%56,57) tanesi yabancı katılımcı tarafından sunulmuştur.

Kongremize ilginiz için teşekkür ederiz.

Saygılarımızla,

Abstract **–** Generative Artificial Intelligence (GenAI) chatbots can make positive contributions to education processes thanks to their advanced natural language processing capabilities. This is a new technology, and it is important to know its proper use. GenAI literature students have more potential to use chatbots effectively. In the literature, there are a limited number of measurement tools to measure the literacy level of AI chatbots, which are in the productive artificial intelligence category. The aim of this study is to adapt an instrument to measure the GenAI literacy of university students. The AI literacy scale developed by [1] was adapted into Turkish with the participation of 297 undergraduate and graduate university students. The scale consists of four dimensions and ten items. The Cronbach's alpha internal consistency coefficient for the four dimensions was calculated to be 0.74. The total test scores showed a significant difference between the upper and lower 27% groups. The fit indices were examined to demonstrate the adequacy of the model, and it provides a good foundation to build upon. With this structure, the instrument can be used as a suitable tool to measure the level of GenAI literacy, the effectiveness of learning activities to improve this level, and to conduct research on this topic.
Keywords – Artificial intelligence (AI) chatbots, GenAI literacy, measurement tool, university students

I. INTRODUCTION

We can think of artificial intelligence (AI) as a field of research that focuses on producing intelligent machines and intelligent computer programs [2]. Today, AI applications developed for many different purposes are used. Chatbots are also a type of AI applications. ChatGPT, a chatbot, works with Generative Artificial Intelligence (GAI) logic, collects data with its own algorithm, performs operations on this training data and provides information as a result of interaction with people [3]. The text-based information it provides is as if it were created by a human [4]; [5] and uses statistical correlations to choose the next word when constructing sentences [3]. ChatGPT, a good representative of chatbots, has impressed its users with its performance since it became available for free use in November 2022 [6].

Traditionally, when looking at the working logic of computer technology, computers operate and produce results according to the commands given by people. When we perform this search process through chatbots, we assign the task of selecting and synthesizing the resources to it. However, the ability of chatbots used to produce text-based content to select valid and reliable sources is unclear. Because chatbots cannot distinguish between right and wrong [7], they can present information that is biased, tends to maintain existing power dynamics, and has the potential to manipulate people [8]. A chatbot can return very good, completely wrong, or even irrelevant results to the given prompts. The text it produces

may contain errors. Therefore, text-based content produced by a chatbot should be checked by an expert for accuracy, bias, appropriateness, and logic [9].

II. Literature Review

Generative AI Literacy

Chatbots are tools that can communicate with people via text or voice by combining technologies such as artificial intelligence and language processing [10]; [11]. In addition to having the potential to improve workplaces and daily life, chatbots bring many opportunities as communication and information tools for digital learning [12]; [13]; [14]. Chatbots play an important role as a tool that emphasizes individualized teaching and supports accessibility [10]. A systematic review study reports that research on the use of chatbots in education generally focuses on language, engineering, and computer courses [15]; [16]. Chatbots might offer significant support in helping students and reinforcing repetitive tasks [10]; [17]. However, in cases where there are no repetitive processes and require in-depth and instant decisions, chatbots inadequacy can be mentioned. For example, it is reported that there are limitations in ensuring that chatbots are matched with learning strategies in the design of e-activities [18]. Therefore, it is suggested that more comprehensive and student-focused studies are needed to evaluate their effectiveness in education [15]. At this point, students' artificial intelligence literacy and their awareness of it are important [19]; [20].

AI knowledge encompasses the proficiency to assess AI technologies critically, engage in effective communication and collaboration with AI systems, and utilize AI as a versatile tool across online platforms, households, and professional environments [21]. It is an important starting point for learners to have AI literacy, to understand the underlying mechanisms of these technologies and thus to gain awareness about their capabilities and limitations, and to develop a critical attitude towards the information produced [22].

The Present Study

Various conceptualizations and frameworks have been proposed in the literature regarding AI literacy. Recently, there have been studies conducted by researchers on how AI literacy can be measured for different education levels. There are studies focusing on the scope of AI literacy or how it can be improved for early childhood education [23], secondary school [24] or K-16 [1] Although it is important to prepare students in AI literature from an early age, GenAI has very quickly entered the business world and has begun to be seen as an innovation that has the potential to transform and change expectations from the workforce. In this respect, it is necessary to first measure the GenAI literacy levels of university students so that their current situation can be determined. The concept of AI literacy is applicable to intelligent agents, automata, problem-solving through data structures, sorting, searching, and machine learning, with the exception of the latter in terms of measuring AI literacy in students within the computer science education system. The instrument that refers to digital literacy to measure the AI literacy of users in the general population is based on the emotions and behaviours that users exhibit in relation to knowledge and skills, along with values, attitudes and ethics. The term "AI literacy" is defined as "awareness and understanding of AI technology in practical applications; the ability to apply and use AI technology to perform tasks competently; and the ability to analyse, select, and critically evaluate data and information provided by AI, while promoting awareness of one's own personal responsibilities and respect for mutual rights and obligations." Four constructs have been proposed for AI literacy: awareness, use, evaluation, and ethics. These dimensions cover the general skills of the general population related to AI. While the measurement tool is adapted to productive AI, which is a type of artificial intelligence, there is no adaptation that would disrupt this scope. In this respect, the adapted instrument was used for measuring general productive AI literacy in the general population.

In this way, educators can have the necessary starting data to prepare them to adapt to their professional lives. Based on this point, the current study aims to adapt AI literacy survey developed by [1] to Turkish culture and obtain the necessary findings regarding its validity and reliability.

MATERIALS AND METHOD

A. *Study Group*

In this study, 66.7% of the 297 participants were female and 33.3% were male. Their mean age was 21.75 years. 85.9% were associate and undergraduate students, 14.1% were graduate students. This demographic distribution provides a diverse representation of young adults in higher education, primarily focusing on those in early stages of their academic careers.

B. *Data Collection Instrument*

The measurement tool developed by [1] to measure AI literacy was adapted to generative AI. A 12-item instrument was obtained to measure AI literacy. The scale items have a 5-point Likert scale. A high score on the instrument indicates a high level of AI literacy. 12 items provide a general measure of generative AI literacy. These general statements were subjected to confirmatory factor analysis with GenAI adaptation.

C. *Data Collection*

Data collection was conducted through an online Google Form, which allowed for an efficient and widespread distribution among the target audience. "Voluntary status of the participants" was accepted as the main criterion for data collection.

D. *Data Analyses*

The collected data were then analyzed using Lisrel 8.0 and IBM SPSS 24. These statistical software tools enabled detailed examination of the data, including confirmatory factor analysis and other relevant statistical tests. The use of Lisrel 8.0 enabled an understanding of whether the AI literacy instrument adapted by confirmatory factor analysis was both reliable and valid for measuring AI literacy in productive AI contexts. IBM SPSS 24 was used for additional validity and reliability analyses.

RESULTS

Descriptive Findings

Table 1 presents the mean, standard deviation, skewness, and kurtosis statistics and standard error values of the items in this scale.

Table 1 Mean, standard deviation, kurtosis and skewness

Items	Mean	Standard Deviation	Skewness		Kurtosis	
			Statistic	Std. Error	Statistic	Std. Error
L1	5.38	1.208	-0.202	0.141	-0.981	0.282
L3	4.39	1.321	0.233	0.141	-0.461	0.282
L4	4.77	1.333	-0.063	0.141	-0.588	0.282
L6	5.46	1.205	-0.325	0.141	-0.844	0.282
L7	5.25	1.226	-0.235	0.141	-0.844	0.282
L8	5.32	1.163	-0.185	0.141	-0.778	0.282
L9	5.05	1.155	0.040	0.141	-0.730	0.282
L10	4.96	1.538	-0.392	0.141	-0.603	0.282
L11	2.40	1.528	1.064	0.141	0.384	0.282
L12	4.96	1.505	-0.176	0.141	-1.037	0.282

Table 1 indicates that the mean scores of the items range from 5.47 to 2.40, with standard deviations varying from 1.733 to 1.155. The skewness and kurtosis values calculated for each item fall within the range of +1.5 and -1.5. Upon analysis of the normal distribution curve of the items, it was concluded that the scores were normally distributed.

Confirmatory Factor Analysis

In order to adapt the scale to Turkish, confirmatory factor analysis was applied. The fit indices of the confirmatory factor analysis were as follows: $\chi 2(29)=60.85$, $\chi 2/df=2.063$, RMSEA= 0.061, GFI= 0.96, NFI= 0.96, NNFI=0.97, CFI=0.98, IFI=0.98. The fit indices were examined to demonstrate the adequacy of the model, and it was found that they demonstrated acceptable and excellent fit values. Items 2 and 5, which had estimated factor loadings of 0.2 and 0.3, were not removed from the scale. The presented analyses are the values obtained after item removal.

Confirmatory factor analysis was employed to assess the factorial validity of the model comprising four factors and 12 items. Dimensions are: FF1: Awareness, FF2: Usage, FF3: Evaluation, FF4: Ethics. The resulting model is presented in Figure 1.

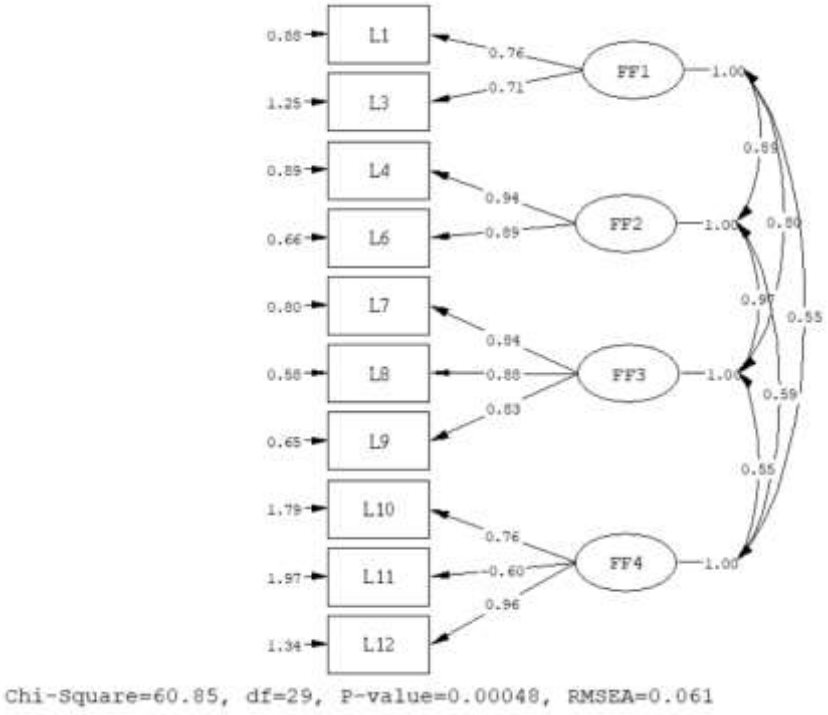

Figure 1: CFA Model

Factor loadings are between 0.94 and 0.60. According to the t-test findings, all connections are statistically significant. It can be said that factorial validity is achieved.

Internal Consistency Analysis

The Cronbach α internal consistency coefficient of this scale was calculated as 0.739. The Cronbach α internal consistency coefficients for the sub-factors of the scale were 0.60, 0.682, 0.761, 0.60, respectively.

Item-Total Scores Correlation and Item Discrimination Index

Item-total score correlations were calculated on the relationship between the score for each item and the total score obtained from the scale. It was found that the item-total score correlation values ranged between 0.300 and 0.656 and had a significant relationship.

In addition, it was examined whether there was a statistically significant difference between the scores of the group in the upper 27% group (N=80) and the group in the lower 27% group according to the total score obtained from the scale. According to the total test scores, a significant difference was observed between the upper and lower 27% groups (t=26.301, p=0.000).

CONCLUSION AND RECOMMENDATIONS

The results of confirmatory factor analysis for the GenAI literacy scale (Appendix 1), adapted into Turkish by integrating with the GenAI structure, indicated that the fit indices were acceptable and had an excellent fit. The scale comprises four dimensions and ten items. The Cronbach α internal consistency coefficient for the four dimensions was calculated as 0.739. The Cronbach α internal consistency coefficients for the sub-factors of the scale were 0.60, 0.682, 0.761, and 0.60, respectively. These values of 0.60 and above provide evidence of reliability, as stated by Dijkstra and Henseler (2015). The low

number of items in the dimensions may explain the Cronbach alpha level. The item total score correlation values were found to range between 0.300 and 0.656, with a significant relationship. According to the test total scores, a significant difference was observed between the upper and lower 27% groups (t=26.301, p=0.000). This structure enables the instrument to be used as a suitable tool for measuring the level of GenAI literacy, evaluating the effectiveness of learning activities to improve this level, and conducting research on this topic.

This study has some limitations. A larger number of participants can be reached. Hair et al. [25] argued that the number of items should be at least 5 times. Nunnally [26] argues that at least 10 times the number of participants should be reached. Although more than 10 times the number of participants was reached in this study, the number of participants can be expanded. The instrument is limited to the adaptation of general AI literacy to generative AI literacy. Recently, GenAI tools have been rapidly integrated into social systems, which may lead to the perception of artificial intelligence being associated only with large language models. On the other hand, artificial intelligence works with many disciplines and has many application areas, such as modeling and simulation. In addition, rapid developments in GenAI tools, expansion of the capacity, and the increase in the diversity of the problems they solve may lead to the need to update the adapted instrument, perhaps more quickly than another measurement tool. Another limitation is that countries still need more institutional and government work on ethical concerns in productive artificial intelligence tools. Although this is not a limitation of the research, it should be kept in mind that awareness of the violation of ethical use of productive artificial intelligence tools is in its early stages, not only at the individual but also at the system level.

Another point is related to the fact that the data collection process is self-reported. However, the current study shows that the measurement tool has achieved sufficient statistical findings regarding the construct validity and reliability. It should be considered that errors may arise due to social desirability. Therefore, in the future, it is recommended that task- and performance-based tools be developed that consider users' actual usage.

Generative Artificial Intelligence Literacy Scale for University Students

Üretken Yapay Zeka Okuryazarlığı Ölçeği Maddeleri Turkish	GenAI Literacy Scale Items English
1. Akıllı (yapay zekayı kullanan) ve akıllı olmayan araçlar arasındaki farkları ayırt edebilirim.	1. I can distinguish between intelligent vehicles (using AI) and non-intelligent vehicles.
2. Üretken yapay zekanın bana nasıl yardımcı olabileceğini bilmiyorum (ölçekten çıkarılmış madde).	2. I do not know how generative AI can help me (removed item).
3. Üretken yapay zeka uygulama ve ürünlerinde kullanılan teknolojiyi tespit edebilirim.	3. I can identify the technology used in generative AI applications and products.
4. Günlük işlerime yardımcı olması için üretken yapay zeka uygulamalarını veya ürünlerini ustalıkla kullanabilirim.	4. I can skillfully use productive AI applications or products to help me in my daily work.
5. Yeni bir üretken yapay zeka uygulamasını veya ürününü kullanmayı öğrenmek genellikle zordur. (ölçekten çıkarılmış madde).	5. Learning to use a new productive AI application or product is often difficult (removed item).
6. İş verimliliğini artırmak için üretken yapay zeka uygulamalarını veya ürünlerini kullanabilirim.	6. I can use productive AI apps or products to improve work efficiency.
7. Bir süre kullandıktan sonra bir üretken yapay zeka uygulamasının veya ürününün yeteneklerini ve sınırlamalarını değerlendirebilirim.	7. I can evaluate the capabilities and limitations of a productive AI application or product after using it for a while.
8. Üretken yapay zeka tarafından sağlanan çeşitli çözümler arasından uygun bir çözüm seçebilirim.	8. I can choose an appropriate solution from a variety of solutions provided by generative AI.
9. Farklı görevler için çeşitli üretken yapay zeka uygulamaları arasından en uygun ürünü seçebilirim.	9. I can choose the most suitable product from a variety of generative AI applications for different tasks.
10. Üretken yapay zeka uygulamalarını kullanırken her zaman etik ilkelere uyarım.	10. I always follow ethical principles when using generative AI applications.
11. Üretken yapay zeka uygulamalarını veya ürünlerini kullanırken gizlilik ve bilgi güvenliği konularına hiç dikkat etmem.	11. I never pay attention to privacy and information security issues when using generative AI applications or products.
12. Üretken yapay zeka teknolojisinin kötüye kullanımına karşı her zaman dikkatliyim.	12. I am always alert to the misuse of generative AI technology.

SAE1050 İmalat Çeliğinin Farklı Soğutma/Yağlama Koşullları Altında İşlenmesinin Enerji Tüketimi Üzerine Etkileri

Emine ŞAP[1*]

[1]*Elektronik ve Otomasyon Bölümü / Teknik Bilimler Meslek Yüksekokulu, Bingöl Üniversitesi, Türkiye*

[*]*(esap@bingol.edu.tr) Başlıca yazarın mail adresi*

Özet **–** İmalat endüstrisinde sıklıkla kullanılan SAE1050 çeliği otomotiv sanayisinde ve makine parçalarının yapımında tercih edilmektedir. Bu çelik ısıl işlem ve yüzey sertleştirme işlemleri uygulanabilen bir malzeme olarak bilinmektedir. İşlenebilirlik özelliklerinin iyi olması sebebiyle talaşlı imalat sektöründe kullanılabilmektedir. İşleme sırasında malzeme ile kesici takım arasında oluşan yüksek sıcaklıklar olumsuz durumlara neden olabilmektedir. Bu olumsuz durumlar soğutma/yağlama sistemleri kullanılarak ortadan kaldırılabilmektedir. Son yıllarda hem insan sağlığına zarar vermeyen hem de az miktarda soğutma sıvısı kullanılarak yapılan çalışmaların sayısı artmaktadır. Tüm bu işleme koşulları ve imalat sektöründe kullanılan tezgahlarının tükettiği enerji bir bütün olarak ele alındığında tüketilen enerjinin azaltılması oldukça önem arz etmektedir. Bu çalışmada imalat endüstrisinde sıklıkla kullanılan SAE1050 çeliğinin farklı kesme parametreleri ve farklı soğutma/yağlama koşulları altında frezelenmesi sonucunda harcanan enerji tüketimi araştırılmıştır. Bu amaçla iki farklı kesme hızı (140-160-180 m/dak), iki farklı ilerleme hızı (0.050-0.075-0.100 mm/dev) ve üç farklı soğutma/yağlama (kuru, hava ve MMY) ortamı kullanılmıştır. Ayrıca Taguchi istatistiksel analizi kullanılarak en etkili kontrol faktörleri belirlenmiştir. Uygulanan girdi parametrelerinin enerji tüketimi üzerindeki etkileri araştırılmıştır. Elde edilen sonuçlara göre MMY ortamının SAE1050 çeliğinin frezelenmesinde enerji tüketimi açısından en iyi seçenek olduğu tespit edilmiştir. Ayrıca Taguchi istatistiksel analizi kullanılarak en etkili kontrol faktörleri belirlenmiştir. İstatistiksel analiz sonuçlarına göre enerji tüketiminde en etkili faktör ilerleme hızı olarak kaydedilmiştir. Ayrıca yapılan istatistiksel analizin anlamlı olduğu belirlenmiştir.

Anahtar Kelimeler – SAE1050 çeliği, Frezeleme, Kesme hızı, İlerleme hızı, MMY ortamı, Enerji Tüketimi

I. GİRİŞ

SAE 1050, Amerika Demir ve Çelik Enstitüsü (AISI) tarafından sınıflandırılmış bir karbon çeliği sınıfıdır. SAE 1050, orta karbonlu bir çelik türü olup, genellikle yüksek mukavemet ve sertlik gerektiren uygulamalarda kullanılır. Bu tür çeliklerin bileşimi ve özellikleri, endüstriyel standartlara göre tanımlanmıştır. SAE 1050 çeliği, yüksek mukavemet ve aşınma direnci gerektiren çeşitli uygulamalarda kullanılır. Akslar, şaftlar ve dişli çarklar gibi parçaların imalatında, Mil ve yatak gibi bileşenlerin üretiminde ve pulluk ve disk bıçakları gibi aşınmaya maruz kalan parçalarda yaygın olarak kullanılmaktadır. Orta karbon içeriği sayesinde yüksek mukavemet ve sertlik sağlar. Yeterli işlenebilirlik özelliklerine sahiptir, bu da çeşitli imalat süreçlerine uygun olmasını sağlar [1]. Isıl işlemle mekanik özellikleri geniş bir aralıkta ayarlanabilir. Karbon içeriğinin yüksek olması, kaynak yapılabilirliği azaltabilir ve özel önlemler gerektirebilir. SAE 1050 çeliği, dengeli kimyasal bileşimi ve ayarlanabilir mekanik özellikleri ile çeşitli endüstriyel uygulamalarda yaygın olarak kullanılmaktadır. Yüksek mukavemet ve sertlik gerektiren yerlerde tercih edilen bu çelik türü, ısıl işlem ve diğer üretim süreçleri ile özellikleri optimize edilebilen güvenilir bir malzemedir [2].

Talaşlı imalat sanayisinde enerji tüketimi, üretim süreçlerinin verimliliği ve sürdürülebilirliği açısından kritik bir öneme sahiptir [3]. Talaşlı imalat, malzemelerin işlenmesi sırasında kesme, delme, tornalama ve frezeleme gibi yöntemlerle istenilen geometrik formların elde edilmesini sağlar. Bu süreçler genellikle yüksek enerji gereksinimi olan makine ve ekipmanların kullanımını içerir [4]. Enerji tüketiminin yüksek olması, işletme maliyetlerini artırmanın yanı sıra, çevresel etkileri de önemli ölçüde yükseltir. Dolayısıyla, enerji verimliliğinin artırılması, maliyetlerin düşürülmesi ve çevresel sürdürülebilirliğin sağlanması açısından büyük bir öneme sahiptir. Enerji tüketiminin yönetimi, sadece doğrudan enerji maliyetlerini azaltmakla kalmaz, aynı zamanda üretim sürecinin genel verimliliğini artırır ve karbon ayak izini azaltır. Enerji verimliliği, gelişmiş kesici takım teknolojileri, optimize edilmiş kesme parametreleri ve modern CNC (Bilgisayarlı Nümerik Kontrol) makinelerinin kullanımıyla artırılabilir. Ayrıca, enerji tüketiminin izlenmesi ve yönetilmesi için gelişmiş izleme sistemlerinin entegrasyonu, enerji kullanımını daha etkin bir şekilde kontrol etmeye olanak tanır [5]. Bu bağlamda, talaşlı imalat sanayisinde enerji tüketiminin optimize edilmesi, hem ekonomik hem de çevresel açıdan sürdürülebilir bir üretim sistemi oluşturmak için hayati bir rol oynamaktadır. Enerji verimliliğine yönelik yenilikçi yaklaşımlar ve teknolojik gelişmeler, sanayinin rekabet gücünü artırırken, sürdürülebilir kalkınma hedeflerine ulaşılmasına da katkı sağlar. Ayrıca kesme parametrelerinin optimize edilmesi ve soğutma/yağlama stratejilerinin kullanılması da enerji tüketiminin azaltılmasına yardımcı olabilmektedir.

Bu çalışmada SAE1050 imalat çeliği farklı kesme parametreleri ve farklı soğutma/yağlama stratejileri altında frezelenerek enerji tüketimi araştırılmıştır. Ayrıca Taguchi istatistiksel analizi kullanılarak hem deney sayısı azaltılmış hem de maliyetler azaltılarak enerji tüketimi üzerindeki en etkili kontrol faktörleri belirlenmiştir.

II. MATERYAL VE YÖNTEM

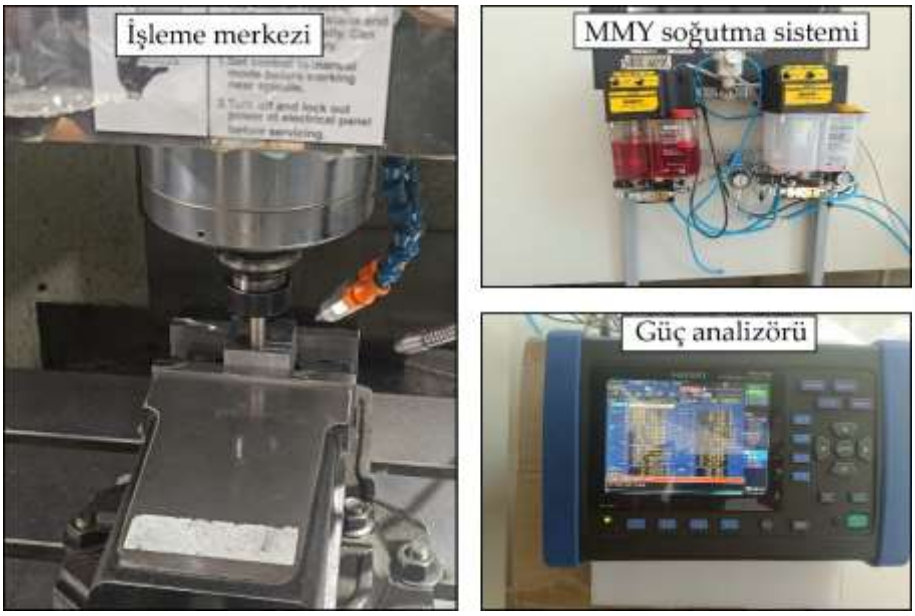
Bu çalışmada SAE1050 çeliği deney numunesi olarak kullanılmıştır. Bu malzeme metal endüstrisinde sıklıkla kullanılmaktadır. Numune boyutları 50x50x20 mm olarak kesilmiştir. Deneyler üç eksenli bilgisayar kontrollü bir işleme merkezinde yapılmıştır. Deneylerde üç farklı kesme hızı (140-160-180 m/dak), üç farklı ilerleme hızı (0.050-0.075-0.100 mm/dev) ve üç farklı soğutma/yağlama (kuru, hava ve MMY) tekniği kullanılarak gerçekleştirilmiştir. Tek kesme derinliği (0.5 mm) seçilmiştir. Ayrıca deney sayısını ve maliyetleri azaltmak amacıyla Taguchi L_9 ortogonal dizisi kullanılmıştır. Tablo 1, deney tasarımını temsil etmektedir.

Tablo 1. Deneysel tasarım (Taguchi L_9) [6]

Deney no	**Kesme hızı (m/dak)**	**İlerleme hızı (mm/dev)**	**Soğutma/ Yağlama**
1	140	0.050	Kuru
2	160	0.075	Kuru
3	180	0.100	Kuru
4	140	0.075	Hava
5	160	0.100	Hava
6	180	0.050	Hava
7	140	0.100	MMY
8	160	0.050	MMY
9	180	0.075	MMY

İşleme tezgahına bağlı olan bir nozuldan kompresör yardımıyla basınçlı hava kesici takım ile malzeme arasına gönderilmektedir. Werte Micro STN-15 model bir cihaz ile MMY tekniği kullanılarak pülverize hale getirilen kesme sıvısı buhar şeklinde kesici takım ve iş parçası üzerine püskürtülmektedir. MMY tekniğinde nozul kesme bölgesine yaklaşık 50 cm mesafede konumlandırılarak püskürtme işlemi gerçekleştirilmektedir. Deneylerde kesici takım olarak AlTiN (Alüminyum Titanyum Nitrür) kaplanmış karbür uçlar kullanılmıştır. Bu karbür uçlar frezeleme işlemlerinde genellikle tercih edilmektedir. Her bir deney için yeni bir kesici uç kullanılmaktadır. Freze tezgahından çekilen enerjiyi ölçmek için bir güç analizörü (HIOKI) kullanılmıştır. Güç analizörünün kabloları freze tezgahına monte edilerek bağlantı

işlemleri tamamlanmıştır. Deneyler tamamlandıktan sonra güç analizöründen elde edilen veriler özel bir yazılım aracılığıyla kayıt altına alınmıştır. Şekil 1.'de deneysel şema görülmektedir.



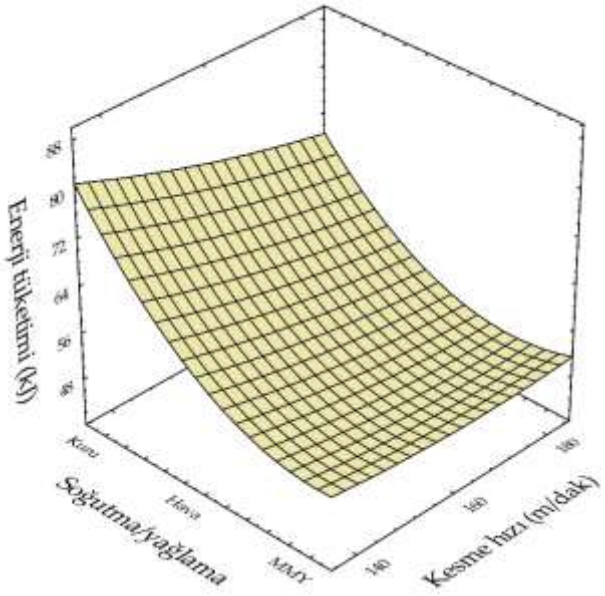
Şekil 1. Deneysel şema

III. BULGULAR TARTIŞMA

A. *Enerji Tüketimi analizi*

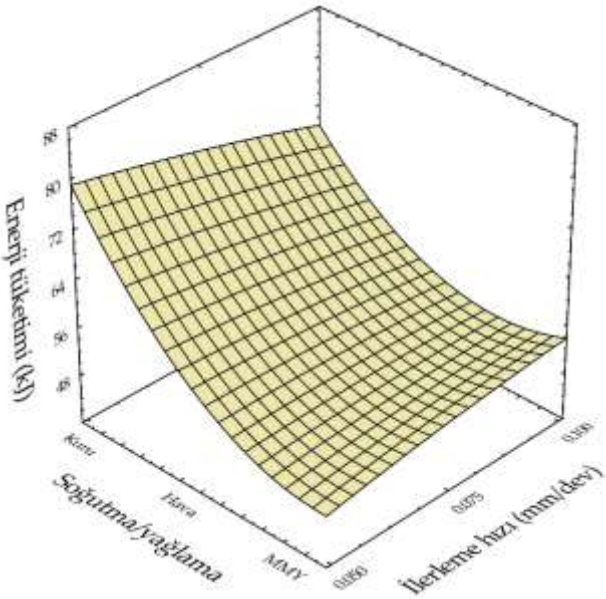
İşleme süreçlerinde enerji tüketimi, üretim verimliliği ve sürdürülebilirlik açısından büyük bir öneme sahiptir. İşleme süreçleri, hammaddelerin istenilen şekil, boyut ve yüzey kalitesine getirilmesi amacıyla çeşitli makine ve ekipmanların kullanıldığı operasyonları içerir. Bu süreçlerde enerji, makinelerin çalıştırılması, kesme işlemleri, soğutma sistemleri ve yardımcı ekipmanların işletilmesi için gereklidir [7]. Yüksek enerji tüketimi, üretim maliyetlerini artırırken, aynı zamanda çevresel etkilere de neden olur. Özellikle enerji maliyetlerinin yükseldiği ve enerji kaynaklarının sınırlı olduğu günümüzde, enerji verimliliği daha da kritik hale gelmiştir. Enerji tüketiminin azaltılması, işletmelerin rekabet gücünü artırırken, karbon ayak izini azaltarak çevresel sürdürülebilirliğe de katkı sağlar. Bu amaçla, gelişmiş makine teknolojileri, optimize edilmiş kesme parametreleri ve verimli enerji yönetim sistemlerinin kullanımı, enerji tüketimini minimize etmek için önemlidir [8]. Aynı zamanda, enerji izleme ve yönetim sistemlerinin entegrasyonu, enerji kullanımının sürekli olarak izlenmesini ve optimize edilmesini sağlar [9]. İşleme süreçlerinde enerji tüketiminin etkin bir şekilde yönetilmesi, sadece maliyet tasarrufu sağlamakla kalmaz, aynı zamanda çevresel etkileri azaltarak daha sürdürülebilir bir üretim modeli oluşturur. Bu da, hem ekonomik hem de çevresel açıdan uzun vadeli yararlar sağlar [10]. Soğutma ve yağlama ortamları, işleme süreçlerinde enerji tüketimi üzerinde belirleyici bir rol oynamaktadır [11]. İşleme sırasında kesici takımlar ve iş parçaları arasında meydana gelen yüksek sıcaklık ve sürtünme, kesme işlemlerinin verimliliğini ve kalitesini olumsuz yönde etkileyebilir [12]. Soğutma ve yağlama ortamlarının kullanımı, bu sorunları minimize ederek, işleme sırasında oluşan ısıyı dağıtarak ve sürtünmeyi azaltarak enerji verimliliğini artırır [13]. Etkin soğutma ve yağlama, kesici takım ömrünü uzatır ve işleme hızını artırır, böylece makine verimliliğini ve üretim hızını yükseltir. Bu durum, enerji tüketimini doğrudan etkiler; çünkü daha verimli kesme işlemleri, aynı miktarda işin daha az enerji ile yapılmasını sağlar. Ayrıca, soğutma ve yağlama sıvılarının doğru seçimi ve kullanımı, makinelerin daha düşük enerji tüketimi ile optimal performans göstermesine olanak tanır [14]. Bunun yanı sıra, modern soğutma ve yağlama sistemleri, geri dönüşüm ve yeniden kullanım özellikleri sayesinde enerji tasarrufunu daha da artırır [15]. Örneğin, yüksek basınçlı soğutma sistemleri, soğutma sıvısının etkin kullanımını sağlayarak, toplam enerji tüketimini düşürür. Sonuç olarak, soğutma ve yağlama ortamlarının optimize edilmesi, sadece enerji tüketimini azaltmakla kalmaz, aynı zamanda üretim süreçlerinin genel

verimliliğini ve sürdürülebilirliğini de önemli ölçüde iyileştirir. Bu çalışmada kesme parametreleri ve soğutma/yağlama ortamlarının enerji tüketimi üzerindeki etkilerine odaklanılmıştır. Şekil 1'de kesme hızı ve soğutma/yağlama ortamlarının enerji tüketimi üzerindeki etkilerini temsil eden 3B grafik gösterilmektedir. Kesme hızı açısından değerlendirildiğinde, kesme hızının artmasıyla genel olarak enerji tüketiminin azaldığı görülmektedir. Soğutma/yağlama ortamı açısından değerlendirildiğinde ise kuru ortamdan MMY ortamına doğru gidildikçe enerji tüketiminin azaldığı tespit edilmiştir.



Şekil 2. Kesme hızı ve soğutma/yağlama ortamlarının enerji tüketimi üzerindeki etkileri

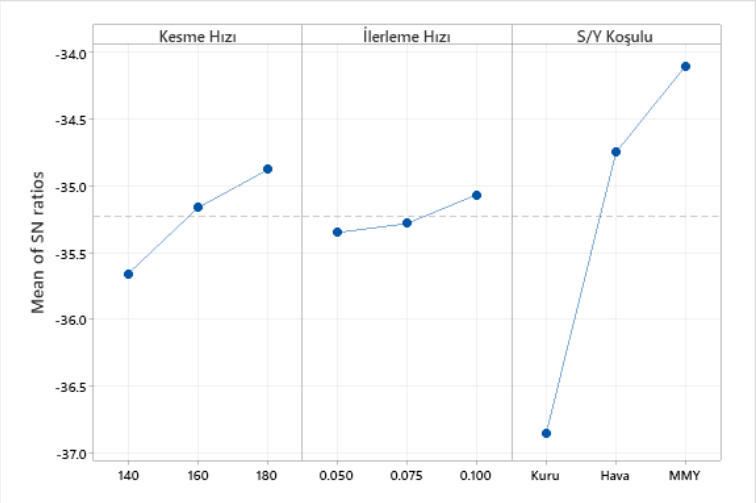
Şekil 3'te ilerleme hızı ve soğutma/yağlama ortamlarının enerji tüketimi üzerindeki etkilerini gösteren 3B grafiği verilmiştir. İlerleme hızı açısından değerlendirildiğinde, artan ilerleme hızları enerji tüketiminin azalmasına neden olmuştur. İlerleme hızı arttığında işleme için toplam süre azalacağı için dolaylı olarak enerji tüketimi de azalma eğiliminde olmaktadır. En düşük enerji tüketimi değeri (61 kJ) 140 m/dak kesme hızında, 0.100 mm/dev ilerleme hızında ve MMY ortamında kayıt altına alınmıştır.



Şekil 3. İlerleme hızı ve soğutma/yağlama ortamlarının enerji tüketimi üzerindeki etkileri

B. *İstatistiksel analiz*

Taguchi istatistiksel analizi, ürün ve süreç geliştirme faaliyetlerinde kaliteyi artırmak ve varyasyonu minimize etmek amacıyla kullanılan güçlü bir deney tasarım metodolojisidir. Japon mühendis ve istatistikçi Genichi Taguchi tarafından geliştirilen bu yöntem, özellikle imalat ve mühendislik alanlarında yaygın olarak uygulanmaktadır [16]. Taguchi yöntemi, deneylerin sistematik bir şekilde planlanmasını, faktörlerin ve etkileşimlerin etkilerinin analiz edilmesini ve optimal koşulların belirlenmesini sağlar. Bu metodoloji, deneylerin daha az sayıda koşul ve tekrar ile gerçekleştirilmesine olanak tanıyarak maliyet ve zaman tasarrufu sağlar [17]. Taguchi analizinde, ortogonal dizi adı verilen özel deney matrisi kullanılır. Bu matriks, faktörlerin farklı seviyelerinin kombinasyonlarını kapsayarak, ana etkilerin ve etkileşimlerin tahmin edilmesini kolaylaştırır. Sonuçlar, sinyal-gürültü oranı (S/N oranı) gibi istatistiksel ölçütlerle değerlendirilir, bu da kalite karakteristiklerinin istenen seviyede tutulmasını ve varyasyonun en aza indirilmesini hedefler. Ayrıca, Taguchi yöntemi, ürün ve süreçlerin sağlamlığını artırarak, dış etkenlerin olumsuz etkilerine karşı dirençli hale gelmesini sağlar [18]. Bu bağlamda, Taguchi istatistiksel analizi, endüstriyel süreçlerin optimizasyonunda ve kalite iyileştirmede etkin bir araç olarak kabul edilmektedir. Şekil 4'te ana etki grafikleri gösterilmektedir. Ayrıca tablo 2'de deneylerden elde edilen sonuçlar ve tahmin sonuçları verilmiştir.



Şekil 4. Ana etki grafikleri

Tablo 2. Deneysel sonuçlar ve S/N oranları

Deney no	**E_T (kJ)**	**E_T için S/N (dB)**
1	82.1	-37.493
2	91.5	-36.852
3	138	-36.199
4	67.1	-35.095
5	84.5	-34.616
6	112.5	-34.535
7	61	-34.382
8	90.6	-34.021
9	94	-33.8991

Varyans analizi (ANOVA), birden fazla grup ortalaması arasındaki farkların istatistiksel olarak anlamlı olup olmadığını belirlemek için kullanılan güçlü bir istatistiksel yöntemdir. Fisher tarafından geliştirilen ANOVA, özellikle deneysel ve gözlemsel çalışmaların analizinde yaygın olarak uygulanmaktadır. Bu yöntem, verilerin toplam varyansını, grup içi varyans ve grup arası varyans olmak üzere iki bileşene ayırır. Grup içi varyans, aynı grup içindeki bireylerin değişkenliğini ifade ederken, grup arası varyans ise farklı grupların ortalamaları arasındaki farkları yansıtır. ANOVA'nın temel amacı, bu iki varyans bileşenini karşılaştırarak, gruplar arasındaki farkların rastgele değişkenlikten mi yoksa gerçek bir etkiden mi kaynaklandığını belirlemektir. Tek yönlü ANOVA, yalnızca bir bağımsız değişkenin etkisini incelerken, iki yönlü ANOVA ve çoklu ANOVA (MANOVA) gibi varyasyonları, birden fazla bağımsız

değişkenin etkisini ve bunların etkileşimlerini analiz eder. ANOVA sonuçları, F istatistiği ve P-değeri kullanılarak değerlendirilir. Elde edilen F değeri, grup arası varyansın grup içi varyansa oranını gösterir ve bu oran yeterince büyükse, P-değeri belirli bir anlamlılık düzeyinin altında çıkar, bu da gruplar arasında istatistiksel olarak anlamlı farklar olduğunu gösterir. ANOVA, deneysel tasarımda etkili bir araç olarak, farklı faktörlerin bağımlı değişken üzerindeki etkilerini ayırt etmeye ve bilimsel araştırmalarda hipotez test etmeye yönelik geniş bir uygulama yelpazesi sunar. P-değeri 0.05'ten küçük olması durumunda analizin anlamlı olduğu söylenebilir. Bu analizde en etkili (% 91.52) kontrol faktörünün ilerleme hızı olduğu tespit edilmiştir. Aynı zamanda ilerleme hızının P değeri de 0.05'ten küçük olduğu için analizin anlamlı olduğunu söylemek mümkündür. Tablo 3'te ANOVA sonuçları gösterilmektedir. Ayrıca Şekil 5'te deneysel sonuçlar ile tahmin sonuçlarının karşılaştırıldığı grafik verilmiştir.

Tablo 3. ANOVA sonuçları

Yanıt parametreleri	**DF**	**Seq SS**	**Adj SS**	**Adj MS**	**F**	**P**	**Katkı oranı (%)**
Enerji Tüketimi							
Soğutma/Yağlama	2	0.9315	0.9315	0.46575	11.28	0.081	6.88

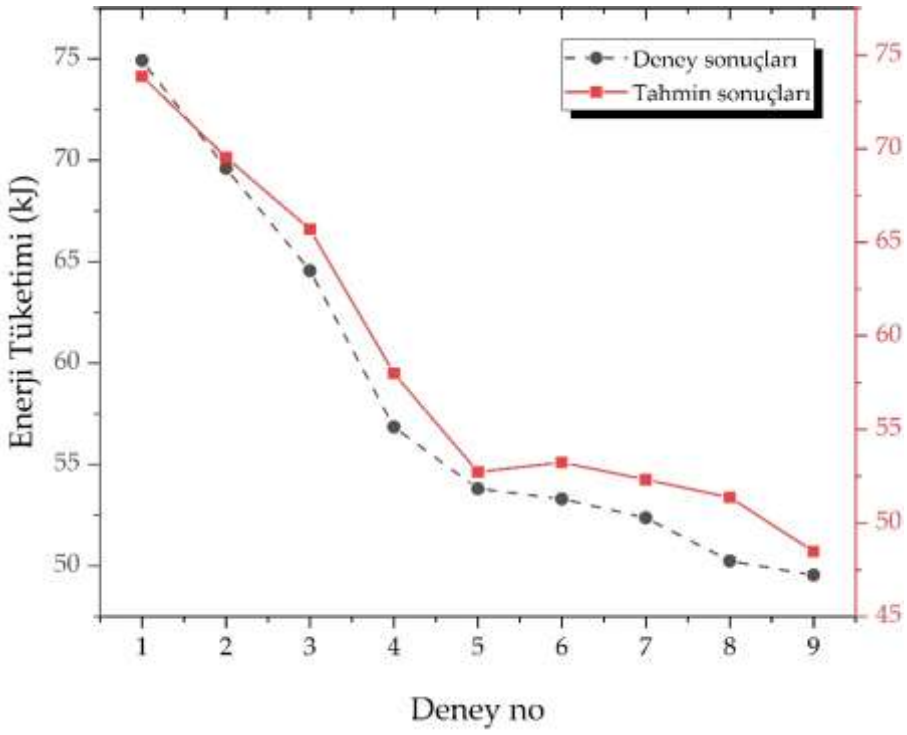
Toplam	8	13.5247					100.00



Şekil 4. Deney sonuçları ve tahmin sonuçlarının karşılaştırılması

IV. SONUÇLAR

Bu çalışmada SAE1050 imalat çeliği farklı kesme parametreleri ve farklı soğutma/yağlama stratejileri altında frezelenerek enerji tüketimi araştırılmıştır. Ayrıca Taguchi istatistiksel analizi kullanılarak hem deney sayısı azaltılmış hem de maliyetler azaltılarak enerji tüketimi üzerindeki en etkili kontrol faktörleri belirlenmiştir. Soğutma/yağlama ortamları açısından enerji tüketimini azaltan en iyi ortamın MMY ortamı olduğu tespit edilmiştir. Ayrıca kesme ve ilerleme hızlarının artmasıyla enerji tüketiminin azaldığı gözlenmiştir. Yapılan istatistiksel analiz sonucunda en etkili (% 91.52) kontrol faktörünün ilerleme hızı olduğu tespit edilmiştir. Aynı zamanda ilerleme hızının P değeri de 0.05'ten küçük olduğu için analizin anlamlı olduğunu söylemek mümkündür.

Data Warfare: Emerging Threats to US Election Integrity

Abdelkrim Dekhakhena *

[1]*Departmen of Literature and English Language, 8 May 1945 Guelma University, Algeria*

*(dakco1969@gmail.com)

Abstract – This paper delves into the potential ramifications of employing data warfare tactics and The rise of advanced data analysis and targeting methodologies in political campaigns in the U.S. raises concerns about privacy infringements and intentional manipulation. The article explores vulnerabilities in voter databases, the intricacies of micro-targeting practices, and the influence of online disinformation campaigns. The emergence and proliferation of data warfare pose substantial threats to the integrity and resilience of American democracy. The vast reservoirs of personal data obtained through various sources raise troubling questions about privacy and the ethical use of information. The paper delves into the potential misuse of voter data and emphasizes the need for stringent safeguards to protect the confidentiality and integrity of electoral information. Micro-targeting, a practice enabled by granular data analytics, allows campaigns to tailor messages to specific demographics, but raises concerns about the potential manipulation of voter sentiments. Online disinformation campaigns, fueled by the strategic dissemination of misleading or false information, have become a potent tool in contemporary political warfare. The paper examines vulnerabilities in voter databases, micro-targeting practices, and online disinformation campaigns, arguing that data warfare threatens the integrity and resilience of American democracy. It emphasizes the importance of robust mechanisms to counter disinformation and ensure the authenticity of information available to voters.

Keywords – Data Warfare; US Elections; Integrity; Potential Ramifications; American Democracy

I. Introduction

The digital age has opened new frontiers of opportunity but also new vectors of vulnerability across society. This is particularly true in the political arena, where campaigns and foreign actors are increasingly leveraging advanced data analytics and targeting techniques to promote their agendas. Sophisticated data warfare tactics that capitalize on networks, algorithms, and information are emerging as threats to the integrity of the American electoral system.

Data warfare in this context involves weaponizing data to gain an advantage over an opponent. In political campaigns, it may enable hyper-precise voter targeting, promotion of propaganda, or the sabotage of an opposing side. Technologies like psychometrics, social media bots, and hacked information can manipulate public opinion with little accountability. And the same systems that allow impactful grassroots engagement by ethical actors can be coopted by those with ulterior motives.

This article will examine troubling trends in data-driven attempts to influence democratic processes, focusing specifically on US elections as a case study. Key areas of concern include violations of voter privacy, manipulative microtargeting on social platforms, and large-scale disinformation campaigns designed to erode

confidence in election outcomes. Each exploits different vulnerabilities and weaknesses, but their cumulative impact may undermine citizens' faith in the electoral process itself.

Understanding emerging data warfare threats is crucial for incentivizing responsibility from political practitioners while implementing safeguards to preserve electoral integrity. Without thoughtful solutions, the very foundations of the democratic system in America hang in the balance.

Literature Review

Prior research has examined multiple aspects of data warfare tactics and their potential impact on US election integrity. this review is structured around key themes in the context of emerging data warfare threats to the integrity and resilience of American democracy.

Voter Database Security:

A seminal study by Springall et al. (2014) in the Proceedings of the 2014 ACM SIGSAC Conference on Computer and Communications Security exposed critical vulnerabilities in Estonia's online voting system, demonstrating how attackers could potentially alter votes and compromise election outcomes. This research highlighted the broader risks associated with digital voting systems and voter databases.

Building on this, Casey et al. (2019), in *Recommended Security Controls for Voter Registration Systems (Version 1.0),* provide essential guidelines for securing voter registration systems. It outlines specific security controls necessary to safeguard voter information from cyber threats, emphasizing the importance of robust measures to protect against unauthorized access, tampering, and data breaches. The recommendations aim to enhance the integrity and reliability of voter registration databases, crucial for maintaining public trust in electoral processes.

Political Microtargeting:

The influential work of Kosinski et al. (2013) in the Proceedings of the National Academy of Sciences demonstrated how digital footprints on social media could be used to accurately predict a range of personal attributes, including political views. This research laid the groundwork for understanding the potential of psychographic profiling in political campaigns. A comprehensive review by Zuiderveen Borgesius et al. (2018) in the Utrecht Law Review examined the legal and ethical implications of political microtargeting. The authors raised concerns about the potential for manipulation and the undermining of democratic discourse through highly personalized political messaging.

Computational Propaganda:

Howard and Kollanyi (2016) provided early insights into the scale of computational propaganda during the 2016 US presidential election in their study published in Project on Computational Propaganda. They identified significant bot activity and the spread of polarizing content on social media platforms. Expanding on this, Bradshaw and Howard's (2018) working paper for the Oxford Internet Institute offered a global perspective on the use of social media for manipulation and disinformation in political contexts, highlighting the widespread nature of these tactics.

Systemic Impacts:

Addressing the need for a more holistic approach, Persily's (2017) article in the Journal of Democracy examined the intersection of social media, computational propaganda, and election law. This work began to

bridge the gap between individual tactics and their cumulative effects on democratic processes. Tenove et al. (2018) published a comprehensive report through the Centre for the Study of Democratic Institutions at the University of British Columbia, which synthesized various digital threats to democracy, including those related to data warfare. Their work emphasized the interconnected nature of these challenges and the need for multifaceted responses.

Recent Developments:

More recent research has started to address the hypothesis more directly. For instance, Aral and Eckles (2019) in Science discussed how the combination of big data, algorithmic targeting, and behavioral science creates new challenges for election integrity and democratic discourse. A study by Schneider et al. (2021) in Nature Communications examined the complex interplay between microtargeting, misinformation, and political polarization, providing empirical evidence for the systemic nature of these threats.

This literature review demonstrates a growing body of research supporting the hypothesis that data warfare tactics exploiting voter databases, microtargeting, and online propaganda pose a significant threat to the perceived legitimacy of US election outcomes. However, while individual components have been studied extensively, there remains a need for more integrated research examining their combined effects on democratic resilience.

Hypothesis: Data warfare tactics exploiting voter databases, microtargeting, and online propaganda constitute a threat to the perceived legitimacy of US election outcomes. Their impacts should be studied holistically to assess democratic resilience.

Methodology

To evaluate the hypothesis on data warfare's threat to US election legitimacy, this study will utilize a mixed methods approach combining quantitative dataset analysis with qualitative case studies.

The quantitative component will capture empirical evidence of vulnerabilities across the areas of focus identified. Security lapses in statewide voter databases over the past 5 years will be tabulated through public breach reports. Known instances of voter microtargeting by campaigns will be aggregated from media investigations and whistleblower accounts, and disinformation campaign scale will be estimated by examining social media archives through partnerships with leading academic research groups.

These measurements will establish empirical scale in how data systems are being weaponized. But the nature of data warfare means many threats likely go undetected. So qualitative case studies of attempted and successful data-driven election influence operations will also be assessed. Three representative cases that gained significant public or investigative attention will illustrate in depth how these tactics work in practice. Findings will detail the technical and social engineering involved across targeted database extraction, audience microtargeting, and manufactured virality.

Both quantitative and qualitative evidence will inform the overall threat assessment. The combination aims to gauge actual risk levels while shedding light on the capacity for abuse as data warfare tactics grow more advanced. Results will also look longitudinally to track which approaches are scaling rapidly versus slowly being mitigated. This framework allows systematically evaluating the paper's hypothesis on threats to US election legitimacy. It also surfaces specific vulnerabilities in need of policy or technology interventions to safeguard democratic integrity.

II. Conceptual Framework

a. Definition and examples of data warfare tactics

Data warfare refers to weaponized use of information, analytics, and access to data systems to gain advantage over an opponent (Smith, 2021). In the context of elections, it enables attempts to illegitimately shape voter decisions and perceptions around democratic choice. Tactics continue to grow more technologically intricate, empowering external and internal actors to distort participation and perspectives on electoral outcomes.

Voter Database Hacking: Common data warfare approaches include voter database hacking, manipulative microtargeting, and scalable online disinformation campaigns. Voter database breaches allow the theft or manipulation of registered voter data to hamper turnout for one side. For example, state election systems in 2016 endured SQL injection attacks allegedly to acquire voter rolls to inform further propaganda efforts (FBI, 2016). The stolen personal details of over 19 million California voters later appeared for sale on a hacking forum that year (Gomez, 2017).[1]

Manipulative Microtargeting: Microtargeting leverages psychographic voter models and social media data to enable campaigns or foreign influence operations to precision target receptive audiences. Services like the controversial data firm Cambridge Analytica maintained thousands of data points on each US voter for customized manipulation (Rosenberg et al., 2018). Its executives were caught openly boasting of propaganda tactics like baiting candidates with fake sex scandals tuned to different personality types among the electorate (Cadwalladr & Graham-Harrison, 2018).

Scalable Disinformation Networks: Meanwhile scalable online disinformation like computational propaganda spreads conspiracy and misinformation to segments prone to amplify it. Russia's Internet Research Agency spent 2014-2017 falsifying identities on platforms like Twitter and Facebook to make fabricated election news stories go viral (DiResta et al., 2019).[2] Bots and fake accounts gave the illusion of grassroots interest, playing to cognitive biases.

Individually and in concert, data warfare threats enable information asymmetry and analytical leverage to be weaponized against unaware populations and underprepared electoral infrastructure. Their scaling sophistication demands urgent attention across technology, media, and governance to harden integrity.

b. Brief Background on Use of Data Analytics and Targeting in Campaigns

The application of data in electoral campaigns is nothing new - voter files, polling, and demographic modeling have long informed strategy. But the digitization of nearly all human communication and activities has taken such efforts to an unprecedented scale. Campaigns now routinely ingest billions of behavioral, consumer, and social media data points to tune messaging and outreach.

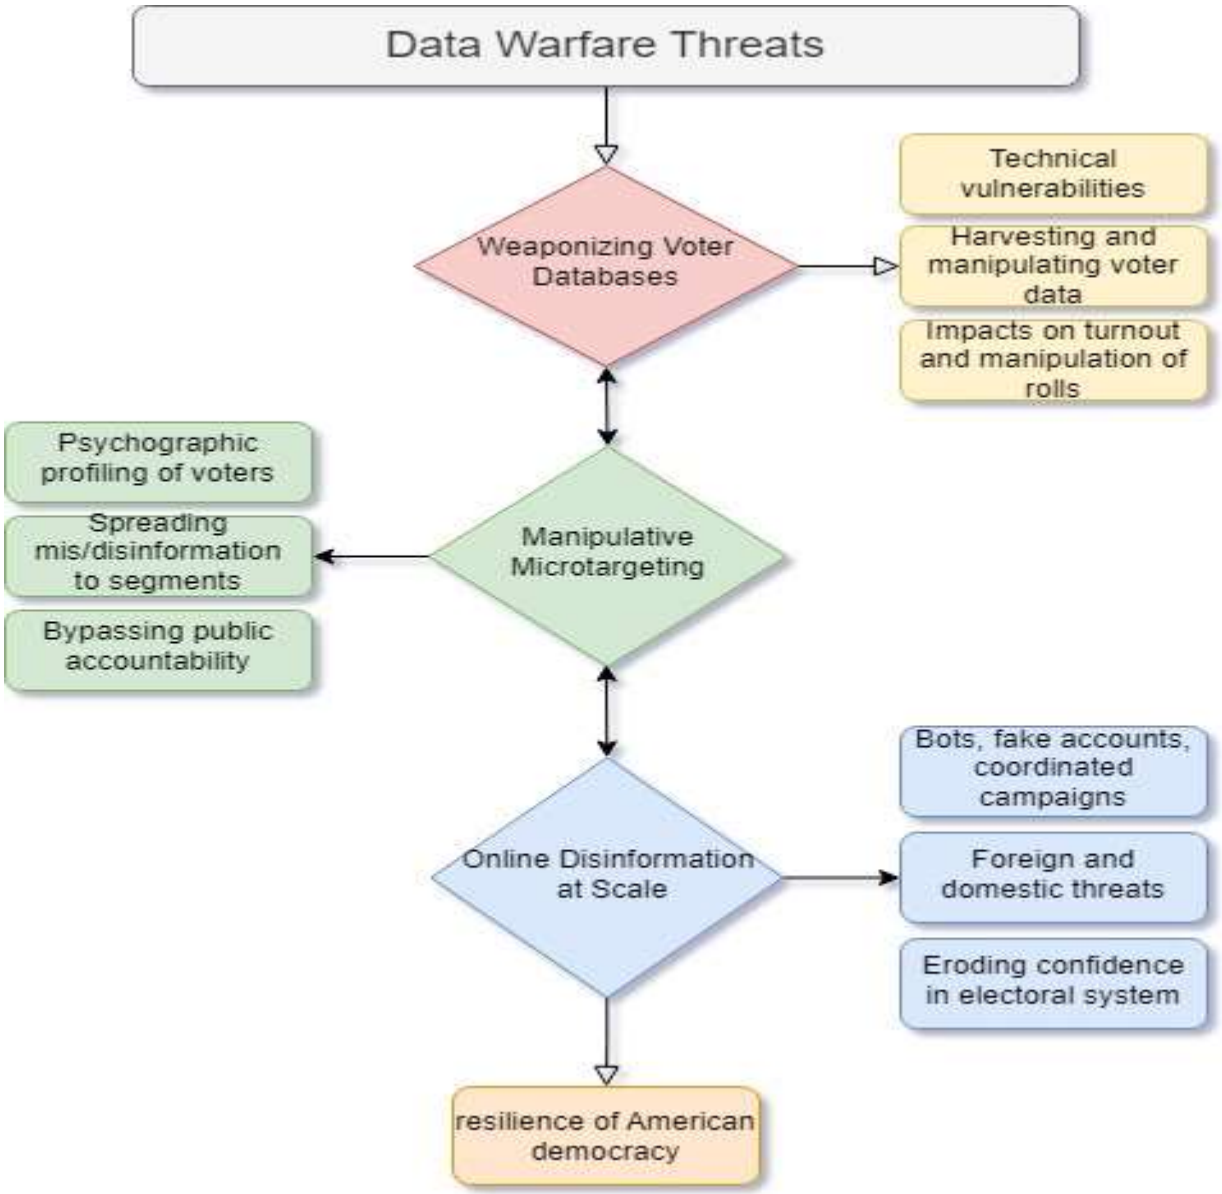
Modern microtargeting can now segment the electorate into thousands of distinct psychographic profiles to predict susceptibility to emotional appeals or narratives (Vian, 2020). These rich voter models have proven eerily accurate - experiments have shown that combining public records with as few as 150 likes on

[1] Tech site investigated also anonymous hacking forum auctioning personal details on 1.9 million Arizona and Illinois voters obtained from database infiltration, including addresses, phone numbers, and voting history.

[2] Detailed analysis of the Russian IRA online influence operation tactics during 2016-2017 US elections, including leveraging falsified identities on platforms, incendiary media targeting, and computational propaganda maximizing engagement vulnerabilities.

platforms like Facebook enable reliably gauging private traits for large swaths of the populace (Youyou et al., 2015).

This degree of intimate voter insight raises growing ethical alarms, but remains legal so long as individuals consent in platform terms of service. Such information asymmetries between campaigns with huge data budgets and citizens with little visibility into how their data is used multiplies risks of manipulation. Stories abound of voters only seeing messages that campaigns selectively present (Judge & Pal, 2021).



While marketing and engagement data fuel such initiatives, even core electoral data like voter files face mounting threats. Increases of vulnerabilities in US vote counting systems include outdated software up to 15 years old still used in keeping voter rolls and tabulating votes, and security flaws found through penetration testing and lack of paper trails. Local election authorities with budget pressures have proven vulnerable to phishing and server exploits (Chaudhary et al., 2022). The hot market for voter records also incentivizes

questionable data selling - dozens of firms now traffic in people's names, addresses, political affiliation, contact info, and modeled profiling for campaign intake (Culliford, Funakoshi, & Foo, 2020).

This expanding data-fication of the political landscape empowers better organization, feedback, and representation. But the same apparatus risks distortion by bad actors. Understanding modern integration of data warfare tactics with electoral systems is crucial as threats scale to integrity.

III. Weaponizing Voter Databases

Voter registration databases are a significant target for data warfare threats, as they house sensitive information on over 150 million Americans. Election authorities are understaffed and rely on aging IT infrastructure, making them vulnerable to hacking and weaponizing stolen data to distort participation (Cable et al., 2023). Technical vulnerabilities are endemic due to uneven cybersecurity investments across thousands of local jurisdictions. Between 2014-2016, over 100 election systems experienced remote penetration, exposing millions of voters' information (Hirschi, Schmid, & Basin, 2020).).

The decentralized nature of US elections makes it vulnerable, as breaches can expose millions of voters' information (Good, 2018; Wofford, 2018). Access to voter data can lead to targeted suppression or ineligible registration, boosting opposition turnout. Stolen voter data can inform wider propaganda efforts and hold high black market value for voter suppression schemes or identity theft (FBI, 2016). Foreign state exploitation also threatens coercive potential if hacked details are leaked publicly.

Voter rolls pose a risk to election interference through stolen personal data. Standardized security protocols and local authorities' incentives can mitigate this, but creative hackers and dynamic threats will likely persist, particularly on systems with sensitive information.

a. Technical vulnerabilities

A 2019 AP investigation found the vast majority of states were using voter systems that are over a decade old, creating risks of unpatched vulnerabilities (Cassidy, 2019). For example, flaws were found in even newer devices like electronic poll books that could allow vote tampering. Common vectors like phishing and SQL injection attacks have repeatedly compromised election sites.

In 2016, illicit access was gained to Illinois voter registration databases using these techniques, exposing personal info on up to 90,000 voter registration records (ABC News, 2016). Russian GRU intelligence cyberattacks in mid-2016 targeting voter sites to access millions of Americans personal voter data, focusing on battleground states were revealed.[3] Successful intrusions confirmed into Arizona’s and Illinois's voter databases by stealing login credentials were also detected (ABC News, 2016). Audits found many systems used default passwords and settings that could allow easy exploit. An Idaho county election website was found protected only by username/password combo “admin/admin” (Corasaniti et al., 2016).

The decentralized nature of US elections creates distributed threats across over 8,800 jurisdictions nationwide. While it makes national interference more difficult, it also multiplicatively increases the attack surface area requiring defenses (CybelAngel, 2024). Financial and staff constraints hamper security upgrades

[3] The attacks on Ukraine in 2014 and the United States in 2016 are particularly illuminating. See, for instance, Martin-Rozumilowicz, B. and T. Chanussot (2019). "Cybersecurity and Electoral Integrity: The Case of Ukraine, 2014-Present." In Krimmer, R. et al (Eds). Fourth International Joint Conference on Electronic Voting, E-Vote-ID 2019: 1-4 October 2019, Lochau/Bregenz, Austria: Proceedings. https://www.zora.uzh.ch/id/eprint/175950/

for cash-strapped local election authorities. Rural counties reported lacking basic needs like IT staff or modern operating systems, let alone cybersecurity training or solutions (van der Staak & Wolf, 2019).

The Chicago Board of Election Commissions reported that 1.8 million registered voters' names, addresses, and birth details were exposed online on an Amazon cloud-computing server for an unknown period. The discovery was made by a security researcher at Upguard, who alerted election officials and took down the file three hours later. The database was managed by Election Systems & Software, an Omaha-based contractor (Weise, 2017).

These systemic vulnerabilities continue to put voter data at escalating risk, with potential repercussions for electoral participation, coercion, fraud, and disinformation threats downstream if weaponized.

b. Harvesting and Manipulating Voter Data

The theft of voter records through database intrusions enables malicious actors to weaponize sensitive personal information in multiple ways. Voter profiling based on names, addresses, party affiliations, demographics, and modeled partisanship can inform highly targeted suppression and propaganda. For example, a hacker group with ties to Russian intelligence stole information on 1.5 million Chicago voters in 2016, including profiling data used to assign scores for each voter's likely openness to certain appeals (Mueller, 2019). This informed further phishing emails sent to Illinois election authorities in attempted intrusions, while also powering disinformation campaigns on social media tuned to different personality types (FBI, 2019).

Stolen registration data also facilitates tampering with voter rolls to undermine turnout. In the 2016 election, researchers found over 90,000 voter registrations suspiciously modified without consent in key swing states like North Carolina and Florida (Calabresi, 2017). Algorithms can parse full voter files to identify likely opposition party supporters for disenfranchisement. These vulnerabilities persist today - a 2021 probe of Colorado's SCORE statewide voter database unveiled external actors could directly add, alter or remove voter registration records (Bender, 2022; Pults, 2021).

Internally, such capabilities have also enabled unethical attempts to undermine political rivals. For example, dirty tricks by the 2002 South Dakota Republican Party to fill voter rolls with thousands of residents from Democratic-friendly Indian reservations backfired when many showed up to vote (Mayes, 2002). This illustrates the potential for weaponizing registration systems. Voter data exposure thus enables downstream threats - technical flaws must be addressed, but preparation is also needed for malicious data weaponization by resourceful adversaries.

c. Impacts on Turnout and Manipulation of Rolls

The theft and abuse of voter records can have direct impacts on turnout through targeted suppression techniques. By profiling an opposition party's likely supporters, hacked registration data enables malicious actors to precision target voter intimidation. Policy analysis examining infrastructure showed vulnerabilities that could enable voter suppression, alteration of rolls, vote destruction and other threats - including using hacked state voter database data to precision target marginalized or opposition likely supporters with misinformation.

For example, African-American and Latino neighborhoods can be discretely singled out for misinformation campaigns aimed at discouraging turnout, including false threats or dates for elections (Norden & Vandewalker, 2018). This exploits systemic disadvantages in time, transport, and flexibility to get the polls.

Such manipulation explained estimated 16% average reductions in Miami Latino voter turnout in the 2018 midterms after targeted Spanish language propaganda (Gerstein, 2019).

Stolen registration data also facilitates direct tampering with voter rolls to sow confusion and frustration. Hackers compromised at least four county election databases in Florida prior to the 2016 election, gaining ability to alter and delete voter profiles (Geller, 2019). Subtle changes like modifying home addresses can hamper vote-by-mail delivery and eligibility.

Meanwhile processing delays and strict voter ID laws have denied registrations for hundreds of thousands of marginalized applicants per cycle (Anderson, 2018). This is enabled by flaws in patchwork state systems - a Stanford study found registration errors affected Asian-American voters up to 4.5x more than whites in key districts during the 2016 primaries (Huang et al., 2019). Combined with microtargeted suppression, registration vulnerabilities multiply barriers to turnout among underrepresented groups. Better voter data hygiene and security controls are essential to mitigate potential manipulation and disenfranchisement. The integrity of participatory democracy hangs in the balance.

Threats also stem from unauthorized insider access to voter systems, beyond external hacking. Insider risks range from political appointees to third-party contractors tasked with maintaining sensitive registration databases. The potential for abuse multiplies across partisans or election deniers motivated to distort participation. For example, an alleged GOP dirty tricks scheme exploited a Republican contractor's admin access privileges within a North Carolina voter registration system months before the 2016 general election (Fain et al., 2019). Queries pulled thousands of voters' personal details matching African-American surnames, suspected to enable targeted suppression efforts.

Similarly, in Georgia, scrutinized Republican Secretary of State Brian Kemp neglected security patches while overseeing his own gubernatorial race's voter rolls in 2018. These exposed millions of residents to potential disenfranchisement, earning condemnation for ethical conflicts and data hygiene negligence (Devine & Griffin, 2018). The incident illustrates insider risks across under-resourced and highly decentralized US electoral infrastructure.

Voter targeting requires rigorous access controls and auditing to trace. Technology fixes cannot prevent social engineering or insider threats on their own. Enhancing accountability through transparency and separation of duties offers promising paths to safeguarding voter data integrity against all adversaries.

IV. Manipulative Micro-Targeting

The integration of big data and social platforms has revolutionized political messaging allowing campaigns to engage voters with unprecedented precision. But the same technologies also threaten manipulation at scale based on intimate psychological and behavioral voter insights. Manipulative microtargeting invisibly spreads propaganda only to selected segments most receptive to it, enabling campaigns or foreign actors to strategically hide narratives from scrutiny.

Powerful voter analytics now feed microtargeting systems by incorporating thousands of data variables on individuals from commercial marketing profiles, data brokers, and social media (Zuiderveen Borgesius et al., 2018). Advanced psychographics models can reliably predict personal attributes like personality traits, intelligence, religious views, and political leanings for tailored influence (Matz et al., 2017).

Campaigns conceal tailored messaging between small groups exposed only to bias-confirming content. Empirical studies demonstrate the effectiveness of mass microtargeting ads on Facebook tailored by psychological profiles predicting receptiveness. They Argue lack of transparency risks manipulation given precision persuasion at scale based on intimate analytics beyond user consent. For example, Cambridge Analytica prepared over 190,000 distinct ads in 2016 microtargeted by five personality traits it scored all American voters on (Merrill & Goldhill, 2020).[4] This enabled tests of which sets of voters would be most influenced by immigration threats, second amendment appeals, or Clinton pseudo-scandals.

Meanwhile the firm MicroTarget constructs profiles incorporating consumers' magazine subscriptions and favorite TV shows for personalized microtargeting (Scherer, 2012). The resulting impact becomes invisible to the general public or press. Such information and analytical asymmetry threatens democratic transparency and accountability. The same practices that increase inclusion can also covertly manipulate identity groups or swing voters. Stronger consent, oversight, and transparency safeguards are urgently needed on political microtargeting data and practices.

a. Psychographic Profiling of Voters

Psychographic modeling refers to using big data and analytics to infer psychological and behavioral attributes about individuals for the purposes of personalized influence. In electoral contexts, campaigns leverage vast data from consumer histories, social media, voting records, and other sources to score individual voters across various psychological dimensions.

For example, Cambridge Analytica claimed to have profiled all 227 million 2016 American voters across five personality traits known as OCEAN - Openness, Conscientiousness, Extroversion, Agreeableness and Neuroticism (Oddleifson, 2020). This leveraged ill-gotten Facebook data combined with commercial marketing data bought or scraped without consent. Some contend that the CA's capacity to forecast personality using Facebook data is limited (Rathi, 2019), and that data analytics may not have a significant impact on individuals until technology advances. Recent study (Matz et al., 2017; Ward 2018) supports the usefulness of data-driven psychological assessments used in advertising, including those pioneered by CA.

Customized media messaging tailored by religious beliefs could elicit emotional reactions that overwhelm critical evaluation - enabling microtarget persuasion appeals to specific subgroups. Once psychographic scoring models categorize all voters, campaigns can then develop messages and policies tuned to resonance with different personality segments. Neurotic and introverted individuals may receive messaging around reducing uncertainty, while religious appeals target very specific denominations (Hirsh et al., 2012). Because data predicted models of who was a persuadable undecided voter, swing demographics receive an overwhelming share of tailored outreach.

Cetina Presuel, R., and Martínez Sierra, J. M. argue that transparent oversight and consent required around modern political microtargeting algorithms given precision messaging to swing demographics, and Continued self-regulation risks driving divides for profit absent ethical checks. This degree of intimate psychological insights on entire citizenry creates enormous risks of manipulation with little accountability on

[4] Former Cambridge Analytica CEO Alexander Nix discussed how the company could modify political ads to target specific personality traits. Leaked documents reveal five ads directed by the Bolton SuperPAC to individuals who scored high in each of the five personality traits. These documents, which link to authentic videos from the Bolton SuperPAC's YouTube channel, have not been independently verified.

selectivity or truthfulness. Stronger safeguards around voter analytics transparency, auditing, and consent are imperative to avoid distortion of participatory choice.

b. Spreading Mis/Disinformation to Segments

Campaigns can A/B test completely fabricated news stories about opponents only to personality types profiled as prone to share content without verification. Spreading fake scandals about candidates to the most reactive audiences, risks going viral before fact checking occurs (Bovet & Makse, 2019). High resolution psychographic models identify individuals leaning towards conspiracy beliefs who can be discreetly targeted with messaging designed to erode trust in institutions like the medical establishment or electoral process (Douglas et al., 2019). This avoids broader scrutiny while rallying the base.

Outreach tuned for specific religious denominations or ethnic subgroups can promote dog whistles, race-baiting narratives, or extremist content directly into those communities without press or watchdog visibility (Haney López, 2015).[5] This exploits cultural in-group dynamics. Segmenting by political ideology allows bombarding far left or far right voters with radicalizing media. Anti-government militias have already microtargeted Second Amendment messaging calling for violent resistance against gun control policies to receptive online forums (Everytown for Gun Safety Support Fund, 2024).

Situational voter models based on short-term emotional states like financial anxiety, healthcare costs, or pandemic fears facilitate manipulation by promoting "solutions" with immediate visceral appeal over reasoned policies. Outrage can be strategically manufactured and channeled (Roeser, 2010). The combination of intimate psychographic voter insights with the opacity of modern online advertising ecosystems risks overwhelming spread of persuasive lies directly to the ears already most open (Burkell & Regan, 2019).

Microtargeting based on psychographic profiles also enabled Cambridge Analytica to precision target Black American voters with messaging aimed at deterring turnout in 2016. By scoring individuals on traits like conscientiousness and neuroticism, the firm identified persuadable voters open to narratives about systemic threats to their communities. Cadwalladr, J.C. (2019) profiled of the now defunct voter targeting firm Cambridge Analytica a year after scandal over their illicit use of 50 million Facebook user psychographic data profiles and documented their ability to microtarget voters with personality tailored messaging en masse for political clients.[6]

"Predominantly black precincts were bombarded with messaging that the election was not going to be fair, in an effort to deter them from voting at all," said Brittany Kaiser, a former Cambridge Analytica staffer turned whistleblower (Cadwalladr, 2019). Turnout suppression focuses on minorities most vulnerable to voter ID laws and polling access barriers. Meanwhile, liberal white voters received parallel messaging promoting fringe third-party candidates to split the left vote share. Tailored Facebook ads emphasized Jill Stein's student

[5] Berkeley political scientist Ian Haney López writes, Politicians exploited insecurity to gain votes and satisfy billionaires funding their campaigns, aiming to reduce government involvement in their economic activities. Republicans and Democrats used ominous phrases like "inner city crime" and "the silent majority" to highlight racial issues and the threat of racial change, while portraying white people as under threat from violent minorities.

[6] Alexander Nix, the currently suspended CEO of Cambridge Analytica, and his firm were accused of misusing the personal data of 50 million people as part of their political consulting work, which included President Trump's 2016 campaign. See Detrow, S. (2018, March 20). What did Cambridge Analytica do during the 2016 election? *NPR*. Retrieved from https://www.npr.org/2018/03/20/595338116/what-did-cambridge-analytica-do-during-the-2016-election.

debt forgiving platform in idealistic terms. This form of voter manipulation weaponized identity appeal combined with psychological receptiveness modeling to nudge choices.

Similar demographic microtargeting bombarded young women voters with scare stories around Hillary Clinton planning war with Iran. Other narratives promoted her ill health, playing to higher neuroticism in the segment. None of these insidious messages were subjected to broader press or fact checking scrutiny given opaque platforms. But in aggregate they may have marginally eroded turnout enough to tip tight races in contested states.

More oversight and consent protections are acutely needed to prevent such intimate and obscured manipulation based on citizens' race, gender, personality scores, and other protected attributes. Ethics demand constraints when political microtargeting threatens democracy itself.

c. Bypassing Public Accountability

Highly tailored ads or messaging only seen by tiny voter segments escapes press coverage or watchdog visibility. Fact checking bodies cannot evaluate claims not publicly accessible from broader scrutiny (Bennett & Livingston, 2018). This enables "pink sliming" - spreading manufactured lies with no accountability.

Lack of oversight on ad targeting criteria or the underlying psychographic models used by campaigns raises concerns. Legally questionable attributes like race, health, religious faith, or sexual orientation shape segmentation without disclosure (Zuiderveen Borgesius et al., 2018). The advent of microtargeted political advertising online based on large voter data analytics has highlighted developing transparency difficulties and the threat to informed democratic participation through selective messaging without full public accountability. Microtargeted ads are bid out in real-time digital auctions, filling users feeds algorithmically. This prevents traditional reporting on specific media buys and markets reached as Explanatory transparency becomes impossibility at billions of impressions (Tunuguntla & Hoban, 2020).

Whistleblower accounts paint disturbing exploitation, but few legal constraints exist in the US. While democracies like Canada and the EU have begun limiting political microtargeting, US platforms retain broad exemptions from fact checking or public reporting requirements on ads (Kröger et al., 2024). Data-driven study of over 80 million Facebook posts found engagement-privileging algorithms creating echo chambers, especially on pages and groups spreading political misinformation. Such architectures enable microtarget viral manipulation (de-Lima-Santos & Ceron, 2023).

The sophisticated behavioral science underpinning modern voter influence optimization exploits predictable cognitive biases. Tailored messaging hits psychological triggers promoting anger, fear, or bandwagoning with limited reflection on consequences (Tucker et al., 2018). Without addressing obscured exploitation and asymmetric targeting, microtargeting risks overwhelming participatory consent and informed choice so central to healthy democracies. Technical and policy innovations should aim to restore visibility and accountability around practices hidden in the shadows.

The hyper-customization of modern political messaging also creates oversight challenges for the platforms themselves hoping to avoid manipulation by bad actors. While companies like Meta have touted increased transparency features for confirming ad sponsors' identities, verifying truth claims at mass personalized scale remains implausible. For example, during CEO Mark Zuckerberg's 2018 congressional testimony on election interference after 2016, he floated fact checking targeted ads before they reach voters.

But when pressed on the details by lawmakers, the firm admitted between 15-20,000 new variations of microtargeted content get created every single minute - far too fast for human review (Frier, 2018).

The velocity which computerized voter analytics platforms generate tailored creative outpaces any feasible moderation approach. And the most dangerous psychological triggers promoting anger or fear often manifest subtly through nuanced linguistic framing. Platforms currently require media literacy as the primary check against persuasion customized using personal data and automated testing at a scale exceeding human comprehension.

Truly addressing transparency in political targeting likely requires reducing targeting dimensionality itself. Policies should weigh the democratizing power of personalized messaging against vulnerabilities to mass manipulation hidden individually. There exist no easy technical fixes to exposure segmentation enabling covert threats.

IV. Online Disinformation at Scale

The final data warfare front threatening US elections involves computational propaganda - the use of algorithms, automation, hacking, and human teams to influence discourse at mass scale. The same social media platforms that enable vibrant political speech also provide vectors to spread fake content deliberately engineered for virality. These disinformation campaigns threaten to erode citizen trust and media integrity around electoral outcomes.

Inauthentic accounts, bots, hacked identities and trained teams coordinate influence campaigns designed to manipulate trends, frame narratives, and rally support or opposition around targets. They manufacture false controversy simply by gaming rules of algorithms privileging engagement over accuracy. Data-driven automation increasingly outpaces human detection - recent cycles saw AI-generated fake profile photos and content impersonating real voters shared millions of times (Ferrara et al., 2016). The rise of automated social bot accounts exhibits human behaviors for online influence, including in political contexts. Evidence indicates bots amplify propaganda, manufacture consensus narratives, spread misinformation at scale by gaming trending algorithms.

Meanwhile hacking and leaking strategically timed insider documents shape news cycles based on incomplete data. Anonymous sources facilely inject unverified “evidence” into circulation, forcing rebuttal from legitimate parties. Dumping email troves online skips journalistic vetting in favor of weaponized transparency, fabricated sex scandals or leaks of personal financials or emails offer rich fodder for public spectacle (Benkler et al., 2018). Benkler (2018) documented media manipulation across partisan ecosystems online, revealing tactics like fake news factories, false leaks, sensationalism, computational propaganda that erode epistemic consensus on factual electoral matters.

These techniques allow tremendously asymmetric influence from just a few malicious actors. But their true power stems from riding and amplifying pre-existing societal tensions (DiResta et al., 2019). Even marginal signals boosting already polarized groups yield outsized results. Understanding modern disinformation thus requires examining vulnerabilities in our own networks, culture, and institutions.

a. Bots, Fake Accounts

A range of automated and inauthentic accounts have been leveraged to spread disinformation and amplify propaganda narratives on social platforms. Bots in particular enable manufacturing the illusion of grassroots

interest in certain electoral messaging or candidates. For example, an estimated 400,000 bots were identified flooding Twitter with pro-Trump messaging in the week's leading up to the 2016 election (Bessi & Ferrara, 2016). Hashtags like #MAGA and #DrainTheSwamp were artificially pumped to trend across the platform. Researchers found sophistication in bots' ability to target key swing states and voters with content aimed at suppressing opposition turnout.

Meanwhile Facebook uncovered over 120,000 division-sowing Russian troll accounts active from 2015-2017 that impersonated American citizen profiles online. These regularly posted election-related clickbait to drum up site traffic and comments, exploiting engagement incentives, before targeted ads spread the content wider (Weedon et al., 2017). Millions of users joined Groups run by the disinformation teams without realizing their inauthentic origins.Such influence operations combine automation with human coordination for maximal manipulative impact. Teams armed with psychographic profiles and voter data analytics inform the operational tactics and narratives. Continued progress in generative AI will only make fake accounts more difficult to detect across text, images, and video. This rising tide of manipulated virality erodes faith in online discourse itself.

Policymakers face challenges balancing free speech protections with mounting evidence of computational mass deception. But bolstering sponsorship transparency, bot detection, platform accountability, and media literacy education provide promising starting points to counter data-driven threats.

b. Foreign and Domestic Threats

While foreign influence campaigns by adversaries like Russia or China capture headlines, domestic partisan actors now perpetrate an enormous volume of computational propaganda as well. Extremist groups, conspiracists, and even mainstream political consultants now systematically spread disinformation across social platforms. For example, media investigations identified a far-right conspiracy network spreading fabricated election fraud claims to millions of users on Facebook after 2020 (Collins et al., 2020).

Termed “The Big Lie” by some, this influential cluster utilized pay-per-click ads, imposter news sites, and real aligned pundits to perpetrate falsified stolen election narratives. Such purely algorithmic engagement-based amplification creates extreme visibility. Meanwhile consultants to major Republican political committees have been caught running networks of high reach false pages flagrantly impersonating groups like Black Lives Matter to spread anti-progressive messaging (Vogel & Swan, 2022). Tactics like spreading exaggerated or out of context images and video to inflame tensions around crime or immigration reform prove common.

Domestic disinformation often outpaces foreign due to linguistic and cultural fluency. And protections for political speech limit constraints on even blatantly manipulative messaging. Expanding transparency on paid promotions, bot detection, and disabling provably false accounts after viral spread offer promising policy paths. But addressing computational propaganda requires looking inward at societal vulnerabilities being exploited more than external adversaries alone. The platforms merely channel divides that already exist.

c. Eroding Confidence in Electoral System

The manufacturing and spread of viral falsehoods around voting, ballot counting, and election administration now threatens to overwhelm facts and erode citizen trust in electoral integrity. Even the perception of conspiracy or failures can be depressing turnout regardless of reality. This underscores disinformation's dangers. For example, widespread computational propaganda pushed narratives about rigged processes, biased

officials, and illegal practices around early and mail-in voting leading up to the 2020 election (Benkler et al., 2020). These seeded groundless doubts, especially on far right aligned social forums. But platform policy exemptions prevented labeling or removing debunked claims by political figures, allowing tremendous organic reach.

The stolen election narratives culminated in the January 6th Capitol insurrection as political violence stemming directly from viral alternative reality. Surveys showed over 30% of certain partisan subgroups bought into baseless theories about voting machine hacking and vote dumps circulated online despite universal rejection from election authorities and officials from both parties. The stubborn persistence of viral narratives despite all factual rebuttal illustrates the asymmetries allowing computational propaganda to erode faith in democratic processes themselves. Experts argue successfully combating "belief echoes" requires addressing vulnerabilities in media ecosystems through financial transparency on influence sources and disciplined epistemic hygiene, not just piercing bubbles after mass deception already spreads (Benkler, 2022).

V. Policy and Technical Solutions

Addressing the multifaceted election threats posed by data warfare tactics requires pursuing interventions across several fronts. Technical protections can patch known vulnerabilities in systems like voter databases while reducing risks in opaque practices like microtargeting. Meanwhile policy innovations focused on transparency, accountability, and consent offer structural changes to incentive responsible use of analytics. Combined with public awareness building around media literacy, a range of promising options exist:

Improving voter database security involves pushing standardized cybersecurity requirements for local election authorities paired with increased federal security grants addressing gaps (Cable et al., 2023). Parallel auditing of voter roll access logs enables tracking unauthorized changes. Transitioning to multi-factor voter authentication could reduce identity spoofing. On microtargeting, platform and legal changes requiring verifiable identities for political advertisers limits foreign interference and computational actors (Ó Fathaigh et al., 2021). Transparency on targeting mechanics exposes questionable attributes for segmentation like race or health. Requiring citizen consent and appeal processes empowers user agency over data use rights.

For scaling computational propaganda, prefixing automated account names indicates likely bots for special scrutiny (Stella et al., 2018). Content ranking changes reducing visiblity for inauthentic and new sources might limit gaming. Meanwhile infiltrating coordinated influence networks enables tracking tactics (Paquet-Clouston et al., 2018). However, beyond fixing isolated systems, addressing data warfare also requires systemic changes in how the media environment privileges engagement over public deliberation. Promoting visibility for quality sources rather than computational amplification alone may balance participatory access with veracity (Helberger et al., 2018). It demands rethinking analytics built for addiction over empowerment.

While no silver bullet exists, pursuing social, technical, and policy innovations to shore up vulnerabilities offers a starting point. A healthy democracy requires nurturing ecosystems of trust - media, culture, and data governance reforms should aim to restore confidence, consent, and accountability against those who would weaponize information itself to erode freedom.

a. Transparency and Consent Requirements

Many democracies have begun implementing advertiser transparency laws requiring verification of sponsor identities and locations for political ads on platforms. This prevents masking behind false grassroots groups. The US Honest Ads Act would extend existing TV/radio requirements revealing funding sources and targeting

details to online paid messaging as well (Warner et al., 2019). However, organic reach still enables tremendous influence from verified insiders posting false claims themselves. One proposal requires labeling computational amplification and engagement metrics to expose artificially inflated perceptions of popularity (Clayton et al., 2019). Flags denoting high algorithmic promotion versus public sharing provide cues on information quality.

Consent poses challenges given the use of broadly permissive platform terms of service and commercial data flows into political targeting. But tools giving users visibility into why they are being shown certain ads based on derived traits empowers more meaningful opt-out and appeals processes (Andreou et al., 2018). Data minimization also reduces risks, while strict consent for politically relevant data creates friction against exploitation.

Importantly, transparency alone does little without accountability. Corporate policies deprioritizing engagement bait if demoting computational propaganda risks reach and revenue (Zuckerman, 2019). And the decentralized nature of US elections multiplied attack surfaces across states. The technical investigation of security issues in major electronic voting infrastructure models, including voter registration databases, reveals attack attribution problems due to decentralized system topologies and the difficulty in identifying sophisticated perpetrators.

Centralizing oversight through funding requirements has shown promise in securing critical infrastructure elsewhere (Ahmed et al., 2020). van der Staak, S., and Wolf, P. (2019) argue enhancing transparency through logging, monitoring, and information sharing represents crucial path for securing electoral systems against cyberthreats. This includes voter registration databases and election reporting systems. Though political targeting regulation risks allegations of censorship, ensuring consent and revealing manipulation serve democratic values. Combined with investments securing data systems, policy can help restore check and balances against asymmetric information warfare.

b. Cybersecurity Investments

While federal initiatives have aimed to bolster security readiness among state and local election authorities, huge gaps persist in standardized practices, let alone resources for modern systems. Stepped up funding through programs like the EAC Election Security Grants fund essential training, cybersecurity services, upgraded IT infrastructure, and routine auditing (EAC, 2020). The EAC election infrastructure security grant programs provides funding to states for auditing, cybersecurity training, upgrading IT infrastructure, and managing risks. But amounts to date fall far short of actual projected needs nationwide.

However, accounting for ongoing tech debt across thousands of jurisdictions will likely require Congress appropriating sums on par with critical infrastructure like energy and transportation. Expert recommendations called for $2.2 billion in urgent digital transition support for administrators over next decade, dwarfing current commitments (NASS Report, 2021). Passing bills like the SAFE Act introduced last session offer paths by authorizing this scale investment.

Beyond financial backing, policy incentives around voluntary info sharing on threats and compliance frameworks for voter database hygiene help systematize best practices nationwide (Brown, Curry, & Pleake-Tamm, 2019). New public-private partnerships through ISAOs expand channels for transparent collaboration across county offices, software vendors, DHS cybersecurity services, and infrastructural providers (Smith, 2016). Though securing elections constitutes complex challenge with threat surfaces across 50 states, robust

investment matched by strategic coordination can pay dividends. The integrity of the democratic process merits placing election infrastructure on par with other national priorities as data and automation permeate risks.

c. Media Literacy and Public Awareness

Experts argue computational propaganda and microtargeted disinformation cannot be countered through platform policy and technical fixes alone - a societal emphasis on building critical thinking and media literacy serves as the frontline defense. Inoculating citizen capacities against mis/disinformation requires going beyond information quality signals and source cues to instill skills evaluating message credibility on dimensions like emotional triggers, financial incentives, evidence types, and rhetorical credibility itself (Jones-Jang et al., 2021).

Fluency in assessing how online virality distorts perceptions proves essential. Towards this goal, legislation like the Digital Citizenship and Media Literacy Act introduced last year aims to fund state education programs, media research, and public workshops helping Americans parse online influence campaigns (Murphy & Young, 2021). Prioritizing life-long learning around responsible digital literacy empowers individual resilience.

Meanwhile public information campaigns raising awareness around data rights, platform incentives, and common logical fallacies serve as low-cost interventions with promise (Boyd, 2017). In Europe, such initiatives reduced vulnerability to computational propaganda by encouraging a culture of epistemic responsibility. Renewed commitments to civics and critical discourse can balance information overload. Boyd highlights the role of critical thinking in combating online viral deception campaigns. He argues societal media literacy initiatives require going beyond teaching identification of questionable sources to empowering evaluation reflexes and epistemic perspective.

Strengthening cognitive defenses through media literacy serves as a complementary measure for reducing societal exposure from data-driven threats even as technologies continue advancing. No single solution suffices, but equipping citizens represents necessary starting point.

VI. Conclusion

Data warfare poses an existential threat to the perceived integrity of electoral processes and democratic governance in America. As techniques harnessing weaponized information, analytics, and system access continue advancing faster than defenses, risks expand across multiple fronts. Voter records, microtargeted propaganda, and computational mass deception already directly endanger recent elections with incremental interference plausibly tipping outcomes.

This analysis examined vulnerabilities across voter database exposures, psychographic microtargeting, and online disinformation ecosystems. Evidence indicates gaps persist around basic data hygiene, transparency, and consent necessary for accountable targeting. The reliance on vulnerable legacy systems combined with opacity in political analytics and platform self-interest hampers oversight. Without addressing these gaps, the asymmetries enabling data warfare to covertly manipulate electoral participation and perspective at scale will only grow.

Some promising options exist in pursuing financial backing, policies emphasizing consent and accountability, platform reforms reducing visible manipulation, as well as public awareness campaigns. However, preparations should plan for threats outpacing solutions as computing power expands. Our

decentralized and polarized politics remains ripe for mass deception tactics. This demands consideration of deeper reforms that structurally align information architectures with enfranchisement over solely profit or reach.

Healthy democracies require nurturing environments of access, trust, and truth to function. All those with power over data, media, and technology infrastructure bear responsibility in preventing abusive information warfare threatening these foundations. There exist no easy answers, but promoting transparency alongside literacy, upgrading vulnerabilities, and incentives reforms offer potential starting points. The future of participatory self-determination hangs in the balance. Further research should continue monitoring data warfare developments while evaluating interventions on hiding deception, hardening systems, and bolstering cognitive defenses. Our freedoms demand vigilance against data-driven threats.

Summary of Threats

This examination surfaced numerous troubling vulnerabilities that constitute vectors for election interference when weaponized — whether by foreign adversaries, domestic partisans, or mercenary data operatives. Systemic gaps solemnly demand address across multiple areas.

First, voter registration databases represent enticing targets, with remote data exposures enabling both participation distortion through suppression techniques as well as downstream propagation of weaponized profiling. Our decentralized election infrastructure multiplies risks across under-resourced local authorities relying on dated tools to secure personally identifying data for over 150 million Americans.

Second, abusive microtargeting based on psychographic voter scoring allows campaigns, super PACs, or computational teams to discretely spread mis/disinformation only to selected personality types predicted most vulnerable to emotional manipulation. This exploits personal data and platforms built for addiction and outrage with limited consent or public visibility on targeting criteria. The resulting impact scales asymmetrically.

Finally, advances in artificial profiles, automation, and coordination of provocative media allows negligible actors to achieve widespread viral deception. The same social data and algorithms privileged for reach regardless of truth comes weaponized deliberately by platforms economically incentivized towards “engagement bait.” False manufactured controversies overwhelm organic accountability.

In totality, data warfare seizes upon vulnerabilities across electoral data resources, media accountability, and administrative infrastructure to enable incrementally undermining perceptions of legitimacy, freedom, and fairness central to the democratic process. The threats outlined in this analysis should trouble all citizens invested in securing participatory self-determination against information tyranny. Urgent action is needed, even as risks continue outpacing remedies.

Questions On Ethics and Future Research

Examining data warfare surfaces profound ethical questions around consent, transparency, and autonomy necessary for trust in fair democratic participation. Do citizens meaningfully agree to weaponization of their data profiles to enable mass manipulation without their knowledge? What accountability exists around AI systems exploiting sensitive attributes like race, health, or personality for opaque persuasion? How should society balance innovation against escalating asymmetries from technology concentrated in hands unbound by public oversight?

Equally pressing remains questions of global precedent if data warfare overwhelms domestic integrity. Would uncontrolled use abroad by authoritarian regimes utilizing US-pioneered techniques irreparably erode international elections worldwide? Could advances in generative media render recovered trust impossible as public evidence itself comes undone? Are democracies already past the point of securing informed consent again once systematic mass deception becomes normalized?

Such inquiries underscore the urgency of multidisciplinary investigation into interventions before breaches overwhelm recovery. Understanding complex interactions spanning media manipulation, group psychology, consumer law, and technical architecture constitutes rising imperative. Policy debates on platform regulation like Section 230 just scratch the surface of reforms needed across data rights, transparency requirements, upgraded election infrastructure, cybersecurity frameworks, and more.

Future research directions could include developing comprehensive models of data warfare impacts on elections, conducting longitudinal studies of voter trust and behavior in response to these tactics, and exploring potential technological and policy solutions to mitigate these threats while preserving democratic values. Meanwhile expanding media literacy and societal antibodies against viral lies cannot wait on institutions alone. Public consciousness around the very real vulnerabilities in information quality represents first line of resilience. In partnership across public, private and civic realms lies potential to weather this era of disruption without forfeiting liberty.

NH_4SCN Additive Assisted Vertically Aligned Efficient 1,5-Diamino Naphthalene Based Two-Dimensional Dion Jacobson Phase Perovskite Solar Cells

Murat EBİC*

[1]*Karamanoglu Mehmetbey University, Institute of Science and Technology, Turkey*

**(muratebic@kmı.edu.tr)*

Abstract – Dion-Jacobson (D–J) phase two-dimensional (2D) perovskites have emerged as a preeminent class of layered perovskite materials owing to their superior ambient stability and structural tunability. Amid superb improvements in stability, the power conversion efficiencies (PCEs) of D–J phase perovskite solar cells (PSCs) are limited due to the parallel alignment of inorganic octahedral layers further creating anisotropy in the mobility of charge carriers. In 2D perovskites, additive engineering is one of the efficient process to enhance the out of plane crystallinity and modulate the phase distribution that further leads to the improved carrier transport and also beneficial in upscaling the device performance. In this work, a new member of D–J phase 2D perovskites based on 1,5-diamino naphthalene spacer is fabricated and further NH_4SCN additive treatment is employed to facilitate the growth of preferred out of plane orientation of perovskite crystals. For the optimized amount of NH_4SCN additive, the PCE of $NDA(MA)_3(Pb)_4(I)_{13}$ perovskite device is improved significantly from 6.4% to 9.5%. Moreover, the additive engineered $NDA(MA)_3(Pb)_4(I)_{13}$ perovskite device is shown the preferred orientation, higher crystallinity, lower defect-states and superb stability. The additive engineered unsealed perovskite device retains 59% of its initial efficiency after 1000 h of continuous storage under 60% of relative humidity.

Keywords – D–J phase 2D perovskite, bifunctional spacers, additive engineering, 1,5-diamino naphthalene,

I. INTRODUCTION

Two-dimensional (2D) halide perovskites are currently considered as promising semiconducting materials for the fabrication of photovoltaic devices due to their superior ambient stability and structural diversity [1-6]. The power conversion efficiency (PCE) of the 2D perovskites is increasing significantly and reached up to 20% [7-9]. Larger organic spacer cations used to cleave the conventional 3D perovskites into crystallographically oriented planar 2D perovskites has a great influence on its crystal structure [10-11]. On the basis of the choice of organic spacer, 2D perovskite can crystallize into three different structures: - 1) Ruddlesden Popper (RP) phase, 2) Dion-Jacobson (D–J) phase, and 3) Alternating cation interface phase perovskites. Notably, the RP phase structure comprises of monovalent organic cations that are electrostatically bound to the inorganic lead halide framework on one end only, resulting in a double layer of organic spacers creating a van der Waals gap between the adjacent inorganic interlayers [9], [12-13]. This gap in RP phase perovskite structure not only became the reason for moisture penetration but also creates hindrance for charge transport. In principle, D–J phase 2D perovskite structures having general formula $(A')(A)_{n-1}(Pb)_n(X)_{3n+1}$ use divalent organic amine A' ($H_3N–R–NH_3$) as the spacer molecule and has the potential to eliminate the van der Waals gap [14-16]. Here the two amine groups attached at

both ends of the diamine molecule has the ability of the formation of hydrogen bonds with the inorganic perovskite slabs without creating any gap into the perovskite structure. The advancement of low-dimensional D–J phase perovskites has lately attracted considerable attention in view of their appealing stability against harsh environmental conditions as well as their competitive performance in optoelectronic applications.

Several divalent amines as ethylenediamine, 1-4 butyl diamine (BDA), 1-4 phenylene-dimethanammonium (PDMA) etc [17-20]. have been utilized to synthesize D–J phase 2D perovskites, however, these initial methods based on D-J phase perovskites have demonstrated comparatively low efficiencies. The inferior device performance in D–J phase perovskites is mainly generated due to poor charge transport attributed to the random crystal orientations and poor film morphology. Recently, chemical doping or additive engineering has been adopted as an efficient approach to improve the out of plane crystallinity as well as the device efficiency in D–J phase perovskites and recent investigations have revealed that they are capable of achieving high PCEs up to 20% [21-22]. Hitherto, different additives such as MACl, NH_4Cl, MASCN, and NH_4SCN have been utilized for this purpose [23-24]. Recently, Wu et al. used the methylammonium thiocyanate (MASCN) additive to achieve the preferred vertical orientation from 3-(aminomethyl)piperidinium (AMP) spacer-based D–J phase $(3AMP)(MA_{0.75}FA_{0.25})_3(Pb)_4(I)_{13}$ films. The optimized device not only attained higher crystallinity and preferred vertical orientation but also possess the PCE of 16.25% as well as 35 days of ambient stability with retaining 80% of its PCE [25]. Similarly, Yuan and co-workers dramatically elevated the PCE of p-Xylylene diamine (PXD) spacer based $(PXD)(MA)_2(Pb)_3(I)_9$ D–J phase PSCs to 15.6% from 1.2% with the assistance of methyl ammonium chloride (MACl) and achieved 29 days of ambient stability [26]. On the other hand, Xu et al. prepared trans-1,4-cyclohexanediamine spacer based self-aligned vertically oriented $(CHDA)(FA)_3(Pb)_4(I)_{13}$ D–J phase PSCs with 15% efficiency with 96.5% of thermal stability under 60 ^oC for 68 h [27]. Also, Jen et al. demonstrated the efficient tuning of random crystal orientation of $(BDA)(MA)_4(Pb)_5(I)_{16}$ quasi 2D perovskites into vertical crystal growth with a narrowed intermediate phase distribution. Here the improved crystal orientation and phase purity ultimately lead to the high PCE of 14.53% with a J_{SC} of 16.07 $mAcm^{-2}$ in corresponding D–J phase PSCs [28]. Similarly, Chen and co-workers formulated propane-1,3 diammonium (PDA) based $(PDA)(FA)_3(Pb)_4(I)_{13}$ based 2D perovskite devices having remarkable PCE of 13.8%. They utilized formamidinium chloride (FACl) as an additive during the film fabrication and investigated the role of Cl^- ion in the formation of vertically oriented $\{(FA)_nPb_nI_{3n+1}\}^{-2}$ inorganic quantum wells in the perovskite film. Here FACl addition led to $(PDA)(FA)_3(Pb)_4(I)_{13}$ thin films with compact morphologies, vertical-oriented crystal grains, proper energy- bandgap alignments and enhanced photovoltaic performance (PCE ~14%) with decent moisture stability, as 85% of original PCE of device retained after 540 h under 30-40% humidity exposure[29]. Hence additive engineering seemed to be an effective approach to obtain high crystallinity vertically oriented D–J phase 2D perovskite films with improved carrier transport.

In the present work, we have reported the first example of fabrication of n-4 layered D–J phase quasi 2D perovskite films having general formula $(NDA)(MA)_3(Pb)_4(I)_{13}$ that comprise of 1,5-Diamino naphthalene organic spacer cation. Further, we have demonstrated that NH_4SCN additive can enhance the crystallinity of $(NDA)(MA)_3(Pb)_4(I)_{13}$ 2D perovskite films and can induce the favorable out of orientation of inorganic 2D perovskite quantum wells, as evidenced by XRD and SEM. Moreover, we have also explored the photovoltaic performance of $(NDA)(MA)_3(Pb)_4(I)_{13}$ with and without NH_4SCN additive. Here the vertically oriented champion perovskite device fabricated with optimized amount of additive (2 mol NH_4SCN) has exhibited a preferred orientation, high crystallinity, decreased defects, and delivered the improved PCE of 9.5%. Moreover, the unsealed $(NDA)(MA)_3(Pb)_4(I)_{13}$ device with optimized NH_4SCN concentration has demonstrated very good ambient stability by retaining 59% of its PCE under 60% relative humidity along with a decent thermal stability.

II. MATERIALS AND METHOD

1,5 Diamino naphthalene ($n - C_4H_9NH_2$) was purchased from TCI, methylammonium bromide (MAI, Greatcell). Lead Iodide (PbI_2), Anhydrous ethanol (99.9%), chlorobenzene (95%), anhydrous N, N-dimethylformamide (DMF, 99.8%), acetonitrile (99.8%), dimethyl sulfoxide (DMSO, 99.9%), Hydrochloric acid (HCl, AR, 35-37%), titanium (IV) isopropoxide (99.9%), 2,2',7,7'-Tetrakis[N,N-di(4-methoxyphenyl)amino]-9,9'-spirobifluorene (spiro-OMeTAD), 4-tertbutylpyridine (tBP), lithium bis-(trifluoromethylsulphonyl) imide (Li-TFSI), and cobalt salt Co[t-BuPyPz]$_3$[TFSI]$_3$ (FK209) are received from Sigma-Aldrich. The SnO_2 solution was purchased from Alfa Aesar (tin (IV)oxide, 15 wt% in H_2O colloidal dispersion).

Absorption spectra were recorded with an Agilent Cary 100 UV-Vis spectrophotometer equipped with an integrating sphere to account for reflected and transmitted light. The room temperature photoluminescence spectra were taken by a SHIMADZU RF-6000 Spectro Fluorophotometer. The scanning electron microscopic images of the films were taken using a field-emission scanning electron microscope. An electron beam accelerated to 3 kV was used with an in-lens detector. The time correlated single photon counting (TCSPC) experiments for average lifetime measurement of perovskite films were performed using Horiba Jobin Yvon, Florocube with Excitation Sources: Nano LEDs with a wavelength of 400nm. For structural characteristics measurement X-ray diffraction pattern measurement of perovskite films were taken by using a Rigaku X-ray advanced diffractometer with Cu Kα 1,2 radiation (λ=1.541°). X- ray spectrum was collected within an angular range of $5° < 2\theta < 50°$.

Quasi 2D perovskite film fabrication

The 2D perovskite precursor solutions were prepared in a DMF: DMSO (4:1 v/v) solvents. Typically, for the fabrication of precursor solution (40 wt%) of n = 4 layered films 230.50 mg of PbI_2, 59.61 mg of MAI, and 19.77 mg of NDA were added to 550 mL of DMF:DMSO solution. Then solutions were stirred at 60 °C for 12 h. The precursor solution was spin-coated onto the substrate at 1000 rpm for 10 sec and continuously at 6000 rpm for 30 sec. Before end of the second step at 20 sec, 200 mL of chlorobenzene was poured on the films and followed by thermal annealing at 100 °C for 60 min. For the fabrication of additive incorporated n = 4 layered films, 1 mol (9 mg) and 2 mol (19 mg) NH_4SCN and were added into the precursor solution[30].

Device Fabrication

Fluorine-doped tin oxide (FTO) (8 Ω cm^2) substrate was etched with zinc powder and 2 M aqueous HCl. The etched FTO was cleaned in a soap solution, deionized water, acetone, and isopropanol, each step accompanied by sonication for 10 mins and followed by drying in a nitrogen air. Prior to c-TiO_2 deposition, FTO was treated with UV-Ozone for 15 mins. Then, c-TiO_2 film (20 nm) was deposited by spin-coating from a sol-gel precursor solution consisting of titanium isopropoxide (TTIP) in anhydrous isopropanol. The substrate was annealed at 150 °C for 15 mins on a hot plate and subsequently annealed in air at 500 °C for 30 mins. The SnO_2 aqueous colloidal dispersion (15wt%) was diluted using deionized water to the concentration of 2.5 wt%. Then, SnO_2 layers were fabricated on TiO_2 layer by spin coating method at 4000 rpm for 30 s, (ramp 2000) using the diluted SnO_2 aqueous solution and annealed at 150 °C for 30 min. Then, immediately all the substrates were transferred to the nitrogen filled glovebox for the fabrication of 2D perovskite layer (above mentioned procedure). Next, spiro-OMeTAD solution was prepared by dissolving in chlorobenzene at 70 mM, where tBP, Li-TFSI in acetonitrile, and FK209 in acetonitrile (molar ratio of spiro: FK 209: Li-TFSI: TBP of 1 :0.03: 0.5: 3.3) are added as additives. The gold electrode was deposited by thermal evaporation of 80 nm gold in high vacuum conditions. A 0.09 cm^2 non-reflective mask was used to define the active area.

III. RESULT AND DISCUSSION

1,5 Diamino naphthalene based quasi-2D perovskite

The NDA based n-4 layered $(NDA)(MA)_3(Pb)_4(I)_{13}$ D–J phase 2D perovskite films were fabricated using single step spin coating method. Specifically, $(n-C_4H_9NH_2)$, MAI, PbI_2 and HI were dissolved in DMF/DMSO in the stoichiometric ratio according to the general formula $(A')(A)_{n-1}(M)_n(X)_{3n+1}$ of n phase D–J perovskite. The NDA molecule and corresponding quasi 2D perovskite (n=4) structure is schematically shown in Figure 1a. The absorption spectrum consists of a small excitonic absorption peak near 400 nm representing the lower n phases, a broad low intensity absorption band near 500 nm representing the intermediate n phases and a blue shifted absorption edge at 746 nm confirming the fabrication of n-4 layered 2D perovskite. The photoluminescence (PL) peak of $(NDA)(MA)_3(Pb)_4(I)_{13}$ film is located at 767 nm (FWHM~23 nm). No small wavelength emission peak in the PL spectrum can be explained by fast energy transfer from the low-n phase region to a high-n region, inducing the emergence of a large absorption peak [31-32]. The crystallinity of $(NDA)(MA)_3(Pb)_4(I)_{13}$ perovskite film is investigated using X-Ray diffraction (XRD) method. The XRD patterns of $(NDA)(MA)_3(Pb)_4(I)_{13}$ perovskite film exhibits low crystallinity diffraction peaks at 2θ = 14.2°, 24.8°, and 28.5° corresponds to the (110), (202), and (220) facets of 2D perovskite further indicating a random crystal orientation [33-34].

Additive engineering of n-4 composition quasi-2D perovskite

In 2D perovskites, additive engineering is one of the efficient process to enhance the out of plane crystallinity and modulate the phase distribution that further leads to the improved carrier transport and also beneficial in up-scaling the device performance[35]. Till date, different additives such as MACl, NH_4Cl, MASCN, and NH_4SCN have been used for this purpose [36-37]. Here in this work, we have investigated the effect of NH_4SCN additive on the crystallinity and device performance of $(NDA)(MA)_3(Pb)_4(I)_{13}$ D–J phase 2D perovskite films. The additive incorporated $(NDA)(MA)_3(Pb)_4(I)_{13}$ perovskite composition was prepared by adding different amount of NH_4SCN in the precursor solution according to the most recent reported article (detailed procedure can be found in the experimental section) [38].

First, to study the impact of NH_4SCN additive on the composition of 2D perovskites UV-vis spectrum was conducted for $(NDA)(MA)_3(Pb)_4(I)_{13}$ alone and in the presence of additive. Figure 1b shows that UV-vis spectrum of pristine perovskite consists of a high intensity absorption peak around 400 nm reportedly representing the lower n states, a broad and misty absorption hump near 500 nm representing the intermediate n states (i.e., n~3 or 4) and a blue shifted sharp absorption edge near 750 nm confirming the fabrication of a quasi 2D perovskite structure. After NH_4SCN addition, the absorption spectrum appeared to be similar, representing the similar n phase distribution in the additive incorporated films. Also, the 2mol NH4SCN based films show the 750 nm absorption edge blue shifted to 740 nm that further represents that additive incorporation reduces the presence of higher n states in n-4 perovskite films and plays a vital role in achieving the narrowed intermediate phase distribution.

Figure 1c represents the XRD pattern of pristine n-4 perovskite films after the addition of NH_4SCN additive. The low crystallinity broad peaks observed at 2θ = 14.1° and 28° corresponds to the (110) and (202) facets of 2D perovskite. After the addition of 1 mol NH_4SCN, the intensity of both the diffraction peaks enhanced moderately accompanied with a small decrease in the full width at half-maximum (FWHM). After the addition of 2 mol $NH4_SCN$, these two diffraction peaks have shown considerable enhancement in their intensity. Also, the FWHM of (110) and (220) peaks decreased from 0.136° and 0.164° (no additive) to 0.087° and 0.089° (with 2 mol NH_4SCN), respectively (Figure 1d and 1e). Therefore, superior crystallinity and narrower FWHM has been observed for 2 mol NH_4SCN additive films. Also, the intensity enhancement for the (110) and (220) diffraction peaks indicate the preferential out-of-plane growth of inorganic quasi-2D perovskite QWs. This structural finding is promising since vertically orientated quasi-2D perovskite films leads to improved charge carrier transport which is essential for better photovoltaic performance of the device [39]. Figure 1f represents the transient PL spectra of

$(NDA)(MA)_3(Pb)_4(I)_{13}$ perovskite films with and without additive. The fluorescence decay values were found to be following the bi-exponential decay kinetics. The TRPL decay parameters are listed in Table S1 (supporting information). The average lifetime of these perovskite films is calculated through $\tau_{avg.} = \frac{\sum_{i=1}^{2}(a_i\tau_i^2)}{\sum_{i=1}^{2} a_i\tau_i}$ equation, where a_i is the amplitude of i[th] lifetime component and τ_i is the respective lifetime value [40]. The pristine perovskite films without NH_4SCN shows two lifetime components of 94 ns-slow and 15 ns-fast decay, whereas 178 ns-slow and 36 ns- fast decay lifetime components are observed for 2 mol NH_4SCN additive films. Both lifetime components of the film having 2 mol NH_4SCN as additive are significantly longer in comparison to the pristine perovskite film. Also, the average decay lifetime of films after NH_4SCN addition is significantly increased to 106 ns (2mol NH_4SCN) and 80 ns (1mol NH_4SCN) in comparison to pristine n-4 perovskite films (55 ns). The longer lifetimes suggest the reduced nonradiative recombination with a lower defect density, which will further facilitate carrier transport and hence contribute to a higher V_{OC} value [41].

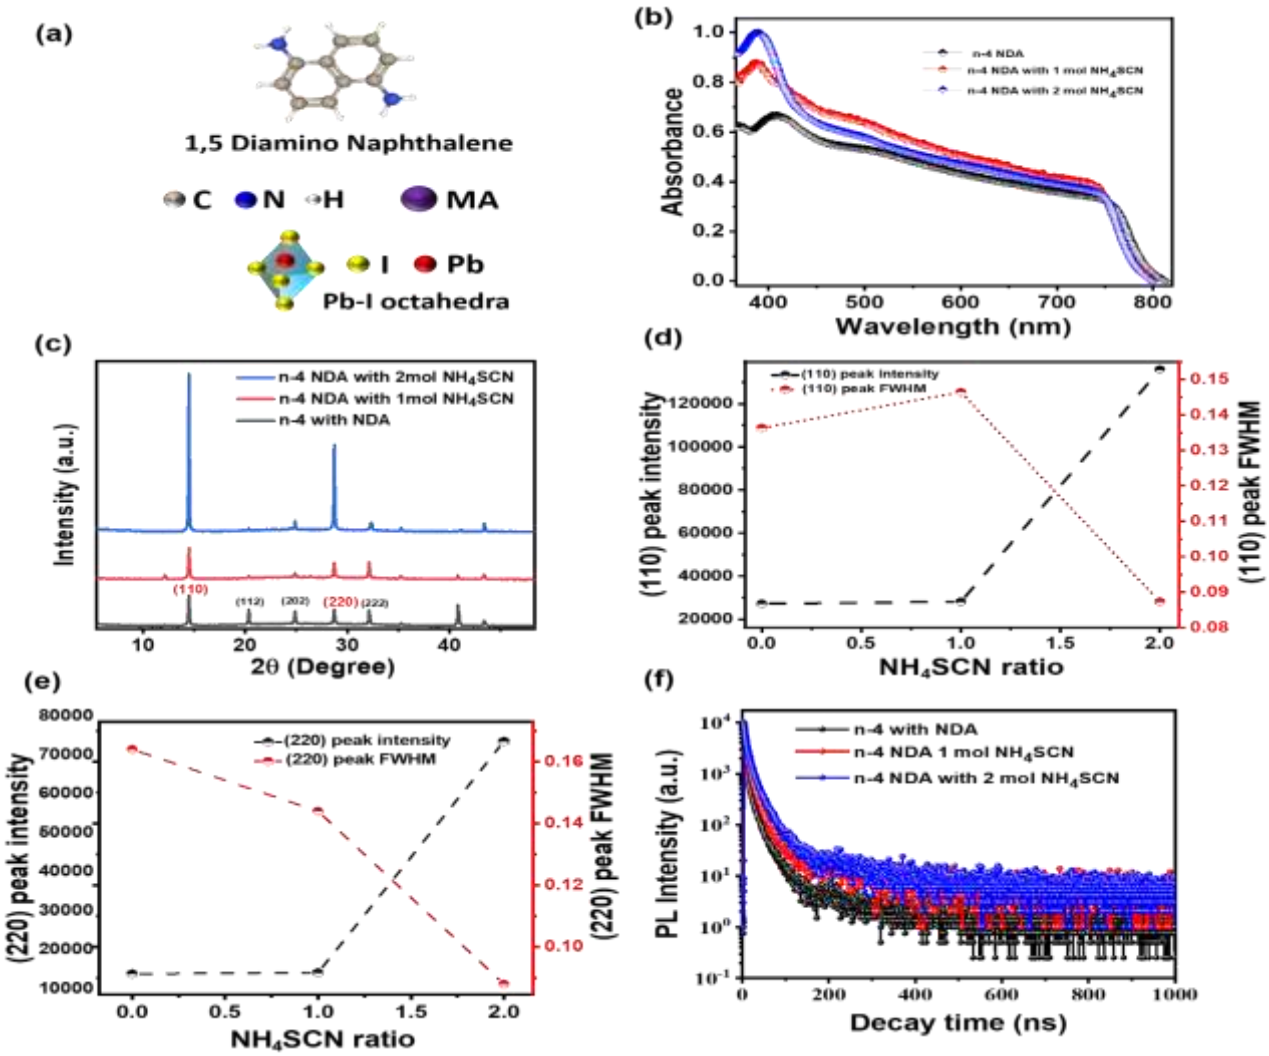

Figure 1. (a) Schematic illustration of the 1,5- Diamino naphthalene molecule. (b) Absorbance spectrum of $(NDA)(MA)_3(Pb)_4(I)_{13}$ perovskite films prepared with different concentration of NH_4SCN additive. (c) XRD pattern of $(NDA)(MA)_3(Pb)_4(I)_{13}$ perovskite films loaded with various amounts of NH_4SCN additive. (d), (e) the variation in peak intensity and FWHM of the corresponding (110) and (220) diffraction peak respectively, with different concentration of NH_4SCN additive. (f) TRPL decay graphs of $(NDA)(MA)_3(Pb)_4(I)_{13}$ perovskite films with/without NH_4SCN addition.

Scanning electron microscopy (SEM) analysis was performed to analyse the effect of additive on the morphology of native $(NDA)(MA)_3(Pb)_4(I)_{13}$ films. The pristine perovskite films show the homogeneous and smooth layered film structure without distinguishable boundaries. On the addition of 1

mol NH_4SCN, the perovskite film became dense and exhibit the emergence of granular structure with smaller grain sizes, but for 2 mol NH_4SCN films, clear grain boundaries with comparatively larger grain sizes are observed. Hence 2 mol NH_4SCN additive based films confirmed the highest crystallinity as consistent with the XRD results. The average grain size calculated for 1 mol NH_4SCN films and 2 mol NH_4SCN films are 535 nm and 1.05 μm, respectively as shown in Figure 2. Combining the SEM images, it has been concluded that NH_4SCN can significantly improve the course of crystallization and has a great impact on the film morphology [42].

Device Performance

To evaluate the influence of NH_4SCN addition on the photovoltaic performance of pristine D–J phase $(NDA)(MA)_3(Pb)_4(I)_{13}$ devices, we have fabricated the photovoltaic devices with FTO/c-TiO_2/SnO_2/2D Perovskite/spiro-OMeTAD/Au configuration (with an active device area of 0.09 cm^2) having different amount of NH_4SCN as presented in Figure 3a. The calculated photovoltaic performance parameters are summarized in Table 1. The pristine D–J phase devices bearing $(NDA)(MA)_3(Pb)_4(I)_{13}$ perovskite film without the NH_4SCN additive has shown the PCE of 6.4% with the short circuit current density (J_{SC}) of 17.15 mA/cm^2, an open circuit voltage (V_{OC}) of 0.92 V and the fill factor (FF) of 40.52%. We further inspected the performance of NH_4SCN additive loaded PV devices. For 1 mol NH_4SCN addition the J_{SC} value increased to 17.58 mA/cm^2 whereas V_{OC} value increased by 0.95 V, FF enhanced up to 49.44% and the overall PCE reached to 8.3%. Further the device with optimized additive concentration of 2 mol NH_4SCN has the maximum PCE of 9.5% with J_{SC} of 18.46 mA/cm^2, V_{OC} of 0.99 V and the FF of 52.25%. As expected, the 2 mol NH_4SCN based D–J phase PV device shown the highest PCE value. Here the significantly increased J_{SC}, V_{OC} and FF values contributed to the enhanced device efficiency. The enhanced J_{SC} and FF implied that the higher crystallinity vertically oriented inorganic layers promoted the superior charge transport and collection in the additive based PV solar cells [43]. While the increased V_{OC} value suggests the reduced nonradiative recombination at perovskite/CTL interfaces [44]. The external quantum efficiency (EQE) spectrum and the corresponding integrated photocurrent curve for pristine $(NDA)(MA)_3(Pb)_4(I)_{13}$ and with different amount of additive is shown in Figure 3c. The value of integrated photocurrent for $(NDA)(MA)_3(Pb)_4(I)_{13}$ device without and with 2 mol NH_4SCN additive is 16.94 mA/cm^2 and 17.24 mA/cm^2 respectively, which almost resembles to the experimental J_{SC} values. The stabilized power output of $(NDA)(MA)_3(Pb)_4(I)_{13}$ with 2 mol NH_4SCN PV devices was scanned at maximum power input of 0.99 V, providing the stabilized PCE of 9.2% under 1 sun illumination for 100 sec (Figure 3d) confirming the best reliability of additive based high performance device. The comparison of PCE distribution of pristine $(NDA)(MA)_3(Pb)_4(I)_{13}$ devices with different amount of NH_4SCN additive is shown in Figure 3e. The performance trend is consistent with the earlier experimental findings as 2 mol NH_4SCN additive devices shown the maximum PCE.

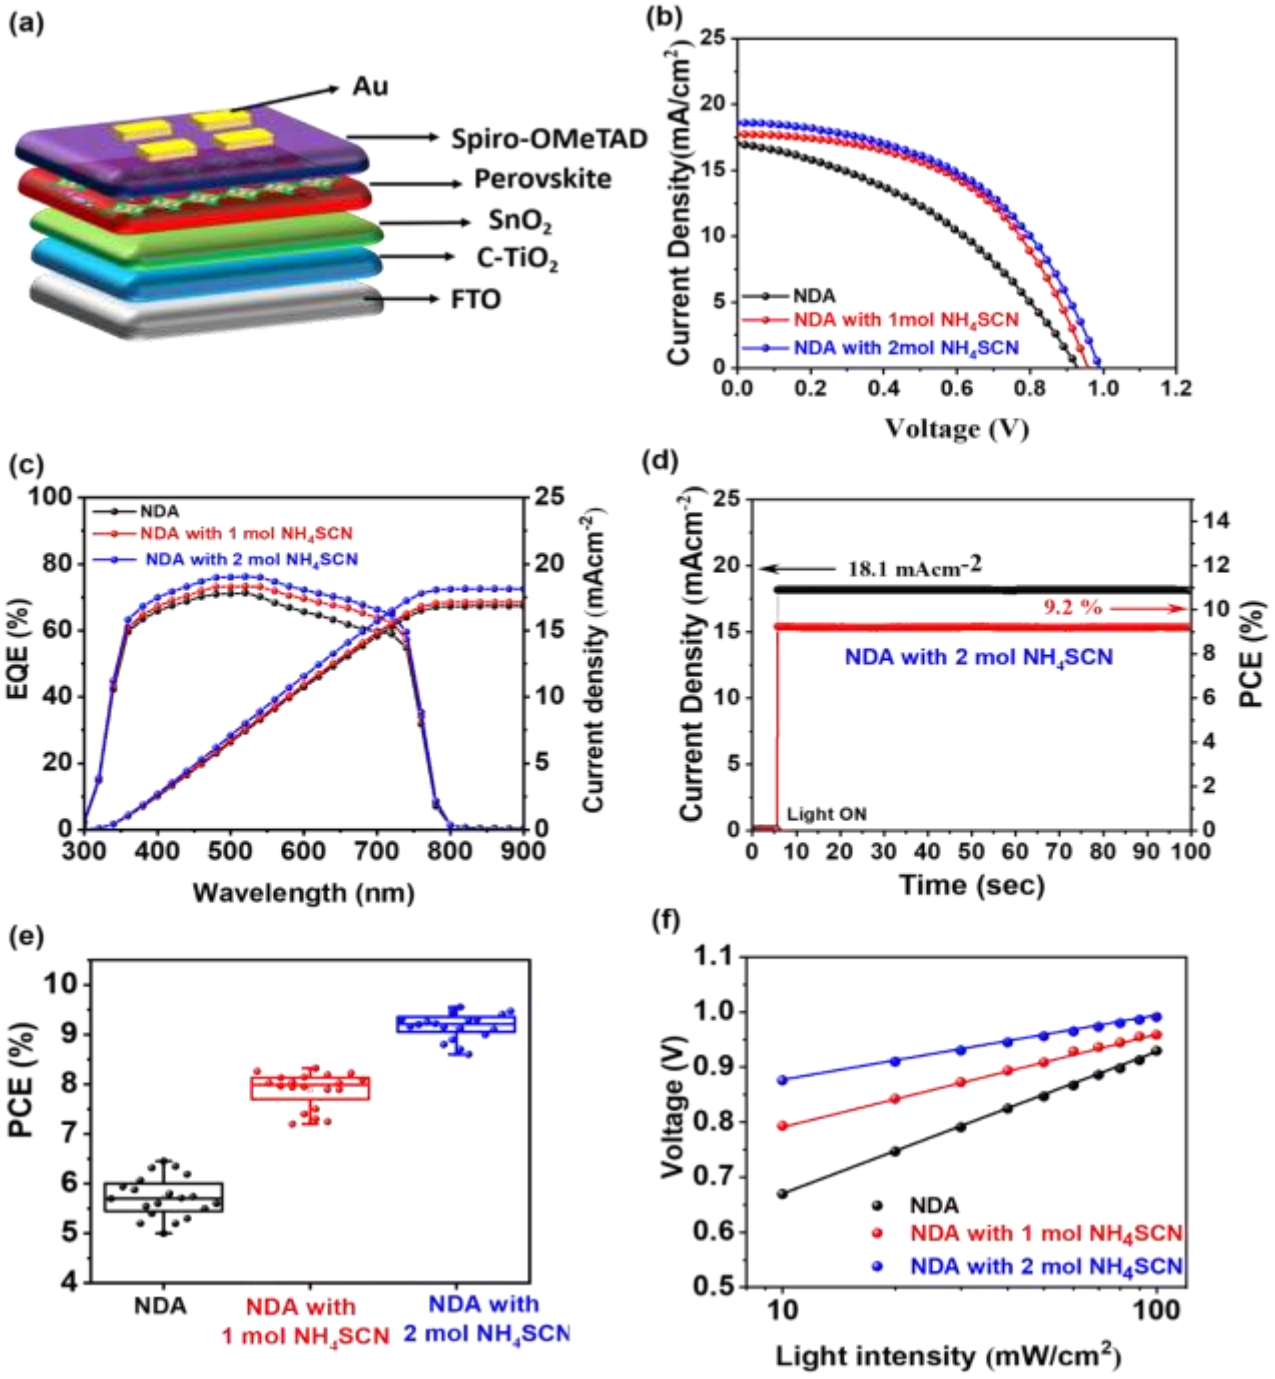

Figure 3. (a) Schematics of the device structure - FTO/c-TiO_2/SnO_2/2D Perovskite/Spiro-OMeTAD/Au. (b) Current density vs voltage characteristics curve of the devices based on the $(NDA)(MA)_3(Pb)_4(I)_{13}$ perovskite films with different amount of NH_4SCN. (c) EQE curves and integrated photocurrent spectrum for the $(NDA)(MA)_3(Pb)_4(I)_{13}$ perovskite devices with various amount of NH_4SCN additive. (d) Stabilized current density and PCE of the $(NDA)(MA)_3(Pb)_4(I)_{13}$ perovskite devices with optimized amount of NH_4SCN additive. (e) The statistics of PCE of the $(NDA)(MA)_3(Pb)_4(I)_{13}$ perovskite devices with different amount of NH_4SCN additive. (f) V_{OC} of the $(NDA)(MA)_3(Pb)_4(I)_{13}$ devices with different amount of NH_4SCN additive.

Table 1: Summary of the photovoltaic parameters of the $(NDA)(MA)_3(Pb)_4(I)_{13}$ photovoltaic devices having different amount of NH_4SCN additive.

Perovskite	V_{OC} (V)	J_{SC} (mAcm^{-2})	FF (%)	PCE (%)
NDA	0.9296	17.15	40.52	6.45
NDA with 1 mol NH_4SCN	0.9584	17.58	49.44	8.32
NDA with 2 mol NH_4SCN	0.9909	18.46	52.25	9.55

We further explored the recombination kinetics of the devices by measuring the light intensity dependence of their corresponding *J–V* characteristics. Here the V_{OC} values for $(NDA)(MA)_3(Pb)_4(I)_{13}$ devices with different amount of NH_4SCN additive is plotted against different light intensities as shown in Figure 3f. From the corresponding graph, the diode ideality factor can be determined using the equation:

Resilience of additive incorporated D–J phase PV devices to moisture and heat

Finally, the resilience of photovoltaic performance of this new class of D–J phase 2D PV devices to ambient air and moisture before and after additive incorporation was scrutinized, as shown in Figure 4, by assessing their hydrophobicity and the stability under heat and humid air conditions. In order to investigate the hydrophobic character of $(NDA)(MA)_3(Pb)_4(I)_{13}$ perovskite films before and after NH_4SCN addition, we measured the contact angle of the corresponding films using a water droplet. The greater contact angle of 79° for 2 mol NH_4SCN additive incorporated film suggested the increased hydrophobicity compared to pristine 2D perovskite film (contact angle ~62°). The shelf life and resilience to ambient air of these perovskite films before and after NH_4SCN addition was also evaluated. The stability test was conducted by the measurement of PCE of the devices under relative humidity of $60\pm5\%$ without encapsulation. As shown in Figure 4d, when devices are stored in ambient atmosphere at relative humidity of 60 %, the device with 2 mol NH_4SCN has shown the optimum stability and retained 59% of its initial efficiency after 1000 h of continuous storage. On the other hand, at similar atmospheric conditions the efficiency of pristine $(NDA)(MA)_3(Pb)_4(I)_{13}$ devices dropped far more quickly and it was degraded completely within 600 h of storage. Also, the thermal stability test of $(NDA)(MA)_3(Pb)_4(I)_{13}$ perovskite devices were conducted under constant temperature of 85 °C. The device with 2 mol NH_4SCN retained 54% of its original PCE after 200 h of storage while pristine $(NDA)(MA)_3(Pb)_4(I)_{13}$ devices were collapsed entirely after 55 h of storage. These results suggested that NH_4SCN addition in pristine D–J phase $(NDA)(MA)_3(Pb)_4(I)_{13}$ devices lead to better moisture and thermal stability. This research presents a new approach towards additive engineered novel D–J phase PSCs having high PCE with reasonable stability.

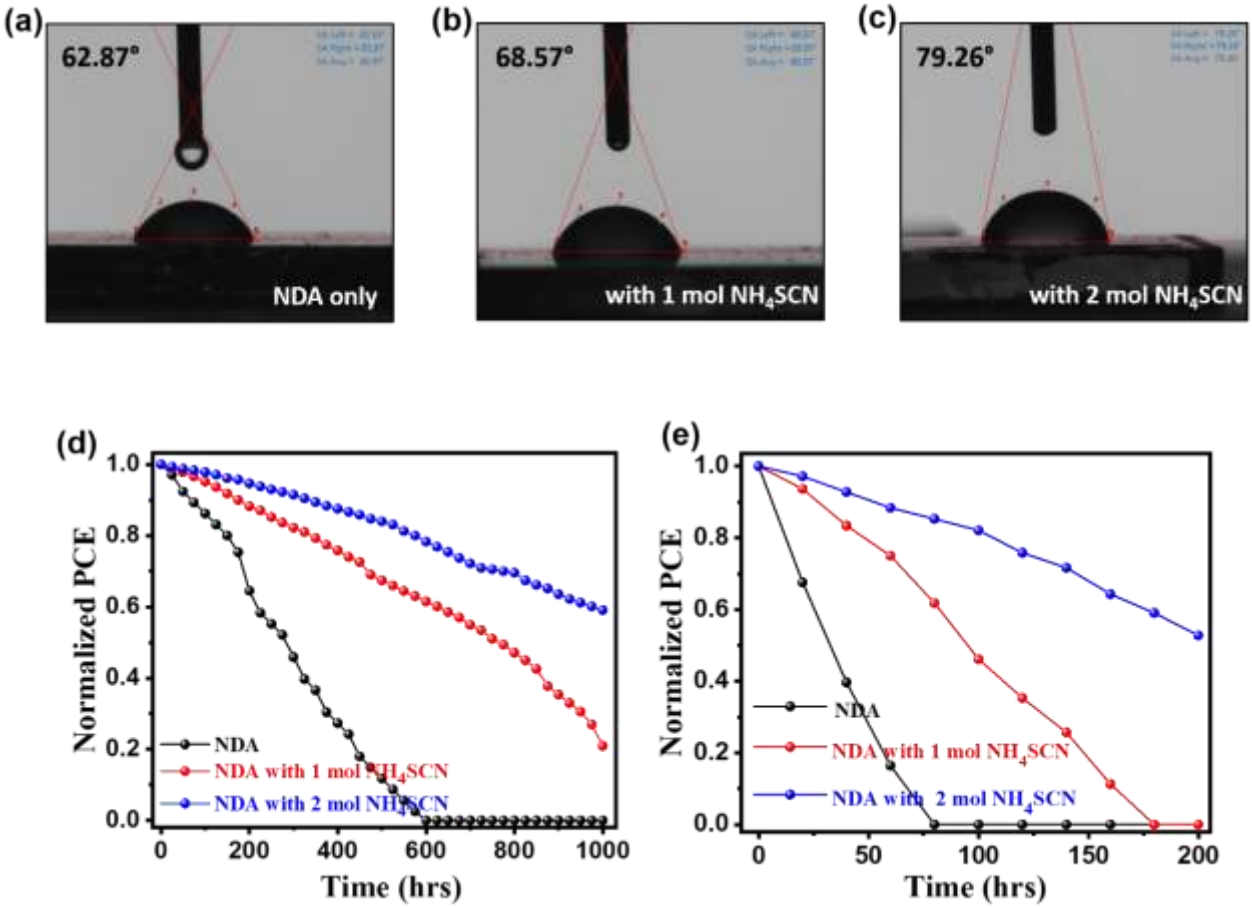

Figure 4. Measurement of contact angle of water droplet on (a) pristine n=4 layered $(NDA)(MA)_3(Pb)_4(I)_{13}$ 2D perovskites films (b) $(NDA)(MA)_3(Pb)_4(I)_{13}$ films with 1 mol NH_4SCN additive. (c) $(NDA)(MA)_3(Pb)_4(I)_{13}$ films with 2 mol NH_4SCN additive. (d) Moisture stability test (under RH 60%) of $(NDA)(MA)_3(Pb)_4(I)_{13}$ perovskite device with and without NH_4SCN additive. (e) Thermal stability test under 85°C heating for $(NDA)(MA)_3(Pb)_4(I)_{13}$ perovskite device with and without NH_4SCN additive treatment.

IV. CONCLUSION

The main conclusions of the study should be summarized in a short Conclusions section. In conclusion, we presented the first example of D–J phase n-4 layered $(NDA)(MA)_3(Pb)_4(I)_{13}$ 2D perovskites with 1,5-Diamino naphthalene bifunctional organic spacer group. We further demonstrated the successful vertical alignment of their crystal orientation using NH_4SCN additive. The evolution of film crystallite orientation with different amounts of NH_4SCN has been revealed by XRD and SEM measurements. The champion $(NDA)(MA)_3(Pb)_4(I)_{13}$ device with optimized NH_4SCN concentration gave remarkable photoconversion efficiency of 9.5%, complemented with excellent ambient stability, by retaining % of its original efficiency after 1000 h under 0% humidity. In view of their excellent photovoltaic performance, NDA based D–J phase 2D perovskites holds promise to be a viable source of high efficiency optoelectronic devices with rational long term ambient stability. Furthermore, additional improvement of the materials and devices is now being investigated.

Denial of Nationality: A Form of French Racial Discrimination Against Algerian Muslims in Colonial Algeria (1830-1962)

Abdelhafid Guebaili*

Mohamed Lamine Debaghine Sétif 2 University, Algeria

*a.guebaili@univ-setif2.dz

Abstract – During the period of French colonial rule in Algeria (1830-1962), the Muslim population of Algeria faced systematic repression that affected all aspects of their lives. Among these practices, the phenomenon of "denial of nationality" emerged as a key tool of marginalization. France regarded Algerian Muslims merely as "subjects" — neither Algerian citizens by virtue of their land nor French citizens by virtue of their submission to the colonial state. France aimed to deprive Algerian Muslims of their basic rights. In this article, we seek to explore this phenomenon by uncovering its roots and motivations and highlighting its devastating effects on Algerian society.

We will begin by explaining the concept of "denial of nationality" and its consequences for individuals and society as a whole. We will then move on to the historical context in which this phenomenon emerged in Algeria, analyzing the colonial policies and laws that contributed to its entrenchment. Subsequently, we will delve into studying the manifestations of racial discrimination that characterized the denial of nationality and reveal the methods used to target Algerian Muslims specifically. Finally, we will assess the long-term impacts of this phenomenon on Algerians.

Understanding "denial of nationality" as a colonial tool of oppression is essential for comprehending contemporary Algerian history under colonial domination and for recognizing the depth of the challenges faced by Algerians in their struggle for freedom and dignity. With each story of denied nationality, a poignant human story is told, revealing the determination of the Algerian people to preserve their identity and dignity in the face of injustice and oppression.

Keywords – Denial of Nationality, Marginalization, Colonial Policies, Racial Discrimination, Colonial Algeria

I. INTRODUCTION

Amidst the chapters of French colonialism in Algeria (1830-1962), the Algerian people, especially Muslims, faced a series of horrors and systematic oppression that encompassed all aspects of their lives.

Nationality was not spared from these practices, as Algerians suffered from the phenomenon of "denial of nationality" which represented a quintessential tool of oppression, aimed at marginalizing them and stripping them of their basic rights.

In this article, we strive to delve into the depths of this phenomenon, uncover its roots and motivations, and shed light on its devastating effects on Algerian society. We will begin our journey by

explaining the concept of "denial of nationality" and its consequences for individuals and society as a whole. Then, we will address the historical context in which this phenomenon emerged in Algeria, and we will analyze the colonial policies and laws that contributed to its entrenchment. After that, we will delve into studying the manifestations of racial discrimination that characterized the denial of nationality, and we will reveal the methods used to target Algerian Muslims in particular. Finally, we will assess the long-term impact of this phenomenon on Algerian society, and we will discuss the efforts made to address its wounds and consequences.

Understanding "denial of nationality" as a colonial tool of oppression is essential to understanding modern Algerian history and to realizing the depth of the challenges faced by the Algerian people in their struggle for freedom and dignity. For with every story of denial of nationality, a moving human story is told, and the Algerian people's determination to preserve their identity and dignity in the face of injustice and oppression is revealed.

1. What do we mean by legal discrimination and denial of nationality?

Legal discrimination refers to the unequal treatment of individuals or groups based on characteristics such as race, gender, religion, or nationality, which is enshrined in and enforced by laws or legal systems. This kind of discrimination is sanctioned and perpetuated by the state through legislation, regulations, and policies.[1] Examples include:

- Apartheid laws in South Africa, which enforced racial segregation and unequal rights for different racial groups.

- Jim Crow laws in the United States, which mandated racial segregation and disenfranchised African Americans.

- Gender laws that restrict women's rights in some countries, such as laws limiting women's ability to own property, travel independently, or access certain jobs.

In the context of Algeria's colonial history, legal discrimination refers to the differential treatment of the various groups that made up the population of Algeria during the colonial period by the French. While settlers and Jews were granted French nationality and allowed to enjoy all the rights that this status entailed, the indigenous Algerians were left without a clear legal status. This had numerous consequences, forcing them to live harsh lives and occupy the bottom rung of the social ladder throughout the period in question.Denial of nationality refers to the practice of depriving individuals or groups of their citizenship or legal nationality. This can happen through explicit laws or administrative practices and can result in statelessness, where individuals are not considered nationals by any state. The consequences are severe, as stateless individuals often lack basic rights and access to services. Denial of nationality can occur for various reasons, including:

-Ethnic or religious discrimination: Targeting specific ethnic or religious groups to exclude them from citizenship.

-Political reasons: Revoking citizenship of political opponents or dissidents.

-Historical contexts: Colonization, decolonization, or the dissolution of states can lead to complex citizenship issues and statelessness.[2]

Denial of nationality often leads to significant human rights violations, including the inability to access education, healthcare, employment, and legal protection. It is a critical issue addressed by international human rights organizations and bodies advocating for the right to nationality and the prevention of statelessness.

2. What are the consequences of denial of nationality?

The legal discrimination faced by indigenous Algerians resulted in significant disadvantages, including disqualification from holding many civil and military positions. This exclusion extended to promotions within civil service roles, preventing equitable advancement opportunities. Additionally, indigenous individuals were barred from military promotions, further marginalizing their representation in state institutions. They were subjected to an exceptional judicial system, which often operated outside the norms applied to settlers. This punitive arsenal reinforced their subordinate status within the colonial framework, exacerbating social and political inequalities throughout the colonial period. Such systemic discrimination deeply affected their lives and prospects for upward mobility.[3]

3. Why was the denial of nationality to Algerian Muslims considered racial discrimination?

It is important to note that the denial of nationality was not the only form of discrimination faced by Algerian Muslims during the colonial period. They were also subjected to various forms of political, economic, social, and cultural discrimination. To understand the context of this discrimination, it is crucial to recognize the diverse population of Algeria during the colonial period:

- **Algerian Muslims:** They formed the vast majority of the population, indigenous to the land and adhering to Islam.
- **Algerian Jews:** While considered part of the indigenous population, they maintained a distinct religious and cultural identity.
- **European settlers:** Comprising French, German, Swiss, Spanish, Italian, and other nationalities, they arrived during the colonial era and were granted preferential treatment.
- **Foreign Muslims:** Primarily from neighboring Maghreb countries (Morocco, Tunisia), they migrated to Algeria for various reasons.[4]

Table 1: Population Growth in Algeria 1861-1954

Year	Settlers	Jews	Muslim Algerians	Total
1861	269,674	28,097	2,691,812	2,989,583
1881	376,772	35,663	2,842,497	3,254,932
1954	400,000	170,000	8,500,000	8,917,000

4- How did France distinguish between the inhabitants of Algeria? What were the manifestations of this distinction?

- **Granting French nationality to European settlers:**

- **Senatus-Consulte of July 14, 1865:** This law allowed foreigners (Europeans) to acquire French nationality and the associated rights and obligations.

- **Requirements:** Settlers only needed to prove three years of residence in Algeria and be 21 years of age to obtain French nationality. [5]
- **Impact:** French nationality made them French citizens ("citoyens français") with full rights.

➢ **Mass naturalization of Jews under the Crémieux Decree of October 24, 1870:**

- **Pre-1865:** The legal status of Jews was ambiguous, similar to Algerian Muslims. France considered them "indigenous Israelites" ("indigens israélites") during this period.
- **Senatus-Consulte of 1865:** This law classified them as French subjects ("sujets français").
- **Conditional citizenship:** They could obtain French citizenship and enjoy its rights if they requested it, but they would be subject to French law.
- **Mass naturalization:** Algerian Jews were collectively naturalized under the decree of October 24, 1870. They gained full rights and obligations as French citizens.[6]
- **Significance:** Jews were no longer considered "French subjects" and became French citizens, leaving Algerian Muslims as the only group with that status.[7]

➢ **Denial of nationality to Algerian Muslims:**

❖ **Ambiguous legal status until 1865:**

- France did not recognize Algerian Muslims as Algerian citizens.
- Despite debates, French authorities did not seriously discuss the issue.
- Their legal status was undefined, and they were referred to as "les indigenes musulmans" in legal texts.[8]

❖ **Senatus-Consulte of July 14, 1865: The First Attempt to Define the Legal Status of Algerian Muslims :**

The Senatus-Consulte of July 14, 1865, marked a significant turning point in French colonial policy towards Algeria. It was the first attempt to formally define the legal status of Algerian Muslims, who had been largely left in a state of legal limbo since the French conquest in 1830.[9]

Key Provisions of the Senatus-Consulte:

- **Algerian Muslims were classified as "French Muslim subjects" ("sujets français musulmans").** This designation implied a subordinate status within the French colonial hierarchy.
- **Retention of Islamic personal status:** Algerian Muslims were allowed to retain their Islamic personal status, governed by Sharia law. This was seen as a compromise to appease religious concerns.
- **Conditional access to French citizenship:** Algerian Muslims could, upon request, obtain French citizenship and enjoy the associated rights. However, the requirements for citizenship were complex and difficult for most Algerians to meet.
- **Military and civil service opportunities:** The Senatus-Consulte opened up the possibility for Algerian Muslims to be recruited into the French army and navy, and to hold certain civil service positions in Algeria.[10]

Outcomes and Consequences:

- **Low uptake of French citizenship:** Despite the potential benefits, Algerian Muslims were hesitant to pursue French citizenship. Statistics indicate that between 1865 and 1899, only 1,131 individuals acquired French citizenship, an average of 32 per year.[11]
- **Religious and cultural resistance:** Many Algerians viewed French citizenship as a betrayal of their faith and culture. They resisted the notion of abandoning their Islamic identity and legal traditions.
- **Continued marginalization:** The Senatus-Consulte failed to address the fundamental issue of Algerian self-determination. Algerians remained largely marginalized, lacking full political and economic rights.
- **Reinforcement of colonial hierarchy:** The law served as a tool of discrimination, distinguishing between French settlers and Algerian Muslims. Settlers had a relatively straightforward path to French citizenship, while Algerians faced numerous obstacles.[12]

➢ **Law of February 4, 1919: Cosmetic Reforms and the Persistence of Legal Marginalization for Algerian Muslims**

❖ **Context and Background:** The Law of February 4, 1919, was enacted in the aftermath of World War I, a period marked by rising nationalist sentiment among Algerian Muslims. The French colonial administration, seeking to appease these growing demands, introduced this law as a series of reforms aimed at improving the legal status of Algerian Muslims.[13]

❖ **Key Provisions of the Law:**

- **Conditional access to French citizenship:** Algerian Muslims could obtain French citizenship either through the Senatus-Consulte of July 14, 1865, or through the new provisions of the 1919 law.
- **Stringent requirements:** The conditions for acquiring French citizenship under the 1919 law remained as complex and difficult to meet as those under the 1865 Senatus-Consulte.[14]

❖ **Limited Impact and Continued Marginalization:**

- **Minimal uptake:** Despite the potential benefits, Algerian Muslims continued to be hesitant to pursue French citizenship. Between 1919 and 1930, only 1,204 Algerian Muslims naturalized, indicating a low level of acceptance.
- **Unchanged legal status:** The Law of February 4, 1919, failed to bring about any significant change in the legal status of Algerian Muslims. They remained classified as French subjects ("sujets français"), lacking full political and economic rights.
- **Denial of opportunities:** Their subordinate status continued to deprive them of access to various opportunities, including employment in many positions, military promotions, and political representation.[15]

➢ **March 1944 Ordinance:** This ordinance maintained the designation of Algerian Muslims as "French subjects" but granted them the theoretical right to hold all civil and military positions.[16]

- **1947 Algerian Basic Law:** While recognizing Algerian Muslims as French citizens, this law granted them limited political rights and obligations.[17]
- **General de Gaulle and the Status of Algerian Muslims:**
  - Upon assuming power in 1958, de Gaulle sought to achieve legal equality among the inhabitants of Algeria to quell popular unrest and isolate the population from the independence movement.[18]
  - **De Gaulle's Measures:** He introduced a series of measures, including speeches, decrees, and ordinances, aimed at granting Algerian Muslims French citizenship.[19]
  - **Resistance from the National Liberation Front (FLN):** The FLN rejected de Gaulle's proposals and continued to advocate for Algerian nationality, reflecting the deep-seated desire for self-determination.[20]

Conclusion:

Throughout the French colonial era in Algeria (1830-1962), the denial of nationality to Algerian Muslims served as a potent instrument of discrimination and marginalization. Rooted in racial and religious prejudice, this policy effectively excluded Algerian Muslims from full political, economic, and social rights, reinforcing their subordinate status within the colonial hierarchy.

The Senatus-Consulte of July 14, 1865, marked a turning point in the legal status of Algerian Muslims. While it granted them some limited opportunities, it also cemented their designation as "French subjects," a position that implied inferiority and denied them the full rights of French citizenship.

Subsequent measures, such as the Law of February 4, 1919, and the March 1944 Ordinance, failed to address the fundamental issue of Algerian self-determination. Algerian Muslims remained largely marginalized, facing restrictions on employment, political participation, and cultural expression.

The denial of nationality had a profound impact on Algerian society, exacerbating social divisions and fueling resentment. It served as a constant reminder of their subordinate status and the colonial administration's disregard for their aspirations.

The struggle for Algerian independence was inextricably linked to the demand for full citizenship and self-determination. Algerian Muslims, through various forms of resistance, challenged the colonial order and fought for recognition of their rights and identity.

The eventual end of French colonial rule in 1962 marked a watershed moment in Algerian history. The attainment of independence brought with it the restoration of Algerian nationality and the opportunity to establish a sovereign nation.

The legacy of the denial of nationality to Algerian Muslims serves as a stark reminder of the injustices and inequalities inherent in colonial systems. It underscores the importance of recognizing and addressing the root causes of discrimination and marginalization in the pursuit of a just and equitable society.

[*]*(ertem@beun.edu.tr)*

Özet – Mesleki eğitim, Anadolu kültürünün bir parçası olan Ahilik Teşkilatı geleneğinin izlerini taşıyan ustalık-çıraklık eğitimlerinin devlet eliyle okullarında yerine getirildiği eğitimdir. Mesleki Eğitim Merkezlerindeki öğrencilerin yabancı dil eğitimine ve bu eğitimin kendi mesleklerine olan katkısına yükledikleri anlamlar nitel araştırma yöntemi ile saptanacaktır. Bu nitel araştırma deseninde olgu bilim deseninden yararlanılarak bir araştırma raporu oluşturulmuştur. Öğrencilerin yabancı dil eğitimindeki deneyimlerine ve düşüncelerine göre, yabancı dili nasıl algıladıkları saptanmaya çalışılmıştır. Öğrenciler Kdz.Ereğli Mesleki eğitim merkezi öğrencilerinden daha önce yabancı dil eğitimi almış olan öğrencilerden seçilmiştir. Bu araştırmada görüşme ve doküman analizi stratejileri kullanılmıştır. Öğrenci algıları araştırmaları için görüşme stratejisi öğrencilerle birebir etkileşim halinde hal, tavır durumlarının sorulara verdikleri cevaplarla paralel olup olmadığı ve sorulara hangi ruh halinde (neşeli, stresli, vb. duygularla) dönütler verileceğine imkân sağlamıştır. Ayrıca doküman analizi ile etkili ve verimli veri elde edilirken Mesleki eğitim merkezlerindeki yabancı dil eğitimi hakkındaki veriler toplanmış ve analiz edilmiştir. Bu çalışmada veri analiz yöntemlerinden olan içerik analizi yöntemi kullanılarak veri analizi yapılmıştır. Veriler kodlara dönüştürülerek temalar oluşturulmuş ve yorumlanmıştır. Öğrenciler genel olarak İngilizce derslerindeki ruh hallerini olumlu kelimelerle ifade etmiştir. Ayrıca İngilizce öğretin kendilerine fayda sağladığını sosyal ortamlarda prestij sağladığını ifade etmişlerdir.

Anahtar Kelimeler – Mesleki eğitim, öğrenci, yabancı dil öğretimi, İngilizce, nitel araştırma

I. GİRİŞ

Mesleki eğitim, Anadolu kültürünün bir parçası olan Ahilik Teşkilatı geleneğinin izlerini taşıyan ustalık-çıraklık eğitimlerinin devlet eliyle okullarında yerine getirildiği eğitimdir. Bu eğitim merkezlerinde öğrenciler ilgi ve yeteneklerine göre ilgili meslek alanlarına yönlendirilip mesleklerini hem pratik hem de teorik olarak gerçekleştirdikleri bölümlerde eğitimlerini almaktadır. Öğretim süresi normal eğitim yapan ortaöğretim kurumlarında olduğu gibi 4 sene olup teorik derslerin haftada bir pratik derslerin de haftanın diğer günlerinde ilgili işletmelerde yapılmasıyla farklılık göstermektedir. İşletmelerde mesleki eğitim ilk seneden son seneye kadar devam eder. Üçüncü yılın sonunda öğrenciler Kalfalık sınavına, dördüncü yılın sonunda ise Ustalık sınavına katılan öğrenciler başarılı olmaları takdirde Kalfalık/Ustalık belgeleri verilmektedir.

MESEM'lerde eğitim gören öğrenciler mezun oldukları takdirde lise diploması ile ustalık belgesini almaya hak kazanmaktadırlar. Çırak öğrenciler meslek hastalığı ve iş kazalarına karşı devlet tarafından sigortalanmaktadırlar. Pratik eğitim aldıkları işletmelerde öğrenciler Asgari ücretin en az %30'u olmak kaydıyla maaş alabilmektedirler. 4 senenin sonunda eğitimlerini tamamlayan öğrenciler ustalık belgelerini alıp KOSGEB'den 50.000 TL hibe ve 100.000 TL de faizsiz kredi desteği alarak kendi iş yerlerine açabilmektedirler (MESEM,2023).

Mesleki eğitim merkezlerindeki öğrenciler serbest piyasa koşullarının hâkim olduğu günümüzde bu rekabet sisteminin içerisinde kendilerine artı değerler katma zorunluluğu hissetmektedir. 10.Kalkınma planında da olduğu gibi iş piyasası ile eğitim sistemi arasında bir ahenk oluşturulup iş piyasasının ihtiyacı olan becerilerin öğrencilere verilmesi gerekmektedir (Horuz,2017, s.11). Yabancı dil bilmek bu becerilerin başında gelmektedir. Bu araştırmanın içerisinde ayrıntılı bir şekilde yabancı dil müfredatına sahip Mesleki eğitim merkezleri öncelikli olarak protokol kapsamına alınan okullardan oluşmaktadır. Protokol kapsamındaki okullar da yabancı dil bulunurken bu kapsamda olmayan okullarda proje kapsamında yabancı dil eğitimi verilmektedir.

Mesleki Eğitim Merkezlerindeki öğrencilerin yabancı dil eğitimine ve bu eğitimin kendi mesleklerine olan katkısına yükledikleri anlamlar nitel araştırma yöntemi ile saptanacaktır. Ayrıca daha önce bu alanda yapılmış bir çalışmanın olmayışı sebebiyle bu alanda yapılacak çalışmalara katkı sağlaması düşünülmektedir. Araştırmada yabancı dil olarak incelenen dil İngilizcedir. Veri akışı bu bağlamda sağlanmıştır.

Günümüzde Lingua Franca (Global ortak dil) olarak kabul edilen İngilizce her alanda etkisini hissettirirken onu öğrenmek hem mesleki hem de gündelik yaşantılarımız için bir yükümlülük halini almıştır. Mesleki eğitim merkezlerinde eğitim alan öğrencilerin yabancı dile olan ihtiyaç ve ilgilerinin tespiti, meslek hayatlarındaki verimlilik düzeylerini etkileyebileceği düşünülmektedir. Meslek eğitimi veren Mesleki eğitim merkezlerindeki öğrencilerin yabancı dil ve yabancı dil öğretimine olan algıları mesleki yetkinlik olarak yabancı dili nasıl gördükleri hakkında veri sağlayacaktır.

II. MATERYAL VE YÖNTEM

Bu nitel araştırma deseninde olgu bilim deseninden yararlanılarak bir araştırma raporu oluşturulmuştur. Öğrencilerin yabancı dil eğitimindeki deneyimlerine ve düşüncelerine göre, yabancı dili nasıl algıladıkları saptanmaya çalışılmıştır. Öğrenciler Kdz. Ereğli Mesleki eğitim merkezi öğrencilerinden daha önce yabancı dil eğitimi almış olan öğrencilerden seçilmiştir.

Bu araştırmada görüşme ve doküman analizi stratejileri kullanılmıştır. Öğrenci algıları araştırmaları için görüşme stratejisi öğrencilerle birebir etkileşim halinde hal, tavır durumlarının sorulara verdikleri cevaplarla paralel olup olmadığı ve sorulara hangi ruh halinde (neşeli, stresli, vb. duygularla) dönütler verileceğine imkân sağlamıştır. Ayrıca doküman analizi ile etkili ve verimli veri elde edilirken Mesleki eğitim merkezlerindeki yabancı dil eğitimi hakkındaki veriler toplanmış ve analiz edilmiştir.

Mesleki ve Teknik Eğitim Merkezindeki öğrenciler ile gerçekleştirilen görüşmeler, okul ders saatleri içerisinde okulun müdür yardımcısının izni ile öğrencilerle birebir araştırmacı ile görüşmecinin karşılıklı soru cevap şeklinde görüşmesi ile yapılmıştır. Görüşme katılımcının onayı alınarak kayıt altına alınmıştır. Öğrencinin kendini rahat hissetmesi için uygun ortam sağlanmaya çalışılmış olup araştırmacı öğrencinin rahatsız hissedebileceği durumlarda kaydı duraklatarak görüşmeyi sürdürmüştür. İlk görüşmede ses kaydına alınan süre 12 dakika olup toplam görüşme yaklaşık 40 dakika sürmüştür. Ayrıca doküman analizi için başvurulan öğretim programları MEB'in internet sayfalarından alınmıştır.

Bu çalışmada veri analiz yöntemlerinden olan içerik analizi yöntemi kullanılarak veri analizi yapılmıştır. Veriler kodlara dönüştürülerek temalar oluşturulmuş ve yorumlanmıştır. Bu araştırmada araştırmacının rolü, Mesleki Eğitim Merkezlerinde eğitim gören öğrencilerin yabancı eğitime olan algılarını araştırmaya uygun veri teknik ve uygulamalar kullanarak araştırma problemine uygun veri akışını sağlamaktır.

Geçerlilik araştırma verilerinin doğruluğu veya problem çözme yetisi konularını kapsamaktadır. Nitel araştırmalarda geçerliliğin sağlanabilmesi için araştırmacının problem durumunu mümkün olduğunca tarafsız olarak aktarması önem arz etmektedir. Ayrıca elde edilen verilerin araştırmaya konu olan durumu gerçekte olduğu gibi aktarması önemlidir (Baltacı,2019, s.380). Bu araştırmada yapılan görüşmelerde sorulan soruların görüşmeci tarafından anlaşılıp anlaşılmadığı teyit soruları ile saptanmaya çalışılmıştır. Araştırmalarda güvenilirlik, araştırma sonucunda elde edilen verilerin aynı araştırma konusunun bir başka zaman veya araştırmacı tarafından yapıldığında aynı sonuçları verip vermediği ile ilişkilidir. Mesleki eğitim merkezlerindeki öğrencilerin yabancı dil eğitimine olan algıları, araştırma konusu yapılan literatür

taramasında bir benzeri olmadığı için bu tür bir güvenilirlikten bahsetmek mümkün değildir. Fakat araştırmada kullanılan kaynakların açık ve şeffaf bir şekilde paylaşımı yapılmıştır.

III. BULGULAR

Nitel verilerin analizi sonucunda görüşme verilerinden elde edilen sonuçlara göre 3 ana tema ve doküman analizi sonucunda da 3 ana temaya ulaşılmıştır.

Görüşme verileri analizi sonucunda;

1. Yabancı dilin faydalarına ilişkin veriler,
2. Yabancı dil öğretimine ilişkin veriler,
3. Öğrencinin derse karşı olan tutumuna karşı olan veriler saptanmıştır.

1.Görüşme Verileri Analizi Sonucunda Yabancı Dilin Faydalarına İlişkin Veriler

Çalışmaya katılan öğrenciler yabancı dilin faydalarından bahsederken tüm öğrenciler yabancı dil becerinden olan konuşmanın en önemli beceri olduğunu vurgulamış birinci öğrenci ;*İngilizce olunca her yerde anlaşılıyor çoğu ülke zaten ana dili olmasa bile İngilizce yoluyla anlaşa biliyorsun ,*cevabı ile İngilizceyi kullanmanın önemini vurgulamıştır ayrıca İngilizce eğitimi ile bir dil farkındalığı oluştuğu öğrencilerin yabancı dil eğitim aldıktan sonra İngilizce ile diğer dilleri ayrıştırabildiği saptanmıştır. Bir öğrenci Almanca ile İngilizceyi karşılaştırmış ve Almancanın İngilizceden daha zor olduğunu söylemiştir.

2. Görüşme Verileri Analizi Sonucunda Yabancı Dil Öğretimine İlişkin Veriler

Çalışmada yabancı dil öğretimine ilişkin öğrencilerin kullanılan metallerden bahsederken en çok görsel materyallerden etkilendikleri bilgisine ulaşılmıştır. Bir öğrenci "Yabancı ders eğitimin de en keyif aldığı unsurlar nelerdir?" sorusuna İngilizce dersinde izlediği bir içerikten bahsetmiş ve keyif aldığını belirtmiştir. Ayrıca bir başka öğrenci İngilizce dersinde yapılan etkinliklerden aklında kalan bir örnek istenmiş ve cevap olarak *resimler vardı insanlar bir şey yapıyor biz onu bulmaya çalışıyorduk İngilizcesini yazıyoruz günlük aktiviteleri onun yaptığı aktiviteleri sıralıyorduk* şeklinde cevap vermiştir. Öğrenciler yabancı dil öğretiminde yapılan uygulamalarla ilgili bire bir katılım gösterdikleri uygulamaları tercih ettikleri belirlenmiştir. Bir öğrencinin "İngilizce dersinde en çok keyif aldığınız unsurlar nelerdir?" sorusuna, *uygulama hani mesela tahtaya kalkıp bir şeyler falan yazıyorum yani onlar çok güzel oluyor daha çok öğrenmiş oluyoruz benim açımdan öyle ben kendimi böyle uygulama yaparak daha çok öğrenmiş gibi oluyorum çünkü böyle bir konuşarak bir kulağımızdan gelip bir kulağımızdan çıkıyor ama görseli böyle kafamızda canlandıra biliyorsun* şeklinde cevaplamıştır. Bir başka öğrencim aynı soruya, *ayağa kalkıp karşılıklı konuşma diyalog yaptım ödevlerimiz vardı güzeldi yani* şeklinde cevap vermiştir. Bu cevap ile öğrencinin dili kullanarak yaptığı etkinliklerden daha çok keyif aldığı söylenebilir.

3. Görüşme Verileri Analizi Sonucunda Öğrencinin Derse Karşı Olan Tutumuna İlişkin Veriler

Çalışmaya katılan öğrenciler derse karşı tutumları için içsel olarak dersi sevdiklerinden, derste iyi hissettiklerinden, heyecan ve dinginliği aynı anda tecrübe ettiklerinden bahsetmişlerdir. Bir öğrenci "İngilizce dersindeki ruh halinizi nasıl tamlıyorsunuz?" sorusuna, *mutlu şahsen ve daha bir enerjik oluyorum sanki bilesiniz derslere biraz daha enerjik oluyorum* şeklinde cevap vermiştir. Ayrıca "İngilizce derslerinde ki ruh halinizi bir hava durumuna benzetseydiniz hangi hava durumu olurdu?" sorusuna, *güneşli çok güneşli* şeklinde cevap vermiştir. Bu metafordan anlaşıldığı gibi öğrenci İngilizce derslerinde kendisini mutlu hissetmekte ve olumlu bir tutum sergilemektedir. Ayrıca bir diğer öğrencinin aynı soruya *böyle bir şeyler öğrendikçe insan heyecanlanıyor hani cevap derken heyecanlanıyor bilmiyorum mutluluk bence* şeklinde cevap vermiştir. İngilizce dersini bir hava durumu metafora benzetmesi istendiğinde *ben böyle hani ılık bir hava olur ya eser ama sıcak eser lodos gibi ama yıkıcı olmayan* şeklinde cevap vermiştir. Bu cevap ile öğrencinin İngilizce derslerinde olumlu bir tutuma sahip olduğu derslerde heyecanlansa da bu heyecanın olumlu bir duygu olduğu söylenebilir. Diğer öğrenci ise İngilizce dersindeki ruh halini *ya işten çıkınca yorucu oluyordum ama nasıl eğlenceliydi ya farklıydı işte işten çıkıp İngilizce dersine gelmek her gün değişik bir rutin oluşturmuştum* şeklinde cevap vermiş ruh halini hava

durumuna benzetmesini istendiğinde *parçalı bulutlu* olarak yanıtlamıştır. Bu öğrencinin staj yaptığı yerden yorgun olarak derse katılması onun İngilizce derslerindeki ruh halini nötr bir şekilde olmasını sağladığı düşünülebilir. Derslere yorgun katıldığı için yeterli enerjisinin bulunmadığı için derslerde kendini ne kötü ne de mutlu hissetmektedir.

Öğrencilerin derse karşı geliştirdikleri dışsal tutumlar; sosyal ortam, küresellik, bilinir olma, farklılık ve fayda sağlama anahtar kelimeleri ile belirlenmiştir. Bir öğrencinin "İngilizce dersi almadan önce ve aldıktan sonra dünyaya bakış açında ne gibi değişiklikler oldu?" sorusuna *yani böyle İngilizce bilmek biraz kendi şeyi gösteriyor yani biraz daha yüksek hissettiriyor diğer öğrencilerden gerçekten evet hem dış ülkeye gitmiş görmüş hem öyle hem de yani farklı yani* şeklinde belirtmiş İngilizce bilmenin kendisine sosyal bir ortamda artı bir değer kattığından bahsetmiştir. Bir diğer öğrenci ise aynı *soruya hani mesela bir oyun yüklersin falan İngilizce bana öyle kattı anlayabildim telefondaki uygulamaları alırken ne bileyim mesela hani İngilizce anlayabildim onları İngilizce biliyorsan oradan anlarsın* şeklinde cevap vermiş İngilizce bilmenin gerçek yaşamında fayda kattığını belirtmiştir.

Doküman analizi sonucunda;

1. Yabancı dilde eğitime ilişkin veriler,
2. Yabancı dil eğitiminde yöntem ve tekniklere ilişkin veriler,
3. Yabancı dil öğretiminde kullanılan araç-gereçlere ait veriler bulunmaktadır.

1)Doküman Analizi Sonucunda Yabancı Dilde Eğitime İlişkin Veriler

Bu çalışmada kullanılan doküman analizinde, yabancı dilde eğitim ana teması altında okuma, İngilizce yazılmış kelimeleri fark etme, yazma, sözcük bilgisi ve cümle kurma becerisi kazandırılması hedeflenen beceriler olarak karşımıza çıkmaktadır. Bir diğer alt tema olan kazanımlar için özellikle mesleki İngilizce dersinde mesleki eğitim merkezi öğrencilerinin yabancı dilde mutfak ekipmanlarını bilme, yemek hazırlama, hijyen kuralları gibi ifadeleri bilmesi ve kullanabilmesi hedeflenmektedir. Mesleki eğitim merkezi konaklama ve seyahat hizmetleri alanı çerçeve öğretim programında karşımıza çıkan öğrenme kazananları olarak *yabancı dil broşür ve rezervasyon işlemlerini yapar, yabancı dilde havalimanı işlemlerini yapar, yabancı dilde tur ve gezi işlemlerini yapar*, kazanımları dikkat çekmektedir yani kendi alanları dahilindeki işlevleri gerçekleştirebilmeleri için öğrencilerin yabancı dil öğrenmesi hedeflenmektedir.

2) Doküman Analizi Sonucunda Yabancı Dil Eğitiminde Yöntem ve Tekniklere İlişkin Veriler

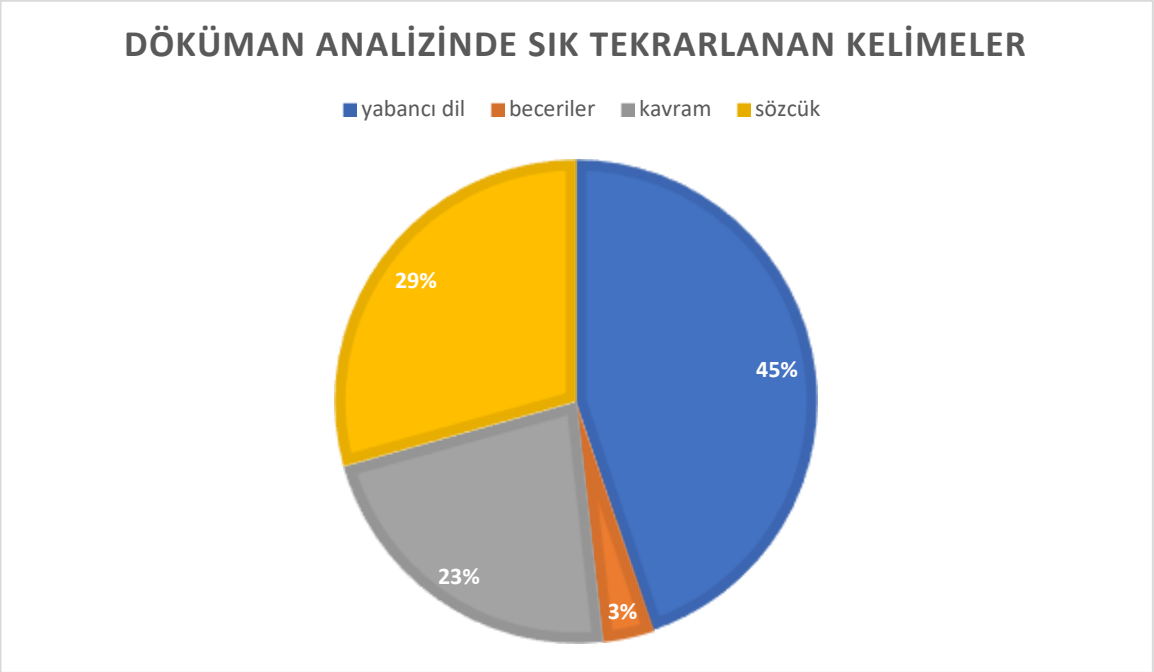
Bu çalışmada yabancı dil öğretiminde yöntem ve teknikler başlıkları , öğretmenler için anlatım ve gösteri tekniği bireysel bir yöntem olarak belirlenmiş hem öğretmenin hem de öğrencilerin beraber gerçekleştirilebileceği öğretim yöntem teknikleri olarak beyin fırtınası ,tartışma, soru-cevap ve grup çalışması kavramları öne çıkmaktadır .mesleki eğitim merkezlerinde gösterilen çerçeve programlarda yabancı dil öğretiminde kullanılan yöntem ve tekniklerden bahsedilmemiş olup örneklem grubumuzda bulunan öğrencilerin halk eğitim merkezi aracılığı ile aldıkları İngilizce A1 seviye kurs programında bahsedilmektedir..

3. Doküman Analizi Sonucunda Yabancı Dil Öğretiminde Kullanılan Araç-gereçler

Bu çalışmada kullanılan dokümanlarda yabancı dil öğretiminde araç gereçler ana teması altında modern araçlar ve klasik araçlar temaları belirlenmiş olup modern araçlar temasında *bilgisayar, televizyon, slaytlar ve videolardan* bahsedilmektedir. Klasik araçlar temasında ise *tahta, pano ve basılı metaller* yer almaktadır. Bir önceki ana tema iletildiği gibi mesleki eğitim merkezleri çerçeve programlarında araç gereçler özellikle belirtilmemiş olup öğrencilerin halk eğitim merkezlerinde aldıkları İngilizce ders programında yer almaktadır. Bu materyaller kullanılan yöntem ve tekniklere göre değişiklik göstermektedir. Örneğin; öğretmenlerin bireysel olarak gerçekleştirdiği anlatım tekniğinde tahta kullanımının daha fazla olduğu söylenebilir ya da öğretmen ve öğrencilerin beraber gerçekleştire bildikleri grup çalışmalarında basılı materyaller slaytlar ve bilgisayarlar kullanılmaktadır.

Şekil 1'de görüldüğü üzere doküman analizinde kullanılan yabancı dil, beceriler, kavram ve sözcük kelimeleri en sık tekrarlanan kelimeler olmuştur. En sık tekrarlanan kelime olan yabancı dil kelimesi %45'lik oranına sahiptir. İngilizce dersinin yabancı dil adı altında gösterilmesi bu sonucun

çıkmasını sağlamıştır. En az tekrarlanan kelime olan beceri kelimesi, kazandırılmak istenilen becerilerin sınırlı olduğu anlamına gelebilmektedir.



Şekil 1. SIk tekrarlanan kelimeler

IV. TARTIŞMA VE SONUÇLAR

Günümüzde küreselleşmenin de etkisi ile üretim küreselleşmiş bu üretimin gerçekleştirilebilmesi için nitelikli iş gücü ihtiyacı her zamankinden daha fazla olmaktadır. Bu kapsamda birçok ülke eşgüdümlü atılımlar gerçekleştirmektedir (Özer,2021.s.1). Nitelikli iş gücü ihtiyacının karşılanabilmesi için ülkelerde mesleki eğitime verilen önem gün gün artmaktadır. Bu farkındalık ile ülkeler rekabet edebilmek adına mesleki eğitimlerinin sürdürülebilir ve küresel standartlara uygun olarak şekillendirmemektedirler (Kınsız,2005, s.260). Bir dünya ortak dili olan İngilizce mesleki eğitim de önemli bir avantaj olarak karşımıza çıkmaktadır. Türkiye'de de mesleki eğitim merkezlerinde küresel boyutta rekabet edebilmek için öğrencilerin eğitim hayatları boyunca İngilizce dersi almaları bir avantaj olarak görülebilir.

Bu çalışmada elde edilen bulgular, görüşme ve doküman analizleri yapılarak bulunmuştur. Örneklem grubunda yer alan öğrencilerin yabancı dil eğitimine olan algıları belirlenmeye çalışılmıştır. Öğrenciler genel olarak İngilizce derslerindeki ruh hallerini olumlu kelimelerle ifade etmiştir. Ayrıca İngilizce öğretin kendilerine fayda sağladığını sosyal ortamlarda prestij sağladığını ifade etmişlerdir. Öğrenciler İngilizce derslerinin ileriki iş hayatlarında katkı sağlayacağı görüşünü de iletmişleridir. Öğrencilerin olumsuz olarak ifade ettikleri görüşler; İngilizce dersinin kendi ders müfredatlarında bulunmayışı, daha önce almış oldukları İngilizce ders saatlerinin yetersiz oluşu ve İngilizce derslerine staj yaptıkları yerlerden sonra katıldıkları için yorgun ve bitkin hissetmeleri bu sebeple derse adapte olamadıklarını ifade etmişlerdir. Ayrıca doküman analizinde bulgular elde edilirken mesleki eğitim merkezleri çerçeve programlarının çok kolay ulaşılabilir olmadığı saptanmıştır. Araştırma boyunca kaynak internet sitelerinin taşınması bu bilgilere ulaşmayı zorlaştırmıştır. Ulaşılan programlarında ayrıntılı ve kapsayıcı olmadığı saptanmıştır. Çerçeve programlar incelenirken içeriğinde öğrencilere kazandırılması gereken beceriler ve kazanımlar yer almış fakat bu eğitimin nasıl yapılması gerektiğinde bahsedilmemiştir. Öğrencilerin proje kapsamında aldıkları halk eğitim merkezi aracılığı ile yapılan İngilizce A1 kursu planında bu eksiklikler bulunmamaktadır. Mesleki eğitim merkezlerinin kökenin köklü bir geçmişi olmasına rağmen kurum olarak yeni bir yapılanma olması literatür taramasında derinlemesine bir araştırma yapılmamasına sebep olmuştur.

Yukardaki sonuçlar göstergesinde birkaç öneri sunulmuştur. Bunlar;

- Mesleki eğitim merkezlerinde ki öğrencilerin istek ve ihtiyaçlarına uygun olarak yabancı dil eğitim politikası oluşturulabilir.
- Bu alanda daha çok çalışma yapılabilmesi için araştırmacılar teşvik edilebilir.
- Mesleki eğitim merkezlerinde öğretimi yapılan çerçeve programların daha kolay erişilebilmesine olanak sağlanabilmelidir.

Ortak Sınavlarda Açık Uçlu Soruların Kullanılmasına İlişkin Öğretmen Görüşleri

Funda Özbay[1], Hasan Yücel Ertem [*2]

[1]*Sosyal Bilimler Emstitisü, Zonguldak Bülent Ecevit Üniversitesi, Turkiye*
[2]*Eğitim Bilimleri Bölümü, Zonguldak Bülent Ecevit Üniversitesi, Turkiye*

[*]*(ertem@beun.edu.tr)*

Özet **–** 9 Eylül 2023 tarihinde Resmî Gazetede yayımlanan MEB Ölçme ve Değerlendirme Yönetmeliğinin amacı, Bakanlıkça yapılan merkezi sistem sınavları, ulusal Millî Eğitim Bakanlığı /uluslararası izleme araştırmaları, okul öncesi eğitim kurumları ve ilkokullarda akademik ve sosyal gelişimin takibi, ortaokul ve ortaöğretim kurumlarındaki ortak yazılı sınav faaliyetlerinin usul ve esasları ile ölçme değerlendirme merkezi müdürlüklerinin görev, yetki ve sorumluluklarını düzenlemektir. Araştırmanın amacı Eylül 2023' te uygulanmaya başlanan ve temel eğitim ile ortaöğretİm kademesindeki bütün sınıf düzeylerinde yönetmelik gereği ülke ve il/ ilçe ortak sınavları dışında okulda yapılan bütün sınavların açık uçlu sorularla hazırlanması gereğinden yola çıkarak bu konuda öğretmen görüşlerini tespit etmektir. Çalışmada nitel araştırma yöntemlerinden olan durum çalışması yöntemi kullanılmıştır. Milli Eğitim Bakanlığı' na bağlı devlet kurumunda çalışan Matematik öğretmeni örneklem olarak yer almıştır. Araştırmada veri toplama aracı olarak yarı yapılandırılmış görüşme formu kullanılmıştır. Veriler, içerik analizi yöntemi kullanılarak incelenmiştir. Görüşme neticesinde; açık uçlu soruların etkin, derin ve ayrıntılı öğrenmeyi sağladığını bu soru türünün öğrencilerin öğrenmelerini yapılandırması, zaman yönetimi ve ifade becerisi kazandırması yanında onları daha fazla çalışmaya sevkederek öğrenmelerini etkilediği belirlenmiştir

Anahtar Kelimeler – Ortak sınav, ölçme değerlendirme, öğretmen, merkezi sınav, öğrenci

I. GİRİŞ

MEB Ölçme ve Değerlendirme Yönetmeliği üçüncü bölüm 5. Maddesi bendine ''İlçe, il veya ülke genelinde ortak yazılı sınavlar yapılabilir. Bu sınavların uygulanmasına ilişkin iş ve işlemler millî eğitim müdürlüklerince yürütülür'' d bendinde ise '' Uygulamalı sınavlar hariç, öğretmenlerin ortak değerlendirme yapabilmelerine imkân vermek üzere birden fazla şubede okutulan derslerin sınavlarının ortak yapılması esastır. Bu sınavların şube ve sınıflar bazında analizleri yapılır. Konu ve kazanım eksikliği görülen öğrencilerin durumları, ders öğretmeni ve eğitim kurumu sınıf/alan zümreleri tarafından yeniden değerlendirilir'' ibaresi yer almaktadır. Yönetmeliğin üçüncü bölüm 6. Maddesinin g bendinde 'Ülke ya da il/ilçe genelinde yapılacak ortak yazılı sınavlar hariç, okullarda yapılan tüm sınavlar cevaplarını öğrencilerin oluşturduğu ve farklı bilişsel düzeyde kazanımları ölçen maddelerden oluşan yazılı yoklama şeklinde yapılır' ifadesi yer almaktadır.

Eğitim sisteminin işlerliğini sağlamak adına, öğrencilerin istenilen davranışları kazanıp kazanmadığını belirlemek amacıyla eğitim-öğretim etkinliklerinin sonunda ölçme ve değerlendirme faaliyetleri zorunlu hale gelmiştir. Günümüzde, öğretmenler tarafından hazırlanan ölçme araçları kullanılarak elde edilen ölçümler, öğrencilerin başarı durumlarını değerlendirmek için temel alınmaktadır. Türkçe öğretimi özelinde, öğretimsel etkinliklerin hedeflere ulaşma derecesini belirlemek için doğru ölçme ve değerlendirme yöntemlerinin kullanılması gerekmektedir. Bu faaliyetler, programdaki amaçlara uygun olarak gerçekleştirilir ve öğrencilerin öğrenme düzeylerini tespit etmeye yöneliktir. Değerlendirme,

öğrencilere geri bildirim sağlayarak onları motive eder, öğretmenin kararlarını destekler ve öğretim etkinliğinin etkisini değerlendirmeye yardımcı olur. Sınavlardan elde edilen ölçümler, öğrenci başarısını yansıtmanın yanı sıra öğretimin etkililiğine dair bilgiler de sunar. Eğer öğrenciler istenilen davranışları kazanamazlarsa, bu durumun nedenleri araştırılmalı ve elde edilen bulgular çerçevesinde eğitim sistemi revize edilmelidir (Üstüner&Şengül,2004).

Okullarda uygulanacak ortak sınavların nasıl uygulanacağı konusunda yönetici ve öğretmenlerde çok sayıda soru işareti mevcuttur. 2023-2024 Eğitim Öğretim yılı itibariyle Ülke il/ilçe ortak sınavları dışında okulda yapılan bütün sınavlar açık uçlu veya açık uçlu ve kısa cevaplı maddelerden oluşmak zorunda ve birden fazla şubede okutulan bütün derslerin sınavı okulda ortak yapılmaktadır.(MEB, 2023).

Alan yazın incelendiğinde öğretmenlerin ortak sınavlarda açık uçlu soruların kullanılması hakkında öğretmen görüşlerine ilişkin daha önce yapılan bir çalışmanın olmaması, bu uygulamanın 2023-2024 yılında yayımlanan yönetmelik kapsamında zorunlu hale geldiği düşülürse doğal bir sonuçtur. Bu konuyla benzer nitelikte az sayıda araştırmanın olduğu (Bolat, Karamustafaoğlu& Korkmaz, 2022; Özen, 2020, Kahraman, 2024) görülmüştür. Türkiye'de açık uçlu soruları hazırlama konusunda öğretmen görüşlerinin belirlenmesini amaçlayan tezler incelendiğinde; konuya en yakın İnceçam, Demir &Demir, 2018, ''Ortaokul Öğretmenlerinin Sınıf İçi Ölçme ve Değerlendirmelerde Yazılı Yoklamalarda Kullandıkları Açık Uçlu Maddeleri Hazırlama Yeterlikleri'' makalesine ulaşılmıştır.

Araştırmanın amacı Eylül 2023' te uygulanmaya başlanan ve temel eğitim ile ortaöğretİm kademesindeki bütün sınıf düzeylerinde yönetmelik gereği ülke ve il/ ilçe ortak sınavları dışında okulda yapılan bütün sınavların açık uçlu sorularla hazırlanması gereğinden yola çıkarak bu konuda öğretmen görüşlerini tespit etmektir.

II. MATERYAL VE YÖNTEM

Çalışmada nitel araştırma yöntemlerinden olan durum çalışması yöntemi kullanılacaktır. Araştırma kapsamında öğretmen görüşlerini detaylı şeklide öğrenebilmek için nitel araştırma yöntemi kullanılır.

Durum çalışması, belirli bir sistemin detaylı bir şekilde incelenmesi ve anlaşılması için çoklu veri toplama yöntemlerinin kullanıldığı bir metodolojik yaklaşımdır Merriam (2013), durum çalışmasını sınırlı bir sistemin kapsamlı bir biçimde betimlenmesi ve incelenmesi olarak tanımlar. Creswell (2007) ise durum çalışmasını araştırmacının zaman içinde sınırlı sayıda durumu çoklu kaynaklardan (gözlemler, görüşmeler, dokümanlar, raporlar) derinlemesine incelediği, durumlar ve duruma özgü temaların belirlendiği nitel bir araştırma türüdür.

Milli Eğitim Bakanlığı' na bağlı devlet kurumunda çalışan Matematik öğretmeni örneklem olarak yer almıştır. Araştırmada veri toplama aracı olarak yarı yapılandırılmış görüşme formu kullanılmıştır. Veri toplama sürecinde yarı yapılandırılmış görüşme formu kullanılmış. Öğretmene 6 soru yöneltilmiş bu altı soru dışında alternetif sorulara da yer verilmiştir. Konu gündemde bir konu olduğundan öğretmenin ilgi ve aynı zamanda düşüncelerinin oldukça açık ifade ettiği karşılıklı söyleşi manasında akıcı iletişimle gerçekleşen bu görüşmede öğretmenin söyledikleri birebir yazı ile kaydedilmiştir. Yaklaşık 45 dakikalık bir görüşme yapılmıştır. Görüşme süreci oldukça verimli geçmiştir.

Veriler, içerik analizi yöntemi kullanılarak incelenmiştir. Veriler, içerik analizi yöntemi kullanılarak incelenmiştir. İçerik analizi, benzer verileri belirli kavramlar ve temalar altında toplamayı ve bunları okuyucunun anlayabileceği bir düzenleme ve yorumlama sürecini içerir (Yıldırım ve Şimşek, 2011, s.228). Analiz sürecinde dört aşama izlenmiştir: 1. Verilerin kodlanması, 2. Temaların belirlenmesi, 3. Kodların ve temaların düzenlenmesi, 4. Bulguların tanımlanması ve yorumlanması. Analiz sürecinde önce görüşme kayıtları düzenlenmiş ve sonra bilgisayar ortamına aktarılmıştır.

İçerik analizi veya içerik çözümlemesi, incelenen herhangi bir kaydedilmiş iletişim biçiminin içeriğine odaklanan bir yöntemdir. Bu kaydedilmiş iletişim biçimi, yazılı metinlerden kitap ve dergilere kadar çeşitli sözlü anlatım türlerine kadar geniş bir yelpazede bulunabilir. Ayrıca, görsel öğeleri de içerebilir, örneğin televizyon programları, reklamlar gibi. İçerik analizi, tanıklıklar, mevzuat, kamu belgeleri, vaka çalışmaları, raporlar, anket ve görüşme sorularının cevapları, haber bültenleri, web sayfaları, reklam panoları, posterler, grafiti, radyo programları, kataloglar, fotoğraflar, çizimler, videolar, filmler, müzikler,

gazeteler, kitaplar, dergi makaleleri, dini metinler, ders kitapları, nutuklar, romanlar ve mektuplar gibi birçok iletişim biçimini analiz etmek için kullanılabilir (Gül & Nizam, 2021, s.182).

III. BULGULAR

Açık Uçlu Soruların ortak sınavlarda uygulanmasıyla ilgili araştırmadan elde edilen bulgular öğretmen görüşlerine göre belli alt temalara ayrılmış, yapılan görüşmelerden doğrudan alıntılar yapılarak özetlenerek kodlar oluşturulmuştur.Görüşmede elde edilen verilerle tema "Açık Uçlu Soruların Öğretime Etkisi" olarak belirlenmiştir. Alt temalar ise sırasıyla; "öğrenmeye etkisi'', "düşünmeye etkisi", "ölçmeye etkisi", "öğretim programına etkisi", "öğretmene etkisi" adı altında beş başlıkta belirlenmiştir. Bu beş koda karşılık gelen görüşmede geçen öğretmen görüşlerinden alıntılar alınarak. tabloya eklenmiştir.

Tablo1. Açik Uçlu Sorularin Öğretim Sürecine Etkileri

	ALT TEMALAR	**KODLAR**	**KATILIMCI GÖRÜŞÜ**
TEMA: AÇIK UÇLU SORULARIN ÖĞRETİM SÜRECİNE ETKİLERİ	***Öğrenmeye Etkisi***	*Etkin öğrenme* *Derin öğrenme* *Ayrıntılı öğrenme* *Öğrenilenleri Yapılandırma* *Öğrenmek için daha fazla çaba* *Zaman yönetimi becerisi*	*"Yazmak, açıklama yapmak, kendi cevabını kendisi oluşturmak durumunda olduğunu biliyor öğrenci bu soru türünde.Onun için öğrenci daha çok çalışmaya gayret ediyor, ayrıntı ve aşamalara yer vermesi gerektiğini biliyor,daha iyi çalışması gerektiğini biliyor Cevabı kendisi yapılandırıyor, derin ve etkin öğrenmeye olanak sağlıyor.*." (ÖĞR).
	Düşünmeye Etkisi	Eleştirel düşünme Üst düzey düşünme becerileri Farklı bilşsel düzeyde cevaplar Yaratıcı fikirler Kendini ifade edebilme Düşünmeyi yapılandırma	".*Günümüzde öğrenciler cümle kurmakta zorlanıyorken mesela sözel derste yorum yazacak, zor tabi bu öğrenci için.Üst düzey düşünme becerisi gerektiriyor,eleştirel düşünme olanağı sağlıyor, sorular hakkıyla hazırlanırsa.Aslında sayısal derslerde durum pek böyle deği en fazla basamağına yaklaşır sınavla. Ben soru sayısının fazla olmamsı taraftarıyım daha önce belirttiğim gibi öğrenciye rahat rahat kendini ifade etme fırsatı yazma zamanı verilmeli. Yaratıcı fikirler çözümler üretsin, zamana fazlaca takılıp ifade etmesi kısıtlı olmasın.*" (ÖĞR).

	Ölçmeye Etkisi	Kazanım eksiklerinin aşamalı tespiti Üst düzey düşünme becerilerini ölçen sorular sorma imkanı Farklı bilişsel düzeyde sorular sorma imkanı Ayrıntılı ölçme Güvenilir ölçme Geçerli ölçme Zaman alıcı değerlendirme Uzman görüşü desteği Rubrik kullanma Düşük şans başarısı Ekonomik soru hazırlama süreci	"*Açık Uçlu Sorularda öğrencinin bilip bilmediğini, kazanımın ne derece öğrenci tarafından anlaşıldığını* *Nerede takıldığını anlayabiliyoruz. Açık uçlu sorulardan oluşan sınavlar bana göre diğer sınav türlerine* *göre çok daha güvenilirliği geçerliği yüksek sınavlar. Bunun yanında hazırlamak daha kolay bence* *seçenekleri oluşturmak da ustalık istiyor çoktanseçmeli olduğunda soru, burada soru hazırlarken* *daha çok istenilen davranışa odaklanarak soru üretiyoruz bu anlamda daha kolay.* *Daha az soru soruyoruz aslında bu daha net ölçüm yapmamızı sağlıyor.Aslında şans başarısının da* *neredeyse olmaması öğrencinin birbirinden rahat kopya çekememesi de ölçme değerlendirmeyi* *daha güvenilir ölçme sağlıyor. Aslında daha az soru daha az kazanımın ölçülmesi tabi bir yandan, ama* *öğrencinin neyi ne kadar öğrendiğini belirlemek bana göre bundan daha önemli. Açık uçlu sorular diğer* *sorulara kıyasla bize daha açık ayrıntılı durumu anlama analiz etme fırsatı veriyor* *.Bunun yanında bence bu sınavları okumak gerçekten zor ve zaman alıcı*." (ÖĞR)
	Öğretim Programının Düzenlenmesine Etkisi	*Hatalı ve eksik öğrenmelerin tespiti ve telafisi* *Kavram yanılgılarının saptanması* *Alt öğrenmelerin gözden geçirilmesi* *Öğrenmenin ayrıntılı analizi*	*'En önemlisi ön bilgilerdeki eksikliğin belirlenmesi aslında. Ben Matematik öğretmeniyim alanımdan* *örneklersem; trigonometri sorusu soruyorum örneğin fonksiyon bilmediğini anlıyorum verdiği cevaptan* *orayı anlayamamış ve bu nedenle bu aşamayı öğrenmekte zorlanıyor ya da rasyonel ve köklü sayıları* *yapamıyor temelinde o nedenle trigonometri sorusunda zorlanıyor gibi. Matematikte bir kazanımın* *öğrenilmesi için bir çok kazanımın öncesinde öğrenilmiş olması gerekiyor. Ön bilgilerdeki eksiklikleri* *tespit eebildiğimiz için süreçte telafi etme şansı veriyor veya öğrenci ve veliye* *doğru dönütler vermemizi sağlıyor.''(ÖĞR)*

	Öğretmene Etkisi	*Kazanıma dair dönütleri öğrenme* *Pratik soru hazırlama* *Aşamalı çözüm ve puanlama* *Süreci değerlendirme* *Analiz etme* *Hizmet içi eğitim* *Rubrik hazırlama eğitimi*	*"Soru çözümlerine baktığımda öğrenmiş diyebiliyorum, ayrıntılar var, veya öğrenemediği takıldığı yerleri görüyorum Sorun nerde, ön bilgi mi buna neden oluyor, öğrenmedeki hatalı öğrenme mi çocuk aslında temel matematik dört işlemde mi sorun yaşıyor vs. Ön bilgilerdeki eksiklikleri tespit eebildiğimiz için süreçte telafi etme şansı veriyor veya öğrenci ve veliye doğru dönütler vermemizi sağlıyor. Soru hazırlarken, kontrol ediyoruz zümre olarak uzman görüşü alıyoruz yani.. Tabi bu daha sağlıklı sonuç veriyor. Değerlendirme konusunda da soruların ortak olması sebebiyle rubriklerimiz ortak, bu da ortak Görüşlerle belirleniyor.Uzman görüşü bu süreçleri daha sağlıklı hale getiriyor her ne kadar çoğunluğumuz alanımızda zaten uzman olsak da ortak kararlar süreci daha objektif daha genel ve dah a temel sorulara dayandırıyor. Sınavlarımı değerlendirirken ayrıntılı dereceli puan anahtarı/ rubrik kullanıyorum. Rubrik hazırlama eğitimi almak yararlı olabilir diye düşünüyorum aslında. Değerlendirmelerimi anahtara göre yapsam da dikkatli olma gereği hissediyorum." (ÖĞR)*

IV. TARTIŞMA VE SONUÇLAR

"Ortak Sınavlarda Açık Uçlu Soruların Kullanılmasına İlişkin Öğretmen Görüşleri" isimli bu çalışma için bir öğretmenle ayrıntılı görüşme yapılmış; bu görüşme neticesinde kodlar yazılmış bu kodlara karşılık gelen alt temalar ve tema elde edilmiştir.Görüşme neticesinde ; açık uçlu soruların etkin, derin ve ayrıntılı öğrenmeyi sağladığını bu soru türünün öğrencilerin öğrenmelerini yapılandırması, zaman yönetimi ve ifade becerisi kazandırması yanında onları daha fazla çalışmaya sevkederek öğrenmelerini etkilediği belirlenmiştir.Bununla ilişkilendirilebilecek çalışmalar incelendiğinde, literatürde Temizkan ve Sallabaş (2011, s.217) çalışmalarında öğrencilerin okuduğunu anlama becerilerinin ölçülmesi açısından açık uçlu soruların bulunduğu testlerin çoktan seçmeli sorulardan oluşan testlere göre dezavantajlı olduğu bulguları da mevcuttur. Bunun temel sebebi olarak da yapılan çalışmada açık uçlu yazılı sınavlarda öğrencinin metni anladıktan sonra yazılı olarak ifade etmekte zorlanmasından kaynaklandığı ifade edilmiştir.

Ortak sınavlarda açık uçlu soruların kullanılmasına ilişkin öğretmen görüşlerine göre, bu soru türünün, öğrencilerin eleştirel düşünmelerini, üst düzey düşünme becerilerini, farklı bilşsel düzeyde cevaplar vermesini etkilediğini ayrıca öğrencilerin yaratıcı fikirler üretmelerini, kendilerini ifade edebilme ve bildiklerini yapılandırma yoluyla düşünmelerini etkilediğini ortaya koymuştur. Literatürdeki bir çok araştırmada açık uçlu sorunun etkileri olarak üst düzey düşünme becerilerini geliştirdiği konusunda veri, bulgu ve açıklamalar mrvcuttur. Karatay ve Dilekçi (2019, s.688) çalışmalarında; öğretmenlerin sadece basit bilgi hatırlatmalarından ziyade öğrencilerin üst düzey düşünme becerilerini geliştirmeye yönelik sorular kullanmalarının gerekliliğidir. Bu tür sorular, öğrencilerin eleştirel düşünme yeteneklerini

geliştirirken, üst düzey düşünebilme yeteneğinin de temelini oluşturduğu, ölçme araçlarında yer alacak soruların konu alanı ile ilgili olmanın yanı sıra bilişsel açıdan öğrencilerin eleştirel düşünme becerilerini alt düzeyden üst düzeye doğru geliştirecek şekilde olması gerektiği vurgulanmaktadır.

Ortak sınavlarda açık uçlu soruların kullanılmasına ilişkin öğretmen görüşlerine ilişkin yapılan araştırmada elde edilen Açık uçlu soruların öğretime etkisi temalı çalışmanın alt teması olarak belirlenen ölçmeye etkisi temasındaki kodlar incelendiğinde, öğretmenlerin; kazanım eksiklerinin aşamalı tespiti, üst düzey düşünme becerilerini ölçen sorulardan oluşması, farklı bilişsel düzeyde sorular sorma imkanı tanıması, ayrıntılı-güvenilir-geçerli ölçme, zaman alıcı-uzan görüşü ve rubrik gerektiren değerlendirme bu soru türünün ölçmeye etkisi olarak belirtildi. Literatür incelendiğinde, Birgün ve Gürbüz (2018, s.177) çalışmalarında, öğretmenlerin ölçme ve değerlendirme yaklaşımlarının ve öğrencilerin ölçme ve değerlendirmeye ilişkin algılarının, öğrencilerin öğrenme yaklaşımlarını ve çalışma biçimlerini önemli ölçüde etkilediği belirlenmiştir.

Ortak sınavlardaki açık uçlu sorular , öğrenci öğrenmeleri hakkında önemli dönütler vermesi açısından önemlidir. Öğretim programına etkisi, kavram yanılgılarının tespiti, eksik hatalı öğrenmelerin tespiti, ayrıntılı analiz imkanı sunması şeklinde öne çıkmaktadır.

Ortak sınavlarda açık uçlu soruların Kullanılmasındaki görüşlere ilişkin araştırmada yapılan görüşme sonucunda alt tema olan öğretmene etkisi incelendiğinde soruları hazırlık sürecinin kolay gelmesine rağmen değerlendirme sürecinin zorlayıcı olduğu görülmektedir. Bu konuda literatür taraması yapıldığında bir çok araştırma bu soru türünü hazırlamak konusunda hizmetiçi eğitim ihtiyacına işaret etmektedir. İnceçam, Demir ve Demir (2018) çalışması bağlamında açık uçlu soruları değerlendirirken öğretmenlerin objektif ve tutarlı olmayan puanlamalar yaptıkları bulgusunu destekler nitelikte açıklamalara yer vermektedir. Bulgulara göre öğretmenlerin; soru redaksiyonu yapılması, uzman görüşü alınması, soruların deneme uygulamasının gerçekleştirilmesi ve bu sonuçların değerlendirilmesi ölçütlerini bir maddenin hazır hale getirilene kadar yapılan uygulamalar bütünü olarak görmedikleri düşünülmektedir.

Özet – Bu çalışma hastanelerdeki nükleer atıkların kontrolü ve bertarafı için etkili stratejiler belirlemeyi ve mevcut yönetim pratiğini iyileştirmeyi hedeflemektedir. Böylelikle hastanelerdeki nükleer atık yönetimi süreçlerindeki eksiklikleri, riskleri ve zorlukları ortaya koyacak ve geliştirilmesi gereken alanların araştırması hedeflenmiştir. Ayrıca, atık üretiminin azaltılması, doğru depolama yöntemlerinin benimsenmesi, güvenli taşıma prosedürlerinin uygulanması ve etkili bertaraf süreçlerinin oluşturulması için öneriler sunmaktadır.

Anahtar Kelimeler – Radyoaktif atık. Sağlık Radyolojisi, Güvenli taşıma, Depolama yöntemleri

I. GİRİŞ

Nükleer enerji teknolojileri, tıp alanında çeşitli uygulamalar için önemli bir rol oynamaktadır. Bu teknolojiler, tanı ve tedavi süreçlerinde kullanılan çeşitli nükleer tıp prosedürlerini mümkün kılar. Nükleer tıp, izotopların radyoaktif bozulması ve radyoaktif işaretlemeler gibi nükleer fenomenlerin kullanılmasıyla hastalıkların tanı ve tedavisinde değerli bilgiler sağlar. Bu alanda kullanılan teknikler arasında radyofarmasötiklerin kullanımı, radyoterapi ve görüntüleme yöntemleri bulunmaktadır.

Radyofarmasötikler, nükleer tıpta sıkça kullanılan önemli bir araçtır. Radyoaktif izotoplar, farmasötik bileşiklerle birleştirilerek hastaya enjekte edilir ve böylece vücutta hedeflenen bölgelerde izlenerek veya tedavi edilerek hastalıkların teşhis ve tedavisi gerçekleştirilir. Örneğin, radyofarmasötikler kullanılarak kanserli hücrelerin tespiti ve tümörlerin yerini belirleme amacıyla pozitron emisyon tomografisi (PET) yapılmaktadır. Bu yöntem, kanserin erken teşhisi ve tedaviye yanıtın değerlendirilmesi gibi önemli klinik bilgiler sağlar [1]

Radyoterapi, nükleer enerji teknolojilerinin bir diğer önemli uygulama alanıdır. Yüksek enerjili iyonlar veya röntgen ışınları gibi radyasyon kaynakları kullanılarak kanser hücreleri hedeflenerek yok edilir. Radyoterapi, kanser tedavisinde kullanılan etkili bir yöntemdir ve cerrahi müdahale gerektirmeden tümörlerin kontrol altına alınmasına yardımcı olur. Örneğin, lineer hızlandırıcılar (LINAC), kanser tedavisinde yaygın olarak kullanılan ve yüksek enerjili parçacıkların tümöre odaklanmasını sağlayan bir teknolojidir. Bu şekilde, tümör hücreleri öldürülürken normal hücrelere minimum zarar verme hedeflenir [2]. Nükleer enerji teknolojilerinin bir diğer önemli uygulama alanı, görüntüleme yöntemleridir. Manyetik

rezonans görüntüleme (MRG) ve bilgisayarlı tomografi (BT) gibi görüntüleme teknikleri, tıbbi teşhis ve hastalık izleme süreçlerinde önemli bir rol oynar [3].

Özellikle, pozitron emisyon tomografisi (PET) ve tek foton emisyon bilgisayarlı tomografi (SPECT) gibi nükleer tıp görüntüleme teknikleri, hastalıkların erken teşhisini sağlayarak tedavi sürecini iyileştirebilir. Bu teknikler, hastalıklı dokuların, organların veya fonksiyonel aktivitelerin görüntülenmesi için kullanılır ve doktorlara değerli bilgiler sağlar [4].

Sonuç olarak, nükleer enerji teknolojileri, tıp alanında önemli bir role sahiptir. Radyofarmasötiklerin kullanımıyla hastalıkların tanısı ve tedavisi kolaylaşırken, radyoterapi kanser tedavisinde etkili bir yöntem olarak kullanılır. Ayrıca, görüntüleme teknikleri sayesinde hastalıkların erken teşhisi ve izlenmesi mümkün olur. Bu nedenle, nükleer enerji teknolojileri tıp alanında önemli bir araçtır ve gelecekte daha da gelişeceği ve kullanımının artacağı öngörülmektedir.

II. HASTANE ATIKLARININ TANIMLANMASI VE AZALTILMASI

Modern sağlık hizmetleri hastanelerde ciddi miktarda atık üretmektedir. Bu atıklar hem çevre hem de insan sağlığı için potansiyel riskler taşır. Hastanelerde atık kaynaklarının tanımlanması ve azaltılması, sürdürülebilirlik ve çevresel koruma açısından önemlidir. Atık kaynaklarının tanımlanması, hastane faaliyetleri sırasında üretilen tıbbi atıklar, kesici ve delici atıklar, tehlikeli kimyasallar ve radyoaktif atıklar gibi farklı atık türlerinin belirlenmesini içerir. Her bir atık türü, ayrı bir işleme ve bertaraf süreci gerektirir.

Atık kaynaklarının azaltılması, doğal kaynakların korunmasına katkı sağlar ve atık yönetimi için harcanan kaynakların azaltılmasına yardımcı olur. Örneğin, yeniden kullanılabilir malzemeler tercih edilebilir ve enerji ile su tasarrufu sağlayan teknolojiler benimsenebilir. Araştırmalar, atık kaynaklarının tanımlanması ve azaltılması için farklı stratejilerin etkili olduğunu göstermektedir. Geri dönüşüm programlarının uygulanması, atıkların kaynağında ayrıştırılması ve geri dönüştürülebilir malzemelerin toplanması önemlidir. Ayrıca, personel eğitimi ve farkındalığı, atık yönetimi süreçlerinde önemli bir rol oynar. Eğitim programları, atık oluşumunu en aza indirme, atık ayrıştırma ve geri dönüşüm becerilerini içermelidir.

Sonuç olarak, hastanelerde atık kaynaklarının tanımlanması ve azaltılması, çevresel sürdürülebilirliği sağlamak ve insan sağlığını korumak için önemli bir adımdır. Geri dönüşüm programlarının uygulanması, yeniden kullanılabilir malzemelerin tercih edilmesi ve personel eğitiminin sağlanması gibi stratejiler, atık yönetiminde başarılı sonuçlar elde etmek için kullanılabilir

III. NÜKLEER ATIKLAR VE TANIMLANMASI

Nükleer enerji, enerji ihtiyacını karşılamada önemli bir rol oynamaktadır, ancak nükleer atıkların güvenli depolanması ve taşınması büyük önem taşır. Nükleer atıklar çevre ve insan sağlığı için ciddi riskler oluşturabilir. Nükleer atıkların depolanması, yayılma riskini en aza indirmek için özenle tasarlanmış yapılar gerektirir. Bu yapılar genellikle yer altında bulunur ve sızdırmaz kaplamalar, koruyucu kalkanlar ve izolasyon sistemleri içerir. Nükleer atık taşıma sürecinde ise sızıntı ve çarpma riskleri minimize

edilmelidir. Taşıma kapları darbe emici ve radyasyon emici özelliklere sahip olmalı ve sıkı güvenlik protokollerine uygun olarak kullanılmalıdır. Hastanelerde nükleer atık yönetimi, özellikle radyoterapi ve nükleer tıp uygulamalarında, sağlık çalışanları ve hastalar için kritik öneme sahiptir. Atıklar, sızdırmaz ve etiketli konteynerlerde toplanmalı, özel koruyucu giysilerle taşınmalı ve güvenlik sistemleriyle donatılmış depolama alanlarında saklanmalıdır. Risk değerlendirmesi, atıkların radyasyon seviyeleri, yarı ömürleri ve bileşimleri gibi faktörleri dikkate alarak yapılmalı ve uygun önlemler alınmalıdır. Ulusal ve uluslararası kuruluşlar, nükleer atık yönetimi ve güvenliği konusunda rehberlik sağlamaktadır.

Öbür taraftan, hastanelerdeki nükleer atıklarla ilgili yapılan çalışmalar önemli şu hususların üzerinde durmaktadır. Hastaneler, nükleer tıp ve radyoterapi gibi alanlarda nükleer atık üretir. Bu atıklar doğaya ve insan sağlığına zararlı olabileceği için güvenli bir şekilde bertaraf edilmeleri önemlidir. Nükleer atıklar özel depolama tesislerine taşınarak uzun vadeli depolanabilir veya geri kazanım yöntemiyle içlerindeki değerli radyoaktif materyaller ayrıştırılarak yeniden kullanılabilir. Yeni termal işlem teknikleri ve nanoteknoloji gibi teknolojiler, nükleer atıkların bertarafında umut vaat etmektedir. Uluslararası Atom Enerjisi Ajansı gibi kuruluşlar, bu süreçleri düzenler ve teşvik eder. Sonuç olarak, nükleer atıkların güvenli yönetimi ve bertarafı, çevre ve insan sağlığının korunması için kritik öneme sahiptir.

IV. HASTANELERDEKİ RADYOLOJİK VE NÜKLEER ATIKLARIN BERTARAF YÖNTEMLERİ

Hastahaneler, yoğun tıbbi tedavi ve teşhis faaliyetleri yürüten kuruluşlar olup, radyoaktif materyallerin kullanıldığı önemli tıbbi prosedürlerin gerçekleştirildiği yerlerdir. Bu prosedürler sonucunda ise nükleer atıklar ortaya çıkmaktadır. Nükleer atıkların etkin bir şekilde bertaraf edilmesi, çevresel etkilerin minimize edilmesi ve insan sağlığının korunması açısından büyük bir öneme sahiptir. Hastahanelerdeki nükleer atıkların bertarafı için çeşitli yöntemler ve teknikler bulunmaktadır. Bunlardan biri olan yüzey temizleme, radyoaktif materyallerin kullanıldığı alanlardaki kontaminasyonun giderilmesini amaçlamaktadır. Örneğin, kullanılmış radyoaktif iğnelerin veya tıbbi araçların üzerinde biriken atıkların özel temizleme prosedürleri ile temizlenmesi bu yönteme örnek olarak verilebilir. Bir diğer yöntem, nükleer atıkların uygun şekilde ambalajlanması ve depolanmasıdır. Bu yöntemde, radyoaktif atıklar özel kaplarda toplanır ve daha sonra güvenli bir şekilde saklanması için özel depolama tesislerine gönderilir. Bu depolama tesisleri, radyasyonu emme ve yayma kabiliyetine sahip özel malzemelerle donatılmıştır. Örnek olarak, radyoaktif ilaç kalıntılarının kurşun kaplı konteynerlere yerleştirilerek depolanması gösterilebilir.

Hastahanelerdeki nükleer atıkların bertarafı için bir başka yöntem ise radyoaktif atıkların yakılması veya parçalanmasıdır. Bu teknik, nükleer atıkların içerdikleri radyoaktif elementlerin zararsız hale getirilmesini hedefler. Örneğin, bazı radyoaktif ilaç kalıntılarının termal veya kimyasal işlemlerle ayrıştırılarak zararsız hale getirilmesi bu yönteme örnek olarak verilebilir. Nükleer atıkların bertarafı konusunda uluslararası düzeyde çeşitli kuruluşlar tarafından belirlenen standartlar ve yönergeler bulunmaktadır. Örneğin, Uluslararası Atom Enerjisi Ajansı (IAEA), nükleer atıkların güvenli bertarafı için çeşitli yönergeler ve protokoller yayınlamaktadır (Tablo 1). Hastahaneler, bu standartlara uygun şekilde nükleer atıkların bertarafını gerçekleştirmekle yükümlüdür.

Tablo 1. Ülkelerin Ulusal YSA Yönetim Politikaları [5].

Ülke	İzlenen Politika	Nihai Depolara Yönelik Tesisler ve İlerleme
Belçika	Yeniden işleme	- Dessel'de merkezi atık depolama yer almaktadır. - 1984 yılında Mol'de yeraltı laboratuvarı kurulmuştur. - Depo inşaatı yaklaşık 2035 yılında başlayacaktır.
Kanada	Doğrudan bertaraf	- 2002 yılında Nükleer Atık Yönetimi Kuruluşu kurulmuştur. - Atıkların geri alınabileceği derin jeolojik depolama politikası kabul edilmiştir. - 2009'da depolama sahasına yönelik çalışmalar başlamış, deponun 2025 yılında kullanımda olması beklenmektedir.
Çin	Yeniden işleme	- Lan Zhou'da kullanılmış yakıtlar için merkezi bir depo bulunmaktadır. - Depolama sahası 2020'ye kadar belirlenecektir. - 2020 itibarıyla yeraltı araştırma laboratuvarının çalışmaya, 2050 itibarıyla da bertarafın başlaması planlanmaktadır.
Finlandiya	Doğrudan bertaraf	- Program 1983'te başlatılmış olup, iki adet kullanılmış yakıt deposu mevcuttur. - Onkalo yeraltı araştırma laboratuvarı inşaat halindedir. - Olkiluoto yakınlarındaki depolama tesisinin 2023'te açılması planlanmaktadır.

Hastahanelerde nükleer atıkların bertaraf süreci, atığın kaydedilmesi ve izlenmesiyle başlar. Nükleer tıp birimlerinde kullanılan radyoaktif maddelerin türü, miktarı ve kullanım tarihi kaydedilir. Bu bilgiler, atıkların doğru bir şekilde bertaraf edilmesi ve izlenmesi için önemlidir. Ayrıca, atıkların güvenli bir şekilde taşınması ve depolanması için etiketleme ve izleme sistemleri kullanılır.

Smith'in [6] yaptığı bir çalışma, nükleer atıkların kaydedilmesi ve izlenmesinin, atıkların takibini sağlayarak güvenlik risklerini azalttığını göstermektedir. Tezde, atıkların doğru bir şekilde etiketlenmesi ve izlenmesiyle, atık miktarının azaltılması, kayıp veya hırsızlık gibi güvenlik sorunlarının önüne geçildiği belirtilmektedir. Nükleer atıkların bertaraf sürecindeki bir diğer önemli adım, atıkların geçici depolanmasıdır. Radyoaktif atıklar, özel olarak tasarlanmış kaplarda muhafaza edilir ve belirli bir süre boyunca geçici depolama alanlarında tutulur. Bu alanlar, atıkların güvenli bir şekilde saklanmasını sağlayan çeşitli güvenlik önlemleri içermektedir.

Johnson'ın [7], makalesine göre, geçici depolama alanlarında nükleer atıkların düzenli olarak kontrol edilmesi ve denetlenmesi gerekmektedir. Bu sayede, atıkların sızıntı veya dış etkenlere maruz kalma gibi risklere karşı korunduğu ve güvenlik standartlarına uygun şekilde saklandığı vurgulanmaktadır. Nükleer atıkların nihai bertarafı, güvenlik açısından en kritik adımdır. Bu süreçte, atıkların güvenli bir şekilde bertaraf edildiği ve çevreye zarar vermediği sağlanmalıdır. Farklı yöntemler kullanılarak atıkların geri dönüştürülmesi veya uzun vadeli depolanması mümkündür.

Garcia'nın [8] araştırması, nükleer atıkların nihai bertarafının güvenlik açısından önemli olduğunu vurgulamaktadır. Araştırmada, atıkların doğru bir şekilde işlenmesi ve depolanmasıyla, çevresel etkilerin minimize edildiği ve insan sağlığına olan risklerin azaltıldığı ifade edilmektedir. Hastahanelerde nükleer atıkların bertaraf süreci, çeşitli güvenlik önlemlerini içermektedir. Bu önlemler, atıkların kaydedilmesi ve izlenmesi, geçici depolama ve nihai bertaraf süreçlerinde uygulanmaktadır. Doğru kayıt tutma, izleme ve etiketleme sistemleri, atıkların takibini sağlayarak güvenlik risklerini azaltmaktadır. Geçici depolama alanlarında düzenli kontroller ve denetlemeler, atıkların güvenli bir şekilde saklanmasını sağlamaktadır. Nihai bertaraf sürecinde ise, atıkların çevreye zarar vermeden doğru bir şekilde bertaraf edildiği önemlidir.

V. SONUÇLAR

Nükleer tıp ve radyoterapi gibi tıbbi uygulamalar, hastahanelerde nükleer atık üretiminin artmasına yol açmaktadır. Bu atıkların doğru bir şekilde bertaraf edilmemesi ciddi çevresel ve sağlık riskler doğurabilir. Bu araştırma metni, hastahanelerde nükleer atıkların bertarafının sonuçlarını ve önerilerini incelemekte ve sağlık kuruluşlarının bu konuda alması gereken önlemleri vurgulamaktadır. Nükleer atıkların uygun olmayan bertarafı, çevresel etkilere ve insan sağlığına zararlı sonuçlara yol açabilir. Bu atıkların rastgele atılması veya düşük standartlara göre bertaraf edilmesi, toprak, su ve hava kirliliğine sebep olabilir. Radyoaktif maddelerin çevreye yayılması, biyolojik çeşitlilik üzerinde olumsuz etkilere neden olabilir ve uzun vadede kanser gibi hastalıkların artmasına yol açabilir.

Hastahanelerde nükleer atıkların uygun şekilde bertaraf edilmesi hem çevresel hem de insan sağlığı açısından önemlidir. Bu atıkların toplanması, depolanması ve imha edilmesi için özel prosedürler ve ekipmanlar gerekmektedir. Radyoaktif atıkların kontrollü bir şekilde bertaraf edilmesi, çevresel riskleri minimize edebilir ve personel ile halkın sağlığını koruyabilir.

Hastahanelerde nükleer atıkların bertarafı için bazı öneriler şunlardır:

1. Eğitim: Tüm sağlık personeli, nükleer atıkların doğru şekilde yönetimi konusunda eğitilmelidir. Bu eğitim, atıkların toplanması, depolanması ve bertarafı hakkında bilgi sağlamalıdır. Ayrıca, acil durumlar için gerekli önlemler hakkında da bilgilendirme yapılmalıdır.

2. İzleme: Hastahaneler, nükleer atıkların miktarını ve türünü izlemelidir. Bu izleme, atıkların doğru bir şekilde toplandığından ve depolandığından emin olmak için önemlidir. Radyoaktif atıkların düzenli olarak analiz edilmesi ve izlenmesi, herhangi bir kaçak veya kaza durumunda hızlı müdahale sağlayabilir.

3. İş birliği: Hastahaneler, nükleer atıkların bertarafı konusunda ilgili kurumlar ve yerel yönetimlerle iş birliği yapmalıdır. Bu, uygun bertaraf tesislerinin kullanılmasını ve atıkların taşınmasını sağlayabilir. Ayrıca, nükleer atıkların taşınması ve bertarafının yasal düzenlemelere uygun olduğundan emin olmak için yetkililerle iş birliği yapılmalıdır.

Hastahanelerde nükleer atıkların doğru bir şekilde bertaraf edilmesi, çevresel ve insan sağlığına yönelik riskleri azaltabilir. Uygun eğitim, izleme ve iş birliği önlemleri alarak, sağlık kuruluşları bu sorunun etkin bir şekilde yönetilmesine katkıda bulunabilir. Bu metin, hastahanelerde nükleer atıkların bertarafı konusunda farkındalığı artırmayı ve önlemlerin uygulanmasını teşvik etmeyi amaçlamaktadır.

BİLGİ

Bu çalışma Muş Alparslan Üniversitesi, Fen Bilimleri Enstitüsü, Nükleer Enerji ve Enerji Sistemleri Anabilim Dalında Yüksek Lisans tezi olarak sunulmuş ve Kabul edilmştir.

Abstract – These systems mimic the actions of neurons and synapses by using digital or analogue circuits that are optimised for parallel processing. Neuromorphic computing has the ability to outperform conventional computing architectures in some areas, especially pattern recognition, image processing, and artificial intelligence. This is because it makes use of the distributed processing and parallelism principles found in biological brains.

The goal of this third generation of AI computing is to mimic the intricate neuronal network seen in the human brain. AI is needed to compute and analyse unstructured data at a rate that can compete with the biological brain's exceptional energy efficiency. Spiking neural networks (SNN) are the artificial intelligence counterpart of our neural network of synapses. Artificial neurons are layered structures containing individual spiking neurons that may fire and interact with one another to initiate a cascade of changes in response to external inputs.

Keywords – Neurons, Circuits, Synapses, Spiking Neural Network, Image Processing, Pattern Recognition.

I. INTRODUCTION

One area of computer science called "neuromorphic computing" takes its cues from the architecture and operation of the neural networks found in the human brain. Its goal is to imitate biological neural networks' behaviour to build extremely effective and versatile computer systems. While neuromorphic computing aims to mimic the brain's parallel processing and learning capacities, traditional computing depends on digital processors that carry out computations sequentially. [2].

Hardware for neuromorphic computing systems is often made to mimic synapses and neurons, the fundamental components of neural networks found in the brain. These systems mimic the actions of neurons and synapses by using digital or analogue circuits that are optimised for parallel processing. Neuromorphic computing has the ability to outperform conventional computing architectures in some areas, especially pattern recognition, image processing, and artificial intelligence. This is because it makes use of the distributed processing and parallelism principles found in biological brains. [13].

IBM's TrueNorth chip, which has a large-scale neural network design with low-power, high-density synapse-like connections, is a well-known example of neuromorphic computing. Another illustration is the Loihi chip from Intel, which is designed to resemble the spiking neural networks seen in living brains. Numerous applications where real-time, energy-efficient computation is essential, such as improved robotics, autonomous vehicles, and sensory processing, are being investigated for these neuromorphic computing systems. [3].

The following are some salient features of neuromorphic computing:

• **Brain-inspired:** It seeks to imitate the brain's low-power functioning and pattern recognition capabilities.
• **Synapses and artificial neurons:** these components serve as the foundation for neuromorphic systems, mimicking the actions of their biological counterparts.

• **Possible advantages:** Applications needing real-time learning and adaptation, autonomous systems, and image and speech recognition are among the areas where neuromorphic computing shows promise.
• **Early stage:** Although there is a lot of research being done, neuromorphic computing is still a young subject with few practical uses.
All things considered, neuromorphic computing is a fresh take on computing that might transform a number of industries by providing an alternative information processing paradigm. [7].

This is a schematic representation of a simple neuromorphic system:

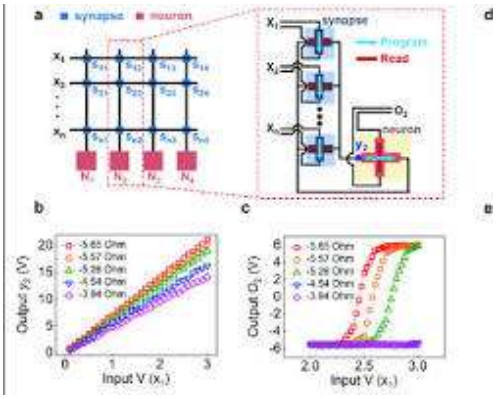

Fig 1A. A description of the diagram

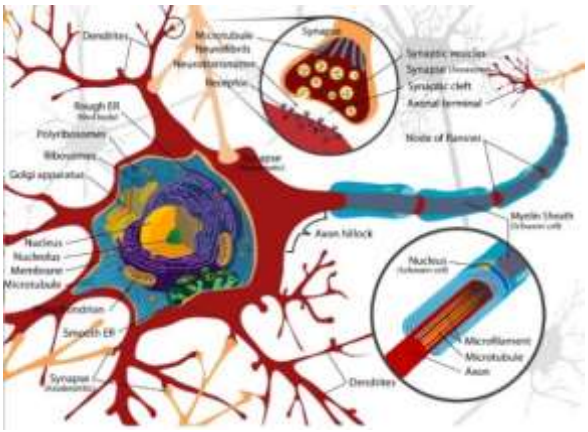

Fig 1B. A description of the diagram

• **Input layer**: Gathers information from the outside world in a manner akin to that of the brain's sensory organs.
• **Artificial neurons**: These are the brain-like structures that perform similarly to real neurons. They process information from other neurons, send out their output signal, and receive input from them.
• **Synapses**: Just as synapses in the brain regulate neuronal communication, these connections between neurons influence the intensity of the signal transmission. The system can learn and adapt by varying the strength of these links.
• **Output layer**: Generates the final product in a manner similar to how the brain produces other outputs, such motor commands.
It is crucial to remember that this is a simplified illustration and that real neuromorphic systems can have several layers of neurons and sophisticated connectivity patterns.

II. Spiking Neural Networks

Artificial neural networks (ANNs) using backpropagation and continuous values have historically been the foundation of deep learning. Even though they work well, ANNs have drawbacks, especially when it comes to energy usage and biological plausibility. Spiking neural networks (SNNs) provide a possible substitute that is modelled after how the brain functions in this situation.

SNNs communicate via discrete electrical pulses, or "spikes," as opposed to continuous values, imitating the spiking behaviour of organic neurons. [16]

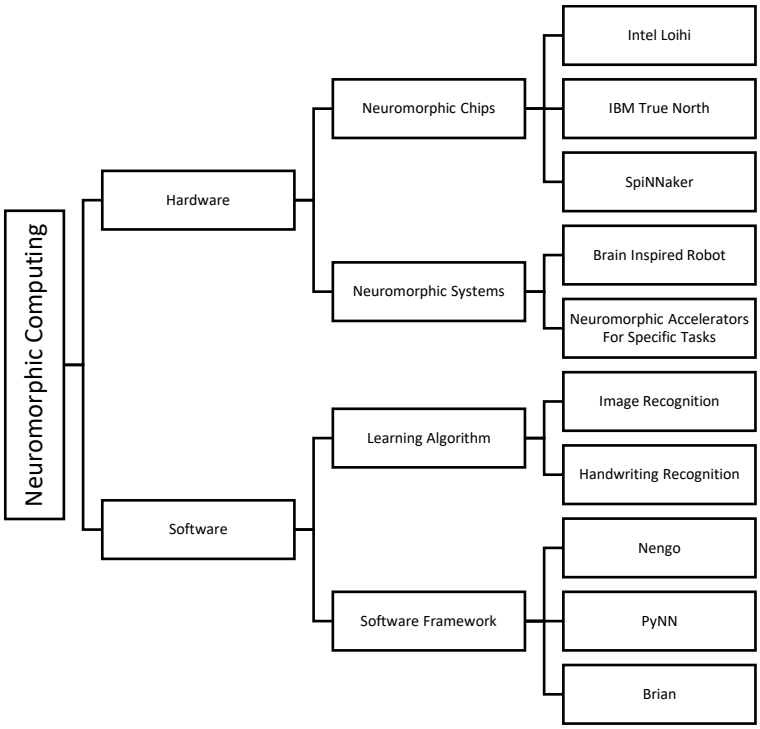

Fig 2. Anatomical Schematic for Neuromorphic Computing

III. PROGRAMMING LANGUAGES USED IN NEUROMORPHIC COMPUTING

Both software and hardware are involved in neuromorphic computing, and the platform and application-specific programming languages employed might change. Neuromorphic computing frequently uses the following programming languages: [10] [18]

1. **Python**: Because of its readability, ease of use, and abundance of libraries for scientific computing and machine learning, Python is a popular choice for creating software interfaces and applications in neuromorphic computing. Neural network models and simulations are frequently developed using Python frameworks like TensorFlow, PyTorch, and Keras.

2**. C/C++:** Programming the hardware of neuromorphic computing systems often involves low-level languages like C and C++. This includes designing and optimising analogue and digital circuits as well as putting device drivers and real-time control algorithms into practice.

3. **Hardware Description Languages, or HDLs**: Hardware Overview Field-programmable gate arrays (FPGAs) and application-specific integrated circuits (ASICs) are examples of neuromorphic computing hardware that can be designed and their behaviour described using languages like Verilog and VHDL.

4. **Languages Specific to Neuromorphisms**: To programme neuromorphic computer systems, several specialised programming languages have been created. Examples are PyNN (Python Neural Network), which is used to create and simulate spiking neural networks, and NESTML (NEural Simulation Tool Markup Language), which is used to describe neural network models in the NEST simulator.

5. **MATLAB**: Especially in disciplines like neuroscience and computational biology, MATLAB is extensively utilised in academic and research contexts for neuromorphic computing model and algorithm creation and simulation.

6. **Programming Frameworks and APIs Exclusive to Neuromorphic Computing**: A number of neuromorphic computing systems offer their own frameworks and APIs for creating applications. For instance, the Python-based BrainScaleS programming interface facilitates the creation and operation of spiking neural networks on its hardware.

The popular neural simulation tool, the Brian2 library, is used to create a spiking neural network (SNN) model for handwriting pattern recognition in the following simple Python code sample. In this example, integrate-and-fire neurons are used to create a simple SNN for pattern recognition. It should be noted that

while this code offers a foundation for creating SNN models, it does not directly target a neuromorphic computing platform such as Intel Loihi.
PSEUDO CODE

```
[56:27] Unexpected character: :
print("Output Spike Times:")
                          ^ here
[58:35] Unexpected character: :
    print(f"Neuron {neuron_index}: {spike_times}")
                                  ^ here
[62:26] Unexpected character: :
print(f"Recognized Digit: {recognized_digit}")
                         ^ here
[56:9] Expected ')' after arguments.
print("Output Spike Times:")
```

CODE EXPLANATION:

1. **Import libraries**: Brian is one of them for modelling neurons that fire.
2. **Definition of neuron model**: Leaky Integrate-and-Fire (LIF) model with particular parameters (voltage, time constant) is used in this example.
3. **Identify input neurons**: These stand in for the pattern's pixels.
4. **Describe synapses and connections**: This describes the type of connections between neurons as well as their strength.
5. **Identify learning rule**: Here, synaptic weights are modified by STDP in accordance with spike timing.
6. **Define input data**: Enter your real pattern data in lieu of the placeholder.
7. Start a simulation and give the network a certain amount of time to run.
8. **Examine output spikes**: Classify output neurons by examining their firing patterns.
9. **Training loop**: Use a training loop to modify weights in accordance with the intended results and learning principles.

Fig 3. Result Output

IV. WHAT IS THE PROCESS OF NEUROMORPHIC COMPUTING?

A technique in computer engineering known as "neuromorphic computing" models computer components after neural and brain systems in humans. The design of computer pieces, including software and hardware, is referred to by this word.
The goal of this third generation of AI computing is to mimic the intricate neuronal network seen in the human brain. AI is needed to compute and analyse unstructured data at a rate that can compete with the biological brain's exceptional energy efficiency. The human brain's exceptional energy efficiency is

demonstrated by the fact that it can function better than supercomputers with less than 20 watts of electricity. Spiking neural networks (SNN) are the artificial intelligence counterpart of our neural network of synapses. Artificial neurons are layered structures containing individual spiking neurons that may fire and interact with one another to initiate a cascade of changes in response to external inputs. [9] [11]

V. BASIC ALGORITHM AND PROCESSES OF NEUROMORPHIC COMPUTING

1. **Data preprocessing**:
- Get the MNIST dataset, which is made up of handwritten numbers 0 through 9.
- Divide the dataset into training and testing sets after normalising the pixel values.
- **Architecture Model**:
- Create the spiking neural network's architecture.
- Describe the output, hidden, and input layers.
- Figure out how many synapses and neurons there are in each layer.
- Decide between synaptic plasticity rules and the spiking neuron model (integrate-and-fire, for example).

3. **Training of the Model**:
- Apply the training algorithm on the Loihi chip (e.g., Spike-Timing-Dependent Plasticity, STDP).
- Give the SNN the training data, which consists of handwritten digits, and modify synaptic weights in response to spike timing.
- To optimise the network parameters, go through the training dataset several times.

4. **Model Evaluation**:
- Use a different testing dataset to evaluate the trained SNN model.
- Show the SNN handwritten digits, then watch the output neurons' spiking activity.
- Using the output spikes, ascertain the digit identification accuracy and compare it with conventional machine learning techniques.

5. **Performance Optimisation**:
- Enhance the SNN model's performance by modifying its many components, including its synapses, number of neurons, and network architecture.
- Adjust the synaptic weights to increase the precision of categorization.

6. **Intel Loihi Deployment**:
- Place the optimised SNN model on the neuromorphic Intel Loihi processor.
- Use the programming interface or software development kit (SDK) that is supplied to interface with the Loihi chip.
- Use the deployed model on the Loihi chip to do inference tasks for handwritten digit recognition in real time.

7. **Analysis and Reporting**:
- Examine the accuracy, energy economy, and computational speed of the SNN model running on an Intel Loihi.
- Examine the outcomes in comparison to machine learning techniques and conventional computer platforms.

Note: This is a simplified overview; extra stages, such as parameter tweaking, optimisation strategies, and hardware-specific considerations for deploying the model on Intel Loihi, may be necessary for the real implementation.

VI. WHY DO WE NEED NEUROMORPHIC COMPUTING?

Despite being based on how the brain functions, neuromorphic designs have the potential to learn a great deal about the brain by enabling us to see synaptic behaviour in action. Significant advancements in neurology and medicine may result from this. Even if the development of the neuromorphic processors that drive supercomputers is still progressing at an incredible rate, neuromorphic technology has not yet reached its full potential.

Even though SpiNNaker is a large-scale effort, it can only model a limited amount of the brain. Nevertheless, even with its current limitations, it has managed to replicate the Basal Ganglia, an area of the

brain that is known to be impacted by Parkinson's disease. With the use of machine learning, more research on the simulated activity may lead to scientific discoveries that clarify the causes and mechanisms of Parkinson's disease. [15]

VII. NEUROMORPHIC COMPUTING BENEFITS

When compared to conventional methods, neuromorphic computing offers several advantages, including energy economy, fast execution, resilience to local errors, and learning capabilities. [17]

1. **Enhanced Efficiency**:
   • Reduced Power Usage: Neuromorphic systems use power only during information processing, as opposed to conventional silicon-based computers that require an uninterrupted power supply. This can be especially helpful for applications where battery life is critical and resources are limited, such as edge computing devices.
   • Quicker Processing for Particular Tasks: Because of its innate architecture, which draws inspiration from the brain's capacity for parallel processing, neuromorphic systems perform very well in parallel processing tasks like pattern recognition and signal processing. For some particular jobs, this may result in processing speeds that are faster than those of regular computers.
2. **Better Learning and Adaptation**:
   • Real-time Learning: Neuromorphic systems, especially those that use Spiking Neural Networks (SNNs), have the ability to learn and adjust depending on incoming input in real-time. This is because, like the brain, they are able to dynamically alter synaptic connections.
   • Fault Tolerance: Neuromorphic systems may be able to continue operating even in the event of a partial hardware failure, drawing inspiration from the brain's natural fault tolerance. This is because, in contrast to traditional systems, information processing is spread over several linked neurons, making them less vulnerable to single point failures.
3. **Possibility of New Uses**:
   • Brain-inspired Robotics: By emulating how the human brain regulates movement and interacts with its surroundings, neuromorphic computing has the potential to create robots that are more capable of making decisions and adapting to their surroundings.
   • Advanced Pattern Recognition: The parallel processing and learning powers of neuromorphic systems may be able to increase the accuracy and efficiency of tasks like voice and picture recognition as well as anomaly detection.

VIII. NEUROMORPHIC COMPUTING LIMITATIONS

Neuromorphic computing has significant benefits, but a number of drawbacks prevent it from reaching its full potential and becoming widely used. [12]

1. **Hardware Challenges**:

• Limited Processing Power: Compared to high-performance CPUs and GPUs, contemporary neuromorphic systems often have lower overall processing power, despite being efficient for certain workloads. This restricts their capacity to be used for activities that require a lot of computation beyond their areas of expertise.
• Scalability and Integration: It is still difficult to scale neuromorphic systems to the complexity of large-scale neural networks used in deep learning techniques. Furthermore, work is still being done on effectively integrating them with conventional computer systems for hybrid solutions.
• Improvements in Power Efficiency: Although neuromorphic systems consume less power than conventional processors when performing active tasks, under some circumstances they may still need a large amount of standby power, which limits their maximum efficiency potential.

2. **Algorithm and Software Difficulties**:

• Limited Software Development Tools: The software development tools and libraries available for neuromorphic platforms are still in the early stages of development, in contrast to the extensive ecosystem of tools and libraries available for conventional computing. This may impede accessibility and development pace.

• Complexity of Algorithm Development: It is difficult for SNNs to be widely adopted and used since it takes specialised knowledge and experience to design and optimise algorithms for effective training and to take use of their distinctive characteristics.
• Limited Standardisation: The design and execution of neuromorphic systems are currently not standardised, which makes it challenging to compare various platforms and prevents the creation of industry-wide common tools and procedures.

3. **Additional Restrictions**:

• Expense: The development and production of neuromorphic hardware is now more costly than that of conventional computer hardware, which may restrict its early acceptance and accessibility.
• Maturity and Research Stage: Neuromorphic computing is still a developing subject with much research and development being done in it. This indicates that although progress is ongoing, it could take some time for the technology to realise its full potential and become widely applied.

It's critical to keep in mind that developers and academics are actively working to overcome these constraints. Hardware, software, and algorithm developments should help solve these issues and realise the full potential of neuromorphic computing as the field develops.

IX. THE POSSIBLE RISKS OF NEUROMORPHIC COMPUTING AND RECOMMENDATIONS

Because neuromorphic computing can emulate the flexibility and efficiency of the brain, it is very promising for many uses. Like any new technology, there are hazards and difficulties associated with it as well. The following are a few possible dangers of neuromorphic computing: [8]

1. **Ethical Concerns**: As neuromorphic computing develops, ethical questions about security, privacy, and possible abuse are brought up. Neuromorphic systems, for instance, may be employed in privacy-invading surveillance applications.
2. **Prejudice and Fairness**: Neuromorphic systems have the danger of prejudice and injustice, especially in situations where decisions are made. Unfair results may result from biases in training data or algorithms, particularly in vital fields like criminal justice or healthcare.
3. **Unforeseen effects**: Because neuromorphic systems are complex, unexpected behaviours or unforeseen effects are possible. This may be the consequence of interactions between various system components or emergent characteristics of neural networks.
4. **Security flaws**: Cyberattacks aimed at the software or hardware components might be one way that neuromorphic computing systems are vulnerable to security flaws. It will be essential to defend neuromorphic systems from malevolent actors in order to guarantee their dependability and security.
5. **Regulatory Challenge**s: As neuromorphic computing technologies grow, it can become more difficult to create the rules and guidelines needed to guarantee their responsible advancement and application. Regulatory frameworks will have to deal with matters like accountability, transparency, and safety.
6. **Requirements for Resources**: Neuromorphic computing systems may need a lot of resources to build and run, such as specialised hardware, software, and knowledge. For smaller research groups or organisations with less resources, this can provide access restrictions.
7. **Environmental Impact**: Although the energy efficiency of neuromorphic computing is frequently cited as an advantage, there may still be environmental effects from the manufacture and disposal of hardware components. Furthermore, if neuromorphic systems are not properly maintained, their energy consumption may become an issue as they grow more common.
8. **Labour Displacement**: By automating processes now done by people, neuromorphic computing has the potential to upend established labour markets, much like other kinds of automation and artificial intelligence. In particular industries, this can result in job displacement if suitable steps are not made to retrain employees.

To mitigate these risks and make sure that neuromorphic computing technologies are developed and applied responsibly, ethically, and in a way that benefits society as a whole, researchers, industry stakeholders, policymakers, and ethicists will need to work together.

X. CONCLUSION

Neuromorphic computing does, however, come with a number of difficulties and restrictions in addition to its intriguing potential. These include problems with scalability, restrictions on programming and software tools, challenges with energy efficiency, hardware limits, and the requirement for better learning and adaptation. Regulatory obstacles, security flaws, and ethical issues also need to be taken into account in order to guarantee the appropriate development and application of neuromorphic computing technology.

Notwithstanding these obstacles, continued study and development are propelling the area of neuromorphic computing forward. To overcome these obstacles and realise the full promise of neuromorphic computing in advancing artificial intelligence, deepening our understanding of the brain, and spurring innovation in a wide range of applications, cooperation between researchers, industry stakeholders, legislators, and ethicists is imperative.

In conclusion, the area of artificial intelligence and computing has a bright future ahead of it with neuromorphic computing. Neuromorphic computing is modelled after the architecture and physiology of the human brain with the goal of imitating the brain's flexibility, efficiency, and parallel processing power. Neuromorphic computing, which uses ideas from neurology to create hardware and software systems that mimic neural networks, has the potential to completely transform a number of industries, including pattern recognition, machine learning, robotics, and sensory processing.

NÜKLEER GÜÇ SANTRALLERİNİN TEKNİK ÖZELLİKLERİ VE YAPISI: AKKUYU NGS ÖRNEĞİ

Hamza ALAHMAD[1*] ve Edip TAŞKESEN [2]

[1]*Enerji Bilimi ve Teknolojileri Anabilim Dalı / Lisansüstü Eğitim Enstitüsü, Şırnak Üniversitesi, Türkiye*
[2] *Enerji Sistemleri Mühendisliği Bölümü / Mühendislik Fakültesi, Şırnak Üniversitesi, Türkiye*

[*]*(hmza8246@gmail.com)*

Özet – Bu çalışma, Türkiye'nin ilk nükleer enerji santralı olan Akkuyu Nükleer Güç Santralı'nın teknik özelliklerini incelemektedir. Santral, Rus devlet şirketi ROSATOM tarafından geliştirilmekte olan bir projedir. İnşası, Türkiye ile Rusya arasında 2010 yılında imzalanan bir hükümetler arası anlaşma ile başlamıştır. Santral, dört üniteden oluşmaktadır ve toplamda 4.800 megavatlık bir kapasiteye sahiptir. Temel tasarımı çift devreli bir VVER (Su-Su-Enerji Reaktörü) olarak bilinmektedir.

Akkuyu NGS'de faaliyet gösteren reaktörler, VVER-1200 üçüncü nesil versiyonunu temel alarak basınçlı su reaktörü tipindedir. Her bir reaktörde 163 adet yakıt demeti bulunmakta olup, yakıt döngüsü süresi dört yıldır. Reaktör, çift kat koruma sistemi ile donatılmıştır ve dünyanın en güvenli reaktörlerinden biri olarak kabul edilmektedir.

Akkuyu NGS'nin ana ekipmanı arasında dört adet VVER1200 tipi su reaktörü, borik asit içeren soğutma ve moderatör suyu, dört adet buhar üreteci, dört ana dolaşım pompa seti ve bir türbin-jeneratör seti bulunmaktadır. Elektrik sistemleri, enerji üretimi, dağıtımı ve yardımcı güç kaynaklarını içermektedir. Santralin güvenlik sistemleri, iyonlaştırıcı radyasyon ve radyoaktif maddelerin çevreye salınımını engellemeye yönelik fiziksel bariyerlerden oluşmaktadır. Bu çalışma, Akkuyu Nükleer Güç Santralı'nın teknik özelliklerini detaylı bir şekilde açıklamakta ve nükleer enerji teknolojisine ilişkin kapsamlı bir bilgi sunmaktadır.

Anahtar Kelimeler – Nükleer, akkuyu, enerji, güvenlik, teknoloji

I. GİRİŞ

Enerji, modern toplumların temel ihtiyaçlarından biri olarak hayati önem taşımaktadır. Bu bağlamda, enerji arzının güvenli, sürdürülebilir ve çevre dostu bir şekilde sağlanması, küresel ölçekte stratejik bir öncelik haline gelmiştir. Günümüzde, enerji talebinin artmasıyla birlikte, çeşitli enerji kaynaklarına olan ihtiyaç da giderek artmaktadır [1]. Bu kapsamda, nükleer enerji, temiz ve karbon emisyonu olmayan bir enerji kaynağı olarak, enerji sektöründe önemli bir yer edinmektedir [2] - [4].

Nükleer enerji, atom çekirdeklerinin bölünmesi veya birleşmesi gibi nükleer reaksiyonlardan elde edilen termal enerjinin elektrik enerjisine dönüştürülmesi prensibine dayanır [5]. Bu teknoloji, yüksek verimlilik, düşük karbon emisyonu ve sürekli enerji üretimi gibi avantajlar sunmaktadır [6].

Türkiye'nin enerji talebinin artması ve enerji arz güvenliğinin sağlanması amacıyla, nükleer enerji teknolojilerine yönelik ilgi ve yatırımlar artmaktadır [6], [7]. Bu bağlamda, Türkiye'nin ilk nükleer güç santrali olan Akkuyu Nükleer Güç Santrali, ülkenin enerji portföyüne önemli bir katkı sağlamayı hedeflemektedir. Rusya'nın ROSATOM şirketi tarafından geliştirilen bu proje, Türk-Rus iş birliğinin bir ürünü olarak hayata geçirilmektedir. Akkuyu Nükleer Güç Santrali'nin teknik özellikleri ve işleyişi, Türkiye'nin enerji sektöründeki geleceği açısından büyük önem taşımaktadır [7], [8].

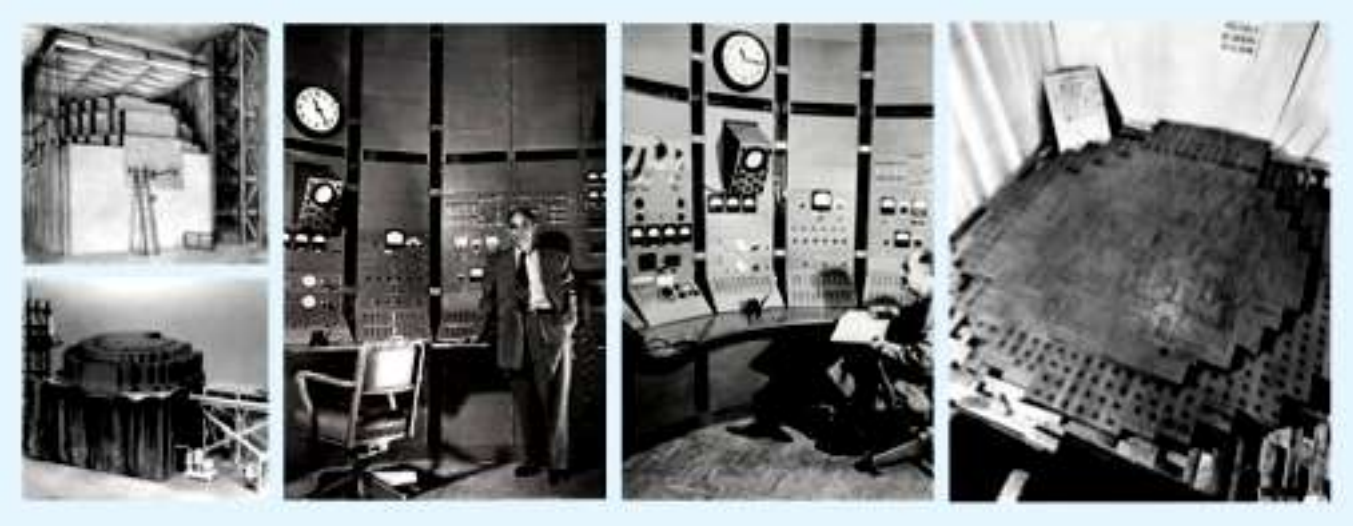
Bu çalışmada, nükleer enerji, nükleer güç santralleri, güç reaktörlerin tipleri, özellikleri ve nesilleri incelenerek, Akkuyu Nükleer Güç Santrali'nin teknik özellikleri detaylı bir şekilde ele alınacaktır.

II. NÜKLEER ENERJİ TEKNOLOJİSİ

Nükleer enerji, ağır atom çekirdeklerinin nötron yakalamaları sonucunda fisyon ve hafif atom çekirdeklerinin çok yüksek sıcaklıkta birleşmesiyle gerçekleşen füzyon tepkimeleriyle elde edilen büyük miktardaki enerjiyi ifade eder [9], [10].

1905 yılında Albert Einstein, fisyon sonucu ortaya çıkabilecek enerji potansiyeli hakkında bir öngörüde bulunmuştur [11] - [13]. Daha sonraki yıllarda, 1930'da bu öngörü Alman fizikçi Otto Hahn, Avusturya kökenli İsveçli fizikçi Lise Meitner ve diğer araştırmacılar tarafından deneysel olarak doğrulanmıştır. 1942'de Amerika Birleşik Devletleri'nin Chicago, Illinois kentinde insan yapımı ilk nükleer reaktör kurulmuştur. Bu proje, Enrico Fermi tarafından yönetilmiştir (Şekil 1) [13]. Ancak, dünyadaki ilk ortaya çıkan reaktör bu değildi. Afrika'da Gabon'daki Oklo'da, bir uranyum madeninde yeraltı sularının varlığı nedeniyle doğal bir nükleer reaktör oluştuğu ve binlerce yıl boyunca ısı ürettiği sonradan keşfedildi. Hem Amerika Birleşik Devletleri'nde Chicago, Illinois'de bulunan insan yapımı ilk nükleer reaktör hem de Afrika'daki Gabon'daki doğal nükleer reaktör, fisyonu kullanarak ısı üretti; ancak her ikisi de elektrik üretmedi [13].

Elektrik üreten ilk ticari nükleer güç santrali 1957'de işletmeye giren Shippingport, Pennsylvania'da (ABD) kuruldu. Fisyon kullanılarak üretilen ilk elektrik ise, Aralık 1951'de Arco, Idaho'daki deneysel üretken reaktörde elde edildi [13].



Şekil 1. Chicago Pile-1, 1942'de Enrico Fermi ve ekibi tarafından inşa edilen dünyanın ilk nükleer reaktörüdür [14] - [18].

Nükleer enerji, elektrik üretiminde nükleer reaksiyonların kullanılmasıyla sağlanan bir enerji kaynağıdır [19] - [21]. Bu enerji, nükleer fisyon, nükleer bozunma ve nükleer füzyon gibi reaksiyonlar yoluyla elde edilebilir. Günümüzde, nükleer enerjiden kaynaklanan elektriğin önemli bir kısmı, nükleer santrallerde uranyum ve plütonyumun nükleer fisyonu ile üretilmektedir [21].

Nükleer enerji, atom çekirdeğinden kaynaklanan bir enerji formudur ve Albert Einstein'ın ünlü $E = mc^2$ formülüyle açıklanan kütlenin enerjiye dönüşümü prensibiyle bağlantılıdır. Bu bağlamda, nükleer fisyon reaksiyonu ortaya çıkar. Bu reaksiyonda, genellikle uranyum izotoplarına maruz bırakılan atom çekirdekleri, nötron bombardımanı sonucunda kararsız hale gelirler. Bu kararsızlık, çekirdeklerin daha hafif atomlara bölünmesine yol açar, bu da enerji açığa çıkarır. Bu süreç, nükleer enerji üretiminin temelini oluşturur [22].

Atom çekirdeklerinin parçalanması, büyük miktarda enerji açığa çıkarmaktadır. Örneğin, uranyum gibi ağır atom çekirdeklerine nötronların çarpmasıyla bu çekirdeklerin parçalanması gerçekleştirilebilir; bu

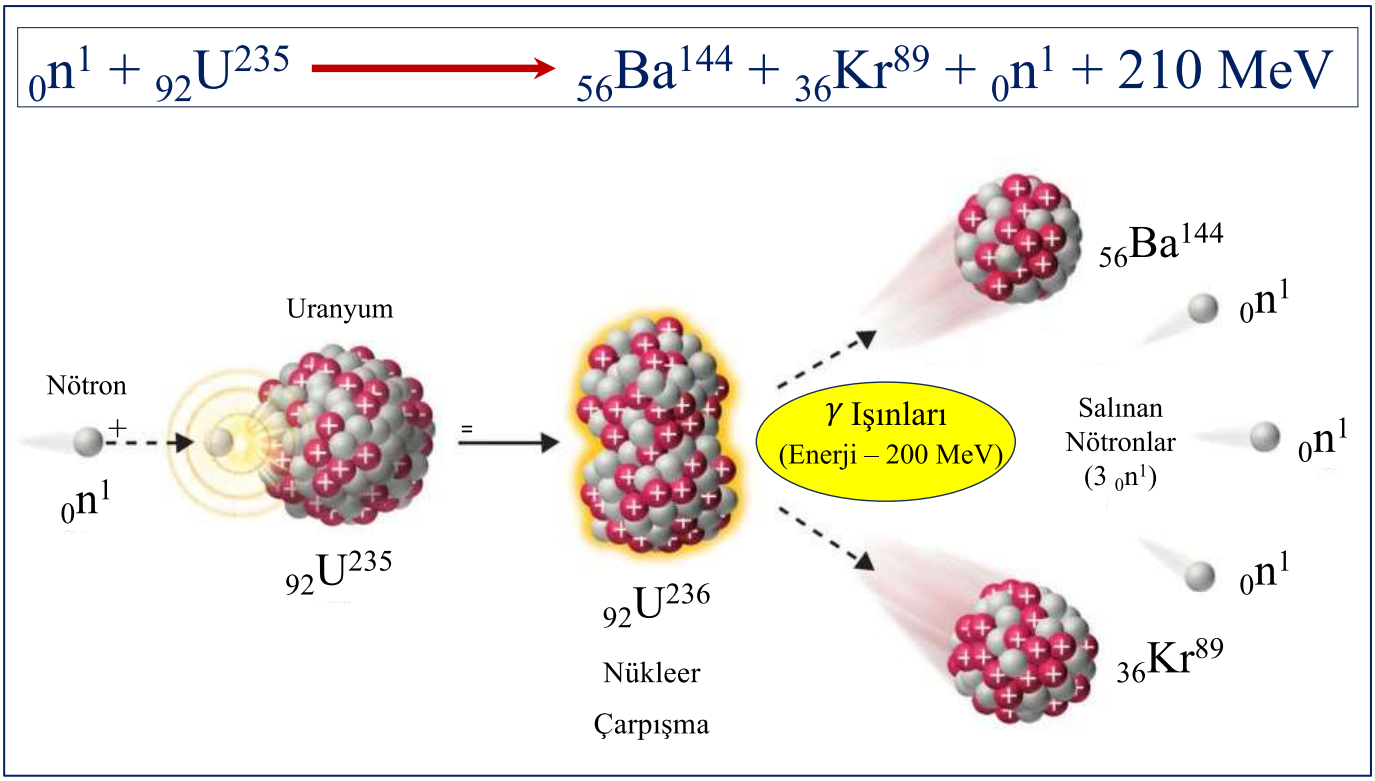
olaya "fisyon" adı verilir. Her bir parçalanma olayında, fisyon ürünleri, enerji ve birkaç nötron açığa çıkar [22].

Parçalanma reaksiyonunun sürekliliği uygun bir şekilde tasarlanmış bir sistemde sağlanabilir, çünkü bu reaksiyon sonucunda açığa çıkan nötronlar kullanılabilir (zincirleme reaksiyon). Bunun yanı sıra, hafif atom çekirdeklerinin birleşerek daha ağır atomları oluşturması da büyük bir enerji açığa çıkarmaktadır. Bu birleşme reaksiyonuna "füzyon" denir. Fisyon ve füzyon reaksiyonlarından elde edilen enerjiye "çekirdek enerjisi" veya "nükleer enerji" adı verilir [22].

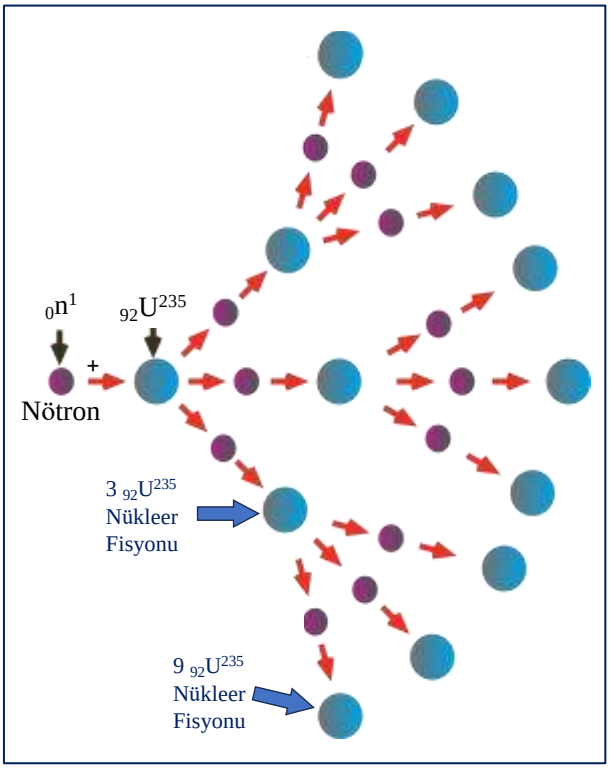
Fisyon, atom çekirdeğinin bölünmesi veya ağır çekirdeklerin ikiye ayrılması olayıdır ve bu süreçte büyük miktarda enerji, nötron ve gamma ışınları açığa çıkar. Ağır çekirdeklerin uyarılmasıyla gerçekleşen fisyon olayında oluşan çekirdekler fisyon ürünleri olarak adlandırılır ve genellikle nötronlar ve gamma ışınları aracılığıyla çekirdeklerin uyarılması gerçekleştirilir [23], [24]. Örneğin, $^{92}U_{235}$ çekirdeği düşük bir enerjiyle uyarıldığında $^{92}U_{236}$ birleşik çekirdeği oluşturur; bu süreçte çekirdek enerji alır ve uyarılmış hale gelir. Yeterli enerji elde edildiğinde ise çekirdek ikiye bölünür ve $^{56}Ba_{144}$ birinci fisyon ürünü, $^{36}Kr_{89}$ ise ikinci fisyon ürünü oluşur. Sonrasında her bir çekirdek, bölünmeden hemen sonra bir veya iki nötron yayınlar ve fazla enerji taşıyan çekirdekler gama ışınları yayarak enerji atarlar [25]. Nükleer santrallerde kullanılan tepkimeler, atom bombası teknolojisi fisyona örnektir [22]. Şekil 2'de, atom çekirdeğinin bölünme mekanizması ve reaksiyonu göstermektedir.

Fisyon reaksiyonlarının ilk çarpışmadan sonra ortaya çıkan fisyon ürünleri, etraflarındaki diğer atomlarla çarpışarak enerji transferine yol açarlar. Bu çarpışmalar sonucunda, atomlar arasındaki etkileşimler nedeniyle kinetik enerjinin büyük bir kısmı ısı enerjisine dönüşür. Oluşan ısı, genellikle bir soğutucu aracılığıyla alınarak, sonrasında bu ısı enerjisi elektrik enerjisi üretimi için kullanılır. Bu süreç, nükleer enerji santrallerinde elektrik üretiminin temelini oluşturur [22].

Fisyon olaylarında, her bir yutulan nötron için ortalama olarak 2-3 nötron oluşur ve bu nötronların enerjisi yaklaşık olarak ~2 MeV'dir. Bu oluşan nötronların bir kısmı dışarıya çıkarak fisyona yol açmazlar. Ancak, ortalama olarak her bir yutulan nötron için 2-3 nötronun oluşması, reaksiyonun kendi kendini sürdürebileceğini gösterir. Oluşan nötronlar yeni fisyon olaylarına neden olarak, oluşan reaksiyona "zincir reaksiyonu" denir [26]. Bu zincir reaksiyon mekanizması Şekil 3'te gösterilmiştir.

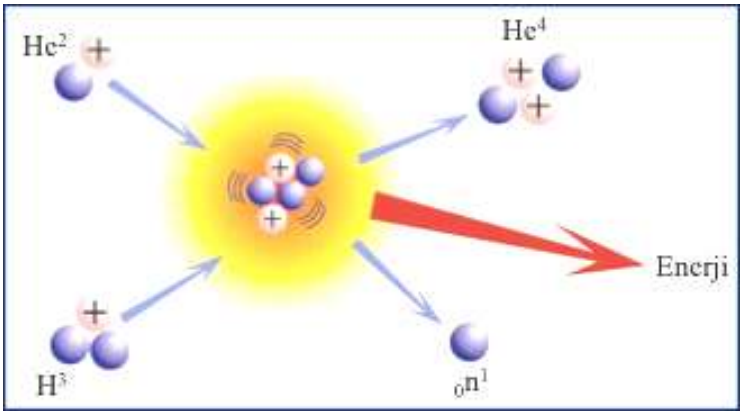


Şekil 2. Tipik bir fisyon reaksiyon mekanizması [27].



Şekil 3. Zincirleme reaksiyon mekanizması [28].

"Füzyon", iki hafif çekirdeğin bir araya getirilerek daha ağır bir çekirdek oluşturulması olayını ifade eder. Bu olay, fisyonun tam tersidir. Füzyon, yüksek enerji seviyelerine sahip atom çekirdeklerinin etkileşimini gerektiren bir süreçtir. Bu etkileşim, atom çekirdeklerinin yüksek sıcaklıklarda ısıtılmasıyla gerçekleşir. Örneğin, deuterium (H_2) ve tritium (H^3) füzyonu için $4 \times 10^8\ K°$ sıcaklık gereklidir. Atom çekirdeklerinin birleşmesinden sonra, başlangıçtaki çekirdeklerin kütlesi ile oluşan parçacıklar arasında büyük bir kütle farkı meydana gelir. Bu kütle farkı, enerji olarak açığa çıkar. Füzyon reaksiyonları sırasında açığa çıkan enerji, fisyon reaksiyonlarından çok daha büyük olabilir [29]. Şekil 4'te tipik bir füzyon reaksiyonu mekanizması göstermektedir.



Şekil 4. Tipik bir füzyon reaksiyonu mekanizması [30].

Nükleer fisyon, son derece yüksek enerji yoğunluğuna sahip olan ve birim yakıt kütlesi başına büyük miktarda enerji üreten bir yöntemdir. Kimyasal reaksiyonlarla enerji üretme sürecine kıyasla, fisyon reaksiyonu kullanıldığında, aynı enerji miktarını elde etmek için gereken malzeme miktarı oldukça azdır. Örneğin, tipik bir nükleer reaktörde 1 kg uranyumdan elde edilen fisyon enerjisi, 45000 kg odun, 15000 kg

petrol, 22000 kg kömür veya 14000 kg likit doğal gazın yanmasından elde edilebilecek enerji miktarına eşdeğerdir (Tablo 1) [22].

Kıyaslandığında, nükleer enerjinin güneş ve rüzgâr gibi yenilenebilir enerji kaynaklarıyla, aynı güç miktarını üretmek için daha küçük bir alan gerektirdiği gözlemlenmektedir. Örneğin, günümüz teknolojisiyle donatılmış bir 900 MWe kapasiteli nükleer enerji santrali bir yılda ürettiği elektriği sağlarken, bu miktarı elde etmek için verimlilik ve kullanılabilirlik faktörleri göz önünde bulundurulduğunda, yaklaşık 70 km^2'lik güneş panelleri ve binlerce rüzgâr türbini gerekmektedir [22].

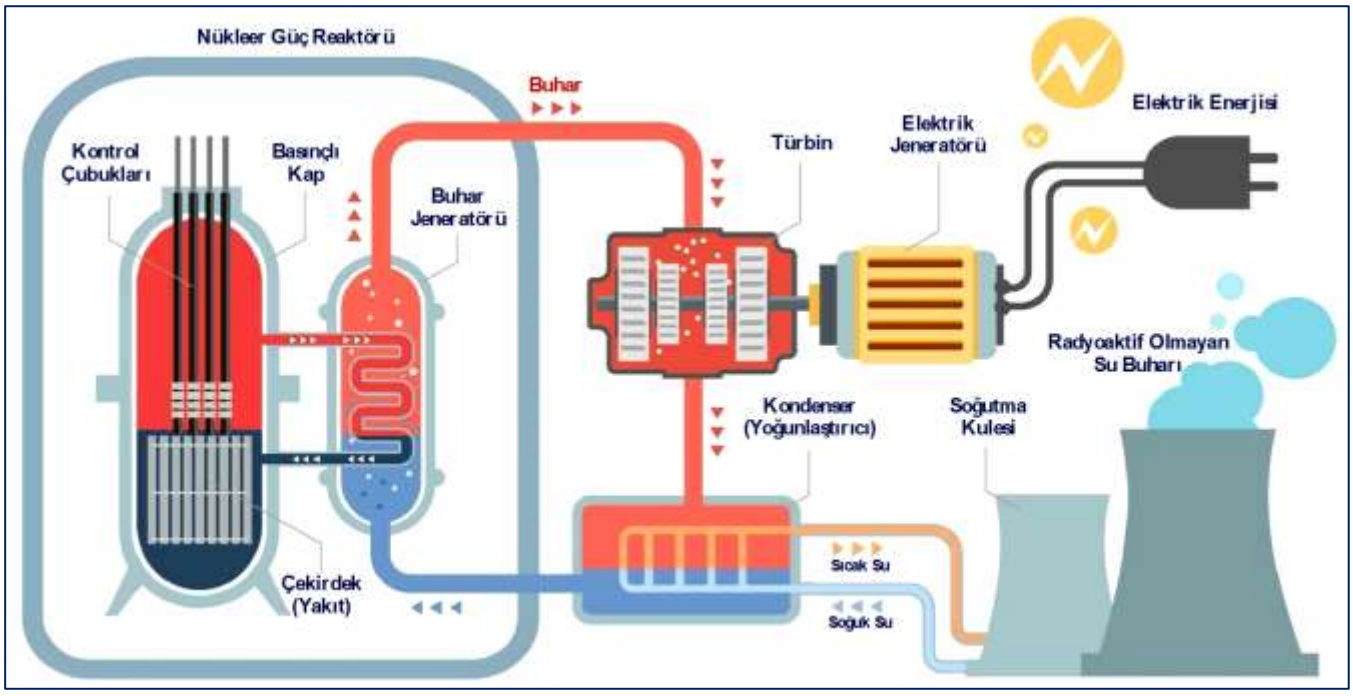
Tablo 1. Farklı yakıt türleri enerji içerikleri (ton/GJ) [22].

Yakıt Cinsi (ton)	Yaklaşık Enerji İçeriği (GJ)
Odun	14
Petrol	29
Kömür	42
Doğalgaz (Sıvılaştırılmış)	46
Uranyum (LWR, Tek geçişli)	630.000

III. NÜKLEER GÜÇ SANTRALLERİ

Nükleer enerji santrallerinde, reaktörün içerisinde ana yakıt olarak uranyum-235 atomu kullanılmaktadır. Uranyumun fisyon tepkimesiyle parçalanması sonucunda ortaya çıkan yüksek enerji miktarı elektrik enerjisine dönüştürülür. Bu büyük enerji, su buharını yüksek sıcaklıklara kadar ısıtarak, buharın türbin şaftını döndürmesini sağlar. Oluşan buhar, buhar türbinlerine iletilir ve bu mekanik hareket elektrik üretimi için alternatör aracılığıyla kullanılır. Jeneratörde üretilen elektrik, bir transformatör yardımıyla yüksek gerilime dönüştürülür ve enerji nakil hatları vasıtasıyla kullanılacağı yerlere iletilir [31], [32]. Şekil 5'te Nükleer enerji santralı çalışma prensipi göstermektedir.

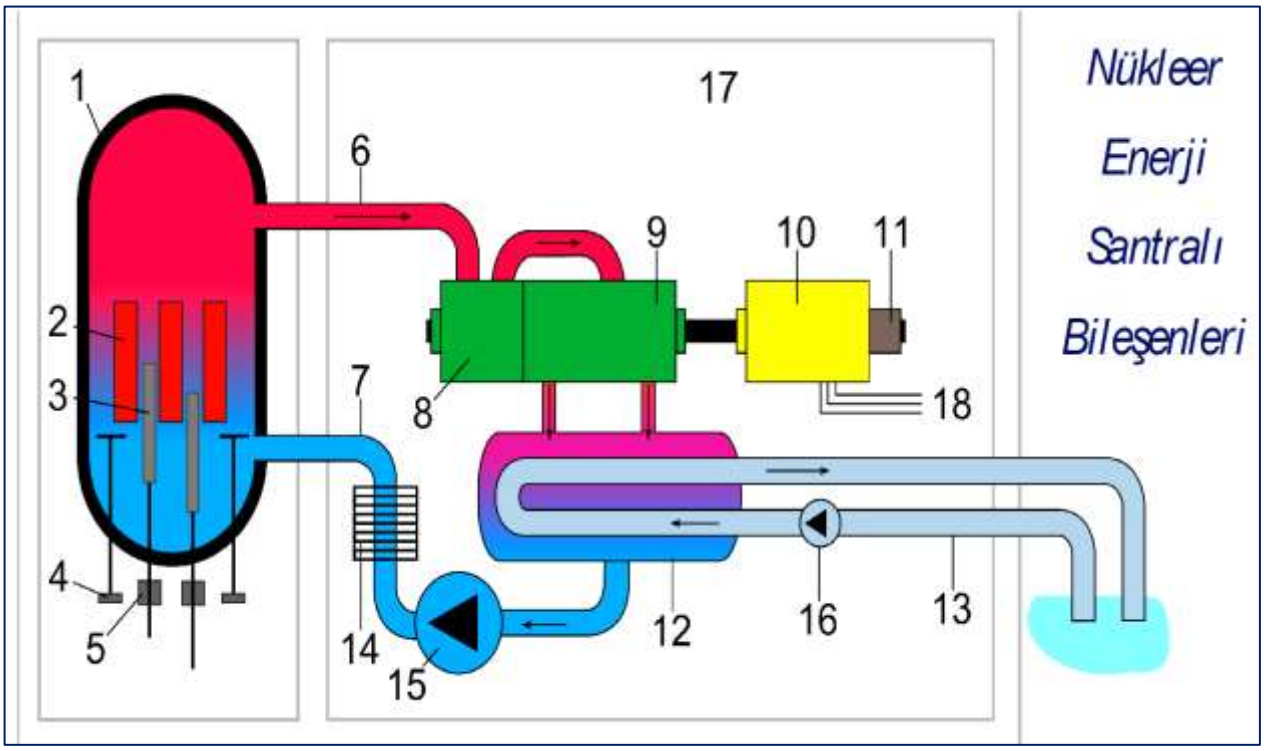
Türbinden çıkan ve basınç ile sıcaklığı düşmüş olan buhar, yoğuşturucuda (kondenser) tekrar sıvı hale dönüştürülür. Yoğuşturucu, bu faz değişimi için çevrede bulunan su kaynaklarını (örneğin deniz veya göl gibi), soğutucu olarak kullanır. Ardından, yoğuşturulan su tekrar reaktörün içine pompalanarak döngü tamamlanır. Bu sistemde su, termik santrallerde olduğu gibi sürekli bir döngü içinde kullanılarak enerji üretimi sürdürülür [31].



Şekil 5. Nükleer enerji santralı çalışma prensip şeması.

Nükleer santraller, kullanılan yakıt, soğutucu, moderatör ve nötron kaynaklarına bağlı olarak sınıflandırılabilir. Bu sınıflandırma, çeşitli alt gruplar içerebilecek şekilde yapılandırılabilir [33].

- Yakıta göre: Reaktörler, tabii ve zenginleştirilmiş yakıt kullanımına göre ayrılabilir.
- Moderatöre göre: Reaktörler, ağır sulu, hafif sulu ve grafik çubuk moderatörlerine sahip olabilir.
- Soğutucuya göre: Reaktörler, hafif sulu, ağır sulu, gaz soğutmalı ve sıvı metal soğutmalı olarak sınıflandırılabilir.
- Nötron kaynaklarına göre: Reaktörler, termal nötronlu ve hızlı nötronlu olarak gruplandırılabilir.
- Nükleer enerji santralı genel olarak bileşenlerini Şekil 6'da göstermektedir. Şekilde sunulan bileşenlerin açıklamaları ve görevleri aşağıda numaralara göre listelenmiştir:
    - Reaktör Kabı: Nükleer enerji santrallerinde, nükleer reaksiyonların gerçekleştiği ve nükleer yakıt çekirdeklerinin barındırıldığı birincil kalkanlı bir yapıdır. Reaktör kabının temel görevi, radyasyonun dış ortama sızmasını engellemek ve reaktör içindeki yüksek basınç ve sıcaklığı kontrol altında tutmaktır.
    - Yakıt Çekirdek Elemanı: Nükleer reaksiyonların gerçekleştiği bölümde bulunan ve nükleer yakıt elementlerini içeren yapısal birimlerdir. Bu elemanlar, reaktör içinde nötronların emilimini ve fisyon reaksiyonlarını destekler.
    - Kontrol Çubuğu Elemanı: Nükleer reaksiyon hızını kontrol etmek için kullanılan ve reaktör içine yerleştirilen malzemelerdir. Bu elemanlar, nötronların absorbe edilmesi yoluyla reaksiyon hızını düzenler ve reaktörün istenilen güç seviyesinde stabil bir şekilde çalışmasını sağlar.
    - Sirkülasyon Pompası: Soğutucu akışkanın (genellikle su) reaktör içinde dolaşımını sağlayan ve buhar üretimi için gerekli olan termal enerjinin transferini kolaylaştıran bir mekanik cihazdır.
    - Kontrol Çubuğu Motoru: Kontrol çubuklarını reaktör içinde hareket ettiren ve reaktörün güç çıkışını düzenleyen elektrikli bir motor sistemidir.
    - Buhar: Reaktörde oluşan termal enerjinin, suyun buharlaşması yoluyla mekanik enerjiye dönüştürüldüğü halidir. Buhar, türbinleri döndürerek elektrik enerjisi üretimi için kullanılır.
    - Girişli Sirkülasyon Suyu: Reaktör içindeki termal enerjinin transferini ve soğutma işlemini sağlamak için reaktöre beslenen soğutucu akışkanın başlangıç noktasıdır.
    - Yüksek Basınç Türbini: Buharı yüksek basınçta alan ve mekanik enerjiye dönüştüren bir türbin türüdür. Bu türbin, yüksek basınçlı buharı alarak elektrik jeneratörünü tahrik eder.
    - Alçak Basınç Türbini: Yüksek basınç türbininden çıkan düşük basınçlı buharı alan ve elektrik enerjisi üretimi için kullanılan ikinci bir türbindir. Alçak basınçlı buharın enerjisini kullanarak jeneratörü tahrik eder.
    - Elektrik Jeneratörü: Mekanik enerjiyi elektrik enerjisine dönüştüren elektromekanik bir cihazdır. Türbinler tarafından döndürülen jeneratör rotoru, manyetik alan içinde döndürülerek elektrik akımı üretilmesini sağlar.
    - Elektrik Jeneratörü Uyarıcısı: Elektrik jeneratörünün çıkış gerilimini ve frekansını kontrol eden ve istenilen elektrik enerjisi parametrelerini sağlayan bir regülasyon sistemidir.
    - Buhar Yoğunlaştırıcı: Kullanılmış buharın soğutularak sıvı haline dönüştürüldüğü bir cihazdır. Yoğunlaştırıcı, buharın dolaşım döngüsünün devamlılığını sağlamak için önemlidir.
    - Kondenser: Buharın yoğunlaştırıcıdan geçerek sıvı hale dönüştüğü birimdir. Kondenser, buharın ısısını çevre ortama aktararak tekrar su haline dönüşmesini sağlar.
    - Ön Isıtıcı Sistemi: Soğutma suyunun ısıtılmasını ve reaktör soğutma döngüsünün verimliliğini artırmayı amaçlayan bir sistemdir.
    - Su Sirkülasyon Pompası: Soğutma suyunun reaktör dolaşımını sağlayan ve soğutma işlemini optimize eden bir mekanik cihazdır.
    - Kondenserli Soğuk Su Pompası: Kondenserde yoğuşan buharın soğuk su ile temasını sağlayarak buharın yoğunlaşmasını ve tekrar su haline dönüşmesini kolaylaştıran bir pompadır.
    - Beton Odası: Nükleer reaktör ve diğer önemli tesisatı korumak için güçlendirilmiş beton yapıdır. Beton odası, çevresel etkilerden korunmayı ve olası kazalara karşı dayanıklılığı sağlar.
    - Elektrik Şebekesine Bağlantı: Üretilen elektrik enerjisinin şebekeye aktarıldığı noktadır. Bu bağlantı, nükleer enerji santralinin ürettiği elektriğin tüketiciye iletilmesini sağlar.



Şekil 6. Nükleer enerji santralı bileşenleri [31].

A. Nükleer Güç Reaktörleri

Nükleer reaktörler, fisyon nükleer zincir reaksiyonunu veya nükleer füzyon reaksiyonlarını başlatmak ve kontrol etmek amacıyla geliştirilmiş teknolojik cihazlardır. Bu reaktörler, genellikle nükleer santrallerde elektrik enerjisi üretimi ve nükleer deniz taşıtlarında güç kaynağı olarak kullanılmaktadır. Nükleer fisyon sürecinden elde edilen ısı, birincil soğutma akışkanı aracılığıyla (genellikle su veya gaz) ikincil bir döngüye aktarılır. Bu döngü, bir geminin pervanesini tahrik etmek veya elektrik jeneratörlerinin rotorlarını döndürmek gibi çeşitli amaçlar için kullanılır [34], [35].

Reaktör, işlevselliğini yakıtı basınçlı suyu ısıtarak sağlar. Bu ısıtma süreci, reaktörün çalışması için gerekli olan termal enerjinin üretilmesini sağlar. Ayrıca, kontrol çubukları reaktör içindeki nötron akışını kontrol eder. Bu çubuklar, gerektiğinde nötronların etkisini azaltarak fisyon reaksiyonunu kontrol edebilir veya tamamen durdurabilirler. Bu şekilde, reaktörün istenen güç çıkışını sağlamak veya güvenliğini sağlamak için kullanılırlar. Bu mekanizma, reaktörün istenilen performans seviyesini korumasını ve potansiyel tehlikeleri önlemesini sağlar [36].

Nükleer reaktörlerin çeşitliliği oldukça geniştir ve enerji güç santrallerde enerji üretiminde en yaygın olarak kullanılan 6 tür reaktör bulunmaktadır [22]. Bu reaktör türleri ve teknik özellikleri aşağıda açıklanmaktadır:

1. Basınçlı Su Reaktörü (Pressurized Water Reactor- PWR)

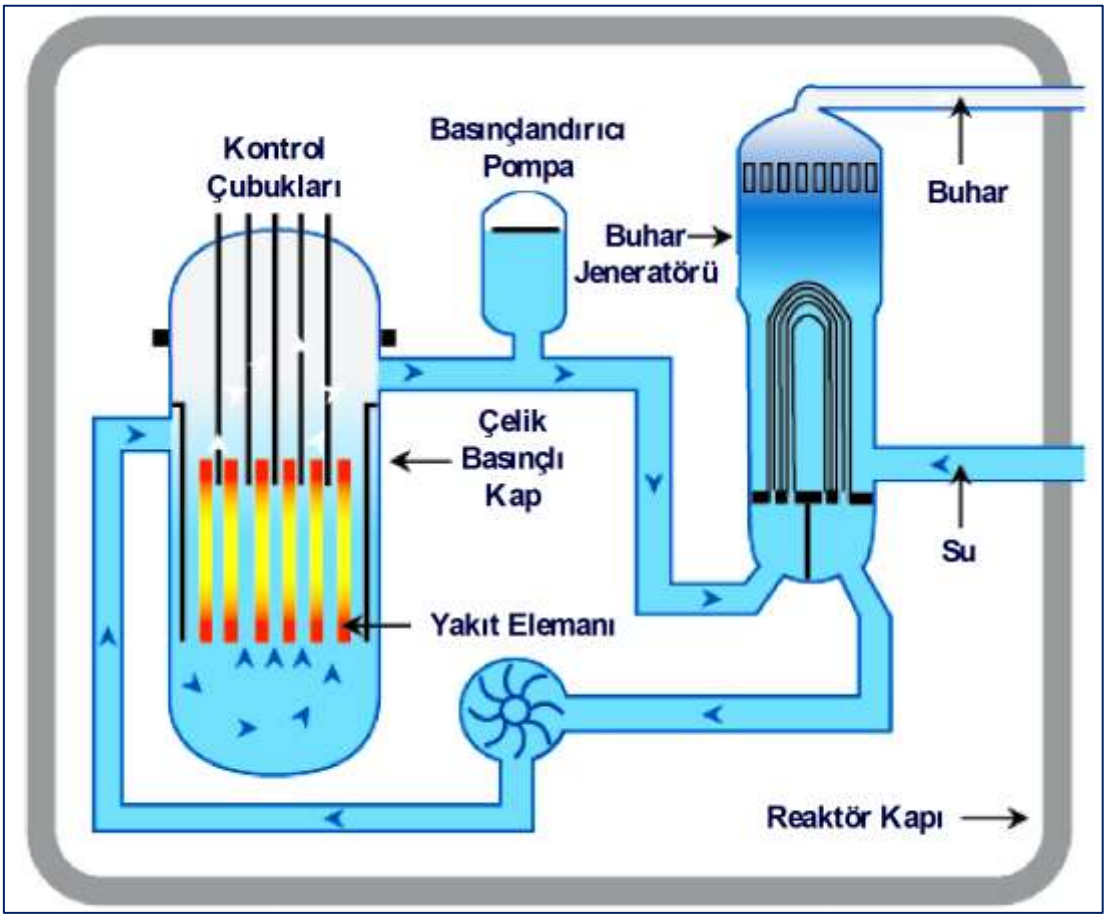
Basınçlı Su Reaktörleri (Pressurized Water Reactor- PWR), nükleer enerji üretiminde yaygın olarak kullanılan reaktörlerdir. Tipik bir PWR tasarımı, çekirdekteki yakıt montajlarının dikey düzenlemesiyle karakterizedir. Genellikle 200-300 çubuktan oluşan bu yakıt montajları, çekirdekte yer alır ve büyük bir reaktörde yaklaşık 150-250 montaj bulunabilir. Reaktör çekirdeğindeki su, yaklaşık 325°C sıcaklığa ulaşır ve 150 atmosfer basınç altında tutularak kaynama önlenebilir. PWR'lerde soğutucu ve yavaşlatıcı olarak normal su kullanılır ve soğutucu yüksek basınç altında tutularak sıvı halde kalması sağlanır. Birincil soğutma devresinde su, aynı zamanda yavaşlatıcı olarak da işlev görür ve buharlaşma, fisyon reaksiyonunu yavaşlatır, bu da güvenlik için önemlidir. İkincil devrede su buhar jeneratörleri olarak işlev görür ve elektrik üretmek için türbinleri tahrik eder. Son olarak, buhar birincil devreye geri döner ve ısı değiştiriciler aracılığıyla soğutulur [22], [36]. Şekil 7'de basınçlı su reaktörü şeması gösterilmektedir.

1. *Kaynar Su Reaktörü (Boiling Water Reactor- BWR)*

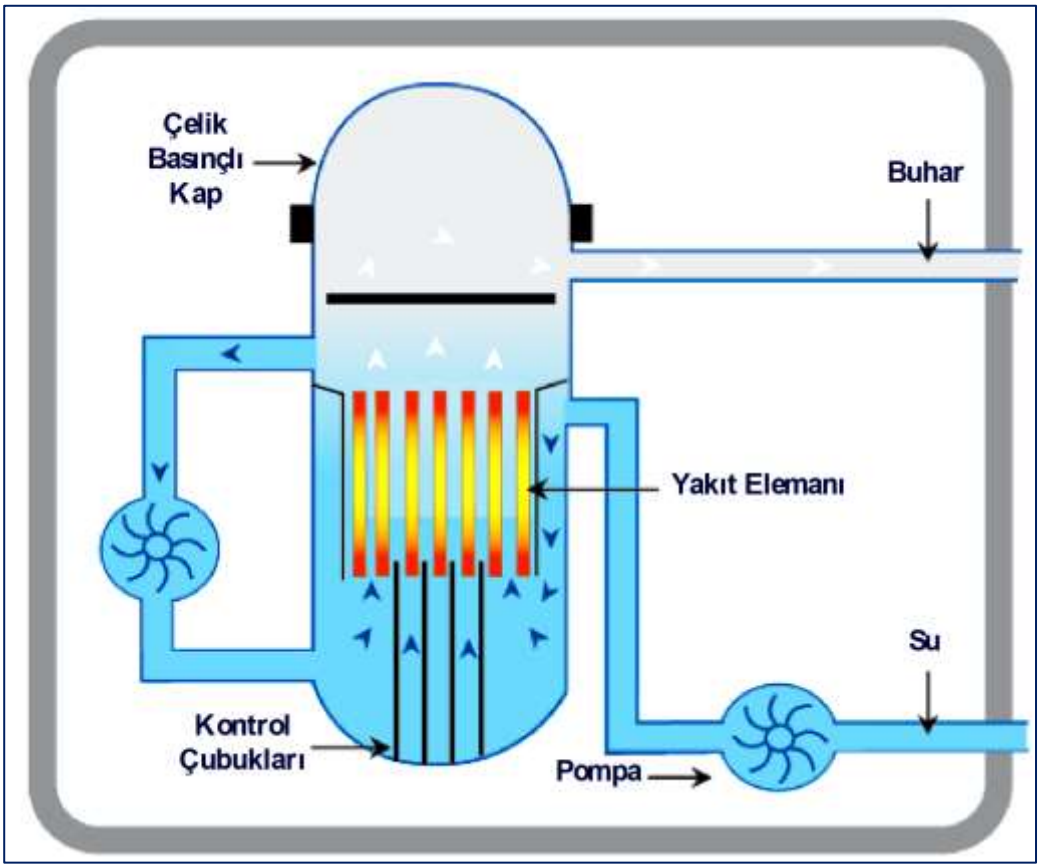
Kaynar Su Reaktörü (Boiling Water Reactor - BWR), düşük basınçta tek bir devre içinde suyun kaynadığı bir yapıya sahiptir. Reaktör, çekirdeğin üst kısmında buhar olarak bulunan suyun %12-15'ini kullanarak daha az soğutma etkisi ve dolayısıyla verimlilik sağlamak üzere tasarlanmıştır. BWR üniteleri, PWR'lere kıyasla daha kolay yük takibi yapabilirler ve buhar direkt olarak reaktör devresinin bir parçası olan türbinlere iletilir. Radyonüklidlerle kirlenmiş su nedeniyle türbin bakımı sırasında radyolojik koruma gereklidir. BWR yakıt montajı, genellikle 90-100 yakıt çubuğundan oluşur ve bir reaktör çekirdeğinde 750'ye kadar montaj bulunabilir, toplamda 140 ton uranyumu barındırabilir. İkincil kontrol sistemi, çekirdeğin içinden su akışını kısıtlayarak, üst kısımdaki daha fazla buharın yavaşlamayı azaltmasını sağlar [22], [36]. Şekil 8'de kaynar su reaktörü şeması gösterilmektedir.

2. *Basınçlı Ağır Su Reaktörü (Pressurized Heavy Water Reactor- PHWR)*

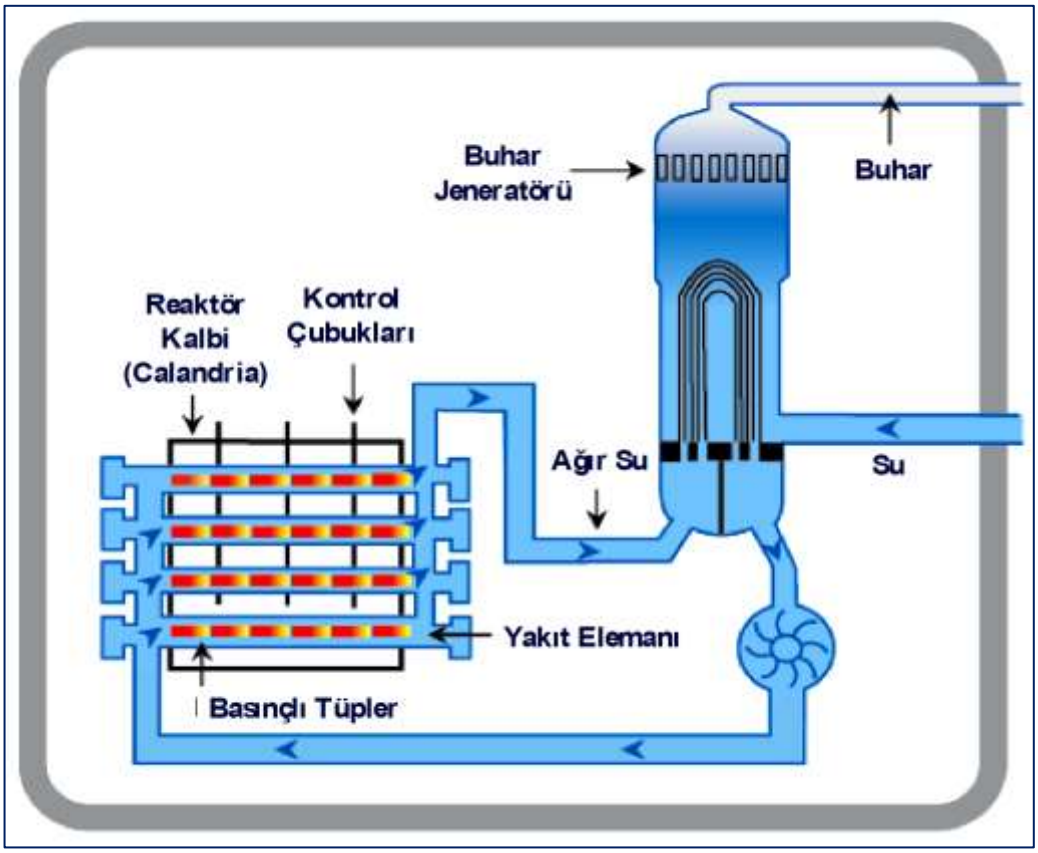
Basınçlı ağır su reaktörleri (PHWR'ler), nükleer reaktörlerin bir alt tipi olarak, soğutma ve nötron moderasyonu işlevlerini ağır su (deuterium oksit- D_2O) kullanarak gerçekleştiren sistemlerdir [37]. Bu reaktörler genellikle doğal uranyum yakıtını tercih etmekle birlikte, zaman zaman düşük oranda zenginleştirilmiş uranyum da kullanılmaktadır. Ağır su soğutucuları, basınç altında tutularak kaynamayı engeller ve bu şekilde, basınçlı su reaktörlerine benzer şekilde, daha yüksek sıcaklıklara (çoğu zaman) buhar kabarcıkları oluşturmadan ulaşılmasını sağlar. Ağır suyun genellikle hafif suya kıyasla izole edilmesi maliyetlidir; ancak, nötronların düşük emilimi sayesinde, zenginleştirilmiş yakıt kullanımı gereksinimini ortadan kaldırarak reaktörün nötron verimliliğini büyük ölçüde artırır. Ağır suyun yüksek maliyeti, doğal uranyum veya alternatif yakıt çevrimlerinin kullanımındaki düşük maliyetle dengelenmektedir [38].



Şekil 7. Basınçlı su reaktörü şeması [36].



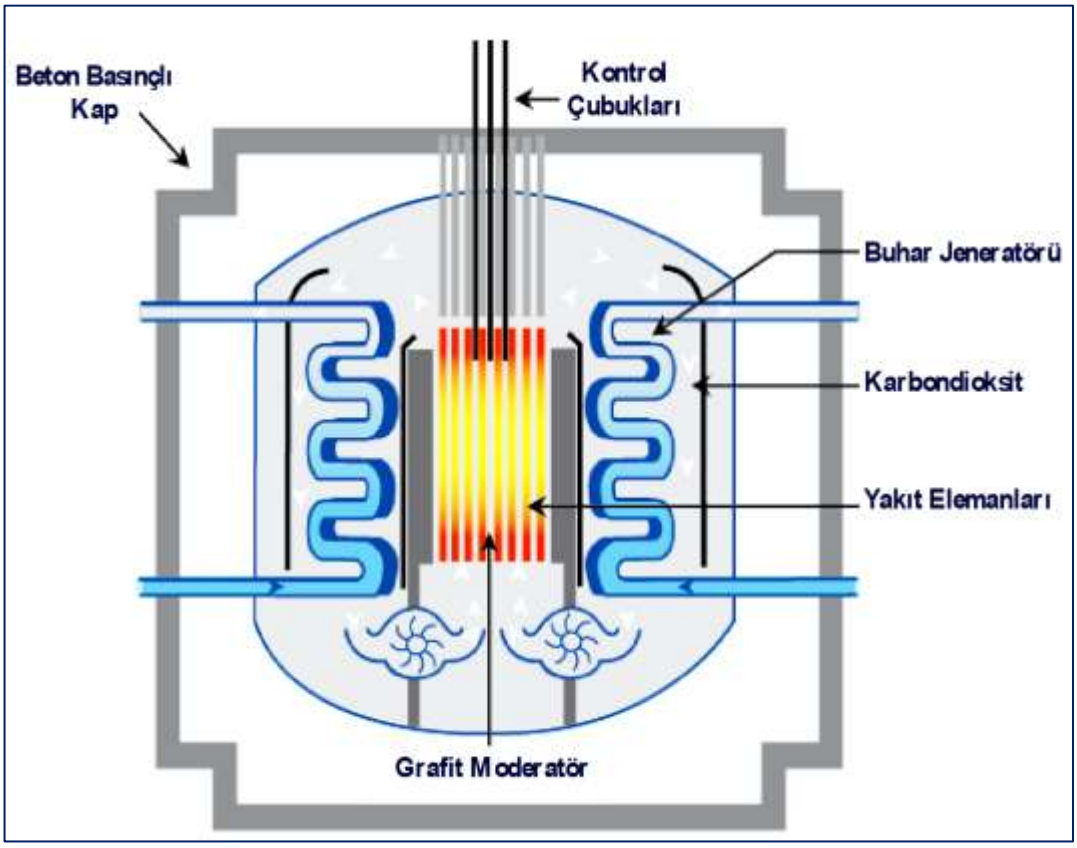
Şekil 8. Kaynar su reaktörü [36].



Şekil 9. Basınçlı döteryum reaktörü [36].

3. Gaz Soğutmalı Reaktör (Gas Cooled Reactor– GCR)

Gaz soğutmalı reaktörler, İngiliz gaz soğutmalı reaktörlerinin ikinci nesli olup birincil soğutucu olarak grafit moderatör ve karbondioksit kullanmaktadır. Bu reaktörlerde, yakıt olarak paslanmaz çelik tüpler içinde %2,5 - 3,5 oranında zenginleştirilmiş uranyum oksit topakları kullanılmaktadır. Karbon dioksit birincil devrede dolaşmakta olup 650°C'ye kadar ulaşmaktadır ve daha sonra dışarıdaki buhar jeneratörü tüplerini geçmektedir. Bununla birlikte, reaktör çekirdeği beton ve çelik basınçlı kabın içinde yer almaktadır, bu da ona 'integral' bir tasarım kazandırmaktadır. Kontrol çubukları moderatöre nüfuz ederken, ikincil kapatma sistemi soğutucuya nitrojen enjekte etmeyi içermektedir. Bu reaktör tasarımı yüksek sıcaklıkta çalışarak yüksek termal verim sağlamaktadır, yaklaşık olarak %41'e kadar [22], [36].



Şekil 10. Gaz soğutmalı reaktör şeması [36].

4. Kurşun-Sodyum Soğutmalı Reaktör (Liquid-Metal Fast-Breeder Reactor- LMFBR)

Kurşun-Sodyum Soğutmalı Reaktör (LMFBR), ışık suyu reaktörlerinden (termal reaktörlerin en yaygın türü) farklı bir prensibe dayanır. Işık suyu reaktörleri, moderasyon ve soğutma amaçları için normal su kullanırken, LMFBR'ler bu işlevleri genellikle kurşun ve sodyum içeren bir sıvı metal karışımıyla gerçekleştirir. Bu değişim, farklı işletme özellikleri ve avantajlar sağlar. Işık suyu reaktörlerinde, hafif hidrojen izotopunun varlığı hafif bir nötron zehiri olarak hareket eder ve bu da yapay olarak zenginleştirilmiş yakıtların kullanılmasını gerektirir. Bu zenginleştirme süreci, yakıt üretim sürecine karmaşıklık ve maliyet ekler. Ayrıca, nötronların ışık suyunda moderasyonu sıcaklık değişikliklerine duyarlıdır. Su sıcaklığı arttığında, yoğunluğu azalır ve daha az nötron yeterince yavaşlatılarak daha fazla tepkimeyi tetikler. Bu içsel negatif geri besleme mekanizması, reaksiyon hızını stabilize eder. Buna karşılık, grafit ve ağır su reaktörleri, ışık suyu reaktörlerine göre daha verimli termalizasyon elde ederler. Bu artırılmış termalizasyon, hafif hidrojen zehirleme etkilerinin olmamasıyla birleşince, bu reaktör tiplerinin doğal uranyum veya zenginleştirilmemiş yakıtı kullanmasını sağlar. Dolayısıyla, yakıtın kullanılabilirliği ve maliyet etkinliği açısından potansiyel avantajlar sunarlar [22], [36].

5. *Florid-Toryum Reaktör (Molten Salt Reactor Experiment - MSRs)*

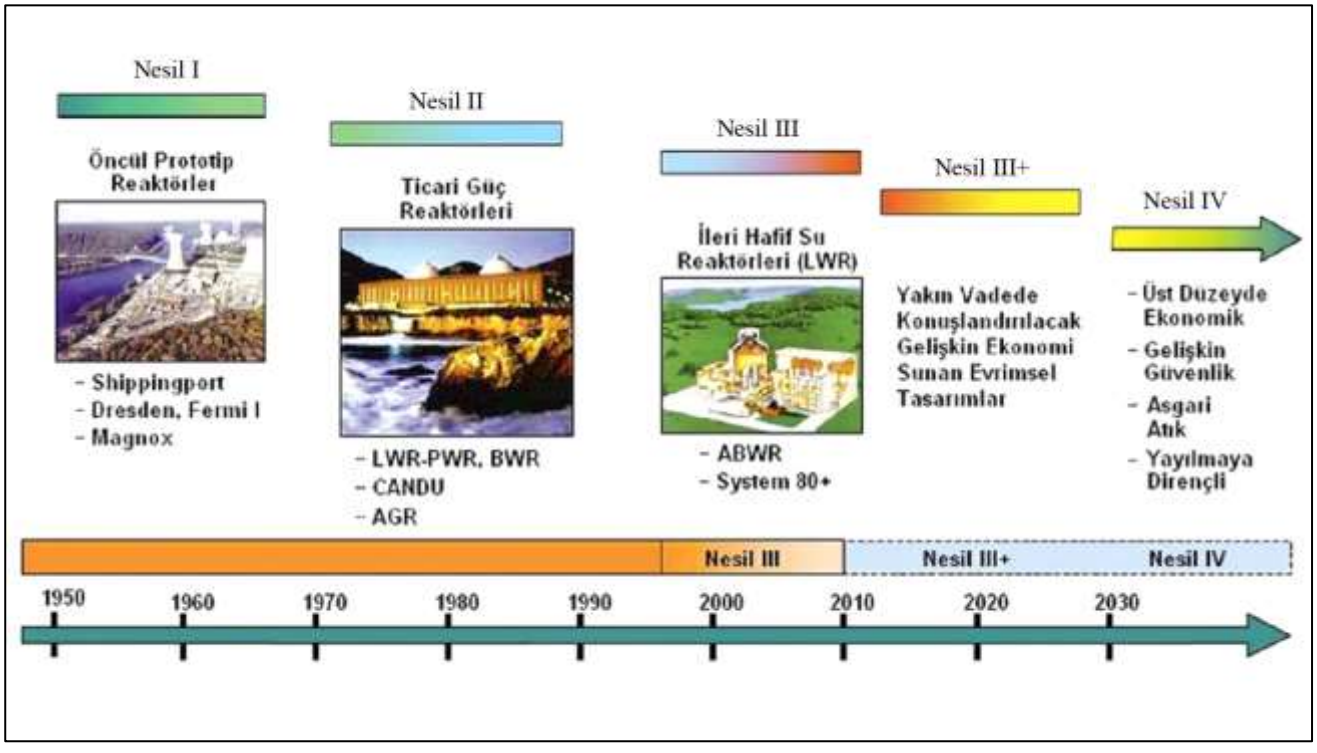
Florid-Toryum Reaktörü (Ergimiş Tuz Reaktör Deneyi), lityum veya berilyum gibi hafif elementler tarafından modere edilir. Bu elementler, soğutucu/yakıt matris tuzlarının birer bileşeni olan "LiF" ve "BeF_2", "LiCl" ve "$BeCl_2$" gibi tuzlarda bulunurlar. Bu tuzlar, moderasyon etkisi yaratarak reaktörde düzenleyici bir rol oynarlar [22].

B. Nükleer Reaktör Nesilleri

Nükleer reaktörler, teknolojinin evrimiyle birlikte farklı nesillerin ortaya çıkmasına olanak tanımıştır. Elektrik üretimi amacıyla 1950'lerde başlayan ilk reaktörler, 1. nesil olarak sınıflandırılmaktadır (Şekil 11). Enrico Fermi tarafından 1942'de geliştirilen atom pilinin ardından dünyanın ilk nükleer reaktörü olarak kabul edilmiştir. ABD'nin Idaho eyaletinde 1951'de 100 kW gücündeki ERB-I adlı deneysel reaktörde elektrik üretimi gerçekleştirilmiştir. Elektrik şebekesine güç sağlamak amacıyla kurulan ilk nükleer santral ise 1954'te Rusya'da faaliyete geçmiştir [39].

Nesiller:

1. Nesil:
   - Elektrik üretimi amacıyla 1950'lerde kurulan ilk reaktörler.
   - Enrico Fermi tarafından 1942'de geliştirilen atom pilinin ardından gelen reaktörler.
   - Dünyanın ilk nükleer reaktörü olarak kabul edilenler.
2. Nesil:
   - Ticari amaçlarla 1990'ların sonlarına kadar inşa edilen reaktörler.
   - PWR, BWR, PHWR, GCR gibi tipik reaktörler.
3. Nesil:
   - 2. nesil reaktörlerin yakıt teknolojisi, verimlilik ve güvenlik sistemleri gibi alanlarda geliştirilmiş versiyonları.
   - Japonya'da 1996'da faaliyete geçen Kashiwazaki-Kariwa Nükleer Santrali gibi örnekler.
4. Nesil:
   - Henüz teorik aşamada olan ve ticari işletmeye açılması için 2030 yılına kadar beklenen reaktör tasarımları.



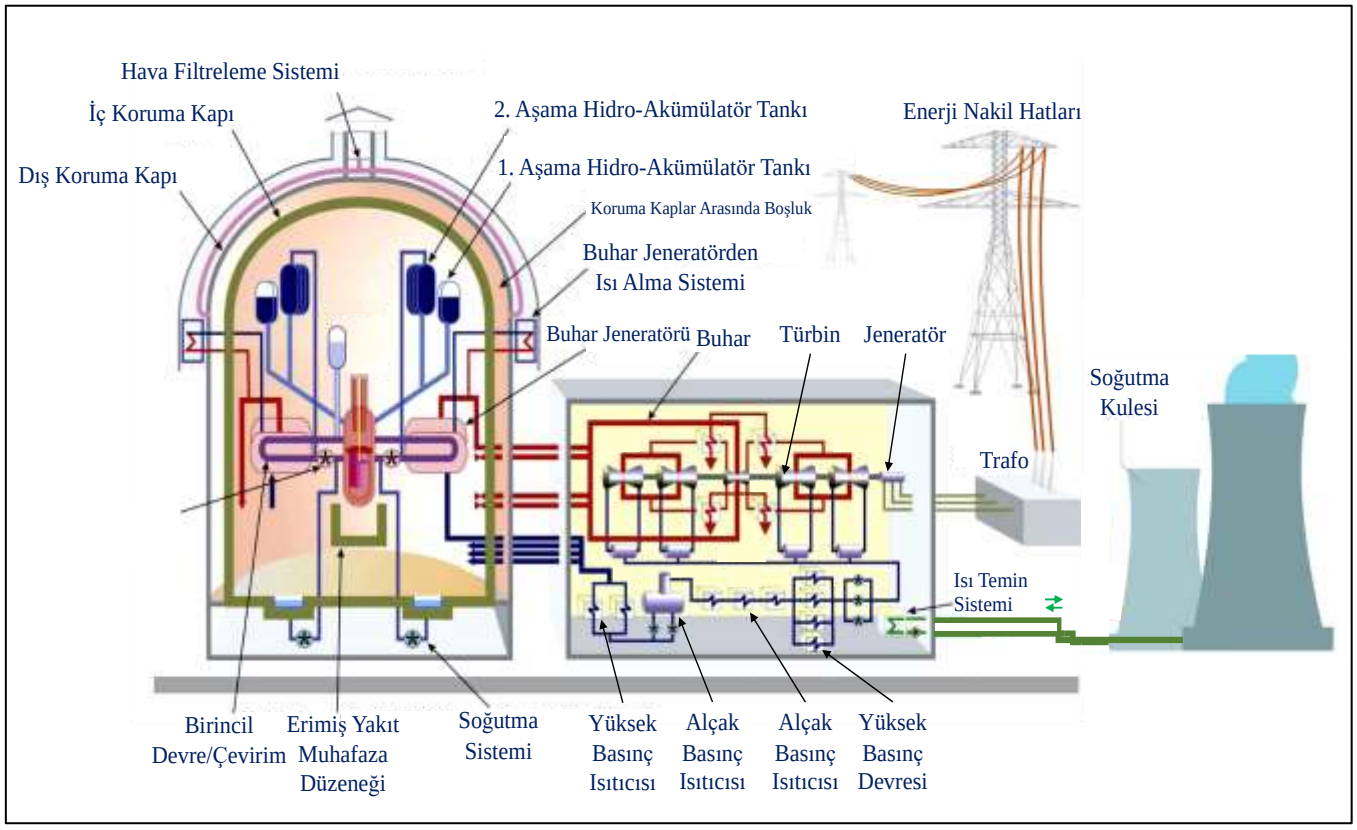
Şekil 11. Nükleer Enerji Reaktörleri Gelişimi [39].

IV. AKKUYU NÜKLEER GÜÇ SANTRALI'NIN TEKNİK ÖZELLİKLERİ

Akkuyu Nükleer Enerji Santralı, Türkiye'nin ilk nükleer enerji tesisidir ve Mersin ilinde, Türkiye'nin güney sahilinde konumlanmıştır. Bu santral, Rusya'nın devlet şirketi ROSATOM (ROSTECHNADZOR) tarafından geliştirilmekte olan bir projedir. İnşası, Türkiye ile Rusya arasında 2010 yılında imzalanan bir hükümetler arası anlaşma ile başlatılmıştır. Santral 4 üniteden oluşmaktadır, toplamda 4.800 megavatlık bir kapasiteye sahip olması ve yılda ortalama 35 milyar kWsaat üretim yapması beklenmektedir, bu kapasite, dört adet VVER-1200 tipi reaktör tarafından sağlanacaktır [40].

Santralı'nın temel tasarımı, çift devreli bir VVER (Su-Su-Enerji Reaktörü) olarak bilinmektedir. Bu tasarım, tipik bir ünitenin şematik gösterimi Şekil 12'de sunulmuştur. Reaktörün merkezinde yakıt bulunur ve su, yakıt elemanları arasındaki boşluklardan yukarı doğru hareket ederek fisyon sürecinde ortaya çıkan ısıyı uzaklaştırır. Bu su, ısıyı uzaklaştırmak için kullanılan "soğutucu" olarak adlandırılır ve çünkü ısı kaynağı radyoaktif olduğundan, soğutucu da radyoaktiftir. Bu durum, suyun saflığı ve kapalı bir sistem gerekliliği gibi kuralların titizlikle uygulanması gerektiğini açıkça ortaya koymaktadır [8].

Soğutma suyu, bir buhar üreteci olarak adlandırılan ara eşanjörün borularından geçirilir. Üreteç içerisinde, ikinci devrede bulunan su ısınır ve buhar haline dönüşür. Oluşan buhar, türbin şaftını döndürür. Bu düzenek sayesinde, ikinci devredeki besleme suyu ile birinci devredeki soğutucu suyun karışması önlenir ve ikinci devrenin radyoaktif kirlenmesi engellenir. Reaktör ve birinci devre, koruyucu kabın içerisinde yer alır ve burada bulunan emici vantilasyon sistemleri, içerideki basıncı atmosferik basıncın altında tutar. Bu yöntem, kirli havanın kontrolsüz bir şekilde yayılmasını önler ve santral çevresine zarar vermez [8].



Şekil 12. Akkuyu nükleer santrallı bir ünitede temel üretim akım şeması.

A. *Reaktör Tasarımı ve Tipi*

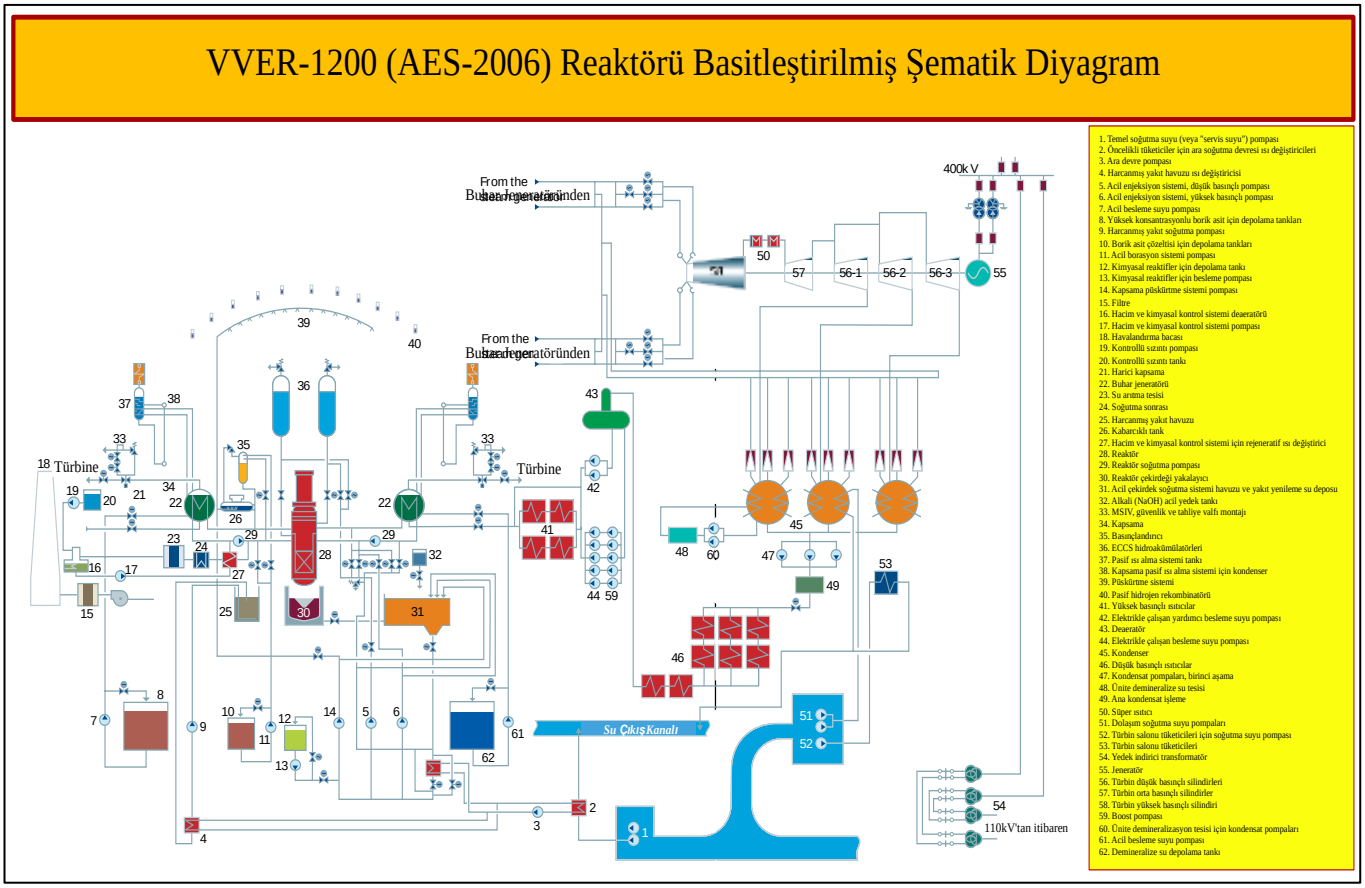
Akkuyu'da faaliyet gösteren reaktör, VVER-1200 üçüncü nesil versiyonunu temel alarak basınçlı su reaktörü tipindedir [41]. VVER-1200, 3200 MW termal güce sahip dört dolaşım devreli bir basınçlı su reaktörüdür ve hafif suyu nötron yavaşlatıcı ve soğutucu olarak kullanır. Reaktör çekirdeğinde toplam 163 adet yakıt demeti bulunmaktadır ve yakıt ikmali 12 aylık periyotlarla gerçekleştirilmektedir. Yakıt döngüsü süresi ise dört yıldır. Bu reaktörde %3.6 oranında zenginleştirilmiş U-235 izotopu kullanılmaktadır [40].

Bu tür reaktörlerde hafif su, hem nötron moderatörü hem de soğutucu olarak kullanılır. VVER reaktörü, dünyanın en güvenli reaktörlerinden biri olarak kabul edilmektedir [8], [42].

Reaktör, çift kat koruma sistemi ile donatılmıştır. İlk koruma seviyesinde, 169 ton ağırlığında, 5,8 metre yüksekliğinde ve 6,1 metre çapında bir koruyucu yer almaktadır. Ayrıca, reaktör tasarımı, tehlike anlarında elektrik beslemesine ihtiyaç duymadan çalışabilme yeteneğiyle desteklenmiştir. Güvenlik önlemleri, kontrol çubukları, aktif ve pasif acil durum soğutma sistemleri, acil durum borik asit enjeksiyon sistemi ve reaktör çekirdeği ile yakıt havuzundan acil durumda ısı transferini içeren önlemleri içerir [42]. Tablo 2'de Akkuyu santrallerinde kullanılan reaktör özellikleri sunmaktadır.

Reaktör kabı, yakıt ve kontrol çubuklarını koruyarak reaktörün işlevselliğini sağlamaktadır (Şekil 14). Herhangi bir reaktörün temel özellikleri, yüksek güç çıkışından kaynaklanmaktadır. Örneğin, 1 MWth gücündeki bir reaktör, zirkirleme reaksiyonları sonucunda 3x10^16 çekirdek fisyonunu içerir. Reaktör kabında, aktif çekirdek yakıt elemanları bulunmaktadır. Her bir yakıt elemanı, belirli miktarda yakıt çubuğunu içerir. Reaktör üst yapısında kontrol çubukları ve ilgili bileşenler yer almaktadır. Dışsal radyasyona karşı biyolojik zırhlama, beton yapı üzerinde sağlanmaktadır. Soğutucu, dört ayrı dolaşım döngüsünde dolaşır. Her döngü, ana dolaşım ("sirkülasyon") pompası ve boru hatlarından oluşur, soğutma suyunun basınçlı dolaşımını sağlar. Şekil 15, soğutucunun dört ayrı dolaşım döngüsünü göstermektedir. Her döngü, soğutma suyunun basınçlı dolaşımını sağlayan ana dolaşım ("sirkülasyon") pompası ve boru hatlarından oluşur [8]

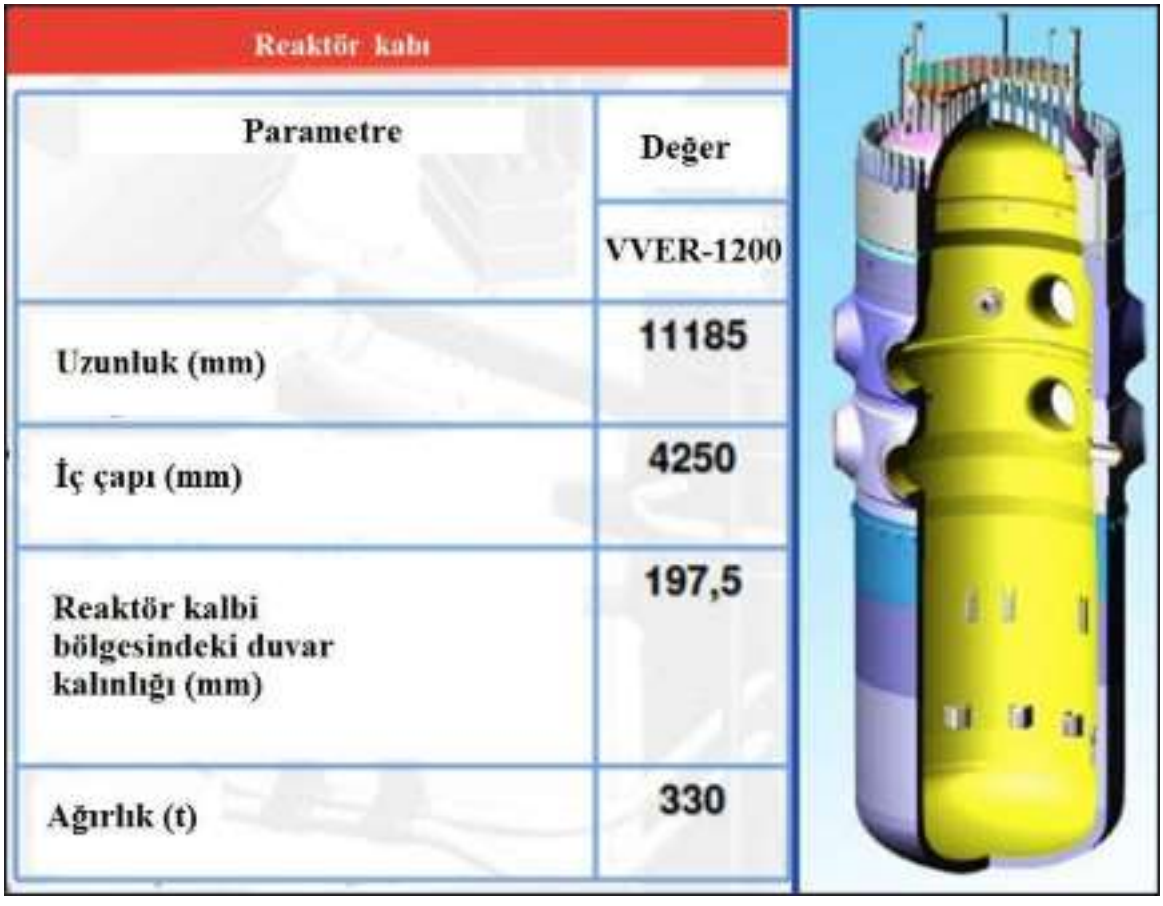
Nükleer güç santrallerinin güvenli işleyişiyle ilgili temel bir konu, yakıtın yanması sırasında ortaya çıkan radyoaktif maddelerin çevreye salınmasını önlemektir. Bu sorunu çözmek için, nükleer güç santrallerinde reaktör sistemleri ve bileşenlerinin tasarımında fiziksel bariyerlerin kullanılması öngörülmüştür. Buhar üreteci, soğutma suyunun dolaştığı küçük tüplerden oluşan bir bölümdür. Şekil 16, buhar üreteciyi göstermektedir. Buhar üreteci, soğutma suyunun dolaştığı küçük tüplerden oluşan bir bölümdür ve reaktörün termal enerjisini elektrik enerjisine dönüştürmek için kullanılır [8].



Şekil 13. VVER-1200 reaktörü basitleştirilmiş şematik diyagram [43].

Tablo 2. Kullanılan VVER-1200 reaktör özellikleri.

Kullanılan VVER Reaktör Özellikleri	
Kategori	Basınçlı su reaktörü
Nesil	III+
Reaktör Hattı	VVER (Voda Voda Energo Reactor)
Reaktör Modeli	VVER-1200/513 (TOI Standardı ile AES-2006)
Yakıt	235U (Düşük zenginleştirilmiş uranium)
Yakıt durumu	Sağlam
Ömrü (yıl)	60
Kullanılabilirlik (%)	90
Nötron enerji spektrumu	Termal
Birincil kontrol yöntemi	Kontrol çubukları
Birincil moderatör	su
Birincil soğutma sıvısı	Sıvı (hafif su)
Birincil kullanım	Elektrik üretimi
Güç (termal)	3,212 MWt
Isı tedarik kapasitesi (Termal)	300 MWt
Güç (elektrik)	1,200 MWel
Tasarıma dayalı maksimum yakıt tüketimi (yakıt grubu başına ortalama) (MWd/kgU)	60
Yakıt kampanyası süresi (yani çekirdekteki yakıt ömrü) (yıl)	4
Birincil soğutma suyu sıcaklığı çekirdek girişinde (°C)	298.2
Birincil soğutma suyu sıcaklığı çekirdek çıkışında (°C)	328.9
Reaktör kabı boyunca birincil soğutucu akış hızı (m3 /saat)	86000
Reaktör kabı çıkışındaki birincil soğutucu basıncı (MPa)	16.2
Buhar jeneratörü çıkışındaki buhar basıncı (MPa)	7



Şekil 14. Reaktör kabı [8].

Şekil 15. Buhar üreteci [8].

B. *Ana Ekipmanı*

Akkuyu NGS'nin temel ekipmanı, aşağıdaki bileşenlerden oluşmaktadır [8]:

- Dört adet VVER1200 tipi su reaktörü, her biri 60 yıllık ömrü olan ve 3.200 MW ısıl kapasiteye sahip. Bu reaktörlerde nükleer yakıt olarak uranyum dioksit kullanılmaktadır.
- Reaktör için soğutma ve moderatör görevi gören, borik asit içeren ve kimyasal olarak demineralize edilmiş su. Suyun konsantrasyonu işletme sürecinde değişkenlik gösterir.
- Her biri 6,9 MPa basınçla 1600+112 t/s kuru doygun buhar üretebilen dört adet yatay tip PGV-1000MKP buhar üreteci.
- Dört ana dolaşım pompa seti, GCNA-1391 modeli.
- Kullanılan bir türbin-jeneratör seti, K-1200-6,8/50 modeli.

Reaktör, buhar üreteçleri ve diğer birincil/ana ekipmanlar, çift katmanlı betonarme bir koruma kabı içerisinde yer alır. Bu çift katmanlı koruma kabı şunlardan oluşur:

- Acil durumlara dayanıklı, kaza kontrol (lokalleştirme) bölgesinde kullanılmak üzere tasarlanmış, ön gerilmeli betonarme iç koruma kabı.
- Dış etkenlere karşı koruma sağlamak ve acil durumlarda iç koruma kabından sızabilecek radyasyonu önlemek ve iki koruma katmanı arasındaki alana sınırlama getirmek amacıyla yapılan ön gerilmeli olmayan betonarme dış koruma kabı.

C. *Elektrik Sistemleri*

AKKUYU Nükleer Enerji Santralı'nın elektrik sistemleri, enerji üretimi ve dağıtımı ile yardımcı güç kaynaklarını içermektedir. Elektrik üretim ve dağıtım sistemi, 1.200 MW kapasiteli, 24 kV üreteç, 24 kV üreteç kesicisi, 24 kV akım kablolarını bağlayan ünite transformatörleri, esnek konnektörler ve 380 kV yüksek gerilimli şalt birimlerinden oluşmaktadır. SF6 izolasyonlu ana şalter / kontrol şalteri, 154 kV bağlantı ototransformatörleri ile 154 kV ve 380 kV bağlantı şaltları da bu sisteme dahildir [8].

Nükleer Güç Santralı yardımcı güç kaynağı sistemleri, işletim, bekleme ve acil durum güç kaynaklarını içerir. Bu sistem, 10 kV ve 0,4 kV AC ile 220 V, 110 V DC gerilim seviyelerinde dağıtım yapabilen bir altyapıya sahiptir. Yardımcı güç kaynağı, iç ve dış kaynaklar olmak üzere iki ana kısımdan oluşur. Normal işletme koşullarında, yardımcı güç kaynağı iç kaynağı türbin üreteci iken, acil durumlarda yardımcı güç kaynağı dizel üreteçler ve akümülatör bataryalarından sağlanır [8].

Santralin soğutma düzeni, deniz suyunun tek bir geçişte ısı değişim ünitesinden geçirilmesine dayanan bir sistemdir. Akkuyu NGS'nin soğutma suyu denizden temin edilmektedir. Güvenlik sistemleri için kullanılan nihai ısı kuyusu da deniz kaynaklıdır. Nükleer Güç Santralı güvenlik sistemleri, koruma, yerelleştirme, destek ve kontrol sistemlerini içerir. NGS ayrıca tasarıma dayalı ve tasarım dışı kaza yönetim sistemlerine de sahiptir [8].

NGS'nin güvenliği, iyonlaştırıcı radyasyon ve radyoaktif maddelerin çevreye salınımını engellemeye yönelik fiziksel bariyer sistemine dayanmaktadır. Bu bariyerlerin korunması ve etkin hale getirilmesi için teknik ve idari tedbirler alınmaktadır. Personel, nüfus ve çevre koruma tedbirleri de kesintisiz olarak uygulanmaktadır [8].

Yakıt matrisi, yakıt elemanları muhafazası, reaktör soğutucu akışkan devresinin sınırları ve reaktör ünitesinin sızdırmaz muhafazası gibi ana fiziksel bariyerlerden oluşmaktadır. Tüm bariyerler, etkinlik ve güvenilirlik açısından düzenli olarak kontrol edilmektedir. Gaz ve aerosol salımları, özel iyot ve aerosol filtreleri ile donatılmış ventilasyon sistemlerinden geçirilir [8].

V. SONUÇLAR

Bu çalışma, Akkuyu Nükleer Güç Santralı'nın teknik özelliklerini ve bileşenlerini detaylı bir şekilde inceledi. Aşağıdaki sonuçlar elde edilmiştir:

- Akkuyu Nükleer Enerji Santralı, Türkiye'nin ilk nükleer enerji tesisidir ve Rusya'nın ROSATOM tarafından geliştirilmektedir. Türkiye'nin güney sahilinde konumlanmış olup toplamda 4.800 megavatlık bir kapasiteye sahip olacak şekilde planlanmıştır.
- Santralın temel tasarımı, VVER-1200 tipi çift devreli bir basınçlı su reaktörüdür. Bu reaktörler, düşük zenginleştirilmiş uranyum kullanarak termal enerjiyi elektrik enerjisine dönüştürmektedir.
- Ana ekipmanlar arasında dört adet VVER-1200 tipi su reaktörü, buhar üreteçleri, ana dolaşım pompaları ve türbin-jeneratör seti bulunmaktadır. Tüm bu ekipmanlar çift katmanlı betonarme bir koruma kabı içerisinde yer almaktadır.
- Elektrik sistemleri, enerji üretimi, dağıtımı ve yardımcı güç kaynaklarını içerir. Normal işletme koşullarında, güç kaynağı türbin üretecidir ancak acil durumlarda dizel üreteçler devreye girer.
- Santralin güvenliği, iyonlaştırıcı radyasyon ve radyoaktif maddelerin çevreye salınımını engellemeye yönelik fiziksel bariyer sistemine dayanmaktadır. Ayrıca, gaz ve aerosol salımları için özel filtrelerle donatılmış ventilasyon sistemleri bulunmaktadır.

Bu sonuçlar, Akkuyu Nükleer Güç Santralı'nın teknik olarak güçlü, güvenli ve çevreye duyarlı bir tesis olduğunu göstermektedir. Gelecekte, bu santralin Türkiye'nin enerji ihtiyacına önemli bir katkı sağlaması beklenmektedir.

Prospects for modernizing energy supply in the Republic of Uzbekistan: Introduction of modern technologies and sustainable development

Amurova Natalia Yurevna

Senior Lecturer, University of Information Technologies, Republic of Uzbekistan

E-mail: amuryonok@list.ru

Abstract – This article examines a set of measures to solve the problem of energy supply in the Republic of Uzbekistan. The main directions include the modernization of energy infrastructure, the introduction of modern control and monitoring technologies, the development of renewable energy sources, the optimization of electricity consumption, the development of international cooperation and support for energy efficiency in industry. These steps are aimed at improving the reliability of energy supply, reducing energy losses and supporting sustainable development of the energy sector in Uzbekistan.

Keywords – energy supply, modernization, control technologies, renewable energy sources, energy efficiency, sustainable development, electricity

I. INTRODUCTION

Modern electrical energy management systems play a critical role in modernizing the energy infrastructure of the Republic of Uzbekistan. The country faces challenges such as increasing electricity consumption, the need to upgrade old energy networks and improve energy efficiency. The introduction of modern management systems is becoming strategically important to ensure sustainable development of the economy and social sector.

Key aspects of modernization are the introduction of digital technologies, integration of distributed energy sources and optimization of load management. Digital platforms allow you to automate the monitoring and management of energy processes, providing accurate forecasting of consumption and optimization of energy consumption. Integrating renewable energy sources requires the development of control systems that can efficiently integrate diverse sources into the grid.

Practical examples of successful implementation of such systems have already been observed in various countries, demonstrating a reduction in energy losses and an increase in the sustainability of energy supply. The introduction of modern electrical energy management systems is necessary to increase energy efficiency and reduce economic costs, contributing to the sustainable socio-economic development of the Republic of Uzbekistan.

Electric power quality assessment is a key aspect of energy infrastructure both globally and in the context of individual countries, including the Republic of Uzbekistan. The quality of electricity is determined by a set of technical parameters, such as voltage stability, frequency, harmonics, absence of interruptions, etc. These parameters are important not only for ensuring the reliability of electrical equipment, but also for maintaining consumer safety and the efficiency of production processes [3].

II. MATERIALS AND METHOD

Globally, power quality is regulated by international standards and guidelines, such as those of the International Electrotechnical Commission (IEC) and the European Association of Electricity Producers

and Distributors (EURELECTRIC). These standards establish requirements for power systems aimed at ensuring stable operation of networks and protecting consumers from possible risks associated with poor quality power supplies.

In the Republic of Uzbekistan, assessment and control of power quality also includes monitoring of technical parameters of network systems, carried out by national energy organizations and regulators. The importance of maintaining a high level of power quality in the country is explained not only by the needs of industrial and domestic consumers, but also by the desire to improve energy infrastructure in the context of rapid technological changes and sustainable economic development. Over the past 5 years, the volume of electricity production in Uzbekistan has increased from 61 billion kW/h to 72 billion kW/h, or 1.2 times, which indicates the relevance of this topic. Graph 1 shows the specific electricity consumption for the period 2022-2023.

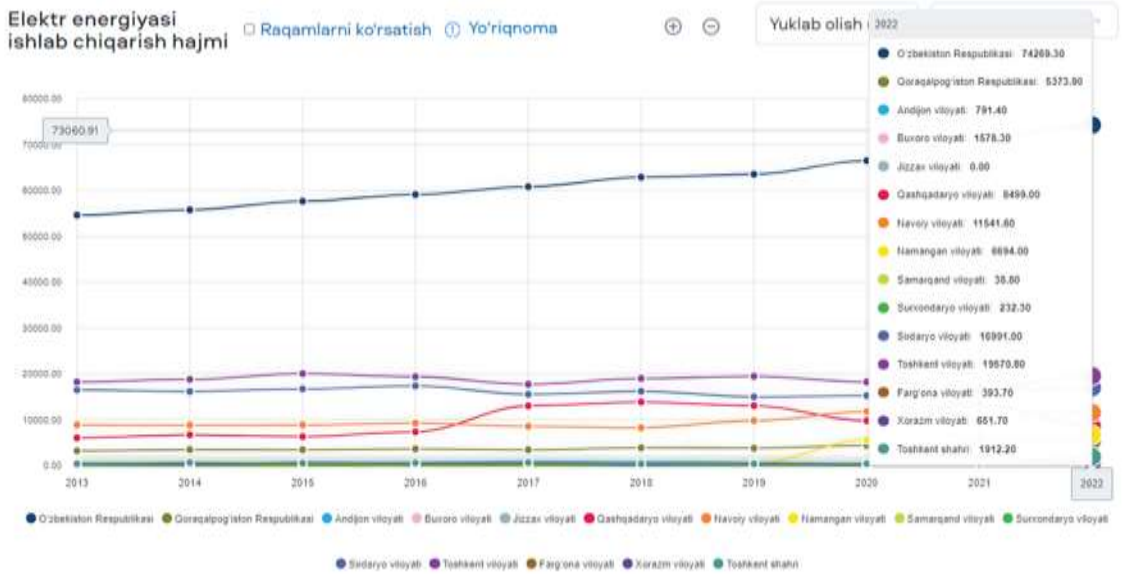

Fig. 1. Specific electricity consumption for the period 2022-2023.

Technical control of the quality of electrical energy includes a systematic analysis of various parameters of electrical networks, aimed at ensuring the stability and reliability of the power supply. Key aspects include monitoring voltage, frequency and harmonic distortion in the electrical network. This allows you to identify and manage potential problems, such as interruptions and failures that could affect the operation of sensitive equipment. It is also important to monitor power factor parameters, phase symmetry and other characteristics, which helps optimize the operation of power systems and increase energy efficiency [1].

However, in the Republic of Uzbekistan, several key aspects limit the effective implementation of modern electrical energy quality control standards and the modernization of the energy industry. Among the main problems are the insufficient technical equipment of the energy infrastructure, limited financial resources for investment, as well as the lack of modern regulatory and regulatory frameworks that meet international standards. Insufficient personnel qualifications and an imperfect monitoring and diagnostic system also play a significant role in this context.

The impact of insufficient implementation of modern electrical energy quality control standards in the Republic of Uzbekistan on production processes is manifested through a number of specific aspects. For example, frequent voltage fluctuations and instability in network frequency can lead to continuous interruptions in the operation of industrial equipment, especially those that require a stable power supply for their normal operation, such as automatic production lines and computerized systems.

In addition, inconsistencies in power quality parameters can lead to increased electricity consumption due to the need to compensate for energy losses when moving through poor-quality networks. This increases the operating costs of enterprises and reduces their competitiveness in the market. An example is

the heavy industrial sector, where even small power outages can lead to production downtime, significant economic losses and loss of consumer confidence [2].

III. RESULTS

Technical limitations can also hinder the adoption of modern technologies aimed at improving energy efficiency and reducing environmental impact. For example, the use of high-tech equipment such as variable frequency drives and automated control systems requires a stable and high-quality power supply for optimal operation. In conditions of insufficient control of power quality, such technologies may not operate at full capacity, which limits their effectiveness and profitability of implementation. The efficiency of production processes directly depends on the quality and stability of power supply, which makes the issue of increasing control over power quality critical for the modernization and development of the industrial sector of the Republic of Uzbekistan.

In the Republic of Uzbekistan, the issue of insufficient quality of electricity is an urgent problem that requires an integrated approach and solution through the modernization of energy infrastructure and the introduction of modern management and control technologies. One of the key areas for improvement is the replacement of outdated equipment such as transformers and distribution networks with modern components with increased efficiency and reliability. The project to modernize the electrical network in Tashkent became an example of the successful implementation of such measures, which led to a reduction in emergencies and increased efficiency of energy supply for the population [4].

The introduction of automated monitoring and control systems also plays an important role in improving the stability of energy supply. Remote energy quality monitoring systems allow you to quickly respond to deviations in network parameters, such as voltage and frequency, and take timely measures to eliminate them. This not only improves the reliability of power supply, but also reduces energy losses during the transmission process.

The use of modern technologies for monitoring and analyzing power quality also has a significant impact on energy processes. For example, the introduction of a system for remote monitoring of energy quality at large energy facilities in the Republic of Uzbekistan made it possible to reduce the frequency of failures and improve voltage regulation, which directly affects the production processes of industrial enterprises and residential areas.

To ensure sustainable development of the country's energy sector, it is also necessary to pay attention to improving the qualifications of technical personnel. This will allow specialists to effectively manage new technologies and methods for monitoring power quality, ensuring the stability and efficiency of energy systems.

Thus, the implementation of a set of measures to modernize infrastructure, introduce modern technologies and improve the skills of specialists is a necessary step to solve the problem of insufficient quality of electricity in the Republic of Uzbekistan. These measures contribute to improving energy supply, increasing the efficiency of production processes and the overall economic stability of the country.

The economic benefits of modernizing the energy infrastructure in the Republic of Uzbekistan are manifested through several key aspects:

- reduction in operating costs entailsthe introduction of modern equipment and technologies makes it possible to reduce the costs of operating energy systems. New equipment is more efficient to operate and requires fewer resources for maintenance and repair, which leads to significant savings for energy companies and the state budget.

- improving the quality of services indicates an increase in the stability of energy supply and a decrease in the frequency of emergencies, which have a beneficial effect on the economy. Improved energy supply contributes to the continuous operation of industrial enterprises, reduces losses in production processes due to power supply failures and improves the living conditions of the population.

- attracting investment and business development in the future will show improved infrastructure and energy supply creating a more attractive investment environment for local and international investors. A reliable energy system facilitates the development of new industrial and technological projects, which stimulates economic growth and creates new jobs.

IV. DISCUSSION

An example of an economic benefit would be improvements in energy efficiency in specific regions of the country. For example, thanks to the modernization of the energy network in one of the regions of Uzbekistan, it was possible to reduce energy losses during the transmission process by 15%, which led to savings of more than $2 million per year by reducing the consumption of resources to compensate for losses and repair equipment. This further stimulated the development of the local economy and improved the living standards of local residents [6].

The introduction of energy efficient technologies in the residential sector of the Republic of Uzbekistan is one of the key areas of modernization aimed at improving energy efficiency. For example, replacing old windows and installing thermal insulation materials in homes can significantly reduce heat loss and average annual heating costs by 20%. This will lead to savings for the population and a reduction in overall energy costs in the country. Considering that more than 30 million people live in the Republic of Uzbekistan, potential savings on heating can reach 6 billion USD. in year. This demonstrates not only the improvement in the living conditions of the population, but also the economic benefits of the energy infrastructure modernization strategy [2].

The introduction of modern control and monitoring systems for power grids makes it possible to reduce electricity losses during transmission and distribution. For example, the introduction of automated control systems can reduce losses by up to 10%, which, given the current volume of consumption in the Republic of Uzbekistan, estimated at 72 billion kWh per year, amounts to savings of up to 7 billion kWh annually. With an average electricity cost of 5 cents per kWh, this could result in savings of more than $350 million per year for the country. Such measures not only reduce the operating costs of the energy system, but also contribute to the sustainable development of the national economy."

The introduction of advanced energy-efficient solutions into the production processes of industrial enterprises of the Republic of Uzbekistan demonstrates significant economic efficiency. For example, a leading textile mill in the city of Tashkent, equipped with modern high-tech weaving machines with energy-saving features, reduced energy consumption by 20% in the first six months of operation. With an average annual consumption of 80 million kWh, this resulted in savings of 16 million kWh per year. Based on the current cost of electricity of 7 cents per kWh, the total savings reached $1.12 million per year. This made it possible to reduce operating costs and increase the competitiveness of products, ensuring the sustainable development of the enterprise and investing in the country's economy [5].

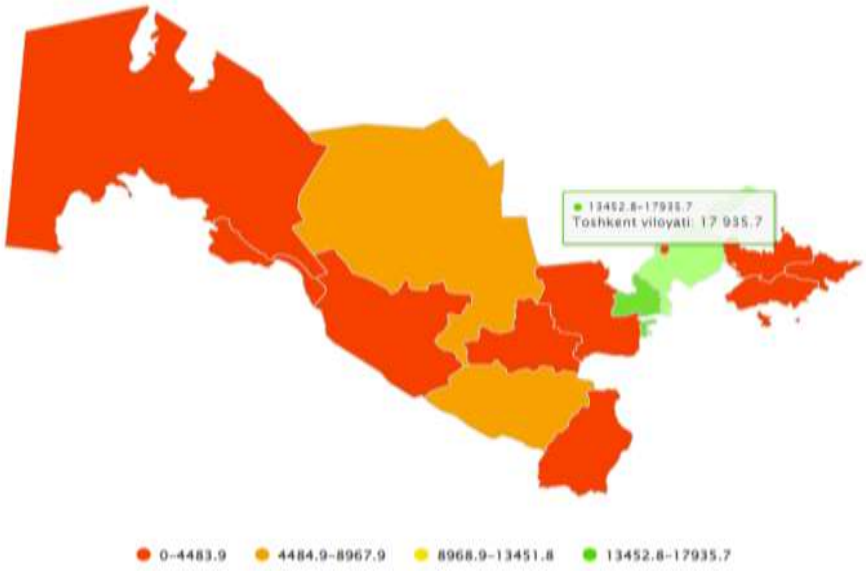

Fig. 2. Electricity consumption in the Tashkent region.

V. CONCLUSION

To solve the problem of energy supply in the Republic of Uzbekistan, a number of specific methods and measures can be proposed:

- Modernization and expansion of energy infrastructure, taking into account the replacement of outdated energy-intensive devices and equipment with modern and energy-efficient analogues, as well as the expansion of network infrastructure to improve access to electricity in remote and underserved areas.

- Introduction of modern control and monitoring technologies, taking into account the introduction of automated monitoring and network management systems for the rapid detection and elimination of emergencies, as well as the introduction of load forecasting systems and optimization of electricity distribution.

- Development of renewable energy sources (RES), taking into account the promotion of investments in RES, such as solar and wind energy, to diversify energy supply sources, as well as stimulating the construction and operation of alternative energy sources through tax incentives and government support.

- Optimization of electricity consumption, taking into account the introduction of energy-efficient technologies and standards in industry, construction and the housing sector, as well as conducting educational programs and energy saving campaigns among the population and enterprises.

- Development of international cooperation based on establishing partnerships with international organizations and countries to exchange experience and technologies in the field of energy, as well as attracting foreign investment and technical assistance for the implementation of major projects to modernize energy infrastructure [11].

-Development of energy efficiency in industry based on implementing programs for updating and modernizing industrial equipment in order to reduce energy consumption and increase the efficiency of production processes, as well as conducting energy efficiency audits at enterprises with the development of individual recommendations for optimizing energy consumption [8].

- Updating legislation and regulation in the energy sector through the development and implementation of new legislation and regulations that help stimulate investment in energy projects and the development of a competitive electricity market, as well as strengthening control over compliance with environmental standards and regulations in the energy sector to reduce the negative impact on environment [10].

- Increasing energy security through the creation of reserve energy capacities and systems for ensuring the reliability of energy supply in emergencies and accidents, as well as the development of measures to protect critical energy infrastructure facilities from cybersecurity threats and terrorist acts [9].

- Stimulating and developing small and medium-sized enterprises in the energy sector while supporting innovative start-ups and projects in the field of energy supply and energy efficiency through government programs and financial instruments, as well as creating favorable conditions for the development of the private sector in the field of alternative energy and distributed generation.

These measures can help improve the reliability and quality of electricity in the Republic of Uzbekistan, reduce energy losses and support the sustainable development of the country's energy sector [7].

[2] *Jeoloji Mühendisliği Bölümü, Gümüşhane Üniversitesi, Gümüşhane, Türkiye*

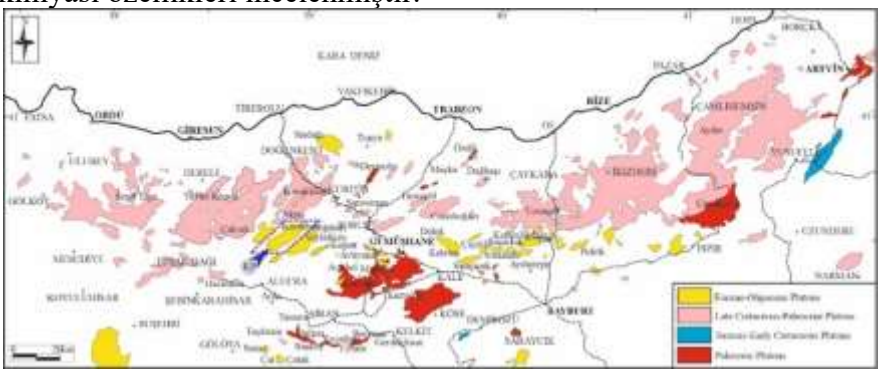
[*]*(sametguloglu610@gmail.com)*

Özet – Bu araştırma, Doğu Pontidler (NE Türkiye)'nin güneyinde Bayburt bölgesinde yer alan Orta Eosen yaşlı Arslandede Plütonu'nun jeolojisi ve mineral kimyası özelliklerini incelemiştir. Arslandede Plütonu, genel olarak KB-GD yönelimli olup yaklaşık 44 km²'lik bir alanı kaplamaktadır. Kayaçlar, gabroik diyorit den monzogranite kadar değişim gösteren geniş bir bileşim aralığı sergilemektedir. Birincil mineralleri plajiyoklaz (An_{25-48}), ortoklaz (Or_{69-88}), kuvars, amfibol (Mg#=0.59-0.67), biyotit (Mg#=0.58-0.62), piroksen (Mg#=0.70-0.75) ve Fe-Ti oksitler oluşturmaktadır. Amfibol minerallerinin mikroprob verilerinden hesaplanan kristalleşme sıcaklıkları 737°C ile 812°C arasında değişmektedir. Basınç tahminleri ise 0.09 ila 1.61 kbar arasında bir aralığı işaret etmektedir. Tüm veriler dikkate alındığında, incelenen Arslandede plutonunun sığ derinliklere (~ 1-5 km) yerleşerek katılaştığı söylenebilir.

Anahtar Kelimeler – Bayburt (KD Türkiye), Mineral kimyası, Termobarometre, Doğu Pontidler, Arslandede Plütonu

I. GİRİŞ

Alpin-Himalaya orojenik kuşağı içinde, kuzeydoğu Türkiye'de yer alan Doğu Pontidler, geniş bir plütonik ve volkanik kayaç topluluğunu barındırmaktadır [1], [2], [3], [4], [5], [6], [7], [8]. Bölgede yer alan plütonik kayaçlar, Permo-Karbonifer'den Geç Eosen'e kadar geniş bir yaş aralığına sahiptirler. Özellikle, Orta Eosen yaşlı plütonik kayaçlar, Doğu Pontidler'in güney kesiminde, kuzey bölgesine nazaran daha yaygındırlar (Şekil 1). Bu araştırmanın konusu olan Arslandede Plütonu, Doğu Pontidlerin güneyinde yer almaktadır (Şekil 1). İnceleme alanındaki Arslandede plütonu [6], [9] ve diğer Orta Eosen yaşlı plutonlar [6], [10], [11], [12] ile ilgili detay çalışmalar yapılmasına rağmen, Arslandede Plütonu'nun mineral kimyası ile ilgili herhangi bir çalışma yapılmamıştır. Bu çalışmada, Bayburt yöresinde yer alan Arslandede Plütonunun jeolojik ve mineral kimyası özellikleri incelenmiştir.



Şekil 1. Doğu Pontidlerdeki Paleozoyik-Eosen yaş aralığında oluşmuş plütonların dağılımı [6]'dan değiştirilerek)

A. Bölgesel Jeoloji

Çalışma alanı Alp-Himalaya Orojenik sisteminin bir parçası olan Doğu Pontidler'de yer almaktadır (Ketin 1966; Şekil 1). Doğu Pontidler'deki temel kayaçları; (1) Mavişist-fasiyesindeki metamorfik birimler ile

yüksek-T, düşük-P metamorfik birimlerinden oluşan Variskan metamorfik kompleksleri [13] ve (2) bu birimleri kesen Karbonifer yaşlı plütonlar [14], [15], [16], [17], [18], [19], [20], [21], [22], [23] oluşturur. Temel kayaçlar üzerine, uyumsuz olarak Erken-Orta Jura yaşlı volkano-tortul istif gelmiştir [24], [25], [26], [27], [28]. Bu istif, Erken-Geç Jura yaşlı intrüzyonlar tarafından kesilmiştir [29], [30], [31], [32]. Geç Jura-Erken Kretase dönemi, yoğun bir karbonat çökelimi ile karakterize edilir (Berdiga Formasyonu, [33]). Bu birimler Geç Kretase yaşlı volkanik kayaçlar tarafından uyumlu olarak örtülmüştür [34], [35], [36], [37], [38], [39] ve Geç Kretase yaşlı plütonik kayaçlar tarafından kesilmişlerdir [3], [4], [40], [41], [42], [43], [44], [45], [46], [47], [48]. Bölgede Geç Kampaniyen'den Maastrihtiyen'in sonuna kadar devam eden yüksek-K'lı magmatizma gözlemlenmiştir [49], [50]. [51] ve [52]'e göre, Anatolid-Torid bloklarının çarpışması Geç Paleosen ila Erken Eosen döneminde gerçekleşmiştir. Bölgede Erken Eosen yaşlı adakitik kayaçların varlığı [53], [54], [55], [56], [57], [58], yay-kıta çarpışmasının son aşamasını temsil eder. Doğu Pontidler'de Eosen yaşlı birimler, volkanik ve volkanoklastik kayaçlar, bazik ila orta dereceli piroklastikler, lav akıntıları ve dayklardan oluşur [1], [5], [59], [60], [61], [62]. Bu birimler, aynı yaştaki kalk-alkalen plutonlar tarafından kesilirler [2], [6], [10], [11], [58], [63], [64], [65], [66], [67]. Bölgede Geç Miyosen-Pleyistosen yaşlı volkanik ve kırıntılı kayaçlar ile Neojen yaşlı volkanik kayaçlar yaygın olarak gözlemlenmiştir [1], [51], [59], [68], [69]. Doğu Pontidler'in en yaşlı kayaçlarını ise Kuvaterner yaşlı traverten, alüvyon ve yamaç molozları oluşturmaktadır.

II. MATERYAL VE YÖNTEM

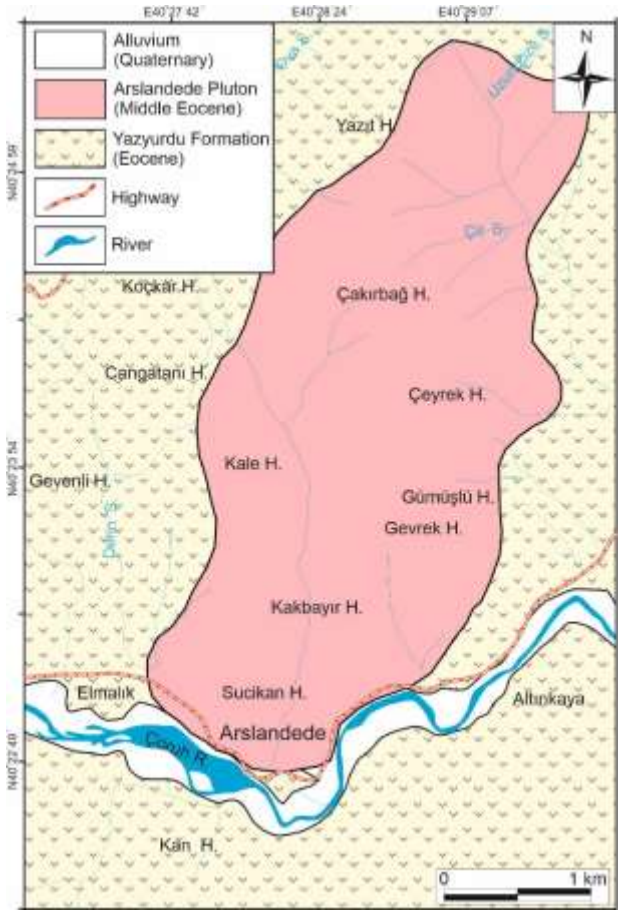
Arslandede Plütonu'ndan toplanan iki temsili kaya örneği (monzodiyorit ve kuvars monzonit) üzerinde mineral kimyası analizleri, Amerika Birleşik Devletleri'ndeki New Mexico Tech Üniversitesi Jeolojik ve Mineral Araştırma Laboratuvarı'nda elektron mikroprob teknikleri kullanılarak gerçekleştirildi. Analizler için cilalanmış ince kesitler kullanıldı. CAMECA SX 100 Elektron Mikroprobu, 15 kV ivme gerilimi ve 20 nA ışın akımı çalışma koşullarında kullanıldı. Al, Si, Ti, Ca, Mn, Fe, Mg, K ve Na gibi elementler için 10 µm'lik bir ışın çapı kullanıldı ve sayma süreleri 10 saniye idi. Piroksen, amfibol, epidot, zirkon ve Fe-Ti oksit mineralleri için analiz sırasında odaklanmış bir ışın çapı olarak 1 µm kullanıldı. Mika, feldspat ve klorit analizlerinde olası Na kaybını azaltmak için 10 µm odaklanmamış bir ışın kullanıldı. Standartlaştırma için Nielsen ve Sigurdsson (1981) tarafından tanımlanan sertifikalı referans malzemeleri (diopsit, kaersütit, albit, ortoklaz, biyotit, manyetit ve anortit (UCB)) kullanıldı.

III. BULGULAR

A. İnceleme Alanının Jeolojisi

Bu çalışmanın odak noktası olan Arslandede Plütonu, Doğu Pontidler'in güney kesiminde, Bayburt ilinin kuzeyinde, Arslandede köyü yakınlarında yer almaktadır (Şekil 2). Arazi gözlemleri, Tersiyer-Kuaterner dönemine ait volkanik ve plütonik birimlerin yaygın varlığını ortaya koymaktadır. Eosen yaşlı Yazyurdu Formasyonu, çalışma alanındaki en eski birimi temsil etmekte olup, Orta Eosen yaşlı Arslandede Plütonu tarafından kesilmektedir. Bu birimler, uyumsuz olarak Kuaterner alüvyonları tarafından örtülmektedir (Şekil 2). Eosen yaşlı Yazyurdu Formasyonu, ağırlıklı olarak andezit, bazalt ve bunlarla ilişkili piroklastik birikimlerden oluşan bir dizi içermekte olup, arada yer yer kumtaşı tabakaları bulunmaktadır (Şekil 2). Andezit ve bazalt genellikle gri renkte olup, yer yer kül sarısı veya kahverengimsi tonlarda da gözlenmektedir. El örneği incelemesinde, plajiyoklaz ve mafik minerallerin varlığı gözlemlenmiştir. Volkanik breşler, andezit parçalarının (2-40 cm, yarı köşeli) bir matris içinde yer aldığı koyu gri ile yeşilimsi renk değişiklikleri sergilemektedir. Tüfler genellikle gri veya yeşil renkte ve gözenekli olup, boşluklar kalsit, epidot ve kuvars gibi ikincil minerallerle doldurulmuştur. Arslandede Plütonu, yaklaşık 3 km²'lik bir yüzey alanına sahip olup, yaklaşık 3 km uzunluğunda ve 1 km genişliğindedir. Arazi gözlemleri, plütonun aynı döneme ait volkanik birimlere sokulduğunu ve temas bölgelerinde kireçtaşlarının yeniden kristalleşmesine neden olduğunu göstermektedir. Plüton içinde soğuma çatlakları belirgindir. Bu çatlak sistemleri mekansal değişkenlik göstermekte olup, özellikle Arslandede ve Kakbayır Tepesi civarında seyrek olarak görülmekte ve iyi eklemli kaya kütlelerine yol açmaktadır. Buna karşılık, ana kaya temasına

yakın bazı bölümler yoğun şekilde çatlamış ve breşleşmiş plütonik kayaçlar sergilemekte olup, bu bölgelerde uygun blok gelişimi bulunmamaktadır. Arslandede Plütonu genellikle masif bir görünüm ile karakterize edilmektedir. Ancak, yerel alanlarda yer yer arenalaşma görülmektedir.



Şekil 2. Çalışma alanının jeolojik haritası [6], [9]'den değiştirilerek)

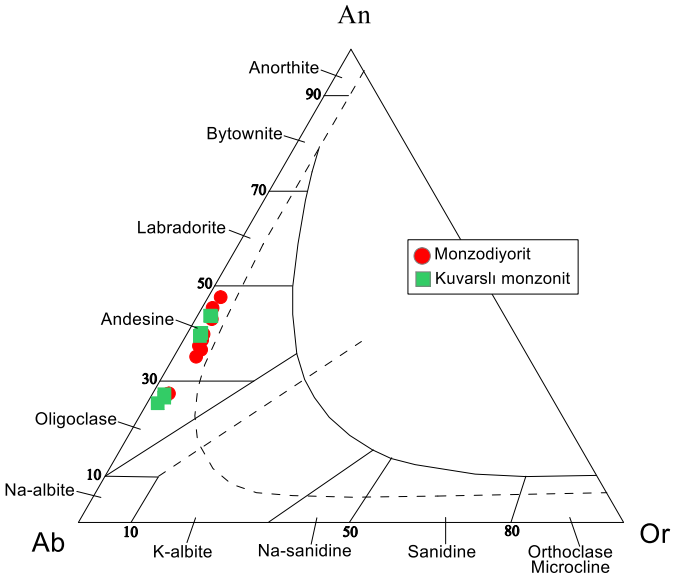
B. Mineral Kimyası

Arslandede plütonu, başlıca monzogabro, monzodiyorit, monzonit, kuvars monzonit ve granit'den oluşmaktadır. Başlıca mineraller plajiyoklaz, kuvars, ortoklaz, hornblend, biyotit ve piroksendir [6], [9].

B.1. Plajiyoklas

Çalışılan Arslandede Plütonu'ndaki plajiyoklaz minerallerinin mikroprob analizi, An_{25} ile An_{48} arasında bileşim değişiklikleri ortaya koymaktadır (Şekil 3). Hem mafik (monzodiyorit) hem de felsik (kuvars monzonit) litolojilerindeki plajiyoklazlar, SiO_2 içeriği %56 ila % 66, Al_2O_3 % 22 ila % 27, FeO^T % 0.2 ila % 0.5 ve K_2O % 0.3 ila % 0.7 arasında değişen içeriklere sahiptir.

Arslandede Plütonu'nun monzodiyoritlerinde bulunan plajiyoklazların farklı bileşimsel bölgelerinin varlığı genellikle salınımlı zonlama ile karakterizedir. Plajiyoklazlardaki An içeriğinin An_{25} ile An_{48} arasında değişmesi, mineralin büyüme sürecinde periyodik bileşimsel değişiklikleri göstermektedir.

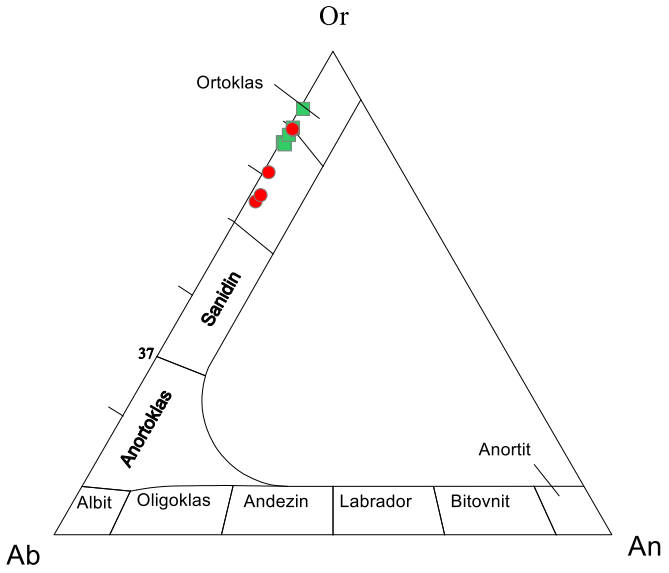


Şekil 3. Çalışılan plütonun feldispat bileşimlerini gösteren An-Ab-Or üçlü diyagramı [70]

B.2. K-Feldsipat

Eosen yaşlı kayaçların incelenmesi, çoğu örnekte K-feldspat minerallerinin varlığını ortaya koymuştur. Bu K-feldspat minerallerinin kimyasal analizleri, SiO_2 (% 65-66), Al_2O_3 (%18-19) ve BaO (%0.04-0.40) içeriğindeki değişkenlikler gözlenmiştir (Şekil 4).

K-feldspatlar genellikle ortoklaz bileşimini sergiler. Neredeyse tüm K-feldspat kristallerinin homojen bir bileşime sahip olduğu gözlemlenmiş ve kimyasal zonlamanın olmadığı anlaşılmıştır. Genel kayaç bileşimleri Or_{69} ile Or_{88} arasında değişmektedir (Şekil 4).

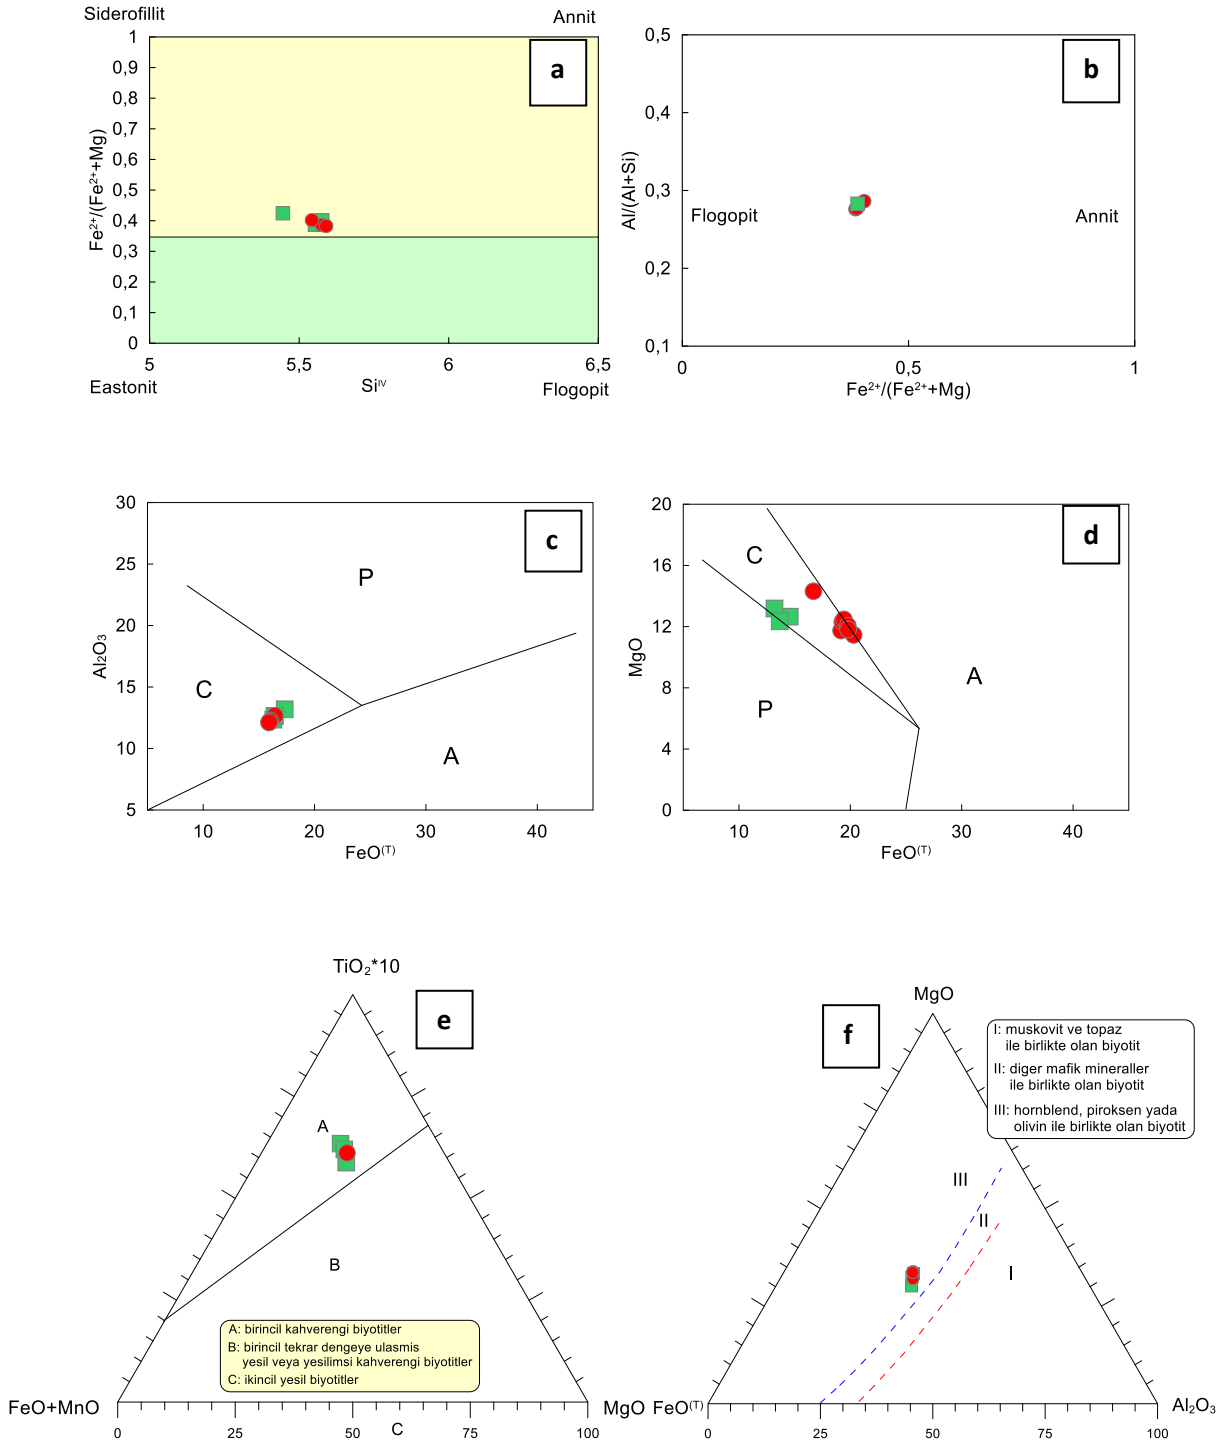


Şekil 4. K-feldspatların sınıflandırma diyagramı, An-Ab-Or diyagramı [71]

B.3. Biyotit

Biyotitlerin mikroprob analizleri, TiO_2 içeriğinin %4.4 ila % 5.3, Al_2O_3 içeriğinin % 12 ila % 13 ve MgO içeriğinin %13 ila %15 arasında değiştiğini ortaya koymaktadır. Mg# ($Mg/(Mg + Fe^{+2})$) ve Fe# ($Fe^{+2}/(Fe^{+2} + Mg)$) oranları sırasıyla % 0.58 ila % 0.62 ve % 0.38 ila % 0.42 aralığında değişmektedir. Bu değerler, biyotitlerin annit ile flogopit uç bileşimleri arasındaki bileşimlerle kristalleşmiş katılaşmış eriyik ürünler

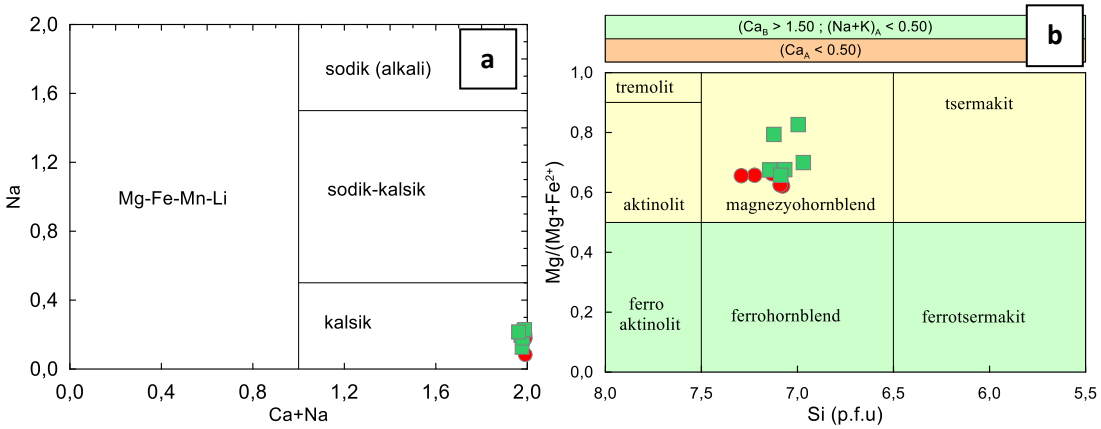
olarak oluşturulduğunu ve flogopit katı çözelti serisinin magnezyum açısından zengin ucu yakınında yer aldığını göstermektedir (Şekil 5a-b). Ayrıca, mikroprob analizleri, biyotitlerin $FeO^{(T)}$-Al_2O_3 diyagramında C alanında sınıflandırıldığını göstermektedir (Şekil 5c). Biyotitlerin MgO-$FeO^{(T)}$ diyagramında C alanında kümelendiğini göstermektedir (Şekil 5d). Biyotitlerin MgO-FeO+MnO-TiO_2^{*10} üçgen diyagramında birincil kahverengi biyotitler (A alanı) olarak sınıflandırıldığını göstermektedir (Şekil 5e). Biyotitlerin $FeO^{(T)}$-Al^2O^3-MgO üçgen diyagramına dayanarak hornblend, piroksen veya olivin ile birlikte bulunduğunu göstermektedir (Şekil 5f).



Şekil 5. Çalışılan kayaçlardaki biyotitlerin bileşimi: a) Si^{IV} - (Fe^{+2}/Fe^{+2} + Mg) diyagramı [72], b) $FeO^{(T)}$-Al_2O_3 diyagramı [73], c) $FeO^{(T)}$- Al_2O_3 diyagramı [73], d) $FeO^{(T)}$- MgO diyagramı [73], e) MgO-FeO+MnO-TiO_2^{*10} üçgen diyagramı [73], f) $FeO^{(T)}$-Al_2O_3-MgO üçgen diyagramı [74]

B.4. Hornblend

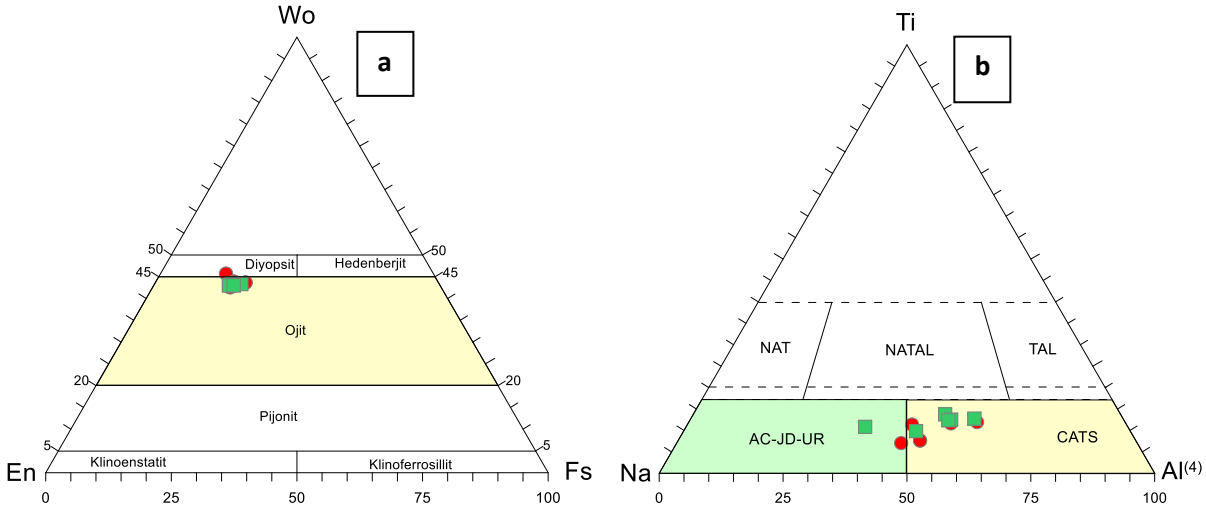
Çalışılan plütonik kayaçlardan yapılan amfibol mikroprob analizleri, Al_2O_3 içeriğinin % 4.7 ila % 5.6, SiO_2 içeriğinin % 48.0 ila % 49.9 ve Mg# değerlerinin % 0.59 ila % 0.67 arasında değiştiğini ortaya koymaktadır. Sınıflandırma diyagramları, tüm amfibollerin Na'ya karşı (Ca+Na) oranına dayanarak kalsik amfibol alanına ait olduğunu göstermektedir (Şekil 6a) ve [75]'e göre magnezyum hornblend kompozisyonuna sahip olduğunu göstermektedir (Şekil 6b).



Şekil 6. Çalışılan plütonik kayaçlardaki amfibol bileşimi [75]

B.5. Piroksen

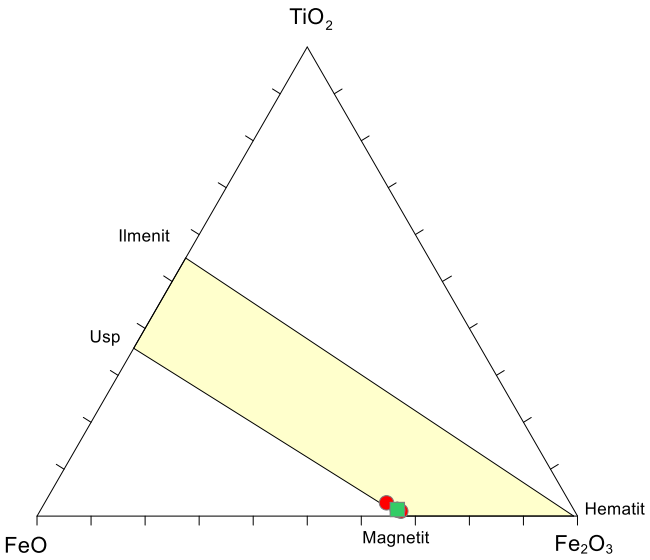
Piroksenler üzerinde yapılan mikroprob analiz sonuçlarına göre, Al_2O_3 içeriğinin % 0.5 ila % 1.4, SiO_2 içeriğinin % 52.0 ila % 53.1 ve Mg# değerlerinin % 0.70 ila % 0.75 arasında değiştiğini ortaya koymaktadır. Analiz sonuçlarına göre, örnekler Wo-En-Fs üçlü diyagramının Ojit bölgesinde kümelendi (Şekil 7a).



Şekil 7. (a-b) Wo-En-Fs, Ti-Na- $Al^{(4)}$ üçgen diyagramı [76]

B.6. Fe-Ti Oksit

Mikroprob analizlerinde, Fe-Ti oksitler, Fe# ($Fe^{+2}/(Fe^{+2}$ + Mg)) oranları % 0.35 ila % 0.37 aralığında değişmektedir. Şekil 8'da, örneklerin TiO_2-FeO-Fe_2O_3 üçlü diyagramında manyetit alanında kümeleştiği görülmektedir. TiO_2-FeO-Fe_2O_3 üçlü diyagramındaki örneklerin, minerallerin kimyasal bileşimlerinin belirli bir alanda kümelendiğini ve FeO ve Fe_2O_3 bileşenlerinin yoğunlaştığı bölgede bulunduğunu göstermektedir.



Şekil 8. Çalışılan plütonik kayaçlardaki Fe-Ti oksitlerin bileşimi [77]

C. Termobarometre Hesaplamaları

C.1. Amfibol-Plajiyoklas Termometresi

Magmalarının kristallenme sıcaklıklarının tahmin edilebilmesi için [78] tarafından önerilen amfibol-plajiyoklas termometresi kullanılmıştır. Bu termometrede sıcaklık T= 0.667 P - 48.98 + Y/- 0.0429 - 0.008314 LnK' formülüyle hesaplanmıştır. Bu termometrenin kullanımında öncelikli olarak amfibol-plajiyoklas denge kristallenmesine, biyotit, kuvars, K-feldispat, piroksen, Fe-Ti oksit ± sfen minerallerinin eşlik etmesi gerekir. Arslandede plütonunu oluşturan kayaçlarda [78] tarafından önerilen amfibol-plajiyoklas termometresi hesaplanan sıcaklıklar 737-812°C arasında olup, monzodiyoritlerde 745-788ºC, kuvarslı monzonitlerde 737-812ºC arasında değişmektedir (Tablo 1).

C.2. Amfibol-Plajiyoklas Barometresi

Plütonik kayaçlarda, hornblenlerdeki $Al^{(T)}$ içeriğinden yararlanılarak basınç tahmini yapılmak üzere kullanılan kalibrasyonlar aşağıda verilmiştir:

P (kbar)= 4.76 $Al^{(T)}$ - 3.01 [81];
P (kbar)= 5.03 $Al^{(T)}$ - 3.92 [79];
P (kbar)= 5.64 $Al^{(T)}$ - 4.76 [80].

Arslandede plutonunu oluşturan kayaçlarda yukarıdaki formüller yardımıyla hesaplanan kristallenme basınçları birbirine yakın değerlerdedir (Tablo 1). İncelenen plütondaki kayaçlara ait kristallenme basınçları 0.1–1.37 kbar arasında olup, monzodiyoritlerde 0.1–1.61 kbar, kuvarslı monzonitlerde 0.2–1.37 kbar arasında değişmektedir (Tablo 1).

Tablo 1. Arslandede Plütonu için amfibol-plajiyoklaz kullanılarak hesaplanan basınç tahminleri

	P (kbar) [79]	P (kbar) [80]	P (kbar) [81]	T (°C) [78]
Mineraller	Amfibol-Plajiyoklas			
Monzodiyorit				
Min	0.20	0.09	0.89	745
Max	0.97	0.72	1.61	788
Ort	0.48	0.44	1.16	772
SD (±)	0.31	0.32	0.29	16
Min Derinlik (km)	0.74	0.35	3.29	
Max Derinlik (km)	3.58	2.66	5.97	
Kuvarslı monzonit				
Min	0.15	0.35	0.84	737
Max	0.71	0.43	1.37	812
Ort	0.29	0.39	0.97	776
SD (±)	0.21	0.06	0.20	28
Min Derinlik (km)	0.54	1.30	3.10	
Max Derinlik (km)	2.63	1.59	5.07	

Min: Minimum, Max: Maximum, Ort: Ortalama, SD (±): Standart sapma. Derinlik kıtasal kabuk için 1 kbar = 3.7 km olarak alınmıştır [82].

IV. SONUÇLAR

Arslandede Plütonu, kuzeydoğu-güneybatı yönünde uzanan, elips şekilli bir plutondan oluşur. Yaklaşık 44 km²'lik bir alanı kaplar ve bileşim olarak monzodiyoritten kuvars monzonite kadar değişen litolojik değişkenlikler sergiler. Plütonik kayaçlar başlıca plajiyoklaz (Anortit içeriği: %27-48), ortoklaz (Ortoklaz içeriği: %73-91), kuvars, amfibol, biyotit, piroksen ve Fe-Ti oksitlerinden oluşur.

Arslandede Plütonunu oluşturan kayaçlardaki amfibollerin Mg# değerleri 0.63-0.73 arasında değişkenlik gösterirken, biyotitlerin Mg# değerleri 0.52 ila 0.58 arasında değişmektedir. Amfibol verilerinden elde edilen hesaplanmış kristalleşme sıcaklıkları 737°C ile 812°C arasında değişmektedir. Basınç değerleri ise 0.09 ila 1.61 kbar arasında değişmektedir.

Saha, petrografik ve termobarometerik tüm veriler dikkate alındığında, incelenen plütonların kıtasal kabukta sığ derinliklere (~ 1-5 km) yerleşmiş oldukları sonucuna varılabilir.

TEŞEKKÜR

Bu araştırma Gümüşhane Üniversitesi Araştırma Fonu (proje 17.F5114.01.03) tarafından kısmen finanse edilmiştir.

Integration of modern monitoring and control technologies into the energy infrastructure of the Republic of Uzbekistan: Prospects and economic benefits

Amurova Natalia Yurevna

Senior Lecturer, University of Information Technologies, Republic of Uzbekistan

Email:amuryonok@list.ru

Abstract **–**This article discusses modern means of monitoring and control of electrical energy, their capabilities and advantages for ensuring the reliability and efficiency of energy supply. Particular attention is paid to technological solutions such as automated control and analysis systems, as well as their application in various industrial sectors and the domestic sector.

Keywords –Electrical energy, monitoring, control, automated systems, energy supply, energy efficiency, technology

I. INTRODUCTION

In modern conditions, sustainable and efficient energy supply is one of the key tasks for many countries, including the Republic of Uzbekistan. With the increase in electricity consumption and the increasing complexity of the energy infrastructure, there is a need to introduce modern monitoring and control tools that will ensure high quality and stability of electrical energy supplies. For the Republic of Uzbekistan, the use of such technologies is especially important due to a number of specific factors.

Firstly, the Republic of Uzbekistan is actively developing, which is accompanied by a significant increase in demand for electricity in both the industrial and domestic sectors. This requires the energy system not only to increase production capacity, but also to increase the efficiency of distribution and consumption of electricity. Modern monitoring and control tools, such as automated control systems (ACS), make it possible to optimize the processes of generation, transmission and distribution of electricity, reducing losses and increasing the overall reliability of energy supply [3].

Secondly, one of the main problems of the energy sector of Uzbekistan is the deterioration and insufficient modernization of the existing infrastructure. The introduction of modern monitoring and control technologies allows not only to quickly identify and eliminate faults, but also to carry out preventive measures for the maintenance and modernization of equipment. This helps to significantly reduce emergencies and increase the stability of the energy system as a whole. Third, Uzbekistan is actively seeking to diversify its energy sources, including the development of renewable sources such as solar and wind energy. Managing these sources requires the integration of sophisticated monitoring and control systems that ensure stability and efficiency of their operation. Modern means make it possible to integrate various energy sources into a single network, ensuring their uninterrupted operation and maximum efficiency of use [7].

In addition, improving the quality of electricity is an important aspect. Modern monitoring systems allow detailed analysis of power quality parameters such as voltage stability, frequency, harmonics and absence of interruptions. This is especially important for industrial plants, where the slightest fluctuations in power quality can lead to serious economic losses and reduced productivity. Thus, the introduction of modern means of monitoring and control of electrical energy in the Republic of Uzbekistan is a strategically important step aimed at ensuring reliable, efficient and sustainable energy supply. This not only helps

improve energy efficiency and reduce operating costs, but also creates conditions for further economic growth and improving the quality of life of the population.

II. Materials and Method

Modern means of monitoring and control of electrical energy include a variety of technological solutions aimed at increasing the reliability and efficiency of energy supply. The main areas of their application include automation of network management, analysis of power quality parameters, consumption forecasting and optimization of resource allocation.[2].

Automated control systems (ACS) play a key role in ensuring the stability of energy supply. They allow continuous monitoring of network parameters, prompt identification and elimination of faults, and optimization of power transmission and distribution processes. An example of successful implementation of automated control systems is the project to modernize the energy infrastructure in the Republic of Uzbekistan, which made it possible to reduce energy losses and increase the reliability of supplies.

Power quality is determined by a number of technical parameters such as voltage stability, frequency, harmonics and absence of interruptions. Modern analysis systems make it possible to study these parameters in detail and identify deviations that can negatively affect the operation of equipment and production processes. For example, the introduction of power quality monitoring systems at industrial enterprises can significantly reduce the number of emergency situations and increase overall productivity.

Modern technologies make it possible to accurately predict energy consumption and optimize resource allocation. This is especially important in environments with variable loads and intermittent energy sources such as renewable sources. Forecasting and optimization make it possible to reduce the costs of production and transmission of electricity, as well as improve the quality of service to consumers [4].

Some of the key systems and technologies used in intelligent electrical energy management systems (IECMS) include:

- Automated control systems (ACS) are a set of software and hardware designed for automatic collection, processing and analysis of data on the state of the energy system. They provide monitoring of the operation of all elements of the power system, including generators, transformers, power lines and distribution networks. ACS allow you to quickly respond to changes in system parameters, predict possible emergency situations and take preventive measures to prevent them. An example of the use of automated control systems is the SCADA (Supervisory Control and Data Acquisition) system, which is widely used for remote monitoring and control of energy facilities [1].

- Intelligent metering systems (AMR/AMI), (AMR - Automated Meter Reading) and intelligent metering systems (AMI - Advanced Metering Infrastructure) are designed to accurately measure and collect data on electricity consumption in real time. These systems allow control of consumption at the level of individual consumers and provide the ability to remotely control loads. The implementation of AMR and AMI helps to improve the accuracy of electricity metering, reduce commercial losses and improve interaction between energy suppliers and consumers.

- Distributed Energy Resource Management Systems (DERMS) are designed to integrate and manage various distributed generation sources, such as solar panels, wind generators, battery systems and other renewable energy sources. DERMS allow optimizing the operation of distributed energy sources, ensuring their effective integration into the overall energy system and helping to achieve a balance between electricity generation and consumption [5].

- Demand management systems (DMS), (DMS – Demand Management Systems) are aimed at optimizing electricity consumption by managing consumer loads. These systems reduce load peaks by redistributing consumption during periods of low demand, which helps reduce grid congestion and improve energy efficiency. DMSs can include technologies such as smart meters, circuit breakers, and appliance control systems.

- Predictive analytics and forecasting systems use machine learning algorithms and big data to analyze historical data and forecast future events in the power system. These systems allow you to predict loads, identify potential emergency situations and optimize maintenance planning. The introduction of such

systems helps to increase the reliability and stability of the power system, reduce operating costs and improve the quality of customer service [9].

- Cybersecurity in energy systems. In the context of digitalization of energy infrastructure, ensuring cybersecurity becomes a critical aspect. Modern information security systems include cyber threat protection systems such as firewalls, intrusion detection systems (IDS), data encryption and access control. These measures help protect energy infrastructure from cyber attacks, maintain data confidentiality and integrity, and ensure continuity of energy supply.

The introduction of intelligent electrical energy management and control systems based on modern technologies is a key factor for increasing the efficiency, reliability and sustainability of energy supply. These systems make it possible to optimize the processes of generation, transmission and distribution of electricity, reduce operating costs and improve the quality of customer service, which contributes to the sustainable development of the energy sector of the Republic of Uzbekistan.

III. RESULTS

Let's consider several examples of the successful use of modern means of monitoring and control of electrical energy in various industries. At large industrial enterprises, the introduction of automated control systems and analysis of power quality can significantly increase energy efficiency and reduce operating costs.

- Intelligent energy management systems Automated energy management systems have been installed at telecommunications facilities such as data processing centers (DPCs) and cellular base stations. These systems include intelligent controllers that provide real-time monitoring of network parameters such as voltage, current and frequency. As a result, it became possible to quickly identify deviations from normal indicators and take measures to eliminate them, which made it possible to reduce the frequency of emergency situations by 30%.

- Analysis of power quality made it possible to improve the reliability of power supply. For example, the average annual number of outages at telecommunications facilities decreased from 20 to 12 cases per thousand facilities, which ensured the continuity of equipment operation and improved the quality of services provided. Power quality analysis systems also identified areas with the greatest losses and instability, which made it possible to carry out targeted modernization measures and improve overall power supply quality indicators [1].

- Optimization of energy consumption, using intelligent control systems it was possible to significantly optimize energy consumption. As a result of the introduction of energy-saving technologies and optimization of equipment operating modes, electricity consumption at communication facilities decreased by 15%, which led to annual savings of about 1.5 million kilowatt-hours. This, in turn, reduced energy costs by $150 thousand per year, given the average cost of electricity in the region.

- Energy audits and equipment modernization, energy audits at communication facilities made it possible to identify outdated and inefficient equipment. After conducting audits and subsequent modernization, including replacing old transformers and uninterruptible power supplies with modern energy-efficient analogues, energy consumption at individual facilities decreased by 10-12%. This move also helped reduce heat losses and improve the overall energy efficiency of the telecommunications network.

- Renewable energy sources, to ensure sustainable development and reduce dependence on traditional energy sources, solar panels and wind generators have been installed at some base stations. As a result, the share of renewable energy in the telecommunications company's overall energy mix reached 5%, reducing carbon dioxide emissions by 200 tons per year and improving the company's environmental sustainability.

As facts show, the introduction of modern means of monitoring and control of electrical energy at communications and telecommunications enterprises in the Republic of Uzbekistan has made it possible to achieve significant improvements in the field of energy efficiency, reliability and sustainability of energy supply. These measures helped reduce operating costs, improve the quality of services provided and support the sustainable development of the industry.

The introduction of remote monitoring and control systems in residential buildings represents a significant step forward in improving energy efficiency and improving living conditions. Such systems include the installation of smart meters and automated lighting and heating control systems, which allow optimizing electricity and heat consumption in real time. Example of implementation in residential areas of Tashkent:

- Smart meters and lighting control systems. As part of a project to improve the energy efficiency of residential areas in Tashkent, smart electricity meters and automatic lighting control systems were installed. These technologies allow residents to monitor and manage their energy consumption more efficiently. Smart meters provide real-time consumption data, allowing residents to adjust their behavior and reduce excess energy consumption. As a result, the total energy consumption in these residential areas decreased by 15%.

- Economic indicators - a 15% reduction in energy consumption in residential areas of Tashkent provided significant savings. Based on the average energy consumption of one residential area of 3 million kilowatt-hours per year, the introduction of smart systems has reduced consumption by 450 thousand kilowatt-hours per year. Considering the average cost of electricity in the region is approximately $0.11 per kilowatt-hour, the total savings amounted to approximately $500 thousand per year.

- Heating and ventilation control systems. In addition to smart meters and lighting control systems, automatic heating and ventilation control systems have been introduced in some residential buildings. These systems regulate temperature and ventilation based on external and internal conditions, maintaining an optimal microclimate while saving energy. According to studies, such systems can reduce thermal energy consumption by 20%, which also makes a significant contribution to overall energy savings.

- Environmental performance is an integral part of the energy sector. Reducing energy consumption also helps reduce carbon dioxide emissions. Reducing electricity consumption by 450 thousand kilowatt-hours per year is estimated to reduce CO2 emissions by 360 tons per year, assuming an emission factor of 0.8 kg CO2 per kilowatt-hour for fossil fuel power plants. This is an important step towards improving the environmental situation and sustainable development of the city.

- Social aspects actively influence the implementation of remote monitoring and control systems, which not only improves economic and environmental indicators, but also helps improve living conditions for residents. The ability to monitor and manage energy consumption through mobile applications and interfaces makes these technologies convenient and accessible to a wide range of users. Increasing public awareness of the importance of energy conservation also plays a key role in creating a culture of responsible energy consumption.

Facts indicate the feasibility of widespread implementation of remote monitoring and control systems in residential buildings in Tashkent, which demonstrates significant advantages in both economic and environmental aspects. These measures improve energy efficiency, reduce energy costs and improve living conditions, which together support sustainable urban development.

In the energy sector, the introduction of modern monitoring and control tools can significantly improve the reliability and efficiency of energy supply. For example, modernization of distribution networks using automated monitoring and control systems has reduced the number of emergency situations by 30% and reduced energy losses by 10% [8].

IV. DISCUSSION

In the energy sector, the introduction of modern monitoring and control tools is a key factor in improving the reliability and efficiency of energy supply. Let's consider this using the example of communications and telecommunications enterprises, where a stable and high-quality power supply is critical to ensure the uninterrupted operation of network systems and equipment.

The introduction of modern monitoring and control tools at communications and telecommunications enterprises indicates an increase in the quality of supplied electrical energy:

- Modernization of distribution networks, implementation of automated monitoring and control systems for distribution networks at communications and telecommunications enterprises can significantly increase the reliability of energy supply. These systems involve the use of smart devices to measure and

analyze network parameters in real time. For example, smart voltage and current sensors are installed at key network nodes, providing constant monitoring of electrical energy parameters. As a result, the number of emergency situations in distribution networks is reduced by 30%, which significantly reduces equipment downtime and improves the quality of services provided.

- Reducing energy losses is one of the key factors. Modern monitoring and control systems also make it possible to reduce energy losses in distribution networks. For example, the introduction of automated control systems makes it possible to optimize network operating modes and promptly identify and eliminate faults. As a result, energy losses in distribution networks at communications and telecommunications enterprises are reduced by 10%. With an average electricity consumption of a communications enterprise of 50 million kilowatt-hours per year, this saves 5 million kilowatt-hours annually. Considering the average cost of electricity is $0.11 per kilowatt-hour, the savings amount to about $550,000 per year.

- Increasing the reliability and quality of services requires the introduction of modern monitoring and control tools, allowing communications and telecommunications enterprises to ensure a high level of reliability and quality of services. For example, remote monitoring and control systems allow you to quickly respond to changes in network parameters and prevent potential emergency situations. This is especially important for ensuring the uninterrupted operation of server and data centers, where even short-term power outages can lead to serious consequences, including data loss and financial losses [10].

- Technical indicators are continuously linked to intelligent monitoring systems to monitor many network parameters such as voltage, current, frequency, power factor and harmonic distortion. For example, the use of a SCADA (Supervisory Control and Data Acquisition) system allows not only to monitor current parameters, but also to predict their changes based on historical data and network behavior models. This allows communications and telecommunications enterprises to more effectively manage their energy resources and prevent emergencies before they occur.

- Economic and environmental indicators indicate that reduced energy losses and increased reliability of energy supply also lead to significant economic and environmental benefits. Reducing emergency situations and energy losses helps reduce operating costs and increase the profitability of communications and telecommunications enterprises. In addition, reducing energy consumption by 5 million kilowatt-hours annually reduces carbon dioxide emissions by 4 thousand tons per year, which improves the environmental situation and supports the sustainable development of the region.

The introduction of modern monitoring and control tools at communications and telecommunications enterprises can significantly increase the reliability and efficiency of energy supply, reduce energy losses and improve the quality of services provided. These measures contribute not only to economic but also environmental benefits, supporting the sustainable development of the energy sector and the economy as a whole [6].

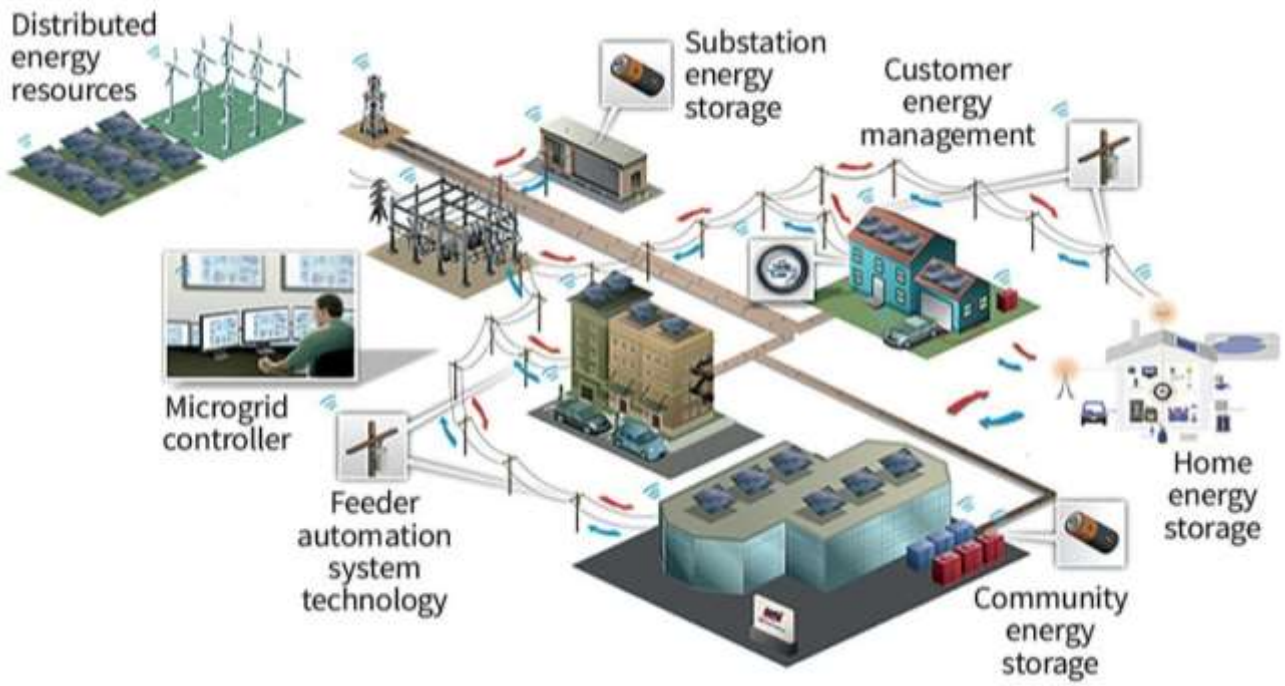

Fig. 1. Electricity consumption in the Tashkent region.

V. CONCLUSION

The introduction of modern means of monitoring and control of electrical energy in the Republic of Uzbekistan represents a strategic step towards increasing the efficiency and reliability of energy supply. The use of these technologies not only ensures prompt identification and elimination of emergency situations, but also significantly reduces energy losses, which is critically important in the context of increasing electricity consumption and the need to modernize energy infrastructure [11].

Modern automated systems make it possible to monitor and manage distribution networks in real time, which significantly increases their stability and reduces the likelihood of interruptions. For example, in the communications and telecommunications industry, where continuity of power supply is critical, the use of such technologies ensures the continuous operation of networks and services, minimizing risks and operating costs.

The economic benefits of implementing intelligent energy management systems come through significant reductions in operating costs and improvements in overall resource efficiency. Reducing energy losses and increasing energy efficiency directly affect the economic efficiency of industrial and residential facilities, which contributes to the long-term economic development of the region.

Reducing emissions of carbon dioxide and other harmful substances through increased energy efficiency is of environmental importance. These measures help improve the environmental situation and maintain sustainable development.

Thus, the introduction of modern means of monitoring and control of electrical energy is a necessary condition for ensuring reliable, efficient and sustainable energy supply in the Republic of Uzbekistan. These measures contribute to economic growth, improvement of living conditions of the population and the creation of a more sustainable and environmentally friendly energy system that can effectively cope with the challenges of our time [7].

Cıvata Bağlantılarının Performanslarının ve Güvenilirliğinin Geliştirilmesi

Erol Feyzullahoğlu

Makine Mühendisliği Bölümü / Mühendislik Fakültesi, Kocaeli Üniversitesi, Türkiye

efeyz@kocaeli.edu.tr

Özet – Cıvatalar günümüzde endüstride en çok kullanılan makina elemanlarından birisidir. Cıvatalar temel olarak çözülebilen bağlantıların teşkilinde ve güç (hareket) iletiminde yaygın olarak kullanılmaktadır. Cıvata bağlantılarının tasarımlarında ve bağlantının teşkilinde yapılacak olan birtakım düzenlemeler sonucunda bağlantının güvenirliği ve performanslarında iyileştirme sağlanabilmektedir. Bu çalışmada cıvata bağlantılarında montajdan, tasarımdan ve işletme koşullarından kaynaklanabilecek hataların önlenmesi, bağlantı performanslarının ve güvenirliklerinin artırılması için yapılması gereken faaliyetler sunulmaktadır. Ayrıca cıvata bağlantılarında çeşitli türlerde yapıştırıcıların kullanımı bağlantının performansının ve güvenilirliğinin geliştirilmesinde önemli bir rol oynamaktadır.

Anahtar Kelimeler – Cıvata bağlantıları; güvenirlik; tasarım; performans; çözülme

I. GİRİŞ

Cıvatalar günümüzde endüstride en çok kullanılan makina elemanlarından birisidir. Cıvatalar temel olarak çözülebilen bağlantıların teşkilinde ve güç (hareket) iletiminde yaygın olarak kullanılmaktadır.

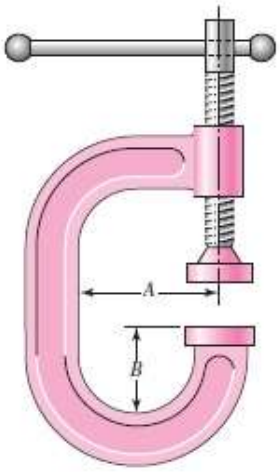
Cıvataların kullanıldığı alanlar oldukça çeşitlidir (Şekil 1) [1]:

- Bağlama elemanı olarak makina parçalarının montajında, çelik konstrüksiyonlarda, silindir kapaklarının montajında, boru flenşlerinde ve bazı parçaların temele tespitinde kullanılmaktadır.
- Gergi elemanı olarak yüksek gerilim hatları, halat bağlantıları ve ön gerilmeli sistemlerde kullanılmaktadır.
- Kapama elemanı olarak sızdırmazlık işlemlerinde ve yağ delikleri gibi yerlerde kör tapa elemanı olarak kullanılmaktadır.
- Ayar elemanı olarak hadde tesisleri gibi aşınma ve boşluk ayarı gereken yerlerde kullanılmaktadır.
- Ölçme elemanı olarak mikrometre gibi boyut ölçümü yapan aletlerde kullanılmaktadır.
- Hareket ve kuvvet iletim elemanı olarak vidalı pres, mengene, kriko vb. donanımlarda kullanılmaktadır.

Cıvata bağlantılarının kullanılmasında birtakım sakıncalar da bulunmaktadır:

- Ön gerilmeli cıvata bağlantılarında iletme kuvveti etkidiğinde ön gerilme kuvvetinde azalma olmaktadır.
- Cıvata bağlantılarında zamanla gevşeme (çözülme) oluşmaktadır.
- Cıvatada üzerindeki vida nedeniyle çentik etkisi oldukça büyüktür.
- Cıvata bağlantıları vida-somun dişleri arasındaki boşluklar nedeniyle iyi bir merkezlenme elemanı değildir.

a) Vidalı kriko



b) Mengene

c) Vidalı pres

Şekil 1. Cıvataların kullanılma yerleri

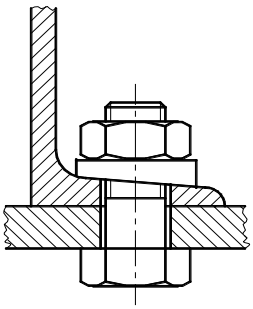
Bu çalışmada cıvata bağlantılarında montajdan, tasarımdan ve işletme koşullarından kaynaklanabilecek hataların önlenmesi, bağlantı performanslarının ve güvenirliklerinin artırılması için yapılması gereken faaliyetler sunulmaktadır.

II. YÖNTEM

Cıvata bağlantılarının tasarımlarında yapılacak olan birtakım düzenlemeler sonucunda bağlantının güvenirliği ve performanslarında iyileştirme sağlanabilmektedir:

a) Eğik rondela kullanımı:

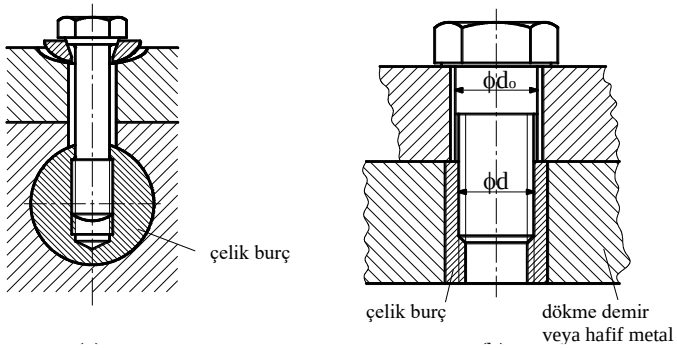
Çelik yapılarda kullanılan L, I ve benzeri profillerde olduğu gibi cıvata başı veya somunun temas yüzeyleri eğik konumda ise bağlantıda eğik rondela kullanılarak cıvata gövdesinin eğilmesi önlenebilir. Bu şekilde sıkma esnasında cıvatanın eğilmesi engellenebilecektir (Şekil 2) [2].



Şekil 2. Eğik rondela kullanımı

b) Burç içine diş açılması:

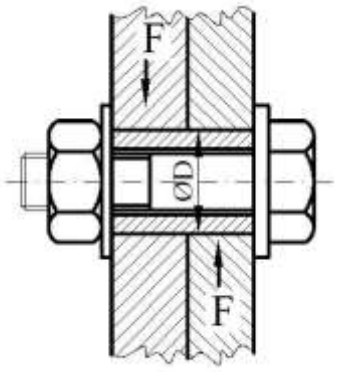
Parça içine kılavuz ile diş açılması durumunda hafif metal veya dökme demir gibi malzemelerde delik içindeki vida dişlerinin kolay aşınabilmektedir. Bu nedenle vidalanacak karşı parça içine bronz veya çelikten küresel veya silindirik bir burç geçirilir. Parça içine takılan bu burç içine vida dişleri açılır. Bu şekilde bağlantının daha uzun ömürlü olarak çalışması sağlanacaktır (Şekil 3).



Şekil 3. Burç içine diş açılması

c) Kesme burcunun kullanılması:

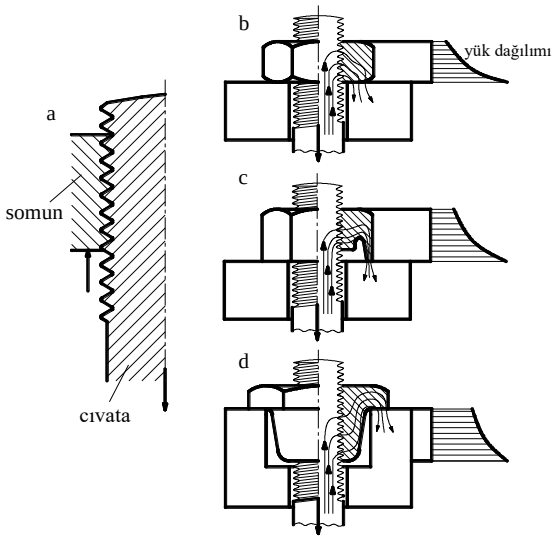
Cıvatalar kesme zorlanması etkisinde bırakılmamalıdır. Cıvata bağlantılarına çalışma esnasında enine kuvvet etkimesi halinde cıvata gövdesinde kesme gerilmesi ortaya çıkacaktır. Bu durumu engellemek için parçalar daha büyük çaplı delinerek deliklerin içine daha yüksek mukavemetli malzemeden üretilmiş bir silindirik kesme burcu takılarak cıvataya gelecek olan kesme gerilmeleri engellenerek cıvatanın güvenilirliği de artırılmış olacaktır (Şekil 4) [3].



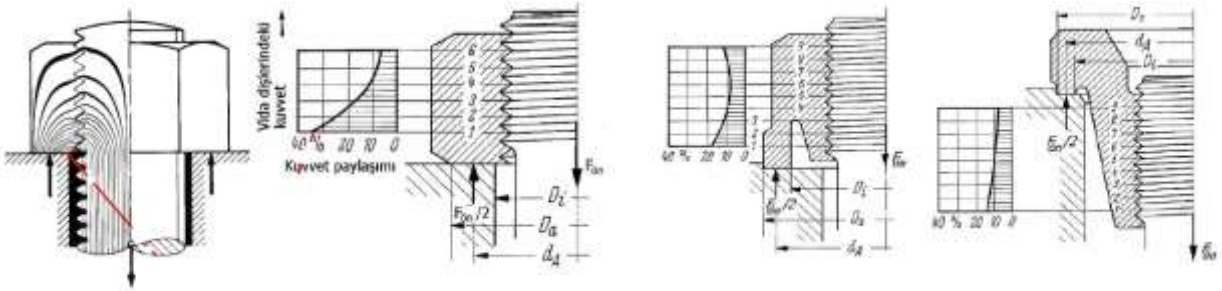
Şekil 4. Kesme burcunun kullanılması

d) Elastik somun kullanılması:

Genel olarak cıvata bağlantılarında cıvatanın üzerindeki gerilme dağılımı düzensizdir. Cıvata bağlantısında somun altındaki kırılmaların en büyük nedeni bağlantıya etkiyen eksenel kuvvetin, standart somunlarda, %35' inin hemen ilk vida dişlerinde iletilmesi ve buna çentik etkisinin de eklenmesidir. Somun içinde kalan 5. ve 6. dişler kuvvetin ancak %5' ini taşımaktadırlar. Hesaplamalarda ise kuvvetin dişler arasında eşit dağıldığı kabul edilmektedir. Normal bir cıvata–somun bağlantısında cıvata çekmeye, somun ise basmaya zorlanmaktadır. Şekil 5 ve 6' da standart cıvata–somun bağlantısında kuvvet akış çizgileri ve vida dişlerinde kuvvetin dağılışı görülmektedir. Gerilme yığılmalarını azaltmak için somunda tasarım değişiklikleri yapılabilir. Elastik somunda somuna bir kanal açılarak kuvvet etkisinde somunun esnemesi, ilk üç dişin esnekliğinin sağlanması ve dolayısıyla kuvvetin üst dişlere doğru yayılışı temin edilmektedir. Özel olarak tasarlanan ve elastik somun olarak adlandırılan somunda özel geometrisi nedeniyle somun çekmeye zorlanmakta ve yük dağılımı daha düzgün olmaktadır [4]. Normal somunlar üzerindeki gerilme yığılması elastik somunun kullanılması halinde %25-30 oranında azaltılabilmektedir. Elastik somunların kullanımı darbeli çalışmaların yoğun bir şekilde etkili olduğu özellikle havacılık endüstrisi gibi uygulamalarında cıvata bağlantısının performansının ve güvenilirliğinin iyileştirilmesinde önem kazanmıştır.



Şekil 5. Elastik somun kullanılması

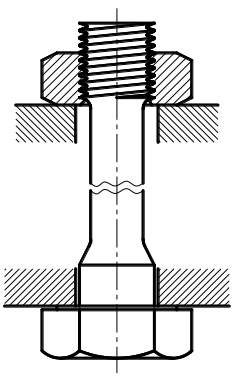


a) Normal somun b) Elastik somun

Şekil 6. Vida dişleri arasındaki kuvvet dağılımı

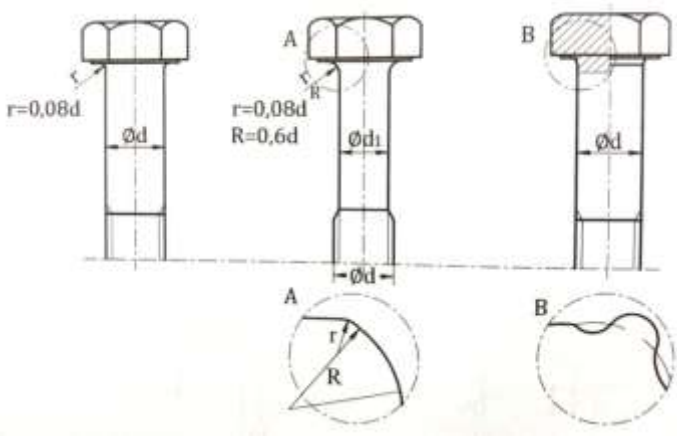
e) Cıvatada gerilme yayılışının düzgün hale getirilmesi:

Dinamik yükleme altında çalışan cıvata bağlantılarında gerilme yığılmalarını azaltacak yönde tasarımlar yapılmalıdır. Cıvata üzerindeki eksenel yükler ve cıvata gövdesindeki keskin köşeli boyutsal değişimler (çentik etkisi) gerilme yayılışında düğüm noktaları oluşturmaktadır. Bu bölgelerde gerilmelerde birikimlerin oluşması dinamik yükleme etkisinde kalan cıvatalarda yorulma sonucunda hasarların oluşmasına neden olmaktadır [5]. Cıvata–somun bağlantılarındaki gerilme yayılışını düzgün hale getirmek için cıvatanın tasarımında vidadan cıvata gövdesine geçiş yerinin tamamen somun içinde kalması ve geçiş yerlerinde büyük yuvarlatmaların yapılması yeterli olacaktır. Cıvata üzerinde gerilme yığılmalarının önlenmesi ile cıvatanın yorulma dayanımı ve güvenirliği de geliştirilmiş olacaktır (Şekil 7).



Şekil 7. Gerilme yayılışı iyileştirilmiş cıvata

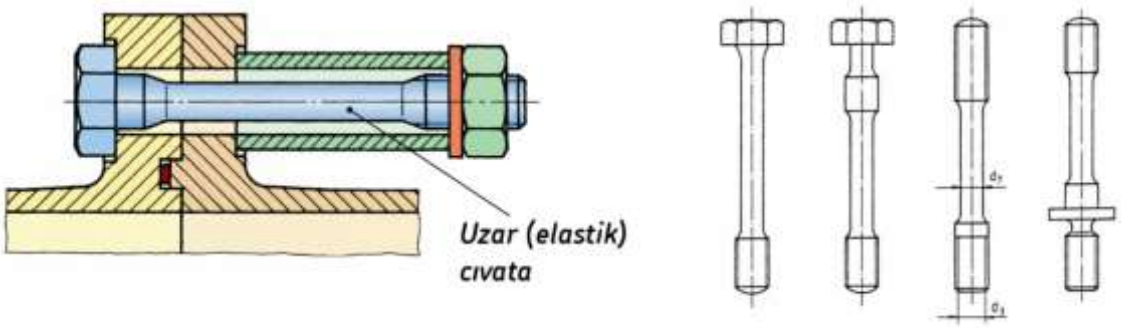
Cıvatada baş bölgesinin altında değişik formlarda radyüs verilerek çentik etkisini azaltmak mümkün olmaktadır (Şekil 8). Bu durumda dinamik yükleme etkisinde cıvatanın yorulma dayanımı iyileştirilerek yorulma ömrü artacaktır [6]. Bu sayede cıvatanın güvenirliği de iyileştirilmiş olacaktır.



Şekil 8. Cıvata başında çentik etkisinin azaltılması

f) Uzar (elastik) cıvata kullanımı

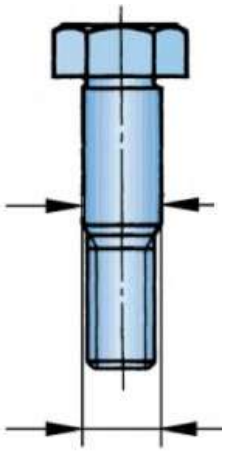
Dinamik yükleme etkisinde kalan cıvatalarda genlik gerilmesinin düşük olması cıvatanın mukavemetinin de yüksek olması anlamına gelmektedir. Bu nedenle özel olarak tasarlanan ve uzar cıvata olarak da tanımlanan elastiklik özelliği fazla olan cıvatalarda cıvatanın boyunun uzatılması ve kesitinin küçültülmesi cıvatanın yaylanma rijitliğini azaltarak cıvataya etkiyecek olan dinamik yükün küçültülmesini sağlayacaktır (Şekil 9). Uzar cıvatanın kullanılması halinde cıvataya etkiyen maksimum gerilme de azalarak dinamik yükleme etkisinde çalışan cıvatanın güvenirliğinin de yükseltilmesi sağlanmış olacaktır.



Şekil 9. Uzar (elastik) cıvata

g) Yüksek sıcaklıklar altında çalışan cıvatalar

Bazı cıvatalar kullanıldıkları yerlerde 150°C üzerindeki yüksek sıcaklıklara maruz kalabilmektedirler. Buhar kazanları, fırınlar ve içten yanmalı motorlar gibi yüksek sıcaklıkların var olduğu sistemlerde bağlantı amacı ile kullanılan cıvataların yüksek sıcaklıklara maruz kalması, sürünme ve gerilme gevşemesi gibi malzeme özelliklerini ortaya çıkarmaktadır. Sıcaklık etkisinde malzemelerin mukavemetleri ve elastiklik modülleri azalmaktadır. Sürünme olayında zamanla cıvata üzerindeki uzamalar artarak kesiti incelmekte ve bir süre sonra incelen kesit cıvata üzerindeki kuvveti taşıyamaz hale gelerek kopmaktadır. Cıvatanın sürünmeden kaynaklanan hasarlarını önleyerek güvenirliğini ve performansını artırmak mümkündür. Bu amaçla cıvata özel olarak yeniden tasarlanır ve gövde çapı olması gerekenden daha büyük yapılarak sürünmeden kaynaklanan hasarlar engellenebilir (Şekil 10).



Şekil 10**.** Sürünmenin engellenmesi için kullanılabilecek cıvata

h) Kimyasal maddelerin kullanımı

Özellikle titreşim etkisinde kalan cıvata bağlantılarında bir süre sonra çözülmeler ortaya çıkabilmektedir. Cıvata-somun bağlantılarında sıvı aneorobik esaslı yapıştırıcılar (Loctite) kullanarak bağlantının çözülmesi engellenebilmektedir. Cıvatanın dişleri üzerine yapıştırıcı uygulamasından sonra oksijen ile temas sonrasında kürlenme başlamaktadır. Cıvatanın montajı yapıldıktan sonra belli bir süre sonra katılaşan yapıştırıcı çözülmeyi engellemektedir (Şekil 11).

Şekil 11. Bir saplama üzerine yapıştırıcının uygulanması

Bazı durumlarda cıvata dişleri üzerinde belli bölgelere yapıştırıcı uygulanarak yüzeyleri kaplanabilir (Şekil 12). Bu kaplamaların içinde mikro kapsüller bulunmaktadır. Cıvataların montajı esnasında bu mikro kapsüller kırılarak yapıştırıcı madde açığa çıkar ve dişler arasındaki boşluğu doldurur. Bir süre sonra da sertleşerek bağlantının çözülmesi engellenir. Cıvata bağlantılarında burada ifade edilen yapıştırıcıların kullanımı bağlantının performansının ve güvenilirliğinin geliştirilmesinde önemli bir rol oynamaktadır.

Şekil 12**.** Yapıştırıcı ile yüzeyleri kaplanmış cıvatalar

III. SONUÇLAR

Cıvata bağlantılarının konstrüksiyonlarında ve bağlantının teşkilinde yapılacak olan birtakım düzenlemeler ile cıvata-somun bağlantısının güvenirliği ve performanslarında iyileştirme sağlanabilmektedir. Cıvata bağlantılarında tasarıma ile ve olarak yapıştırıcıların kullanımı bağlantının performansının ve güvenilirliğinin geliştirilmesinde önemli bir rol oynamaktadır.

Abstract – Android devices are now widespread, with billions of users worldwide relying on them for communication, entertainment, and productivity. The widespread use of these devices makes them primary targets for malware attacks, which can compromise sensitive data, disrupt operations, and pose significant security risks. Consequently, the prevalence and sophistication of Android malware emphasize the critical need for robust security measures and vigilant user practices to mitigate these threats. To address this problem, we utilized various machine learning models and techniques frequently used in artificial intelligence studies, such as feature extraction, feature importance, feature subset selection and hyperparameter optimization. First, we trained our dataset, which contains 79 features, using a Random Forest classifier to obtain a feature importance ranking. Based on this ranking, we divided the top 50 features into five subsets containing the top 10, 20, 30, 40, and 50 features. We then conducted a comparative study by training 11 machine learning models with default parameters on these subsets. Our results showed that some models achieved up to 92% accuracy. For models that performed relatively poorly, we used the Random Search library to determine the best hyperparameters from a predefined parameter pool and fine-tuned these models. For instance, the XGBRF Classifier model, which initially achieved an average accuracy of 81% across the five subsets with default parameters, exceeded 92% performance after fine-tuning process.

Keywords – Android Operating System, Machine Learning, Feature Selection, Feature Extraction, Hyperparameter Fine-tuning

I. INTRODUCTION

As online threats continue to evolve and become more sophisticated, the necessity for advanced protection mechanisms has never been more critical. Malware attacks, which involve the deployment of malicious software to infiltrate, disrupt, or damage computer systems and networks, pose a significant threat to information security. These attacks can lead to severe consequences, including data breaches, financial loss, and compromised personal information. Highlighting the severity of Android malware threats, McAfee's 2023 "Mobile Threat Report" reveals a concerning 50% surge in malware detections on Android devices within the year alone. Notably, a large proportion of these malicious programs are designed to target and compromise users' personal and financial information [1]. This alarming increase underscores the urgent need for robust and adaptive security measures to protect users against such pervasive threats. Traditional security methods, which often rely on static and signature-based detection techniques, are increasingly inadequate in combating the rapidly changing landscape of cyber threats. Malware authors constantly develop new techniques to evade detection, rendering many conventional security solutions obsolete. As a result, there is a growing recognition that innovative approaches are necessary to stay ahead of cyber adversaries. In response to these challenges, cybersecurity professionals

are leveraging machine learning to bolster defenses against these threats. Machine learning models, with their ability to learn from vast amounts of security data, offer promising solutions for the detection and prevention of malware attacks. Unlike traditional methods, machine learning can identify patterns and anomalies in data that may indicate malicious activity, even if the specific malware variant has never been seen before. By continuously analyzing and learning from new security incidents, machine learning models can adapt to emerging threats in real-time. This dynamic capability is crucial in an environment where cyber threats are constantly evolving. Moreover, machine learning can enhance various aspects of cybersecurity, including threat intelligence, anomaly detection, and automated response mechanisms. For instance, machine learning algorithms can be employed to monitor network traffic and identify unusual behaviors that may signify a malware infection. Additionally, these models can assist in classifying and prioritizing threats, enabling security teams to focus their efforts on the most critical issues. The integration of machine learning into cybersecurity strategies not only improves the efficiency and effectiveness of threat detection but also helps in the development of proactive defense mechanisms.

In conclusion, as the landscape of online threats grows increasingly complex, the adoption of advanced technologies such as machine learning is essential for maintaining robust cybersecurity. By harnessing the power of machine learning, we can develop more sophisticated and adaptive defenses that can keep pace with the ever-evolving tactics of cybercriminals. This proactive approach is vital for safeguarding personal and financial information in an era where digital security is paramount.

1. Motivation

The exponential rise in mobile device usage, particularly Android smartphones, has been accompanied by an equally alarming surge in malware attacks targeting these devices. With Android being the most widely used mobile operating system globally, it has become a prime target for cybercriminals. Traditional antivirus solutions, which predominantly rely on signature-based detection methods, are increasingly inadequate in addressing the sophisticated and rapidly evolving nature of modern malware. This inadequacy is further compounded by the sheer volume of new malware variants that emerge daily, outpacing the ability of traditional methods to update and adapt. Given this landscape, there is a compelling need to explore and implement innovative approaches that can offer robust, adaptive, and proactive defense mechanisms. Machine learning (ML) techniques present a promising solution to this challenge. By leveraging the ability of ML models to learn from vast datasets and identify complex patterns, we can enhance malware detection capabilities beyond the limitations of traditional methods. This paper aims to investigate the application of machine learning in Android malware detection, providing a comprehensive analysis of its potential to revolutionize mobile security and protect users against the ever-growing threat of malware.

2. Novelty

The novel aspect of this study in Android malware detection lies in our innovative approach to enhancing model performance by categorizing various features into subgroups for comparative testing. During preprocessing with the Random Forest Classifier, we identified which of our 78 features most significantly impacted outcomes. Utilizing the importance rankings from this classification, we trained 11 different machine learning models using 5 distinct feature subsets. For models that initially underperformed, we conducted fine-tuning with a preselected list of hyperparameters. As a result, even the lower-performing models demonstrated approximately a 15% increase in accuracy, aligning more closely with the performance of the higher-performing models.

3. Related Works

Approaches to malware detection can be broadly categorized into static, dynamic, and hybrid methods. The static approach involves extracting features such as permissions, intent filters, strings, services, activities, Dalvik opcodes, and metadata from an app without executing it. The dynamic

approach extracts feature by running the app in an emulated environment or on a real device, capturing data such as system calls, binder calls, API calls, network usage, and memory usage. The hybrid approach combines static and dynamic analysis to leverage the strengths of each method. After analysis, the collected features are compiled into a dataset used to train and test machine learning (ML) models. For example, a Cat-Boost algorithm-based model achieved high accuracy in malware detection and family classification using static features like permissions and intents but struggled with advanced evolving malware and specific ransomware families [2] Another study extracted permissions and APIs from a large dataset of apps, but it was limited by its imbalance and outdated samples [3]. Dynamic analysis-based techniques, such as those using emulated platforms to extract system calls and binder calls, have shown promise but face challenges with malware that can detect emulated environments [4] also relied on an emulated dynamic malware analysis platform and used multiple types of features (e.g., system calls, binder calls, and composite behaviors). Droidbox [5], DroiMat [6], were developed using dynamic analysis in an emulator or sandbox, focusing on features such as permissions, intents, and API calls. Despite their excellent performance, these models failed to analyze malware with anti-emulation mechanisms. Notably, the ability to detect emulation is not limited to malware; other apps, such as those using Telephony Manager, can also detect emulators using methods like TelephonyManager.getDeviceId() [7]. Hybrid approaches have been highlighted for their higher accuracy, combining the benefits of static and dynamic analysis. Studies have used techniques like pseudo-label stacking autoencoders and VMI-based systems to achieve high detection rates [8]. In [9], [10], the use of hybrid analysis is further supported for effective identification of resource misuse and malware detection. In [11], a toolkit was used to mine different app platforms and user characteristics with the aim of studying the health and sustainable security of different apps. Even though this study provides significant insight into the evolution of the Android platform, the approach used has its limitations in terms of practicality and feasibility. It requires continuous data mining, crawling, and auto updating to achieve durable results. In [12], the static and dynamic characterization of Android apps developed between the years 2010–2017 was carried out. The authors present important findings along with recommendations related to app structure, behavior, and evolution. However, because the researchers only analyze benign apps, the recommendations cannot be generalized to malicious apps because malicious apps are very different from benign apps in terms of their metrics and behavior. In [13], a self-evolving detection solution, called Droidevolver, was developed and trained using a dataset consisting of API calls. The dataset used consists of 34,722 malicious samples from 2011 to 2016 and the final model achieved a F-measure of 95.27%. It is stated that this score decreased by 1.06% per year (on average) until it reached 89.97% in 2016. Because Droidevolver is based on static analysis, it inherits the limitations of this approach. Research has revealed the evolution of malware characteristics to evade detection, underscoring the importance of robust feature engineering and up-to-date datasets [14]. In [15], the dynamic evolutionary behavior of benign and malicious Android apps was evaluated on code-level execution. The dataset included 15,451 benign and 15,183 malicious samples from 2010 to 2017. The study uncovered metrics that differentiate between benign and malicious apps, suggesting these could inform durable malware detection solutions. However, its effectiveness relies on stable patterns across evolving malware versions, and the solution is limited by dynamic analysis conducted in emulated environments. Overall, while each approach has its strengths, the combination of static and dynamic analysis in hybrid methods appears to offer the most promise for effective malware detection.

II. Materials and Method

1. Dataset

For this study, we utilized the Android Adware and General Malware Dataset (CIC-AAGM2017) published by Lashkari et al. (2018) at the Canadian Institute for Cybersecurity [16]. The distribution of the samples in original copy of the dataset is illustrated in table 1. This comprehensive dataset supports the development and evaluation of machine learning models for malware detection and is stratified into three categories: benign, adware, and general malware. It includes 471,597 benign samples, 155,613

adware samples, and 4,745 general malware samples, covering a range of threats such as trojans, ransomware, and spyware. This diversity enables a deep learning-based approach to accurately recognize and differentiate between benign and malicious behaviours, thus enhancing the model's accuracy and robustness. Given the dataset's imbalance, with a predominance of benign samples, we combined the adware and general malware categories to create a more balanced distribution between benign and malicious samples, as shown in Table 2. This adjustment aimed to improve the effectiveness of the machine learning analysis. Using this modified dataset, we tested twelve different machine learning models to evaluate their effectiveness in detecting malicious software. These models, ranging from traditional algorithms like decision trees and support vector machines to advanced neural networks, were rigorously trained and tested in a consistent environment. This comprehensive testing provided valuable insights into each model's strengths and weaknesses in handling imbalanced data scenarios. To address the imbalance issue further, we considered expanding the minority group using synthetic data and employing the Tomek Links method to eliminate records from the majority group that are likely to overlap with the minority group. However, this study focused on comparing metric values obtained from models trained with default settings versus those trained with optimal parameters. Consequently, we conducted model training using a random selection of 150,000 records from each category.

Table 1. The original copy of the dataset.

Type	Number Of Sample
Benign	471597
Adware	155613
General Malware	4745

Table 2. The Dataset After Merging Adware and General Malware Samples

Type	Number Of Sample
Benign	471597
Adware	160358

2. *Machine Learning*

Machine learning, a subset of artificial intelligence, excels at identifying malicious Android apps by analysing comprehensive data about various app types [17], [18], [19]. By learning from both benign and malicious apps, it discerns patterns and anomalies indicative of malware, improving its accuracy over time with new data. This capability is crucial for addressing the ever-evolving cybersecurity threats. In this study, we employed 11 different machine learning methods to train our data, including Random Forest Classifier, Bagging Classifier, Extra Trees Classifier, Decision Tree Classifier, XGB Classifier, Extra Tree Classifier, Gradient Boosting Classifier, XGBRF Classifier, AdaBoost Classifier, SGD Classifier, and Logistic Regression.

3. Preprocessing Phase

In machine learning, an excess of features can complicate model training and degrade performance, especially when many features do not significantly contribute to predictions. This issue, known as overfitting, occurs when a model performs well on training data but poorly on new data. To mitigate overfitting, it is crucial to identify the most important features, assessing how much each one contributes to the model’s predictive accuracy. Various methods can determine feature importance. Models like decision trees and ensembles such as Random Forests inherently provide feature importance by indicating how each feature influences decision-making. Alternatively, model-agnostic methods like permutation feature importance can be employed. This technique involves shuffling features and observing the impact on model performance. By focusing on the most important features, experts can enhance model

efficiency, reduce computational requirements, and potentially improve both accuracy and interpretability. Table 3 illustrates the importance of features in the used dataset.

4. Model Fine Tuning Process

In the rapidly evolving field of machine learning, success hinges not only on selecting the optimal model but also on meticulously fine-tuning its parameters. Fine-tuning involves making precise adjustments to a pre-trained model to enhance its performance for a specific task or dataset. This practice is particularly crucial in transfer learning, where a model trained on a large dataset is adapted for a different, often smaller and more specialized, dataset. By leveraging existing knowledge, fine-tuning improves model accuracy and efficiency, ensuring it adapts well to new data. Hyperparameter optimization focuses on adjusting settings such as learning rate, number of layers, and batch size, which must be determined before training begins. These hyperparameters significantly influence model performance, and finding the optimal combination can enhance accuracy, reduce computational requirements, and improve generalization to new data. Random Search is an effective method for hyperparameter optimization due to its simplicity and efficiency. Unlike grid search, which exhaustively evaluates all possible combinations within a defined space, Random Search selects hyperparameters randomly from a specified distribution. This approach can explore a larger set of combinations in less time, making it ideal for high-dimensional search spaces where grid search would be computationally prohibitive. Random Search increases the likelihood of discovering highly effective hyperparameter settings that other methods might overlook, making it a valuable tool for machine learning practitioners.

In this study, we fine-tuned the XGBRF Classifier, which initially achieved lower scores compared to other models, using the Random Search library to optimize its parameters. The XGBRF Classifier integrates the concept of Random Forests into the XGBoost framework. Instead of using gradient boosting to sequentially build trees, it uses the Random Forest approach to create a collection of decision trees that are trained independently. This hybrid model aims to leverage the robustness and high accuracy of XGBoost while benefiting from the randomness and reduced overfitting characteristics of Random Forests. This fine-tuning process significantly improved the model's performance, demonstrating the importance and effectiveness of hyperparameter optimization in machine learning. The range values used for each hyperparameter is illustrated in table 4.

Table 4. The range of values used during hyperparameter tuning process.

Parameter	Values
n_estimators	50, 100, 200
max_features	auto, sqrt, log2
max_depth	None, 10, 20, 30
criterion	gini, entropy

III. RESULTS AND DISCUSSIONS

1. Evaluation Metrics

The measures we use to evaluate something include precision, recall, F-score, and accuracy. Precision is the number of right decisions divided by the total number of decisions in a specific category. It is figured out as:

$$Precision = \frac{TruePositive}{TruePositive + FalsePositive}$$

The term 'True Positive' refers to situations where malware attacks are correctly classified as malware attacks, while 'False Positive' refers to situations where non-malicious records are incorrectly classified as attacks:

$$Recall = \frac{TruePositive}{TruePositive + FalseNegative}$$

False Negative' refers to the situation where a record that is actually a malware attack is incorrectly classified as benign. Accuracy tells us how correct the decisions are compared to the real classification. The machine learning model's decision is only considered correct if it matches the real malware attack class in the dataset. It is figured out by adding up some numbers.

$$Accuracy = \frac{TruePositive + TrueNegative}{TrueNegative + FalsePositive + FalseNegative + TruePositive}$$

Where True Negative refers to the situation where a record that is actually a benign is correctly classified as benign. Finally, the F1-score is the harmonic mean of precision and recall. It is calculated as:

$$F_1 - Score = \frac{2 * Precision * Recall}{Precision + Recall}$$

2. Experiment Setup

In this research, we conducted extensive tests and evaluations of various machine learning models using a computer equipped with 32 GB of RAM and an i7 12th generation processor. This hardware configuration allowed for efficient and rapid computations. Our work did not necessitate the use of libraries like TensorFlow or PyTorch, nor did it require GPU acceleration. This setup was well-suited for our machine learning tasks, enabling quick processing and analysis without the need for the complex tools and resources typically associated with deep learning.

3. Obtained Results

In this study we carried on number of tests with 11 different machine learning models consist of Logistic Regression, Decision Tree Classifier, Extra Tree Classifier, XGB Classifier, XGBRF Classifier, Ada Boost Classifier, Random Forest Classifier, Extra Trees Classifier, Gradient Boosting Classifier, Bagging Classifier, SGD Classifier. The results of these machine learning classifiers are illustrated in table 5.

The results demonstrated that creating subsets with various features can enhance model performance. However, excluding critical components can result in data loss and reduced model efficacy. To optimize performance, it is crucial to carefully analyse the data, reduce its dimensionality if necessary, and experiment with new features to determine the most effective combination. In this research, we focused on improving the performance of the XGBRF Classifier, which initially performed poorly in our five tests, by utilizing the Random Search library. Our goal was to enhance the model's accuracy and minimize classification errors. The table 6 illustrates the results of the original XGBRF Classifier applied to different group of features.

Table 6. Results of XGBRF Classifier before Fine Tuning

Feature Size	Accuracy	Roc Auc	F1 Score	Precision	Recall
10	80.716.667	0.806994	0.817772	0.777299	0.862692
20	81.796.667	0.817787	0.828324	0.785904	0.875586
30	82.263333	0.822474	0.831699	0.793476	0.873791
40	82.456.667	0.824408	0.833523	0.795262	0.875652
50	82.756.667	0.827422	0.835668	0.800426	0.874157

In order to boost XGBRF Classifier’s robustness, we utilized the Random Search library to fine-tune the n_estimators and max_depth parameters, criterion, max_depth. In this optimization process, the cross-validation parameter was set to 5, guaranteeing a strong assessment of the model's execution over diverse folds of the information. The results of XGBRF classifier after the tuning process was as illustrated in Table 7. Figure 1 illustrates comparison between the confusion matrixes of XGBRF classifier before and after the hyperparameter tuning process.

Table 7. Results of XGBRF Classifier After Fine Tuning

Accuracy	Cross Validation mean	F1 Score	Precision	Recall
0.92168	0.91981	0.92233	0.91747	0.92725

IV. CONCLUSION AND FEATURE STUDY

In our study, we evaluated 11 machine learning models using an Android Malware Dataset. To ensure robust results, we conducted tests on 150,000 samples from our imbalanced dataset's target categories. After balancing the dataset, we employed the Random Forest Classifier to rank the importance of our 79 features. Using subsets containing the top 10, 20, 30, 40, and 50 most significant features, we trained and tested these models. The Random Forest Classifier, Bagging Classifier, Extra Trees Classifier, and Decision Tree Classifier consistently outperformed the other models. To assess the models' sensitivity to hyperparameter optimization, we performed tests and found that the XGBRF Classifier, initially performing lower than the successful models, significantly improved through optimal parameter tuning using Random Search. Post fine-tuning, the model, which initially achieved an average accuracy of 81% across five subsets, achieved up to 92% accuracy. This underscores the importance of dataset balancing, normalization, scaling processes, and parameter optimization in achieving high performance.

In future studies, we aim to enhance machine learning model performance by effectively applying normalization, standardization, and the Cluster Centroid library, particularly beneficial for handling imbalanced datasets.

Özet **–** Anot ve katot tarafında meydana gelecek reaksiyonlar için aktif bölge sağlayan oksidasyon ve indirgenme reaksiyonlarının oluşabilmesi için yakıt pilinin her iki tarafında da bulunması gereken katalizörler yakıt pilinde hayati öneme sahiptirler. Pt ve Pt bazlı katalizörlerin yüksek maliyeti PEM yakıt pili teknolojisinin ticarileştirilmesi önündeki büyük engellerden bir tanesidir. Kullanılan platin ve platin bazlı alaşımların yüksek fiyatı, rezervlerinin azlığı ve zayıf elektrokimyasal kararlılığı nedeniyle PEM yakıt hücrelerinin uygulama alanlarını önemli ölçüde sınırlamıştır.

Bu çalışma da, PEM yakıt hücresinin MEA'sın da kullanılmak üzere, 1:2 atom oranlarında paladyum ve zirkonyum alaşımı, Vulcan 72-R aktif karbon ile birlikte sentezlendi. Sentezlenen $PdZr_2$/C katalizörü PEM yakıt hücresinde anot katalizörü olarak, yakıt hücresinin performansı değerlendirildi. Çalışmada, katot kısmı oksijen gazı yerine güçlü bir oksitleyici madde olan ozon (O_3) gazı ile beslendi. Farklı hücre sıcaklıklarında $PdZr_2$/C katalizörünün ölçülen akım yoğunluğu ve güç yoğunluğu değerlerinden polarizasyon eğrisi oluşturularak, PEM yakıt pilinin değişen hücre sıcaklığına göre aktivitesi ve verimliliği değerlendirildi. H_2/O_3 PEM yakıt hücresinin 40 ºC hücre sıcaklığında açık devre voltajından 1.46 V olarak ölçüldü. $PdZr_2$/C katalizörü, H_2/O_3 ortamında çalışılan hücre sıcaklıklarında; 70°C'de 91 mA/cm^2, 60°C'de 86 mA/cm^2, 50°C'de 81 mA/cm^2 ve 40°C'de 72 mA/cm^{2}lik akım yoğunluğu değeri ölçüldü. Yine, aynı sıcaklıklar da sırasıyla 30.94 mW/cm^2, 27.52 mW/cm^2, 25.11 mW/cm^2 ve 23.04 mW/cm^2'lik güç yoğunluğu değerleri ölçüldü. Hücrenin sıcaklığı arttıkça katalizörün katalitik aktivitesinin arttığı görüldü.

Anahtar Kelimeler – PEM yakıt pili, anot, katalizör, ozon, akım

I. GİRİŞ

Artan küresel enerji talebinin yanı sıra, eş zamanlı olarak üretim maliyetlerinde de artış yaşanıyor. Bu koşullar yenilenebilir enerji kaynaklarının kullanımının arttırılması ve yaygınlaştırılmasının kolaylaştırılması ihtiyacını doğurmuştur [1, 2]. Hidrojenin gelecekte yenilenebilir kaynaklardan enerjinin dönüştürülmesi ve depolanmasında önemli bir rol oynayacağı öngörülmektedir [3]. Güneş, rüzgar, jeotermal ve biyokütle gibi çeşitli yenilenebilir enerji kaynaklarının kullanımında hızlı ve önemli bir artış görülüyor. Enerji taşıyıcıları arasında alternatif bir elektrik güç kaynağı olan Proton Değişim Membranlı (PEM) yakıt hücreleri, kimyasal enerjiyi elektrik enerjisine dönüştürmedeki yüksek verimleri nedeniyle son zamanlarda ilgi odağı haline gelmiştir [1]. Ancak katalizörlerin dayanıklılığı ve maliyeti PEM yakıt hücrelerinin ticarileştirilmesinin önünde engel teşkil etmektedir [4]. Yüksek aktivitesi nedeniyle karbon destekli Pt ve Pt bazlı (Pd, Ru gibi), hem anot hem de katot katalizörleri olarak kullanılır, ve bu da

maliyeti önemli ölçüde artırır. Bununla birlikte, bu malzemeler, Pt nanopartiküllerinin çözünmesi veya toplanması ve karbon destek korozyonu nedeniyle uzun vadeli stabilitesi zayıftır [5]. Son yıllarda, PEM yakıt pili hücresinde anot ve katot katalizörleri için Pt bazlı katalizörlere daha uygun alternatifler bulmak amacıyla değerli olmayan metallerden katalizörler geliştirme yönünde girişimlerde bulunulmuştur. PtCo/C [6], PdNi/C [7], PtFe/C [8], PdMo/C [9] gibi bimetaller ve metal oksitlerle birlikte karbon destekli platinin kısmen kullanılmasıyla elektronların maliyetini azaltmak için çeşitli çalışmalar yapılmıştır. PEM yakıt pillerinde anot kısmı hidrojen ile beslenir iken katot kısmı hava/oksijen ile beslenmektedir. Bu çalışmamızda, kimyasal indirgenme yöntemi ile PEM yakıt pili hücresinde anot katalizörü olarak kullanılması için PdZr2/C katalizörü sentezlendi.
PEM yakıt hücresi H_2/O_3 gazları ile beslenerek farklı hücre sıcaklıklarında (40, 50, 60 ve 70 ºC) çalıştırılarak polarizasyon eğrileri oluşturulup, $PdZr_2/C$ katalizörünün performansı değerlendirildi.

II. MATERYAL VE YÖNTEM

2.1.$PdZr_2$/C katalizörünün sentezi

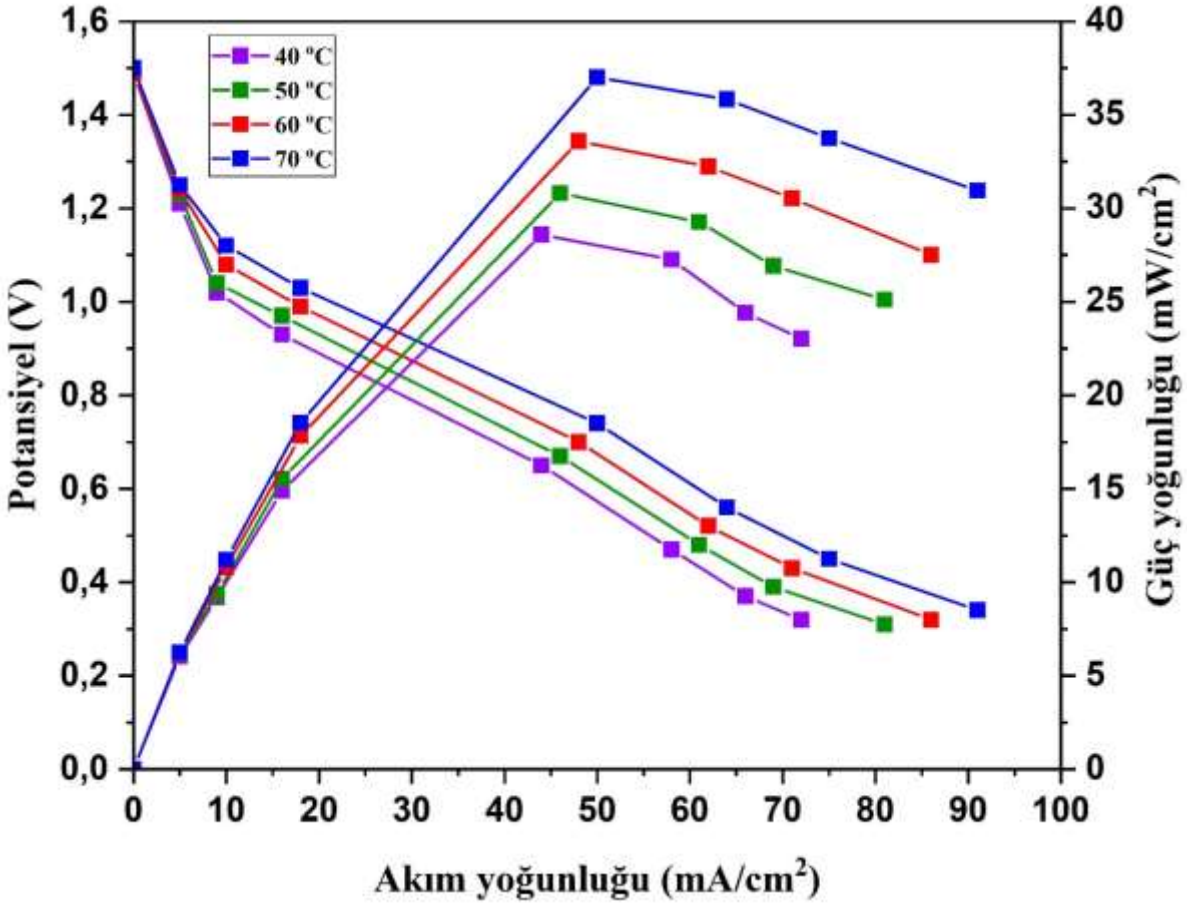
Karbon destekli PdZr (1:2), katalizörü kimyasal indirgeme yöntemiyle hazırlandı. Paladyum klorür ve zirkonyum klorür metal öncüleri olarak, sodyum borohidrür ise indirgeyici ajan olarak kullanıldı. Katalizörlerin tümü ağırlıkça %20'yi destekleyecek şekilde metal yüklemesi ile sentezlendi. İlk olarak PdZr/C katalizörü için uygun miktarda paladyum klorür ve zirkonyum klorür gibi bir metal öncüsü su içinde çözüldü. Yine başka bir beherde ağırlıkça %80 karbon (Vulcan XC-72), 10 mL etil alkol içerisinde 1 saat boyunca dağıtıldı. Daha sonra karbon çözeltisine paladyum klorür ve zirkonyum klorür ilave edildi ve 30 dakika boyunca ultrasonik bir karıştırıcı kullanılarak homojenleştirildi. Çözeltinin pH'ı 0,5 M NaOH eklenerek 11'e ayarlandı ve ardından çözelti 80 °C'ye ısıtıldı. Daha sonra 0,25 M NaBH4 çözeltisi yavaş yavaş damlatılarak 80 °C çözelti sıcaklığında indirgeme işlemi gerçekleştirildi. Elde edilen süspansiyon süzüldü ve çökelti, nitrojen gazı ortamında 90 ºC'deki Etüvde 5 saat kurutuldu.

2.2. MEA'nın hazırlanması

Membran elektrot tutucusu (MEA), Nafion 117 membranının anot katalizörü olarak kulllanılan PdZr2/C ve katot katalizörü olarak kullanılan Pt/C elektrokatalizörleri arasına yerleştirildi. Daha sonra, 132 °C'de ve 1000 psi basınç altında 3 dakika boyunca sıcak presleme işleminin uygulanmasıyla oluşturuldu.

III. BULGULAR VE TARTIŞMA

Tek hücreli PEM yakıt pilinde anot katalizörü olarak kullanılan Pd_2Zr/C katalizörü farklı hücre sıcaklıkların (40, 50, 60, 70 ºC) da H_2/O_3 ortamında akım yoğunluğu-gerilim değerleri ölçümleri yapılarak polarizasyon eğrileri oluşturuldu. Oluşturulan polarizasyon eğrileri Şekil 1 de gösterildi. bilime katkısı yorumlanmalıdır.



Şekil 1. Farklı PEM yakıt pili hücre sıcaklıklarında PdZr2/C katalizörünün polarizasyon eğrisi (anot:$PdZr_2$/C, katot: Pt/C katalizörleri; Hidrojen debisi 20 $mldk^{-1}$ ve O_3 debisi 10 $mldk^{-1}$).

Şekil 1 incelendiğinde, artan hücre sıcaklığıyla PEM yakıt pilinin performansının arttığı gözlemlendi. Pd metalinin Zr metali ile alaşımlandırılması sonucunda, İki metalden kaynaklanan işlevler ve ligand etkisi yakıt hücresi performansını artırdığını gösterdi. Ayrıca, oksijen /hava yerine kullanılan ozon gazı (O_3) yakıt hücresinin açık devre voltajını arttırmış[10] olup 40 ºC hücre sıcaklığında 1.49 V ve 70 C hücre sıcaklığında ise 1.50 V olarak ölçülmüştür. Sıcaklığın ve Pd/Zr atom oranının etkisi açık bir şekilde PEM yakıt pili uygulamasında belirgindi. Sentezlenen PdZr/C elektrokatalizörü kararlı durum koşulları altında mükemmel uzun vadeli stabilite gösterdiği yapılan uygulamalar sonucunda belirlendi. PEM yakıt pilinin farklı hücre sıcaklıklarında ölçülen aktivite değerleri Tablo 1 de sunuldu.

Tablo 1. $PdZr_2$/C katalizörünün PEM yakıt pili hücresinde ki performans değerleri

Katalizör	OCV (V)	Akım yoğunluğu (mA/cm^2)	Çalışma voltajı (V)	Güç yoğunluğu (mW/cm^2)	Sıcaklık (ºC)
$PdZr_2$/C	1.49	72	0.32	23.04	40
	1.49	81	0.31	25.11	50
	1.49	86	0.32	27.52	60
	1.50	91	0.34	30.94	70

Tablo incelendiğinde, O_2/hava yerine O_3 kullanımının yakıt pilinin açık devre voltajını ve aktivasyon kayıp bölgesindeki kayıpları azalttığı görüldü. Ayrıca, daha önce yapmış olduğumuz Pd/C ile kıyasladığımızda yakıt pilinin performansını arttırdığı görüldü.

IV. SONUÇLAR

$PdZr_2/C$ katalizörü PEM yakıt hücresinde anot katalizörü olarak kullanılması arttan hücre sıcaklığı ile beraber yakıt pilinin performansını arttırdığı görüldü. Ayrıca, çalışmada, katot kısmı oksijen gazı yerine güçlü bir oksitleyici madde olan ozon (O3) gazı ile beslenmesi de performansı arttırdı. Sonuç olarak, PdZr2/C katalizörünün artan hücre sıcaklıklarında ki aktivitesi şu şekilde; 40 ºC>50 ºC> 60 ºC > 70 ºC sıralanır.

Implementing a Stock Price Prediction Model with Deep Neural Networks

Halit Çetiner*

[1]*Vocational School of Technical Sciences, Isparta University of Applied Sciences, Türkiye*

**(halitcetiner@isparta.edu.tr)*

Abstract – Big data and deep learning technologies, which are one of the biggest focal points of data science, have recently been interested in which stocks investors will invest in. With the development of digital media, stock price prediction by selecting meaningful data from thousands of data sources has become an important issue. In this study, a Gated Recurrent Unit (GRU) based regression analysis is performed to predict time series data containing ADANI stock price information consisting of 10 columns and 3200 rows. As a result of the experimental studies, a GRU-based model consisting of 6 layers is proposed. In order to determine the effect of the proposed model on performance, it is compared with the classical GRU-based model. As a result of the experimental studies, 0.93 R^2 score performance value was achieved with the proposed GRU, while 0.74 R^2 score performance value was achieved with the classical GRU based model. In order to consolidate the performance results obtained, the outputs of both models were also evaluated in terms of MSE, RMSE, MAPE, MAE performance measures commonly used in the literature. The proposed GRU model achieved values of 0.0009, 0.0192, 21.53, 0.0168 in terms of MSE, RMSE, MAPE, MAE performance measures, respectively. The classical GRU model reached values of 0.0013, 0.0395, 31.35, 0.0221 in terms of MSE, RMSE, MAPE, MAE performance measures. Although the proposed GRU model outperformed the classical GRU model, there are some divergences between the actual values and the predicted values.

I. INTRODUCTION

The dynamic system that is affected by various parameters such as economic conditions, political events, public opinion, and geopolitical factors is called the stock market [1]. Although there are many researchers who want to predict the movements of the dynamic stock market system depending on different factors, this process is difficult. Although investors and traders who use the stock market for investment purposes want accurate predictions, being able to predict it with very little error is a great performance indicator. In order to achieve the specified performance in this sense, researchers have developed many approaches to predict the stock prices of companies on the stock exchange. However, the accuracy performances of these developed methods and approaches are generally insufficient.

An analytical review can be performed by combining existing data from different sources. Establishing a relationship by integrating data will be useful in understanding what is going on in a business [2]. Raman et al. seek to determine how positive and negative emotions affect company performance [2]. As a result of these studies, it is reported that news such as a data breach in a company reduces stock prices from 45.6% to 14.6% [3]. When the unfortunate events in the company spread, the spread of negative feelings towards the relevant company will increase. When companies that were not affected by the global stock prices, which experienced a sharp decline in 2016, were examined, it was determined that these companies made accurate growth forecasts by taking into account news from external factors in

addition to past stock prices [4], [5]. For these reasons, analysts and researchers make a stock price prediction by examining the impact of public opinion and investors on the stock price with sentiment analysis, instead of evaluating only the previous stock price [2]. Sentiment analysis is a subfield of natural language processing designed to obtain meaningful data in an increasing pile of words. With sentiment analysis, it is attempted to extract the emotional tone underlying a data content [6]. It is necessary to automatically extract meaningful data from the mass of raw data that increases day by day [7]–[11]. By analysing text data from many sources such as data obtained from social networking sites, news texts, reports prepared for the relevant stock exchange company, the sentiment in the market about that company can be obtained. Stock market investors, traders, and financial analysts state that high performance can be achieved in predicting market trends by combining these approaches [12].

The following parts of the article consist of 4 sections. In the second section, some of the recently published and related studies on this subject are summarized. In the third section, the data and methods used in the article are mentioned. At the same time, the performance evaluation metrics of the GRU model used and recommended within the scope of the article are mentioned in this section. In the fourth section, the performance results of both models obtained as a result of the experimental studies are presented with tables and graphs. The work has been concluded in the last section.

II. Related Works

In data science, big data analytics and deep learning models are two important points. In recent years, remarkable results have been achieved with these focal points in precision agriculture, health and computer vision studies [13]–[15]. Big data analysis becomes very important in environments where large raw data are shared instantly, such as the stock market. Investors who want to increase their current economic resources by making profits are trying to figure out when to buy and when to sell stocks [12]. Although investors have professional financial advisors to tell them which stocks to invest in, concerns about trusting these decisions are common. In terms of investment consultancy, investment banks such as Lehman Brothers and Goldman Sachs have been providing financial consultancy for years. However, thanks to financial social networks, many small, medium and large investors around the world bring together their experiences and direct investors to the shares of the best companies. The need for realistic and technologically advanced studies in these directions is increasing day by day. At this point, the studies in the literature are briefly summarized.

Sohangir et al. used various neural network models such as LSTM, doc2vec, CNN to analyse stock market sentiments published on StockTwits [12]. Wang and Sambasivan examined the messages in the StockTwits dataset in terms of sentiment and grouped them as Bullish if they believed the stock price would increase over time, and as Bearish if they believed it would decrease over time [16]. Day and Lee state that information from financial sources should be analysed with deep learning to determine whether it is fake or not [17].

Das et al. developed a hybrid deep learning model to predict difficult-to-predict stock prices [1]. In their work, they use an approach that combines GRU, CNN, BiLSTM and LSTM-based models. They also tried to reduce the high dimensionality in the data set with principal component analysis, one of the classical machine learning algorithms. As a result of the studies, there is a need for new approaches that can predict stock prices by taking into account both quantitative and qualitative factors, providing better performance measures than traditional methods.

III. Materials and Method

In this study, the GRU approach, a Recurrent Neural Network (RNN) based method, was used to process time series data consisting of historical stock market data. A GRU-based method has been proposed to perform the specified operations. The proposed structure was compared with the classical GRU method in terms of MSE, RMSE, MAPE, MAE and R^2 score performance criteria.

A. Material

The study contains time series data containing ADANI stock price information consisting of 3200 rows and 10 columns [18]. Historical price data is reportedly taken from the YFinance portal. The sentiment scores of the news articles that make up the last three columns in the dataset have been deleted from the dataset. The values in the dataset were calculated with the forward padding technique. The information in the dataset covers the period between 1.10.2010 and 22.10.2023. Some of the data in the dataset is shown in Fig. 1.

B. GRU

Unlike the classical RNN, GRU models have a memory unit to control the data in RNN architectural models. In GRU models, information control is performed using all hidden states. GRU models, which have fewer parameters than classical RNN models, allow the development of algorithms with less computational load by bending faster. Although GRU models have the ability to operate with less data, they cannot perform too much backward processing [19].

There are two doors in GRU-based models [20]. The names of the gates in GRU models are reset and update gates respectively. The reset gate ensures that the data entering the GRU models and the memory are merged. Another gate in GRU models determines how long the states in the GRU will remain in memory. The equations of the update and reset gates are presented in Eq. 1 and Eq. 2 respectively.

$$Update\ gate\ \ (u_t) = \sigma\left(W^u x_t + U^{(u)} h_{t-1}\right), \tag{1}$$

$$Reset\ gate\ \ (s_t) = \sigma\left(W^s x_t + U^{(s)} h_{t-1}\right), \tag{2}$$

The terms U, h_{t-1} and W in Eqs. 1 and 2 denote cell unit, hidden layer values, and weight values, respectively. The sigmoid activation function is denoted by σ in Eq. 1 and Eq. 2 [21].

C. Evaluation Metrics

In this paper, two different models are used to forecast stock market data. The popular RNN-based method whose performance is to be measured in this study is the GRU architecture [22], [23]. MSE, RMSE, MAPE, MAE and R^2 values were used to evaluate the training and testing of the models used.

$$MSE = \frac{1}{m}\sum_{i=1}^{m}\left(Y_i - \hat{Y}_i\right)^2 \tag{3}$$

$$RMSE = \sqrt{\frac{1}{m}\sum_{i=1}^{m}\left(Y_i - \hat{Y}_i\right)^2} \tag{4}$$

$$MAPE = \frac{100}{m}\sum_{i=1}^{m}\left[\frac{Y_i - \hat{Y}_i}{Y_i}\right] \tag{5}$$

$$MAE = \frac{100}{m}\sum_{i=1}^{m}\left[\frac{Y_i - \hat{Y}_i}{Y_i}\right] \tag{6}$$

$$R^2 = 1 - \frac{\sum\left(Y_i - \hat{Y}_i\right)^2}{\sum(Y_i - \bar{Y})^2} \tag{7}$$

In order to measure the performance of the classical GRU model and the proposed GRU model, Eqs. 3-7 are used. In these equations, Y_i represents the actual value at index i while $\hat{Y}_i$ represents the value at index i.

D. Proposed GRU Model

In this study, a model consisting of 6 layers is proposed. In the first layer, GRU layer with ReLU activation function consisting of 300 units is defined. In the second layer, a dropout layer with a dropout rate of 0.30 is used. In the third layer, the GRU layer with ReLU activation function consisting of 300 units is used again. In the fourth layer, a dropout layer with a neuron dropout rate of 0.40 is used. In the fifth layer, a GRU layer with ReLU activation function consisting of 150 units was added. In the sixth layer, the regression layer is defined and the model is completed.

IV. Experimental Results and Discussion

The parameters in the classical GRU model and the proposed GRU model used in the study conducted in this paper are presented in Table 1.

Table 1. Parameters used in the models

Parameters	**Assigned Values**
Activation	ReLU
Loss	Mean absolute error
Optimizer	Adamax
Epochs	40
Batch size	64
Layers	6

Table 2 presents the training performance results of the models. Looking at the training performance values obtained from the GRU-based proposed model and the GRU model, the proposed model gave a better performance result than the classical GRU model.

Table 2. Training performance results of the models

Model	Loss	MSE	MAPE	MAE
Proposed Model	2.8780e-04	0.00287	2.77	0.0134
GRU Model	3.2201e-04	0.00322	2.94	0.0143

Table 3. Test performance results of the models

Model	Loss	MSE	RMSE	MAPE	R^2 Score	MAE
Proposed Model	9.4514e-04	0.0009	0.0192	21.53	0.93	0.0168
GRU Model	0.0013	0.0013	0.0395	31.35	0.74	0.0221

A graphical representation of the performance results including the performance outputs in Table 2 and Table 3 are presented in Figs. 2, 3, 4 and 5.

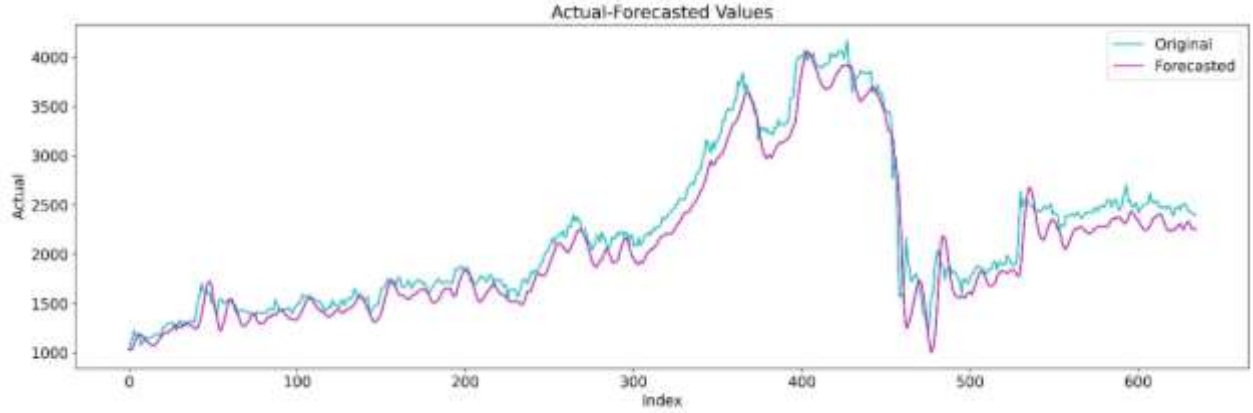

Fig. 2. The first 600 index images showing the agreement of the prediction outputs obtained with the proposed GRU model with the original values

Fig. 2 shows how close the proposed GRU model is to the original data. It can be seen that the prediction results of the proposed GRU model need to be further improved. At indices between 400 and 500, the difference is very small. The whole graph should be in this range. In future studies, it is aimed to propose a more accurate model.

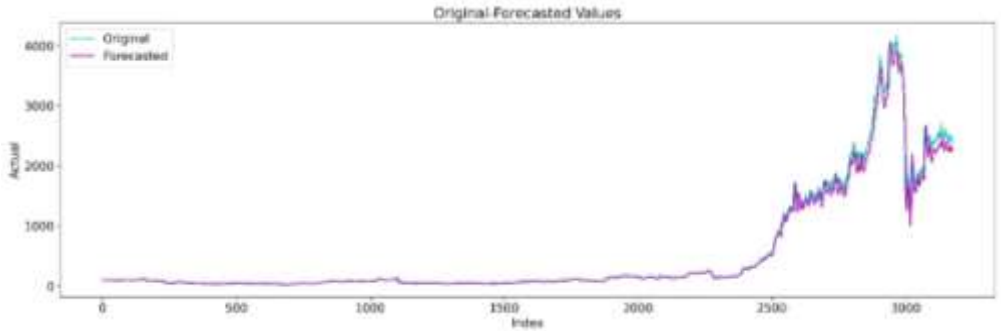

Fig. 3. The entire fit graph of the prediction outputs obtained with the proposed GRU model with the original values

Fig. 3 shows all the indices where the proposed GRU model has convergences and divergences between the original data and the predicted data. It can be seen that the prediction results of the proposed GRU model after the 2500th index need to be further improved. Fig. 4 shows the overlap of the prediction values of the classical GRU model with the actual values. When these values are analysed, it is observed that both graphs are quite different from each other. When the R^2 score values given in Table 3 are also examined, it is seen that there is a difference of 18% points between the proposed model and classical GRU.

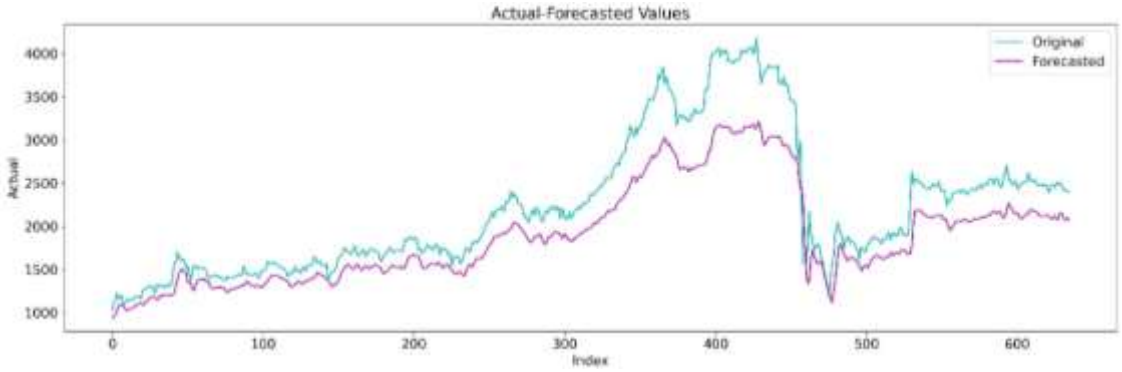

Fig. 4. The first 600 index images showing the agreement of the prediction outputs obtained with the classical GRU model with the original values

Fig. 5 shows the performance outputs of the classical GRU model together with the actual values. The graphs in Fig. 5 show that the prediction results of the classical GRU model are quite different from the actual values.

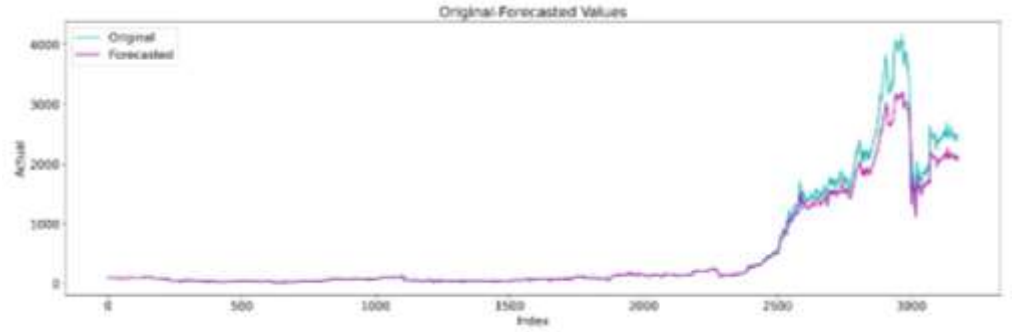

Fig. 5. The entire fit graph of the prediction outputs obtained with the classic GRU model with the original values

When the proposed GRU and classical GRU model outputs are evaluated together, it can be said that the performance results obtained are insufficient. In order to achieve better performance outputs, the GRU-based architecture model needs to be improved.

V. CONCLUSION

In this study, which includes a study that can be very useful for stock market investors, a regression analysis has been performed with two different models that perform price prediction over the stock market data named ADANI. The performance of this study, which was conducted without emotional analysis of ADANI data, was limited with an R^2 score of 0.93. In order to improve this performance result, it can be extended by performing sentiment analysis. Sentiment analysis needs to be integrated with big data consisting of raw data. In big data, information from thousands of economic commentary sources should be analyzed with sentiment analysis to decide whether a stock will be bullish or bearish. In this sense, this study will be further developed by improving the deficiencies mentioned in further studies. The proposed GRU model achieved an R^2 score of 0.93, while the classical GRU model achieved an R^2 performance value of 0.74. Even if the difference is high, the results obtained need to be improved in the following aspects.

The premise of targeting nicotinic acetylcholine receptors for treating cancer

Ermira Jahja Hodo

Western Balkans University

(ermira.hodo@wbu.edu.al)

Abstract – Cancer is a heterogenous disease which becomes even more heterogeneous during the course of disease progression. Classical and innovative therapeutic regimens have been limited in their efficacy and high in toxicity, opting for novel targeting candidates and more innovative treatment approaches. Nicotine acetylcholine receptors have emerged as potential targets for several pathologies, with a recent focus on cancer, due to their role in cell proliferation and induction of apoptosis apon exposure to cholinergic receptor antagonists and blockers. Nicotine has been shown to activate nicotinic acetylcholine receptors, with accumulating evidences which implicate these receptors with nicotine-induced carcinogenesis and chemoresistance. Herein we reveiw cholinergic pathway and nicotinic acetylcholin receptors and review recent experimental cell-based and *in vivo* studies focused on defining the role of cholinergic receptor subunits in cancer cells and respective cellular pathways. In addition, we summarize published data which focus on characterizing the response of nicotine acetylecholine receptor subunits to upregulation, blockage and targeting in cancer cells, which altogether offer insights for future therapeutic drug develoment strategies.

Keywords – Acetylcholine, nicotine, nicotinic acetylcholine receptors, cancer treatment, chemoresistance

I. INTRODUCTION

Neuronal and non-neuronal acetylcholine

Acetylcholine (ACh) plays a critical role in the regulation of cell proliferation and transmission of signals, both between neurons and non-neuronal cells, mainly by affecting the intracellular Ca^{2+} levels [1]. Within the nervous system, ACh behaves as a neuromodulator, by regulating the release of some neurotransmitters and influencing the neuronal networks. The main functions of ACh in the brain is the regulation of: neuronal excitability, firing of neurons in a coordinated pattern, synaptic transmission and plasticity [2]. It's role in several brain areas make it an important molecule in regulating cognitive and behavioral processes [3]. In addition ACh does also have important role in drug addiction, food intake, memory, attention, learning process and stress response [4]. ACh presence is detected at the neuromuscular junction and autonomic ganglia as well as, low but detectable levels, in blood lymphocytes and vascular endothelial cells [5]. The presence of acetylcholinesterase (AChE) in renal tubuli, epithelial cells of airway, cardiac myocytes, CD4+ T cells and trophoblasts in placenta, suggest the presence of ACh also in these cells [6]. The function of ACh in non-neuronal cells incudes the regulation of several biological processes, most notably the regulation of cell proliferation through the increase of intracellular concentration of Ca^{2+} [7].

Nicotinic Acetylcholine receptors

Ion channels are important players in many of the cellular pathways. Most of them open and close upon stimuli such as mechanical stress, voltage change across the membrane or ligand binding. Ligand gated ion channels are either stimulated by an intracellular or extracellular molecule. The ion showing the highest contribution to the inward current is Na^+, while Ca^{2+} is suggested to have a minor effect due to it's low concentration outside the cell [7]. Regarding its role as a second messenger however, Ca^{2+} is considered as having critical importance in regulating physiological processes through ion channel response [8]. Currenlty it is widely accepted that in cancer cells, channels regulating Ca^{2+} level are modulated, which implicates such channels with carcinogenesis [9], including sustained growth, drug resistance, angiogenesis and metastasis, thus this makes ion channels possible targets of treating cancer [10].

Nicotinic acetylcholine receptors (NAChRs) are ligand gated ion channels, composed of five subunits, in either homomeric or heteromeric conformation, permeable to Ca^{2+}, Na^+ and K^+ upon stimulation [11]. When bound to the ligand in high affinity, allosteric changes propagate to transmembrane domains, which results in channel opening and filtering system for selection of ions [12].

NAChRs are found to be present in skin keratinocytes, blood vessel endothelial cells and bronchial epithelial cells. In cells which are sensitive towards nicotine exposure, it is suggested that NAChRs mediate nicotine-induced toxicity [13].

A study where α3 subunit of NAChRs was blocked by antagonists in keratinocytes, found that this subunit was positively regulating cell-cell and cell-substrate adherence, yet negatively regulating the motility and migration of cells [14]. In another study on keratinocytes, it was found that nicotine induced Ca^{2+} uptake by the cells in a dose-dependent manner, which suggests the regulation of cell viability and motility of NAChRs via Ca^{2+} [15]. Similarly, there is evidence for implication of NAChRs in viability and motility of endothelial cells, mainly through α7 subunit [16, 17]. Studies focusing on the function of NAChRs on epithelial and endothelial cells imply the possibility that the effect of nicotine on the respiratory and cardiovascular system, is mediated by the contact nicotine has with NAChRs [18].

The effect of NAChRs on cancer

Smoking remains one of the major risk factors for lung cancer development, even though most of lung cancer subtypes are not related to smoking. NAChRs are considered as the mediators between smoking and lung cancer. According to one article relying on genome-wide association studies (GWAS), allelic variations in the α3-α5-β4 gene cluster increase the risk of lung cancer development, suggested to be mediated through NAChR activation. Another study introduced a variant of α5 which is associated with higher susceptibility to lung cancer by 30% [19]. On the other hand, α3 subunit seems to negatively correlate with cell survival and with the expression level of α5 and α7 [20]. Lung cancer cells treated with nicotine, has resulted in its binding to α7, inducing more Ca^{2+} influx to the cells, followed by activation of voltage-gated ion channels and activation of MAPK, higher cell division and lower apoptosis [21]. However, there are contradictory results on the role of α7 on cell proliferation, mainly linked with the differentiation status of lung cancer cells [22].

Nicotine has been implicated with increase in cell proliferation and metastasis in pancreatic cancer cell lines, through NAChRs, by phosphorylating ERK1/2 [23]. The role of NAChRs in cancer progression has been also reveled in gastric cancer, where NAChRs have been activated by nicotine treatment [24]. In an article of lung and oral cancer, NAChRs have been shown to cooperate with VEGF and EGF and activating cell survival, while suppression of cell proliferation has been observed upon binding of nicotine to mitochondrial NAChRs [25]. Nicotine is also shown to increase resistance of tumor cells to chemotherapy and radiotherapy, resulting in cell proliferation inducing activity. Based on the findings, nicotine was also considered as an angiogenic and metastatic agent in lung cancer [26, 27].
In a study analyzing the expression of different NAChRs subunits in 276 breast cancer samples versus normal tissues, it was shown that α9 was the highest in expression. In mice, the overexpression of α9 induced increased tumor growth, whereas its downregulation reduced cell proliferation and tumor mass [28]. Upregulation of α9 and increase in cell proliferation was similarly observed upon nicotine treatment in another study [29]. On the other hand, inhibition of α7 blocked the induction of higher stem cell proliferation by nicotine [30]. In ER-negative patients, cholinergic pathway has also been associated with recurrence of cancer [31].

Downregulation of α5 in lung cancer has resulted in increased Ca^{2+} influx and cell motility while cell adhesion related genes were downregulated [32]. In another study of lung cancer, downregulation of α5 blocked nicotine-induced cell motility, suggesting again that nicotine affects cell proliferation and metastasis via α5 [33]. Similar results were also observed in gastric cell lines [34]. Downregulation of α5 in another study was followed by the inhibition of PI3K/AKT pathway and increase of apoptosis, suggesting the role of nicotine on the resistance of cancer cells toward chemotherapeutic agents [34]. α5 subunit was found to be upregulated in adenocarcinomas, suggesting its role in lung carcinogenesis. Tumor size was also correlated to α5 expression in CHRNA5-depleted small cell lung cell carcinoma (SCLC) cell line.

Cholinergic receptors as potential drug targets

Based on the implication of NAChRs in nervous system as well as in non-neuronal cells, NAChRs offers promises of treating several disorders [35]. Two drugs targeting NAChRs have been put in market, such as Varenicline and Mecamylamine, used for smoking cessation and hypertension, respectively [36, 37]. Due to their side effects mainly in nervous system, these drugs were not successful in therapeutics. Several other pathologies have been investigated for their treatment by targeting NAChRs, such as depression, epilepsy, Alzheimer's, pain and inflammation [35]. The focus of this study is to summarize the most recent published data on the implication of NAChRs with cancer and offer insights on the potential of targeting NAChRs to develop new cancer treatment strategies.

II. Materials and Method

This study is based on the articles published during the last 5 years on the role of NAChRs on cancer progression. It reviews the major findings of these studies and how those findings can be used to develop new targeting strategies for cancer.

III. RESULTS

Different publications focus either on one cholinergic receptor subunit, several of them, or all of them at the same time, to find the most important subunit affecting cancer initiation, progression and related pathways.

Studies on α5-NAChR are mainly focused on lung cancer and the implication of α5 in nicotine-induced effects. Studies on lung adenocarcinoma (LUAD) reveal a correlation of this NAChR subunit with the smoking status and cell survival via α5-nAChR/STAT3-Jab1-PD-L1 (Table 1) [38] and α5-nAChR/STAT3/NLRP3 [39] axis. Both of these studies show upregulation of α5 upon nicotine exposure of cells. In another study of chronic stress-induced LUAD, NAChR-α5 was upregulated in mice undergoing chronic stress which was then found to induce cell invasion [40]. The highest number of recent publications on cholinergic receptors' relation to cancer biology, focus on NAChR-α7 subunit, which is often upregulated in different cancer types. In one study, upregulation of α7 was mediated by endogenous Lynx1 upon nicotine exposure in lung adenocarcinoma A549 cells, which resulted in increased cell proliferation [41]. On the other hand, activation of α7 by nicotine in breast cancer MCF7 cells induced cell proliferation, motility and calcium signalling [42]. Targeting of α7 blocked nicotine induced increase of adrenaline/noradrenaline in A549 and H1299 lung cancer cells [43], whereas hepatocellular carcinoma cells upon downregulation of α7 and exposure to sorafenib, inhibited migration, colony formation and induced cell cycle arrest as well as apoptosis [44]. Several studies have applied α7 blockers to determine the efficiency of targeting this NAChR subunit, as a premise to treat cancer. Blocking α7 subunit by QND7 antagonist very effectively suppresed cell proliferation and migration, while inducing apoptosis in lung cancer H460 and A549 cells, comparable to cisplatin effect [45]. In addition, another drug, RL-RVG, decreased migration dhe eptithelial-to-mesenchymal transition of BGC and SGCA gastric cancer cells via α7 [46]. Methyllycaconitine citrate, an α7 nicotinic antagonist, was able to reverse the cell proliferation stimulatory effect of acetylcholine in erythroleukemia K562 cells, by decreasing the intracellular Ca^{2+} level [47]. In A549 lung cancer cells, sinomenine, reduced cell proliferation and migration, while increasing apoptosis. In addition, it caused reduced tumor volume *in vivo* throug α7 [48]. Similarly, other NAChR subunits-inhibitors have been used in other studies. In MDA-MB-157 breast cancer cells, α9α10 antagonist GeXIVA inhibited cell proliferation and iduced apoptosis [49]. Another study focused on the relation between nicotine, paxitacel effect and cholinergic refeptors mediation in MDA-MB231 breast caner cells. Nicotine was able to reverse the cytotoxic effect of paclitaxel via α7 and α9 [50]. Multiple cancer cell lines treated with Pinnatoxin G lost normal viability, which was correlated to α7, α4, and α9 [51]. NAChR blockers conotoxins MII, PnIA, RgIA, and ArIB11L16D applied in vitro and vivo, reduced cell viability and tumor growth (respectively) of Ehrlich ascites carcinoma (EAC) [52]. In another study, treatment of multiple lung cancer cells with α-conotoxin TxID (selective blocker of α3β4) rendered cells less viable, whereas cotreatment with Adriamycin increased the sensitivity of lung cancer cell to the chemotherapeutic drug treatment [53]. The immunoregulatory function of Treg cells on the other hand was revealed to be affected by several subunits of NAChRs. In addition, α2, α5, α9, and β2 were found to be differentially expressed in naive, Th1, Th2, Th9, Th17 and iTreg cells [54]. In another recent study, NAChRs were found to mediate the nicotine-promoted Warburg effect, metabolic reprograming, pHi homeostasis, migration and the overall cancer progression of A549 lung cancer cells [55].

Table 1: Recent articles on the implication of NAChRs in cancer

Year of publ.	NAChRs subunit(s) under study	Sample type	Results	Conclusions	References
2022	α5	-Lung adenocarcinoma (LUAD) cancer patient samples with smoking status. -Mice xenograft tumor models	- α5 was correlated with PD-L1 expression, smoking status and lower survival of LUAD in vivo -α5 mediated pSTAT3, Jab1 and PD-L1 expression. -downregulation of α5 increased T cell-mediated killing of LUAD cells and increased IL-2 secretion	α5-nAChR/STAT3-Jab1-PD-L1 axis can be used as therapeutic target for immunotherapy in LUAD	[38]
2022	α5	-A549 and H1975 (LUAD) -Patient specimens -Chicken embryo and mouse xenografts	-The expression of α5-nAChR was correlated with the expression of NLRP3 via STAT3 -Nicotine increased the level of α5, STAT3, NLRP3, CASP1, IL-1β and IL-18 -Nicotine effect on expression of NLRP3 and STAT3 was inhibited by the silencing of α5.	Nicotine promotes lung cell proliferation and migration via the α5-nAChR/STAT3/NLRP3 axis in lung cancer	[39]
2023	α5	Mouse model (LUAD)	-Chronic stress increases the level of acetylcholine and α5 -Chronic stress increases LUAD cell invasion via modulation of α5, DNA-methyltransferase (DNMT1) and fragile histidine triad (FHIT)	α5-nAChR/FHIT axis can be considered as therapeutic target for chronic stress-related LUAD	[40]
2020	α7	H460 and A549 (non-small cell lung cancer (NSCLC) cell lines	-Targeting α7 exhibited the highest cytotoxic effect and induced cell apoptosis in both cell lines at a level comparable to cisplatin - QND7 antagonist very effective in supressing cell proliferation and migration	QND7 needs further preclinical evaluation and demonstrates the potential of α7 as cancer drug target.	[45]
2019	α7	-BGC and SGCA (Gastric cancer cell lines) -mouse xenograft model	-rL-RVG suppressed the migration and reduced EMT of gastric cancer cells via α7-nAChR. -rL-RVG inhibits α7-nAChR-MEK/ERK-EMT to suppress migration of gastric cancer cells.	rL-RVG acts as a competitive antagonist of α7-nAChR to suppress the migration of gastric cancer cells through inhibiting α7-nAChR-MEK/ERK-EMT	[46]
2019	α7	Set of human epithelial cells	- Endogenous Lynx1 controls the nicotine-induced up-regulation of the expression of α7 type nAChRs in A549 cells as well as the cell growth -Co-localization of Lynx1 with α7-nAChRs was revealed in a cell membrane for lung adenocarcinoma A549 and colon carcinoma HT-29 cells, but not for breast adenocarcinoma MCF-7 and epidermoid carcinoma A431 cells.	Lynx1 is a homeostasis regulator of epithelial cancer cells	[41]
2021	α7	K562 (erythroleukemia cells)	-The cell proliferation stimulatory effect of acetylcholine was reversed by methyllycaconitine citrate (α7 nicotinic	Interaction of nicotinic receptors with different signalling pathways.	[47]

			antagonist) and atropine (the cholinergic antagonist). -ACh caused an increase in intracellular Ca^{2+}, methyllycaconitine citrate decreased intracellular Ca^{2+} level.		
2021	α7	-Mouse xenograft model -A549 (Non-small lung cancer)	-Sinomenine decreased cell proliferation and migration abilities but increased the percentage of apoptotic cells. -Tumor volume *in vivo* was significantly reduced after sinomenine treatment -The effects of sinomenine were abolished by the α7 nAChR antagonist mecamylamine and the allosteric modulator PNU-120596 -Sinomenine suppressed α7 expression (in vitro and in vivo), pERK1/2 and ERK1/2, TTF-1 and SP-1, while up-regulating Egr-1.	Sinomenine is a lung cancer inhibitor via α7 nAChR	[48]
2022	α7	Sorafenib-resistant hepatocellular carcinoma cells (HCC)	-Upon downregulation of α7 and exposure to sorafenib, migration and colony formation were inhibited. -Apoptosis and cell cycle arrest was observed	Overexpression of α7 suggests that it might be a therapeutic target for HCC cell resistance therapy.	[44]
2023.	α7	MCF-7 cells (breast cancer)	-Activation of α7 by nicotine or choline induced cell proliferation, motility and calcium signalling	A new role of G protein signalling in α7-related cell proliferation	[42]
2023	α7	A549 and H1299 (lung cancer)	-α7 inhibition blocks nicotine-induced increase of adrenaline/noradrenaline -nicotine decreases GABA levels; increases VEGF expression and PI3K/AKT activity; inhibits p53 activity in A549	VEGF is upregulated by α7 and downregulated by GABA and/or p53 in response to the nicotine	[43]
2020	α9 α10	MDA-MB-157 (breast cancer cell line)	GeXIVA (α9α10 nAChR antagonist) was able to inhibit cell proliferation and promote apoptosis	GeXIVA needs to be further investigated as potential agent for targeted therapy	[49]
2022	α7, α9	MDA-MB-231 (triple negative)	Nicotine reversed the cytotoxic effect induced by paclitaxel, via α7 and α9	In triple negative breast cancer patients treated by paclitaxel, nAChRs should be considered as targets	[50]
2021	α7, α4, and α9	HT29 (colon cancer), U87, LN18 and U373 (glioma cell lines), MDA-MB-231 (breast cancer cells), PC3 (prostate cancer cells)	Upon the treatment of pinnatoxin G on cancer cell viability all cell types lost viability, correlating with expression levels of α7, α4, and α9	Pinnatoxin G is a promising anticancer agent, with both cytostatic and cytotoxic effects.	[51]
2019	α3β4	A549, NCI-H1299, NCI-H1688, DMS114 (Lung cancer)	-Most of nAChRs are expressed in all cell lines -α3 and β4 were upregulated in A549 and NCI-H1299	Targeting of α3β4 shows a potential strategy for lung cancer therapy	[53]

			-A549 and NCI-H1299 treated with α-conotoxin TxID (selective blocker of α3β4) showed reduction in cell growth, whereas simultaneous treatment with adriamycin showed enhanced effect on cell growth inhibition		
2022	α2, α5, α9, and β2	Murine-induced Treg (iTreg) cells	-TGF-β1 production was suppressed by nicotine -α2, α5, α9, and β2-nAChRs were differentially expressed in naive, Th1, Th2, Th9, Th17, and iTreg cells	The immunoregulatory role of Treg cells is affected by the cholinergic system, probably through nAChRs.	[54]
2020	α6, α3β2, α9α10, and α7	-Af/WySnMv mice injected with Ehrlich ascites carcinoma (EAC) -EAC cells in vitro -splenocytes	-Conotoxins MII, PnIA, RgIA, and ArIB11L16D nAChRs blockers promoted tumor growth inhibition in mice -Survival rate of the tumor-bearing, drug treated mice increased - conotoxins reduced the viability of EAC cells and splenocytes	nAChR blockers MII, PnIA, RgIA, and ArIB11L16D have cytotoxic effects	[52]
2023	All subunits	A549 (Non-small lung cancer)	-Nicotine promoted the Warburg effect and accelerated migration of cells through the activation of nicotinic acetylcholine receptors. -Nicotine upregulated NHE1 and MCT4, and facilitated glycolysis.	Nicotine regulates metabolic reprogramming and pHi homeostasis via activation of nicotinic acetylcholine receptors and can therefore aggravate lung cancer progression.	[55]

IV. DISCUSSION

There is enough scinetific evidence that nicotinic acetylcholine receptors are implicated in different cellular pathways such as proliferation, adherence and migration, mainly suggested to be linked with Ca^{2+} uptake.

The majority of the studies published so far on functional characterization of these receptors are focused on the regulation of their subunits by agonists such as acetylcholine and nicotine or blocking of the receptor subunits. NAChRs are considered as the mediators between smoking and lung cancer. Nicotine is considered as an exogenous activator of NAChRs. It has been linked in reducing the effects of chemotherapeutic drugs and limiting therapeutic response [56]. Other data reveal increased sensitivity of cancer cells toward chemotherapeutic agents when deprieved of α7 [44][53], all of which urge more studies on NAChR blockers as drug sensitivity-increasing agents in patients receiving conventional chemotherapy, with a major focus on those cancers where chemoresistance is observed and/or in smoking patients. NAChRs-based therapies can also be offered in combination with chemotherapy drugs to decrease their dosing regimens and reduce the side effects [56].

Allelic variations in NAChR subunits encoding genes have been linked with susceptibility to lung cancer development, suggested to be mediated through NAChRs expression level. Studies on α7 subunit show a direct implication of α7 on cancer cell proliferation and progression. All the herein presented α7-based studies suggest this subunit can serve as a promising target in treatment of different cancer types [41-48]. One of the recent studies on *in vivo* mouse models, shows tumor growth inhibition and survival rate increase in mice treated with several NAChR blockers [52], opting for futher *in vivo* investigations. A very critical implication of NAChRs in cancer through nicotine-induced cancer progression. Targeting of NAChR subunits show premises of effectively treating nicotine-induced cancers [39][41][50]. Other findings implicate cholinergic system in previously unknown pathways such as immunity system [54], whereas others suggest development of cancer therapies by targeting α5-implicated axis, examples of which are nAChR/STAT3/NLRP3 in LUAD [39], α5-nAChR/STAT3-Jab1-PD-L1 via immunotherapy in LUAD [38] and α5/FHIT for chronic stress-related LUAD [40].

CONCLUSION

Acetylcholine receptors are promissing drug targets to treat cancers and reduce chemoresistace. More research on the influence of NAChRs on cancer initiation, progression and chemoresistance is needed to further establish new treatment modalities of cancers via targeting of cholinergic system. Available cholirgic receptor antagonists and new candidates should be considered for future in vivo reasearch and clinical trials.

Abstract **–**The increasing population around the world causes human needs to increase. People's unconscious use of natural resources harms the environment. It is essential to use environmentally friendly products for a liveable world. People primarily need water, food, and energy to carry out their vital activities. Vehicles, equipment, infrastructure, transportation, machinery, and technology are required to meet other needs such as travel, communication, health, and education, which are in the order of needs due to human nature. Achieving these is possible with production, energy, and workforce. Considering all these, carbon emissions occur on our planet due to resource use, and our ecosystem is negatively affected. As a result of industrialization and the rapid development of technology, the problem of climate change and global warming has become a problem that concerns all countries of the world. Evaluating carbon emissions depending on energy production and consumption is an important issue. This study, it was aimed to determine the energy production and energy consumption affecting carbon emissions of Azerbaijan, Kazakhstan, Turkey, and Uzbekistan between 1995-2014. The Random Effects Model of the Panel Data Analysis method was used in the study. According to the study results, it is possible to say that green energy production and consumption in the Turkic Republics will reduce carbon dioxide emissions, while energy production and consumption obtained using fossil resources will increase carbon dioxide emissions. When a general evaluation of the study is made, this research reveals that the use of sustainable green energy is vital for the future of our world.

Keywords – CO2 Emission, Energy Production, Green Energy, Panel Data Analysis, Turkic Republics

I. INTRODUCTION

As a result of industrialization and rapid development of technology, climate change, and global warming have become a problem that concerns all countries of the world. In recent years, the number of studies focusing on the relationships between CO2 emissions and growth and energy production and consumption has been increasing. The fact that economic growth, which is the main goal of countries, is linked to energy consumption, brings about an increase in environmental pollution along with economic growth. It is known that the increase in industrial production harms CO2 emissions [1-3]. Urbanization, industrialization, population, electricity consumption, and technology have a significant impact on changing the economic structure. Industrialization accelerates urbanization. The negative effects of climate change due to carbon emissions are increasing. As CO2 emissions increase, the effects of climate change become more visible [4].

Energy is an important input in the production process. Energy has a very important place in growth and development policies. Environmental degradation, which occurs as an inevitable result of non-environmentally friendly industrialization, causes many costs to be incurred. Renewable energy both

contributes to preventing environmental degradation and is an alternative to fossil-based energy against the threat of depletion of fossil energy reserves [5].

Increasing concerns about climate change have made renewable energy an important research topic. Recent studies analyze carbon dioxide emission savings by using renewable energy as an individual source or in conjunction with conventional energy sources in conjunction with life cycle analysis methods. Some studies in the literature conducted in recent years can be given as examples of these analyses. [6-15]. The dependent and independent variables used in the study were created by examining the relevant literature.

This study aims to investigate the impact of Azerbaijan, Kazakhstan, Turkey, and Uzbekistan's GDP, fossil-based and renewable energy production, and consumption on CO2 emissions. For this reason, 6 different models were created, and because of the Hausman test, it was decided to use the Random Effects Model.

II. MATERIAL AND METHOD

Parametric and non-parametric methods are used both together and separately in economic studies. To conduct studies with parametric methods, different methods such as econometric studies, cross-sections, time series, and panel data are used. Since it is possible to handle data in both horizontal and vertical dimensions, panel data analysis was used in the study [16]. In the study, data from 4 Turkic Republics, namely Azerbaijan, Kazakhstan, Turkey, and Uzbekistan, were used in the horizontal dimension, and time-dependent data covering the years 1995-2014 were used in the vertical dimension. Panel data can be defined as a time series of the number of sections or cross-data with a time dimension [16]. Due to these features, panel data enable many different observations to be made regarding the same sampling unit [17].

The panel data regression equation is created differently from cross-sectional data and/or time series regression equation. Baltagi (2005) expressed this equation as follows [18]:

$$y_{it} = \alpha + \beta X'_{it} + u_{it} \quad (1)$$

where α invariant, β is the regression coefficient representing the slope, i = 1, ..., N section size and t = 1, ..., T(i) specifies the time series size. The X values calculated in the equation represent the independent variables. The one-way error component model is used in most panel data applications as follows [18]:

$$u_{it} = \mu_i + \nu_{it} \quad (2)$$

E (u_{it}) ~ N (0, σ^2) in the distortion term μi unobservable special effect, νit represents extra error. When creating regression, if the time series is the same for all cross-sectional data, it is defined as a balanced panel, otherwise, it is defined as an unbalanced panel [19].

Fixed Effects Approaches and Random Effects Approaches are used in panel data analysis regression estimates. Which of these models should be used depends on obtaining the desired results in the model [19]. The fixed effects approach also uses the Ordinary Least Squares (OLS) method, where the dummy variables of the group and all variables are fixed, while the random effects model assumes a structure of the error term by considering individual effects as a random component of the error term, and its parameters can be applied Generalized Least Squares (GLS) method [20].

When analyzed in the Fixed Effects Model, the form of the equation for each DMU, that is, cross-sectional data, is created as follows [21]:

$$y_{it} = \alpha_0 + \alpha_i S_{it} + \beta_n X_{nit} + \lambda_i(S_{ni}X_{nit}) + u_{it} \quad n = 1..M;\ i = 1\ldots N;t = 1...T \quad (3)$$

There are many parameters in the fixed effects model and since there is a problem of artificial variables, a random effects model was developed. This model was created as follows [19], [21-22]:

$$y_{it} = \beta_{0i} + \beta_n X_{nit} + e_i + u_{it} \quad n = 1. . . M;\ i = 1\ldots N;\ t = 1 ... T \quad (3)$$

There is no correlation between individual error terms and the autocorrelation between time series and cross-section terms [18-19]. When it is necessary to choose between fixed-effect and random-effect models in panel data analysis, the Hausman Test is used to decide the model choice. In this test, the fixed effect estimator is assumed to be consistent and unbiased [18]. The calculation method of the Hausman test is as follows [21]:

$$\chi^2 = (\beta_{SE} - \beta_{RE})'[Var(\beta_{SE}) - Var(\beta_{RE})]^{-1} (\beta_{SE} - \beta_{RE}) \quad (4)$$

Here, SE - Fixed Effects estimator, RE - Random Effects estimator Var (β_{SE}) ve Var (β_{RE}) - The estimation result of variance-covariance matrices, fixed and random effects models, and asymptotics is obtained. The hypothesis used in this test was created as follows [23]:

For Fixed Effects Model; H1: E (αi |xi) ≠ 0 (αi) There is a correlation between and explanatory variables.

For Random Effects Model; H0: E (αi |xi) = 0 (αi) There is no correlation between and explanatory variables. Where the difference between the estimators of two models is not systematic ((Probe> χ2) <%5) While the fixed effects model is preferred, if it is systematic ((Probe> χ2)>%5) random effects model is preferred [19].

Parametric and non-parametric methods are used both together and separately in economic studies. To conduct studies with parametric methods, different methods such as econometric studies, cross-sections, time series, and panel data are used. Since it is possible to handle data in both horizontal and vertical dimensions, panel data analysis was used in the study [16]. In the study, data from 4 Turkic Republics, namely Azerbaijan, Kazakhstan, Turkey, and Uzbekistan, were used in the horizontal dimension, and time-dependent data covering the years 1995-2014 were used in the vertical dimension. Panel data can be defined as a time series of the number of sections or cross-data with a time dimension [16]. Due to these features, panel data enable many different observations to be made regarding the same sampling unit [17].

III. DATA AND VARIABLES

The variables obtained from the World Bank's [24] website and used in the study are presented in Table 1.

Table 1. Variables used in the study

Abbreviations	**Definitions**
CO_2	Carbon dioxide emissions (Kt)
GSYH	Gross Domestic Product (GDP) (constant 2015, million USD)
YEŞEN	Green energy - Renewable energy consumption (% of total electricity production)
ENT	Energy consumption (GDP, constant 2017 PPP $/kg oil equivalent per unit)
ENK	Energy use (oil equivalent per capita, kg)
ELPGK	Electricity production from oil, gas and coal sources (% of total electricity production)
YENEL	Renewable electricity production (% of total electricity production)

This study aims to determine the energy production and energy consumption affecting carbon emissions of Azerbaijan, Kazakhstan, Turkey, and Uzbekistan between 1995-2014. Turkmenistan and Kyrgyzstan, which are other Turkic Republics, were not included in the study because all their data could not be accessed. Statistics regarding the data of the countries are presented in Table 2. When Table 2 is examined in the context of the data obtained, it is seen that the dependent variable, CO2, was highest in Azerbaijan in 1995, in Kazakhstan in 2013, in Turkey in 2014, and in Uzbekistan in 2002. The lowest was in 2010 in Azerbaijan, 2001 in Kazakhstan, and 1995 in Türkiye and Uzbekistan. Among the independent variables, GDP was the highest in all countries in 2014 and the lowest in 1995. The YEŞEN variable was most prevalent in Azerbaijan in 2010, in Kazakhstan in 2002, in Turkey in 1995, and in Uzbekistan in 1996. The least was in 1995 in Azerbaijan, 2008 in Kazakhstan, 2014 in Turkey, and 2000 in Uzbekistan.

Table 2. Statistical data of variables

Countries	**Indicators**	**CO_2**	**GSYH**	**YEŞEN**	**ENT**	**ENK**	**ELPGK**	**YENEL**

	Std. deviation	10200,16	17373,50	0,29	183,55	233,26	3,81	3,81

The ENT variable was most prevalent in Azerbaijan and Kazakhstan in 1995, in Turkey in 1996, and in Uzbekistan in 1998. The lowest was in 2010 in Azerbaijan and 2014 in Kazakhstan, Türkiye, and Uzbekistan. The ENK variable was most prevalent in Azerbaijan in 1995, in Kazakhstan in 2013, in Turkey in 2014, and in Uzbekistan in 1999. The least was in Azerbaijan in 2010, in Kazakhstan in 2001, in Türkiye in 1995, and in Uzbekistan in 2014. The ELPGK variable was most prevalent in Azerbaijan in 2014, in Kazakhstan in 2013, in Turkey in 2008, and in Uzbekistan in 1997. The lowest was in Azerbaijan in 2010, Kazakhstan in 2007, Türkiye in 1996, and Uzbekistan in 2008. The YENEL variable was most prevalent in Azerbaijan in 2010, in Kazakhstan in 2002, in Turkey in 1996, and in Uzbekistan in 2008. The lowest was in Azerbaijan in 2014, Kazakhstan in 2013, Türkiye in 2008, and Uzbekistan in 1997.

The models presented below were created to determine the factors affecting carbon dioxide emissions in the Turkic Republics between 1995 and 2014.

Model 1: $LnCO_2 = \beta_0 + \beta_1 LnGSYH + \varepsilon$

Model 2: $LnCO_2 = \beta_0 + \beta_1 LnYESEN + \varepsilon$

Model 3: $LnCO_2 = \beta_0 + \beta_1 LnENT + \varepsilon$

Model 4: $LnCO_2 = \beta_0 + \beta_1 LnENK + \varepsilon$

Model 5: $LnCO_2 = \beta_0 + \beta_1 LnELPGK + \varepsilon$

Model 6: $LnCO_2 = \beta_0 + \beta_1 LnYENEL + \varepsilon$

IV. RESULTS

The analysis results made with Models 1-6 are presented in Table 3. When Probe > $\chi 2$) > 5% was obtained in regression analysis because of the Hausman Test, random effects model results were used in all created models.

It can be seen from Table 3 that in all analyses, there is a statistical significance of 1% between the independent variables and the dependent variable. In the analysis of Model 1, it was estimated that carbon dioxide emissions in countries would increase by 0.544% because of a 1% increase in GDP. According to Model 2 analysis, it is predicted that a 1% increase in green energy, and renewable energy consumption as a percentage of total electricity production will reduce carbon dioxide emissions by 0.254%. According to the analysis conducted with Model 3 and Model 4, it is estimated that carbon dioxide emissions in countries will increase by 0.326% and 0.596%, respectively, because of a 1% increase in oil equivalent energy consumption per unit of $/kg and oil equivalent energy use per kg capita.

Table 3. Random Effects Model Results

Variables	1. Model	2. Model	3. Model	4. Model	5. Model	6. Model
Constant	-2,069*	11,31***	13,327***	7,114***	28,244***	9,034***
LnGSYH	0,544***					
LnYESEN		-0,254***				
LnENT			0,326***			
LnENK				0,596***		
LnELPGK					3,769***	
LnYENEL						-0,952***
δ_u						
δ_e	0,548	0,914	0,931	0,930	0,834	0,811
ρ	0 (fraction of variance due to u_i)					

Models	R^2	Wald χ	Hausman Test	
			χ^2	Prob
1. Model	0,679	155,65***	1,35	0,2450
2. Model	0,106	8,47***	0,03	0,8549
3. Model	0,075	7,83***	0,02	0,8922
4. Model	0,075	7,13***	0,06	0,8045
5. Model	0,257	22,90***	0,48	0,4871
6. Model	0,298	28,39***	0,47	0,4908

In the analysis of Model 5, it was estimated that carbon dioxide emissions in countries would increase by a very high rate of 3.769% because of a 1% increase in electricity production from oil, gas, and coal sources. According to Model 6 analysis, it is predicted that carbon dioxide emissions will decrease by 0.952% because of a 1% increase in renewable electricity production. Considering the δe results obtained from the regression analyses, it can be said that random effects are at a low level of 54.8% in model 1 only and are at a high level of 81.1% to 93.1% in the other models. The R2 value, which represents the explanatory power of the regression, was 67.9% only in model 1, and was below 30% in the other models. In Models 3 and 4, these values were 7.5%.

V. CONCLUSIONS

Industrial production and resource consumption are increasing due to the increasing population around the world. The use of fossil fuels to meet people's needs is increasing rapidly day by day. Unconscious use of fossil fuels negatively affects the environment and ecosystem. To leave a liveable world to future generations, environmentally friendly energy production and consumption must be prioritized, and this strategy must be implemented sustainably worldwide. When evaluated from this perspective, it is vital to analyze the relationship between carbon emissions and energy production and consumption very well.

In this study, it was tried to determine the energy production and energy consumption that affected the carbon emissions of Azerbaijan, Kazakhstan, Turkey, and Uzbekistan between 1995-2014. As a result of the study conducted with the data of the Turkic Republics between 1995 and 2014, it is possible to say that carbon dioxide emissions will decrease because of the production and consumption of green energy in the countries, and carbon dioxide emissions will increase because of the production and consumption of energy obtained from fossil resources. For this reason, it is suggested that countries should transfer more resources and investments to green energy production in the future.

Like many other studies, this study also has some limitations. It is an important limitation that the study was conducted in only four Turkic Republics. Another limitation is that the study covered the years 1995-

2014. Different countries and years may be used in future studies. When a general evaluation of the study is made, this research reveals that the use of sustainable green energy is vital for the future of our world.

The Relationship Between Soil and Some Endemic Plant Communities Belonging to The Caryophyllaceae Family Growing Naturally Around Karakuyu Marsh (Afyonkarahisar - Turkey)

Ahmet Serteser[1*]

[1]*Afyon Kocatepe University, Faculty of Science and Literature, Department of Molecular Biology and Genetics, 03030, Afyonkarahisar-Turkey*

[*]*(aserteser@aku.com.tr) Email of the corresponding author*

Abstract **–** Karakuyu Marshes are located in the upstream of the Büyük Menderes River upper basin, within the borders of Dinar district of Afyonkarahisar province, and are also known as "Karakuyu Lake", "Çapalı Lake" and "İncesu Lake". The lake, which is connected to the Burdur Basin in the south, the Uluborlu Plain in the east and the Büyük Menderes Basin in the west, has the coordinates of 38° 15. north, 30° 52. east and an altitude of 950 m. The study area is located within the borders of Afyonkarahisar province in the Aegean Region Inner Western Anatolia and is located within the B3 square according to the quadrature system determined by Davis (1965-1988). The region has a "semi-arid Mediterranean Bioclimate" and an "Eastern Mediterranean type" rainfall regime. In the region, there are mostly Alluvial Soils, Hydromorphic Alluvial Soils, Colluvial and Brown Large Soil groups and reeds-swamps as land types. The majority of the research area is covered by Quaternary land. Nearly 100 vascular plants were identified in the study area located within the Iran-Turan floristic region. "Flora of Turkey and the Eastern Aegean Islands", "List of Plants of Turkey (Vascular Plants)", (Flora of Turkey (Vascular Plants) Checklist)" and Afyon Kocatepe University herbarium (AKÜ) were also used to identify the plants. According to Braun-Blanquet (1932), 6 plant communities were identified in the research area. These are *Eromogene ledebouriana* (Fenzl) Ikonn (iğne kumotu), *Bolanthus minuartioides* (Jaub. et Spach) Hub.- Mor. (havalotu), *Dianthus zonatus* Fenzl var. *zonatus* (kaya karanfili), *Minuartia anatolica* (Boiss.) Woron. var. *arachnoidea* McNeill (tıstısotu), *Saponaria prostrata* Willd. subsp. *prostrata* (ebemterliği), *Saponaria pumilio* Boiss. (zarif sabunotu). To carry out the research, plant communities along with their soils were collected, analyzed and evaluated. In order to find out the relationship between these plant communities, soil samples taken from 0-30 and 30-60 cm depths and their physical-chemical analyzes were determined primarily by soil structure, pH, salt, lime and organic matter, determined by the Ankara Soil Fertilizer and Water Resources Central Research Institute. It was interpreted according to the methods.

Keywords – Karakuyu Reeds and marshlands (Afyonkarahisar), Cayophyllaceae, endemic plants, soil features, vegetation-soil relationship

I. INTRODUCTION

Karakuyu Marshes are located in the upstream of the Büyük Menderes River upper basin, within the borders of Dinar district of Afyonkarahisar province, and are also known as "Karakuyu Lake", "Çapalı Lake" and "İncesu Lake". The lake, which is connected to the Burdur Basin in the south, the Uluborlu Plain in the east and the Büyük Menderes Basin in the west, has the coordinates of 38° 15. north, 30° 52. east and an altitude of 950 m. The study area is located within the borders of Afyonkarahisar Province, in

Mid-Western Anatolia, Aegean Region, and falls into B3 square according to the gryd system (Fig. 1). So far, Afyonkarahisar's close near, Sultan Mountains [1], Köroğlubeli Vegetation [2], Vegetation of Afyon Başkomutan Historic National Park [3], Akdağ Flora and Vegetation [4], Türkiye Geothermal Inventory [5], Akarçay Basin Hydrogeology [6], The Steppe Vegetation of Emir Mountain [7], Kumalar Mountain Flora [8], Ahır Mountain Flora [9], Emir Mountain Northern half of Flora [10], Emir Mountains South Half Flora [11], [12], Eber Lake (Afyonkarahisar) Flora [13], Evaluation of Eber Lake (Afyonkarahisar) Macrophytes in Terms of Restoration Ecology [14], and so on, have been found in such studies.

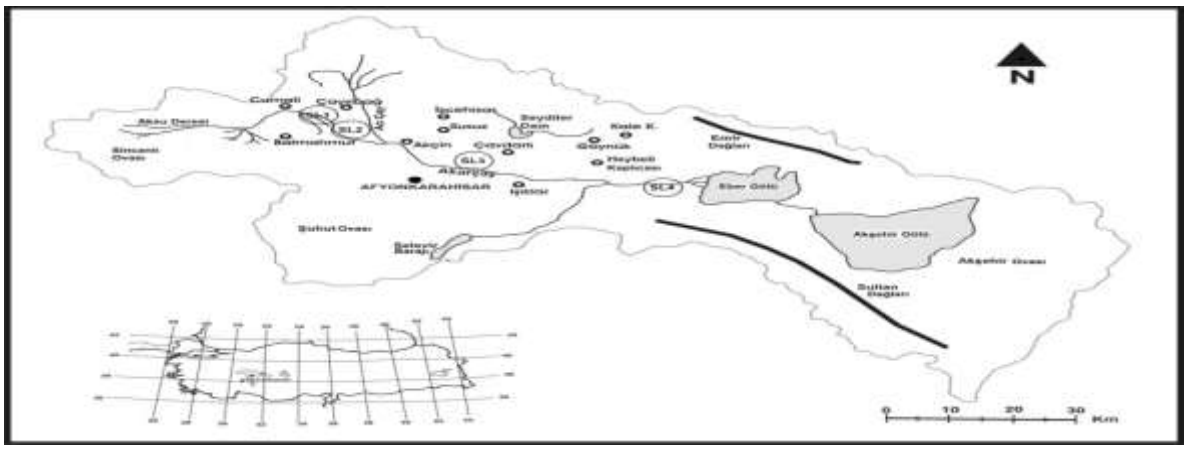

Fig. 1 Study area

II. Materials and Method

Nearly 100 vascular plants were identified in the study site, situated in the Irano-Turanian floristic region. Identification of the plants was based on “Flora of Turkey and the East Aegean Islands” [15]-[17] and "Türkiye Bitkileri Listesi (Damarlı Bitkiler)" (A checklist of the Flora of Turkey (Vascular Plants))” [18], and the herbarium of Afyon Kocatepe Üniversitesi (AKÜ) was also utilized. Most of the study area is covered by Quaternary lands. Bioclimate of the area is a combination of semi-arid - cold Mediterranean climates. The precipitation regime shows the characteristic of eastern Mediterranean. Most of the study area has alluvial soils, hydromorphic alluvial soils, colluvial soils, brown soils with reeds-marshs of land type. Floristic region of the area is a Irano-Turanian type and about 100 vascular plant types have been identified. 6 plant communities are identified regarding to [19] in the research area. These are *Eromogene ledebouriana* (Fenzl) Ikonn, *Bolanthus minuartioides* (Jaub. et Spach) Hub.- Mor., *Dianthus zonatus* Fenzl var. *zonatus*, *Minuartia anatolica* (Boiss.) Woron. var. *arachnoidea* McNeill, *Saponaria prostrata* Willd. subsp. *prostrata*, *Saponaria pumilio* Boiss.

Table 1. Analysis of the soil results

Plant Com. Num.	Depth cm	Water Saturation	Texture Class	EC ds/m	Total Salt %	Water Saturation at Soil pH	Organic Matter %	Phosphorus (P_2O_5) Kg/da	Potassium (K_2O) Kg/da	Lime $CaCO_3$ %

III. RESULTS

To find the relation of the plant community with soils, 12 soil examples which have a high capability of representation were taken from the deepness of 0-30 and 0-60 cms and their physical and chemical analysis were done in Ankara Toprak Gübre ve Su Kaynakları Merkez Araştırma Enstitüsü (Ankara Soil Fertilizer and Water Resources Central Research Institute) laboratories according to the methods determined by Reference [20] (Table 1). The area has "Mediterranean Bioclimate with low precipitation". "Eastern Mediterranean type" precipitation is recorded in the area [21], [22]. To reflect the climate values of the region, a climate diagram was drawn for the nearest meteorological stations, Dinar (Afyonkarahisar) [23]- [25] (Fig. 2). If the climate data of Dinar (Afyonkarahisar) meteorological station is applied to the climate classification formula of Reference [26], Dinar (Afyonkarahisar) show a "semi-arid, cold Mediterranean bioclimate" [27].

It mostly contains the major soil types as alluvial soils, hydromorphic alluvial soils, colluvial soils, and brown soils [28]. Nearly 100 vascular plants were identified in the study site, situated in the Irano-Turanian floristic region.

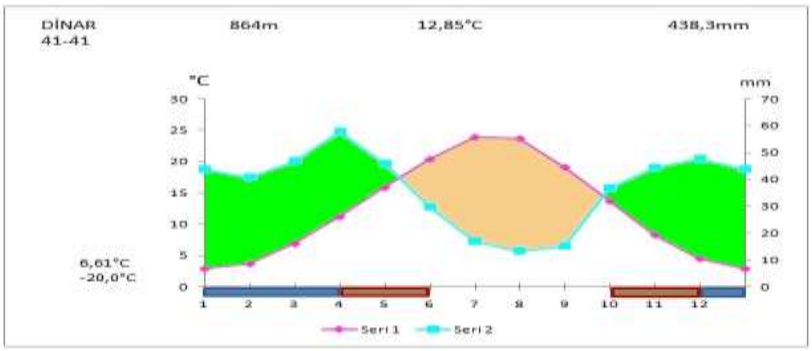

Fig 2. Walter climate diagrame

IV. DISCUSSION

To accomplish the research the communities of plant have been pulled up with their soil and the analysed and evaluated. To find the relationship with this plant communities 0-30 and 30-60 cm soil samples retrieved from the depths and their physical (In percent clay, silt, sand, texture, water saturation, field capacity, wilting point) - chemical [cations (Me/100 gr), anions (Me/100 gr), pH, $CaCO_3$ %, total salt %, EC, organic matter %, changable Na (Me/100 gr), changable K (Me/100 gr), SAR (Me/100 gr), B ppm] analyses and commented. According to the findings, the results vary as follow. In the group, cover of the vegetation is 55 % - % 85 and the number of species in the group is about 5-9. In the group's study field, Hydromorpic Alluvial exist in the soils. Soils are in clayey structure. The soil samples taken from the group are slightly salty to very salty, highly calcareous, organic material in the samples are high and phosphorus in the samples vary from moderate to very high with too much level of potassium. Soils are characterised by very slightly alkali with respect to pH.

V. CONCLUSION

In this study, the relationship of 6 plant communities with soil taken from depths of 0-30 and 30-60 cm was investigated. It is very important to have information about the ecology of these plant communities found in various places, especially about soil properties. Reaching the results of the same ecological conditions in nature without analysis constitutes the essence of the research. Similar studies to be conducted in the future will contribute to plant ecology.

Abstract – This document presents the Tubular surfaces under Möbiüs transformation S. In addition Mean and Gauss Curvatures of a Canal Surface are observed under Möbiüs transformation S. When Mean and Gauss Curvatures of a Canal Surface are observed under Möbiüs transformation S, it is examined whether it is invariant or not.

Keywords – Tube surfaces, curvatures, Mean curvature, Gauss curvature, Möbiüs transfornation

I. INTRODUCTION

In 3-dimensional Euclidean Space, a regular curve is described by its curvatures k_1 and k_2. The relations between the curvatures of a canal surfaces and the curvatures of the curve can be seen in many differential books and papers. Möbius transformations are the automorphisms of the extended complex plane $C_\infty : C \cup \{\infty\}$; that is the metamorphic bijections $M : C_\infty \to C_\infty$. A Möbiüs transformation M has following form as

$$M(z) : \frac{az+b}{cz+d}; a,b,c,d \in C \text{ and } \begin{vmatrix} a & b \\ c & d \end{vmatrix} \neq 0. \tag{1}$$

The set of all Möbius transformations is a group under composition. The Möbius transformation with $c = 0$ form the subgroup of similarities such transformations have the form as follows.

$$S(Z) = A(Z) + B; A, B \in C, A \neq 0. \tag{2}$$

The transformation $J(Z) = 1/Z$ is called an inversion. Every Möbius transformation M of the form (2) is a composition of finitely many similarities and inversions (e.g. [4,5]). In this paper Mean and Gauss Curvatures of a Canal Surfaces under Möbius transformation is obtained. These curvatures of the canal surfaces is invariant or not invariant for Möbius transformation.

II. PRELIMINARIES

A canal surface is defined as the envelope of a family of one parameter spheres. A canal surface is the envelope of a moving sphere with varying radius, defined by the trajectory $C(t)$ of its center and a radius function r(t): This moving sphere $S(t)$ touches the canal surface at a characteristic circle $K(t)$: If the radius function is constant, then the canal surface is called a tube or pipe surface.

Let α be a unit speed curve with tangent $T(s) = \alpha'(s)$ and let $N_1(s)$ be a arbitrary orthogonal unit vector to $T(s)$. If $N_2(s)$ is orthogonal to both $T(s)$ and $N_1(s)$, $N_2(s) = T(s) \times N_1(s)$ (positively oriented) according to this means that $\{T(s), N_1(s), N_2(s)\}$ is an orthonormal frame is called Bishop frame. Let $k_1(s)$ and $k_2(s)$ be Bishop parameters. The derivative formulae which correspond to Bishop frame and Bishop parameters are as follows (e.g. [1-8]).

(3)
$$\begin{aligned} T' &= k_1 N_1 + k_2 N_2, \\ N_1' &= -k_1 T, \\ N_2' &= -k_2 T, \\ k_1 &= \kappa \cos\alpha, \\ k_2 &= \kappa \sin\alpha, \\ \tau &= \gamma'. \end{aligned}$$

III. MEAN AND GAUSS CURVATURES OF A CANAL SURFACE

The Mean H and Gauss K curvatures of a tube surface are computed in reference (e.g. [3]) by 3 situations. These situations are as follows.

i. If the center curve is given with Frenet frame, then the tube is around the center curve α becomes $Y(s,\theta) = \alpha(s) + r(\cos\theta N + \sin\theta B),$ using derivative formulae of this equality and following equalities were obtained from the references (e.g. [2,3,6,7,8]).

(4)
$$\begin{aligned} K &= \frac{-\kappa\cos\theta}{r(1-r\cos\theta)}, \\ H &= \frac{1}{2}\left(\frac{1}{r} + Kr\right). \end{aligned}$$

ii. If the center curve is given with Bishop frame , then the tube around the center α becomes $Z(s,\theta) = \alpha(s) + r(\cos\theta N_1 + \sin\theta N_2),$ using derivative formulae of this equality, then following equalities from the references (e.g. [2,3,6,7,8]) were obtained.

(5)
$$\begin{aligned} K &= \frac{-k_1\cos\theta + k_2\sin\theta}{r\left[r(k_1\cos\theta + k_2\sin\theta) - 1\right]}, \\ H &= rK - \frac{K}{2(k_1\cos\theta + k_2\sin\theta)}. \end{aligned}$$

iii. Let W be a regular surface with a unit normal V and the center curve $\alpha : I \subset R \to W$ be a unit speed curve. In case the tube around the center curve α becomes $X(s,\theta) = \alpha(s) + r(\cos\theta P + \sin\theta S),$ using derivative formulae of this equality and following equations were obtained from the references (e.g. [2,3,6,7,8]).

(6)
$$\begin{aligned} K &= \frac{-k_g\cos\theta + k_n\sin\theta}{r(1-rk_g\cos\theta - rk_n\sin\theta)}, \\ H &= \frac{2r(k_g\cos\theta + k_n\sin\theta) - 1}{2r(rk_g\cos\theta + rk_n\sin\theta - 1)}. \end{aligned}$$

Let the center curve were obtained in $\alpha(s)$ be a spherical curve with order α^2 from the reference (e.g. [3]). According to the reference (e.g. [1]), if a space curve is a spherical curve, then the pair (k_1, k_2) lies on not passing through a line $gx + hy + 1 = 0$. For the $s-$parameter curves, from the reference (e.g. [3,7,8]). the equalities were computed such equalities $g = \cos\theta$, $h = \sin\theta$, $k_1\cos\theta + k_2\sin\theta + 1 = 0$, and,

(7)
$$\begin{aligned} K &= \frac{-k_1\cos\theta + k_2\sin\theta}{r\left[r(k_1\cos\theta + k_2\sin\theta) - 1\right]} = \frac{1}{r(r+1)} \\ H &= rK - \frac{K}{2(k_1\cos\theta + k_2\sin\theta)} = \frac{2r}{2r(r+1)}. \end{aligned}$$

IV. CURVATURES OF THE CANAL SURFACE UNDER MOBIUS TRANSFORMATION S

In here some preliminaries about Möbius transformation were given from the references (e.g. [4,5])..

Every Möbius transformation M of the form as follows is a composition of finitely many similarities and inversions (e.g. [4,5]). Möbius tranformations preserve distance and angle (e.g. [10]). Such as we can write following equalities.

(8) $$M(\alpha) = S(\alpha) o J(\alpha),$$

(9) $$\beta = \beta_1 o \beta_2 .$$

Let $A = (a_1, a_2)$ and the coordinates $(\alpha_1, \alpha_2, \alpha_3)$ of α be a point on the curve. Following equations were written in (e.g. [4,5]).

(10) $$\begin{aligned} S(\alpha) &= S(\alpha(t)), \\ S(Z + t_j) &= AZ + B + |A| t_j, \\ &= (a_1\alpha_1 - a_2\alpha_2 + b_1, a_1\alpha_2 + a_2\alpha_1 + b_2, |A| a_3, \end{aligned}$$

and,

(11) $$\begin{aligned} J(Z + t_j) &= \frac{\overline{Z} + t_j}{|Z|^2 + {t_j}^2}, \\ J(\alpha(t)) &= \left(\frac{\alpha_1(t)}{\|\alpha_1(t)\|^2}, -\frac{\alpha_2(t)}{\|\alpha_2(t)\|^2}, \frac{\alpha_3(t)}{\|\alpha_3(t)\|^2}\right). \end{aligned}$$

For the transformation S, the equalities of the curvatures under Möbius transformation were written in (e.g. [4,5]).

(12) $$\kappa^* = \frac{1}{|A|}\kappa,$$

(13) $$\tau^* = \frac{1}{|A|}\tau.$$

For the transformation J, let take $\alpha = (\alpha_1, \alpha_2, \alpha_3) \in S_o^2 \Rightarrow \|\alpha\| = 1$, and $J(\alpha) = \beta \in S_o^2$. Following equalities were obtained in (e.g. [4,5]).

(14) $$\tau = \frac{\det(\alpha', \alpha'', \alpha''')}{\|\alpha' \wedge \alpha''\|^2},$$

(15) $$\tau^* = \frac{\det(\beta', \beta'', \beta''')}{\|\beta' \wedge \beta''\|^2}.$$

From the reference (e.g. [9]), we have,

(16) $$\begin{aligned} \beta &= (\alpha_1, -\alpha_2, \alpha_3), \\ \beta' &= (\alpha_1', -\alpha_2', \alpha_3'), \\ \beta'' &= (\alpha_1'', -\alpha_2'', \alpha_3''), \\ \beta''' &= (\alpha_1''', -\alpha_2''', \alpha_3'''), \end{aligned}$$

and,

(17) $$\frac{\det(\beta', \beta'', \beta''')}{\|\beta' \wedge \beta''\|^2} = -\frac{\det(\alpha', \alpha'', \alpha''')}{\|\alpha' \wedge \alpha''\|^2},$$

(18) $$\tau^* = -\tau .$$

By applying the Möbius transformation on $\alpha, \kappa, \tau, K, H$, we have $\beta, \kappa^*, \tau^*, K^*, H^*$.

Theorem 1: If the center curve is given with Frenet frame, then the tube is around the center curve α becomes $Y(s,\theta)=\alpha(s)+r(\cos\theta N+\sin\theta B)$, we obtain the Gauss curvature of the Canal surface K^* is not invariant for Möbius transformation S.

Proof. After by applying S transformation, the Gauss curvature of the Canal surface K^* is obtained as follows.

(19) $$K^*=\frac{-\kappa^*\cos\theta}{r(1-r\kappa^*\cos\theta)}.$$

In beginning if radius $r=1$, then the equality (19) is obtained as:

(20) $$K^*=\frac{-\kappa^*\cos\theta}{1-\kappa^*\cos\theta)},$$

By substituting the equalities (12) and (13) in (19), we take following equality.

(21) $$K^*=\frac{-\frac{1}{|A|}\kappa\cos\theta}{r(1-r\frac{1}{|A|}\kappa\cos\theta)},$$

$$=\frac{-\kappa\cos\theta}{r(|A|-r\kappa\cos\theta)}.$$

This proves that the Gauss curvature of the Canal surface K^* is not invariant for Möbius transformation S.

Special case 1: If radius r is equal to 1, then the equality is obtained as follows.

(22) $$K^*=\frac{-\frac{1}{|A|}\kappa\cos\theta}{1-\frac{1}{|A|}\kappa\cos\theta},$$

$$=\frac{-\kappa\cos\theta}{|A|-\kappa\cos\theta}.$$

Corollary 1: This proof is proved that if the angle θ is constant or not, r is equal to 1 or not, K^* is not invariant for Möbius transformation S.

Special case 2: If the angle $\theta=2k\pi$, then the Gauss curvature K^* is not invariant for Möbius transformation S.

If the angle $\theta=2k\pi$, then the Gauss curvature K^* is obtained as follows.

(23) $$K^*=\frac{-\kappa}{r(|A|-r\kappa)}.$$

Special case 3: If the radius r is equal to 1, then the equality is written such following equality.

(24) $$K^*=\frac{-\kappa}{|A|-\kappa}.$$

Corollary 2: If the angle θ and r is equal to $2k\pi$ and 1, respectively, then the Gauss curvature K^* is not invariant for Möbius transformation S.

Special Case 4: If the angle $\theta=k\pi$, then the Gauss curvature K^* is not invariant for S transformation.

If the angle $\theta = k\pi$, then the Gauss curvature K^* is obtained as follows:

(25) $$K^* = \frac{\kappa}{|A| + \kappa}.$$

Corollary 3: If the angle θ and r is equal to $2k\pi$ and 1, respectively, then the Gauss curvature K^* is not invariant for Möbius transformation S .

Corollary 4: If the center curve is given with Frenet frame, then the tube is around the center curve α , surface is the Canal surface and the Gauss curvature K^* is not invariant for S transformation.

Theorem 2: If the center curve is given with Frenet frame, then the tube is around the center curve α becomes $Y(s,\theta) = \alpha(s) + r(\cos\theta N + \sin\theta B),$ we obtain the Mean curvature H^* of the Canal surface is not invariant for S transformation, and also Möbius transformation.

Proof: Let study the Mean curvature H^* of Canal surface under S transformation.

(26) $$H^* = \frac{1}{2}\left(\frac{1}{r} + K^* r\right),$$

By substituting the equality (19) in equality (26), then we take following equation.

(27)
$$\begin{aligned} H^* &= \frac{1}{2}\left(\frac{1}{r} + \frac{-\kappa^* \cos\theta}{r(1 - r\kappa^* \cos\theta)} r\right) \\ &= \frac{1}{2}\left(\frac{1}{r} - \frac{\kappa^* \cos\theta}{1 - r\kappa^* \cos\theta}\right), \\ &= \frac{1}{2}\left(\frac{1}{r} - \frac{\frac{1}{|A|}\kappa\cos\theta}{1 - r\frac{1}{|A|}\kappa\cos\theta}\right), \\ &= \frac{1}{2}\left(\frac{1}{r} - \frac{\kappa\cos\theta}{|A| - r\kappa\cos\theta}\right). \end{aligned}$$

This proves that the Mean curvature H^* of the Canal surface is not invariant for S transformation, and also Möbius transformation.

Special Case 5: If the radius r is equal to 1, then the Mean curvature H^* of the Canal surface is not invariant for S transformation.

If the radius r is equal to 1, then the Mean curvature H^* of the Canal surface is obtained as follows.

(28) $$H^* = \frac{1}{2}\left(1 - \frac{\kappa\cos\theta}{|A| - \kappa\cos\theta}\right).$$

Special Case 6: If the angle $r = 1$ and $\theta = 2k\pi$, then the Mean curvature H^* is not invariant for Möbius transformation.

By substituting $r = 1$ and $\theta = 2k\pi$ in equality (28), we get following equation.

(29) $$H^* = \frac{|A| - 2\kappa}{2|A| - 2\kappa}.$$

The equation (29) shows us that if the angle $r = 1$ and $\theta = 2k\pi$, then the Mean curvature H^* is not invariant for Möbius transformation.

Special Case 7: If the angle $\theta = k\pi$, then the Mean curvature H^* is not invariant for S transformation. If the angle $\theta = k\pi$, then the Mean curvature H^* is obtained as follows:

(30) $$\begin{aligned} H^* &= \frac{1}{2}\left(1 + \frac{\kappa}{|A| + \kappa}\right), \\ &= \frac{|A| + 2\kappa}{2|A| + 2\kappa}. \end{aligned}$$

We obtain the Mean curvature H^* is not invariant for S transformation. Thus, the Mean curvature H^* is not invariant for Möbius transformation.

Corollary 5: If the center curve is given with Frenet frame, then the tube is around the center curve and the Gauss curvature of the canal surface H is not invariant under Mobius transformation.

Special Case 8: If radius $r = 1$, $|A| = 1$ and $\theta = 2k\pi$, then we get the following equation.

(31) $$K^* = \frac{-\kappa}{1 - \kappa}.$$

Special Case 9: If radius $r = 1$, $|A| = 1$ and $\theta = k\pi$, then we get the following equation.

(31) $$K^* = \frac{\kappa}{1 + \kappa}.$$

Theorem 3: If the center curve is given with Bishop frame, then the tube around the center curve becomes $Z(s,\theta) = \alpha(s) + r(\cos\theta N_1 + \sin\theta N_2)$, we obtain the Gauss curvature of the canal surface K^* is not invariant for S transformation.

Proof: Now let apply transformation S and observe the Gauss curvature K^*. Remind that the angle is invariant under Möbius transformation.

(32) $$\begin{aligned} K^* &= \frac{-\kappa^* \cos\theta + \tau^* \sin\theta}{r\left[r(\kappa^* \cos\theta + \tau^* \sin\theta) - 1\right]}, \\ &= \frac{-\frac{1}{|A|}\kappa\cos\theta + \frac{1}{|A|}\tau\sin\theta}{r\left[r(\frac{1}{|A|}\kappa\cos\theta + \frac{1}{|A|}\tau\sin\theta) - 1\right]}, \\ &= \frac{-\kappa\cos\theta + \tau\sin\theta}{r\left[r(\kappa\cos\theta + \tau\sin\theta) - |A|\right]}, \end{aligned}$$

This shows that the Gauss curvature K^* is not invariant under S transformation. So, K^* is not invariant under Möbius transformation It comletes the proof.

Theorem 4: If the center curve is given with Bishop frame, then the tube around the center curve becomes $Z(s,\theta)=\alpha(s)+r(\cos\theta N_1+\sin\theta N_2)$, we obtain the Mean curvature of the canal surface H^* is not invariant for Möbius transformation.

Proof: Now let apply transformation S and observe the Mean curvature H^*.

(33)
$$H^*=r\left[\frac{-\kappa\cos\theta+\tau\sin\theta}{r\left[r(\kappa\cos\theta+\tau\sin\theta)-|A|\right]}\right]-\frac{\left[\frac{-\kappa\cos\theta+\tau\sin\theta}{r\left[r(\kappa\cos\theta+\tau\sin\theta)-|A|\right]}\right]}{2(\frac{1}{|A|}\kappa\cos\theta+\frac{1}{|A|}\kappa\sin\theta)},$$

$$=r\left[\frac{-\kappa\cos\theta+\tau\sin\theta}{r\left[r(\kappa\cos\theta+\tau\sin\theta)-|A|\right]}\right]-\frac{|A|(-\kappa\cos\theta+\tau\sin\theta)}{r\left[r(\kappa\cos\theta+\tau\sin\theta)-|A|\right]\left[2(\kappa\cos\theta+\kappa\sin\theta)\right]},$$

$$=\frac{2r(-\kappa\cos\theta+\tau\sin\theta)(\kappa\cos\theta+\kappa\sin\theta-|A|)}{r\left[r(\kappa\cos\theta+\tau\sin\theta)-|A|\right]\left[2(\kappa\cos\theta+\kappa\sin\theta)\right]},$$

$$=\frac{(-\kappa\cos\theta+\tau\sin\theta)(\kappa\cos\theta+\kappa\sin\theta-|A|)}{(\kappa\cos\theta+\kappa\sin\theta)\left[r(\kappa\cos\theta+\tau\sin\theta)-|A|\right]},$$

$$=\frac{-\kappa\cos\theta+\tau\sin\theta}{r(\kappa\cos\theta+\kappa\sin\theta)}.$$

The Mean curvature H^* is not invariant under Möbius transformation. This is the proof of the theorem.

Theorem 5: If the curve α is a spherical curve with order α^2 and $k_1\cos\theta+k_2\sin\theta+1=0$, then Gauss and Mean curvatures of Tube surfaces are invariant under Möbius transformation S.

Proof: If the curve α is a spherical curve, then the Gauss and Mean curvatures of Tube surfaces are obtained from the equalities (7) under transformation S as follows.

(34)
$$K^*=\left[\frac{1}{r(r+1)}\right]^*,$$

$$=\frac{1}{r(r+1)},$$

$$K^*=K,$$

and,

(35)
$$H^*=\left[\frac{2r}{2r(r+1)}\right]^*,$$

$$=\frac{2r}{2r(r+1)},$$

$$H^*=H.$$

This proof shows that if the curve α is a spherical curve, then the Gauss and Mean curvatures of Tube surfaces are invariant Möbius transformation S.

Corollary 6: If the curve α is a spherical curve, then the Gauss and Mean curvatures of Tube surfaces are invariant Möbius transformation S.

Theorem 6: Let W be a regular surface with a unit normal V and the center curve $\alpha : I \subset R \to W$ be a unit speed curve. In case the tube around the center curve α becomes $X(s,\theta) = \alpha(s) + r(\cos\theta P + \sin\theta S)$, then Gauss and Mean curvature of the Tube surfaces are not invariant under Möbius transformation.

Proof: After applying Möbius transformation S the equation (6), substituting (12) and (13) in final equality, this completes the proof of the theorem.

Corollary 7: If the center curve is given with the Frenet frame, then the tube is around the center curve α becomes $Y(s,\theta) = \alpha(s) + r(\cos\theta N + \sin\theta B)$, then Gauss and Mean curvature of the Tube surfaces are not invariant under Möbius transformation.

Corollary 8: If the center curve is given with Frenet frame, then the tube is around the center curve becomes $Y(s,\theta) = \alpha(s) + r(\cos\theta N + \sin\theta B)$, we obtain the Gauss curvature of the canal surface K^* is not invariant under Möbius transformation.

Proof: For the situation i. If the center curve is given with Frenet frame, then the tube is aroun the center $Y(s,\theta) = \alpha(s) + r(\cos\theta N + \sin\theta B)$, the Gauss curvature of the canal surface K^* is not invariant under Möbius transformation S. Because Möbius transformation becomes two part. One of them is transformation S, the other is transformation J. It can be said if the tube is around the center curve becomes $Y(s,\theta) = \alpha(s) + r(\cos\theta N + \sin\theta B)$, then Gauss and Mean curvatures of the Canal surface are not invariant under Möbius transformation.
In addition, we can say the same cases for the situations ii. and iii.
And also, remind that if the curve is spherical, it have to apply under transformation J.

V. CONCLUSION

The main conclusions of the study should be summarized in Gauss and Mean curvatures of Canal surfaces under Möbius transformation.

ACKNOWLEDGMENT

The authors declare that there is no conflict of interests regarding the publication of this conference paper.

Abstract – A new Einstein-Debye approximation for calculating specific heat capacities of the hafnium oxide was proposed. The adoption of hafnium oxide (HfO_2) in semiconductor manufacturing is part of the industry's ongoing efforts to overcome challenges associated with scaling down the size of electronic components while maintaining or improving performance. It is worth noting that the field of materials science and semiconductor technology is dynamic, and ongoing research may lead to further advancements or new applications for hafnium oxide in the future. Using the calculation result as the input data for structural and application analysis, it will be possible to make optimum design of the devices considering both electromagnetic and mechanical conditions.

Keywords – Hafnium oxide, zirconium oxide, Einstein-Debye approach, Debye temperature

I. Giriş

Bilindiği gibi Einstein-Debye modeli, katıların ısı kapasitesinin daha kapsamlı bir tanımını oluşturmak için her iki yaklaşımı birleştirir. Düşük sıcaklıklarda Einstein katkısı baskın olurken, yüksek sıcaklıklarda Debye katkısı daha önemli hale gelir. Einstein-Debye modeli özellikle katılardaki ısı kapasitesi davranışının tüm sıcaklık aralığını tanımlamak için kullanışlıdır. Özetle, Einstein-Debye modeli, hem Einstein hem de Debye'nin birleştirerek katıların ısı kapasitesinin daha doğru bir temsilini sağlar. Bu modelin bazı basitleştirici varsayımlarda bulunduğunu ve gerçek malzemelerin tüm karmaşıklıklarını yakalayamayabileceğini ancak katılardaki ısı kapasitesini yöneten temel ilkeleri anlamak için değerli bir araç olarak hizmet ettiğini belirtmek önemlidir [1-3].

Hafniyum oksit **(** HfO_2 **)**, hafniyum ve oksijenden oluşan kimyasal bir bileşiktir. Yüksek dielektrik katsayılı malzemedir, yani yüksek bağıl geçirgenliğe veya dielektrik sabitine sahiptir. Bu özellik, yarı iletken teknolojisi alanında, özellikle de metal oksit yarı iletken (MOS) cihazların üretiminde çok önemlidir. Dielektrik Özellikler: Hafniyum oksit, yüksek dielektrik sabitiyle bilinir, bu da onu metal oksit yarı iletken alan etkili transistörlerde (MOSFET'ler) geçit dielektrik olarak kullanıma uygun hale getirir. Yüksek k dielektrikler, daha küçük transistörlerdeki kaçak akımı azaltmak amacıyla geleneksel silikon dioksitin (SiO2) yerine kullanılır [4-7]. Yarı İletken Endüstrisi: Yarı iletken endüstrisi, yüksek k dielektrik yığınları oluşturmak için diğer malzemelerle birlikte hafniyum oksidi benimsemiştir ve gelişmiş yarı iletken cihazlarda geçit dielektrik olarak genellikle silikon dioksitin yerini almıştır. Bu geçiş, geleneksel silikon dioksitin daha küçük transistörlerde kullanılmasıyla ilişkili sınırlamaların aşılmasına yardımcı olur. CMOS Teknolojisi: Tamamlayıcı metal oksit yarı iletken (CMOS) teknolojisi, yarı iletken endüstrisinde yaygın olarak kullanılmaktadır ve hafniyum oksit, geçit dielektrik özelliklerini iyileştirerek CMOS cihazlarının

performansının arttırılmasında rol oynamaktadır. Mikroelektronik: Hafniyum oksit, entegre devrelerdeki transistörlerin ve diğer bileşenlerin sürekli minyatürleştirilmesine izin verdiği için daha küçük özellik boyutlarına sahip mikroelektronik cihazların geliştirilmesinde kritik bir bileşendir. Termal Kararlılık: Hafniyum oksit, yarı iletken imalat işlemlerinde kullanılan malzemeler için önemli bir özellik olan iyi bir termal kararlılık sergiler [7-14].

Yukarıdaki açıklamalardan anlaşıldığı kadarıyla Hafniyum oksit uygulamaları ile teknolojinin farklı alanlarında önemli yere sahiptir. Bu çalışmada hafniyum oksidin C_p ve C_V öz ısı miktarları geniş sıcaklık aralığında Einstein-Debye modeli kullanılarak incelenmiştir. Alınan sonuçlar kaynaklardaki farklı yaklaşımlarla karşılaştırılarak doğruluğu incelenmiştir.

2. Hafniyum oksidin Einstein-Debye modeline göre incelenmesi

Bu çalışmada öz ısı miktarının hesaplamasında aşağıdaki formüller kullanılmıştır [1, 2]:

$$C_P(T) = C_V(T)\left(1+\frac{A_0 T}{T_m}C_V(T)\right), \quad (1)$$

$$C_V(T) = 3N_A k_B M\left(T,\theta_D,\theta_E\right), \quad (2)$$

burada $A_0 = 5.1x10^{-3} J^{-1}K\,mol$, T mutlak sıçaklık, T_m erime sıçaklığı, N_A Avogadro sayısır, k_B the Boltzmann sabiti, θ_D Debye sıçaklığı and θ_E is the Einstein sıcaklığıdır. (2) formülünde $M(T,\theta_D,\theta_E)$ fonksiyonu aşağıdaki formüle göre hesaplanır:

$$M(T,\theta_D,\theta_E) = L_V(T,\theta_D) + (s-1)A(T,\theta_E), \quad (3)$$

burada s bir örgüdeki atom sayısıdır. $L_V(T,\theta_D)$ fonksiyonu ise:

$$L_V\left(T,\theta_D\right) = (n+1)D_n\left(1,\frac{\theta_D}{T}\right) - \frac{\theta_D}{T}\frac{n}{e^{\frac{\theta_D}{T}}-1}. \quad (4)$$

tanımlanır. Burada $D_n(\beta,x)$ Debye fonksiyonudur:

$$D_n\left(\beta,\mathrm{x}\right) = \frac{n}{x^n}\int_0^x \frac{t^n}{(e^t-1)^\beta}dt\,. \quad (5)$$

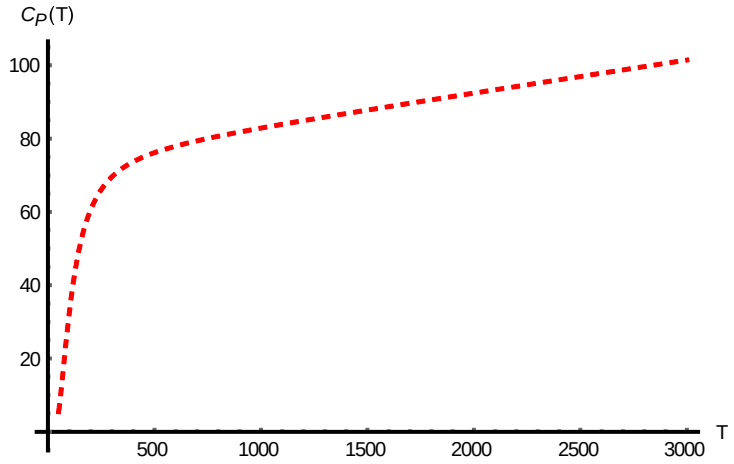
$A(T,\theta_E)$ fonksiyonu ise aşağıdaki formüle göre hesaplanır:

$$A\left(T,\theta_E\right) = \left[\frac{\theta_E}{2T}\frac{1}{\sinh\left(\frac{\theta_E}{2T}\right)}\right]^2. \quad (6)$$

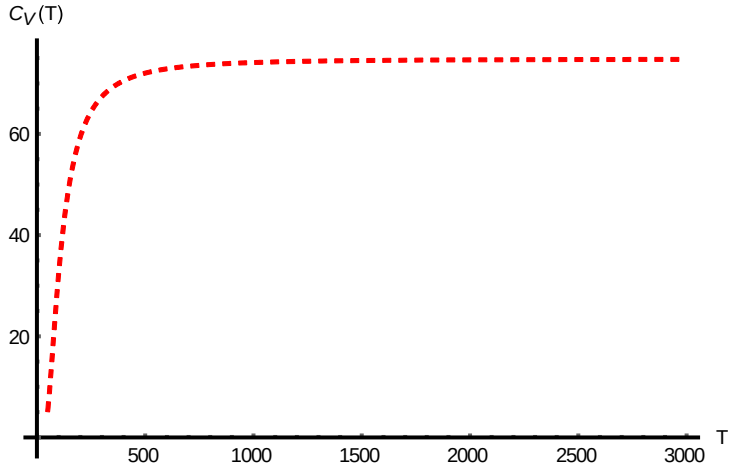
Burada Debye fonksiyonu $D_n(\beta,x)$ yakın zamanda yapılan çalışmadaki formüle göre hesaplanır [3]. Bu çalışmada geniş sıcaklık aralığında hafniyum oksit yarıiletkenin ısı kapasiteleri Einstein-Debye yaklaşımı kullanılarak incelenmiştir.

3. Tartışma ve sonuçlar

Hafniyum oksit kristal yapısına göre monoklinik, tetragonal ve kübik şekillerde olabilir. Bu çalışmada monoklinik yapıdaki hafniyum oksidin (m-HfO_2) ısı kapasitelerinin sıcaklığa göre değişmesi incelenmiştir. Hesaplama sonuçları kaynak [15]'de verilen sonuçlarla karşılaştırılmıştır. Hesaplama sonuçlarının kaynaklardaki verilerle karşılaştırması Şekil 1 ve 2'de verilmiştir. Şekillerdeki sonuçlar kaynaklardaki verilerle uyum içerisindedir. Bu önerilen yöntemin önemli olduğunun bir göstergesidir.



Şekil 1. Hafniyum oksidin C_p ısı kapasitesinin sıcaklığa göre değişmesinin sonuçları ($\theta_D = 484K, \theta_E = 320K, T_m = 3200K$)



Şekil 2. Hafniyum oksidin C_V ısı kapasitesinin sıcaklığa göre değişmesinin sonuçları ($\theta_D = 484K, \theta_E = 320K, T_m = 3200K$)

Abstract – Simple analytical formulas have been used for calculating the electrical conductivity of titanium diboride in a very general and versatile. The electrical conductivity of titanium diboride was calculated based on the Bloch-Gruneisen approach and the classical method in a wide range of temperatures. Titanium diboride's remarkable combination of hardness, high-temperature stability, and electrical conductivity makes it valuable in a range of applications, from industrial tools to electronic components and advanced materials. Its properties continue to be explored for further technological advancements. Titanium diboride is a subject of research for its unique properties. Scientists explore its potential applications in emerging technologies, including energy storage, electronics, and advanced materials. The suggested method requires only simple algorithmic computations, but accuracy is good, and convergence is satisfactory.

Keywords – Electrical conductivity, Titanium diboride, Bloch-Gruneisen approach, Debye temperature, resistivity

I. Giriş

Titanyum diborür (TiB2), titanyum ve bordan oluşan seramik bir bileşiktir. Çeşitli uygulamalarda faydalı olmasını sağlayan birçok önemli özelliğe sahiptir. Titanyum diborürün bazı önemli yönleri ve uygulamaları şunlardır. Sert ve Aşınmaya Dayanıklı Kaplamalar: Titanyum diborür olağanüstü sertliği ve aşınma direnciyle bilinir. Sonuç olarak, sıklıkla kesici takımlar, kalıplar ve aşındırıcı aşınmaya maruz kalan diğer bileşenler için kaplama malzemesi olarak kullanılır. Bu kaplamalar aletlerin dayanıklılığını ve ömrünü artırır. Yüksek Sıcaklık Uygulamaları: TiB2'nin yüksek erime noktası ve mükemmel termal stabilitesi vardır, bu da onu yüksek sıcaklıktaki ortamlardaki uygulamalar için uygun kılar. Yüksek sıcaklıklar içeren prosesler için potaların, ısıtma elemanlarının ve diğer bileşenlerin üretiminde kullanılır. Aşındırıcı Malzemeler: Sertliği nedeniyle titanyum diborür aşındırıcı malzemelere dahil edilir. Taşlama çarklarında ve aşındırıcı bileşiklerde kullanılabilir ve kesme ve taşlama performansının iyileştirilmesine katkıda bulunur. Seramik Matris Kompozitleri (CMC'ler): Titanyum diborür sıklıkla seramik matrisli kompozitlerde takviye fazı olarak kullanılır. Silisyum karbür (SiC) veya alümina (Al2O3) gibi malzemelere eklendiğinde kompozitin mekanik özelliklerini geliştirerek onu havacılık ve yapısal bileşenlerdeki uygulamalar için uygun hale getirir. Elektronik ve Yarı İletken Endüstrisi: TiB2'nin elektriksel iletkenliği ve kimyasal korozyona karşı direnci onu bazı elektronik ve yarı iletken uygulamalarda kullanışlı kılar. Elektriksel iletkenlik ve dayanıklılık kombinasyonunun gerekli olduğu bileşenlerde kullanılabilir. Zırh ve Balistik Koruma: Sertliği ve mukavemeti nedeniyle titanyum diborür zırh ve balistik koruma uygulamalarında dikkate alınır. Mermi darbesine karşı direnci arttırmak için kompozit zırh malzemelerinde bir bileşen olarak kullanılabilir. Refrakter Malzemeler: Titanyum diborür, yüksek sıcaklıklara ve zorlu koşullara dayanabilen refrakter malzemelerde kullanılır. Refrakter özellikleri onu metalurji ve cam endüstrilerindeki uygulamalara uygun hale getirir. Termal Bariyer Kaplamalar: Diğer malzemelerle birlikte

TiB2, havacılık ve gaz türbini motorlarındaki türbin kanatları gibi aşırı sıcaklık değişimlerine maruz kalan bileşenler için termal bariyer kaplamalarında kullanılır. Bu çalışmada teknolojide önemli bir malzeme olan titanyum diborürün özdirencinin sıcaklığa göre değişmesi klasik ve kuantum mekaniksel yaklaşımlar kullanılarak incelenmiştir.

2. Elektriksel iletkenlik için klasik ve kuantum mekaniksel yaklaşım

Materyallerin elektrik iletkenliği genel olarak aşağıdaki formüle göre hesaplana bilinir:

$$\sigma(T) = 1/\rho(T) \quad (1)$$

Burada $\rho(T)$ özdirenç olup kaynaklarda klasik ve kuantum yaklaşımları kullanılarak aşağıdaki formüllere göre incelene bilinir:

$$\rho(T) = \rho_0[1 + \alpha(T - T_0)] \quad (2)$$

Burada α, özdirencin sıcaklık katsayısı, T_0 sabit referans sıcaklığı, ρ_0, T_0 sıcaklıktaki özdirençtir.

Materyallerin özdirencinin sıcaklığa göre değişmesini incelemenin en iyi yöntemlerinden birisi de Bloch-Gruneisen yöntemidir. Debye modeli kullanılarak önerilen Bloch-Gruneisen yaklaşımına göre özdirencin sıcaklığa göre değişmesi aşağıdaki formüle göre hesaplanır [11-12]:

$$\rho(T) = \rho_{01} + (n-1)\rho'\theta_D \left(\frac{T}{\theta_D}\right)^n J_n\left(\frac{T}{\theta_D}\right) \quad (3)$$

burada ρ_0 ve ρ' sırasıyla residual (artık) özdirenç ve sıcaklık özdirenç katsayısıdır. Titanyum diborür için $\rho_0 = 15\mu\Omega.cm$ Formül (3)'de n değişeni iletkenler için $n = 5$ değerini alır. Formülden görüldüğü gibi özdirenci hesaplamak için (1) ifadesindeki $J_5\left(\frac{T}{\theta_D}\right)$ Bloch-Gruneisen fonksiyonun hassas hesaplanması gerekir. Bu çalışmada hesaplamalarda $J_5\left(\frac{T}{\theta_D}\right)$ Bloch-Gruneisen fonksiyonu için aşağıdaki analitik ifade kullanılmıştır [13]:

$$J_5\left(\frac{T}{\theta_D}\right) = 120\zeta(5) - \sum_{k=1}^{\infty} e^{-ky}\left(y^5 + \frac{5y^4}{k} + \frac{20y^3}{k^2} + \frac{60y^2}{k^3} + \frac{120y}{k^4} + \frac{120}{k^5}\right. \quad (4)$$

Burada $y = \frac{T}{\theta_D}$ ve $\zeta(p)$ Riemann zeta fonksiyonu olup aşağıdaki gibi tanımlanır:

$$\zeta(p) = \sum_{k=1}^{\infty} k^{-p} \quad (5)$$

Bu çalışmada önerilen yaklaşımlar geniş sıcaklık aralığında geçerli olup Titanyum diborürün elektrik iletkenliği ayrıntılı olarak inceleme imkânı sağlamaktadır. Titanyum diborürün iletkenliğinin sıcaklığın farkı değerlerinde hesaplama ve kaynak sonuçlar karşılaştırmalı olarak Tablo 1'de verilmiştir.

3. Tartışma ve sonuçlar

Titanyum diborür giriş kısımda belirtildiği gibi teknolojinin farklı alanlarında geniş kullanım alanına sahiptir. Bu çalışmada Titanyum diborürn elektrik iletkenliği sıcaklığın farklı aralıklarında değişmesi Bloch-Gruneisen ve klasik yaklaşıma göre incelenmiştir. Hesaplama sonuçları geniş sıcaklık aralığında Tablo 1'de verilmiştir. Alınan sonuçlara göre önerilen yöntem genel olup sıcaklığın tüm aralıklarında doğru sonuçlar vermektedir

Tablo 1. Titanyum diborürün elektrik iletkenliğinin sıcaklığa göre değişmesinin karşılaştırmalı sonuçları ($\theta_D = 1217K, \rho_{01} = 1\ \mu\Omega.cm, \rho_0 = 15\mu\Omega.cm, \rho' = 0.0572\ \ \mu\Omega.cm, \alpha = 0.0038K^{-1}$)

[*]*(abdullah.kaygusuz@gmail.com)*

Özet **–** Bu çalışmada, Doğu Pontid Kuzey Zonu'nda yer alan Kabakyatak intruzyonunun (Kürtün/Gümüşhane) jeokimyasal özellikleri detaylı bir şekilde incelemiş, intruzyonunu oluşturan kayaçların köken magmasının muhtemel kaynağı ele alınmıştır. İnceleme alanındaki en yaşlı birim Geç Kretase yaşlı Çatak Formasyonu'dur. Bu formasyon Eosen yaşlı Kabaköy Formasyonu tarafından uyumsuz olarak örtülmekte olup, tüm birimler Kabakyatak intruzyonunun da içinde yer aldığı Orta Eosen yaşlı plutonik kayaçlar tarafından kesilmiştir. Kabakyatak intruzyonunu oluşturan kayaçlar, I-tipi yüksek potasyumlu kalk-alkalen ve metalümin özellikte olup, yüksek silis içeriği gösterirler. Ana ve iz element değişimleri dikkate alındığında, artan SiO_2'ye karşı K_2O, Na_2O, Ba, Rb, Yh, Nb, La ve Pb arasında pozitif bir ilişki görülürken; MgO, CaO, Fe_2O_3, TiO_2, Al_2O_3, P_2O_5, Sr, Ni ve Y arasında negatif bir ilişki gözlemlenmektedir. Kayaçlarda hafif nadir toprak elementler ve büyük iyon yarıçaplı litofil elementlerce zenginleşme görülür. Kondirite göre normalleştirilmiş nadir toprak element desenleri konkav şekilli olup, negatif Eu anomalisi gösterirler. Elde edilen jeokimyasal veriler ışığında, Tüm veriler, incelenen Kabakyatak intruzyonuna ait kayaçların kayaçların ana magmasının litosferik mantodan türediğini, kabuksal kayaçların katkısının nispeten az olduğunu göstermektedir.

Anahtar Kelimeler – Gümüşhane, Doğu Pontidler, Kabakyatak intruzyonu, Tüm-kayaç jeokimyası

I. GİRİŞ

Alpin-Himalaya orojenik kuşağı, geniş bir alana yayılmış ve farklı jeolojik süreçlerin etkisiyle oluşmuş kompleks bir yapıdır. Bu kuşağın önemli bir parçasını oluşturan Doğu Pontidler (KD Türkiye), plütonik ve volkanik kayaçların yaygın olarak gözlemlendiği bir bölgedir [1], [2], [3], [4], [5], [6], [7], [8], [9]. Bu çalışmada, Doğu Pontidler'deki plütonik kayaçların jeolojik dağılımı ve jeokimyasal özellikleri incelenerek bölgenin magmatik tarihine ışık tutulması amaçlanmıştır.

Doğu Pontidler'de Permo-Karboniferden Eosen sonuna kadar değişen yaşta ve boyutta plütonik kayaçlar yer alır ve bileşimleri gabrodan granite kadar geniş bir yelpazede değişkenlik gösterir. Bölgede en yaygın olarak görülen plütonik kayaçlar ortaç ve asidik bileşimli kayaçlardır. Gabrolar ise nispeten daha az yayılıma sahiptir. Doğu Pontidler'deki plütonik kayaçlar, jeokimyasal özellikleri bakımından da çeşitlilik gösterir. Kayaçların ana ve iz element konsantrasyonları, köken magmalarının bileşimi ve oluşum koşulları hakkında bilgi verir. Bu element konsantrasyonları analiz edilerek kayaçların tektonik ortamı ve magma kaynağı hakkında yorumlar yapılmaktadır.

İnceleme alanı cıvarındaki Orta Eosen yaşlı plutonlar ile ilgili detay çalışmalar [10] yapılmış olmasına rağmen, Kabakyatak intruzyonu üzerine yapılmış bir çalışma yoktur. Bu çalışmada Kürtün (Gümüşhane) yöresinde yer alan Kabakyatak intruzyonunun jeokimyasal özellikleri incelenmiştir.

II. MATERYAL VE YÖNTEM

Çalışma alanından toplanan ayrışmamış veya çok az ayrışmış kayaç örneklerinin ana, iz ve REE analizleri Sample Solution Analitik Teknoloji Laboratuvarında (Çin) yaptırılmıştır. Tüm-kayaç ana element analizleri için RIGAKU (Japonya) tarafından üretilen Zsx Primus II dalga boyu dağılımlı X-ışını floresan spektrometresi (XRF) kullanılmıştır. Tüm kayaç iz element (NTE analizleri dahil) analizleri ise Agilent 7700e ICP-MS üzerinde gerçekleştirilmiştir. Analiz tekniğinin detayları [10]'de yer almaktadır.

III. BULGULAR VE TARTIŞA

A. *Bölgesel Jeoloji*

Türkiye, [11] tarafından Pontidler, Toridler, Anatolidler ve Kenar Kıvrımları olmak üzere dört tektonik bloğa ayrılmıştır (Şekil 1a). [12] jeolojik yapı ve coğrafi olarak Pontidleri Batı, Orta ve Doğu Pontid'ler olarak üç kısıma bölmüşlerdir. Bazı araştırmacılar [13], [14], [15]. Doğu Pontidler'de Geç Kretase yaşlı birimlerin, kuzey ve güney bölgelerinde farklılık göstermeleri nedeniyle, kuzey zon ve güney zon olarak iki alt birliğe ayırmış olup, bu görüş genel kabul görmüştür (Şekil 1b). [16], [17] ise Doğu Pontidler'i kuzey zonu, güney zonu ve eksen zonu şeklinde üç alt birime ayırmıştır.

Sakarya Zonu'nun kuzey kesimi olarak da bilinen Doğu Pontidler'de temel kayaları Variskan öncesi şistler ve gnayslar oluşturur [18]. Bu birimler Silüriyen-Devoniyen yaşlı metagranitler ve Orta-Geç Karbonifer yaşlı plutonlar tarafından kesilmiştir [19], [20], [21], [22], [23], [24], [25], [26], [27], [28]. Erken-Orta Jura yaşlı volkano-tortul istif, bu temel kayaçlarını uyumsuz bir şekilde örterler [29], [30], [31], [32], [33] ve Erken-Geç Jura yaşlı intrüzyonlar [34], [35], [36], [37] tarafından kesilirler. Geç Jura-Erken Kretase dönemi, yoğun bir karbonat çökelimi ile karakterize edilir (Berdiga Formasyonu, [38]. Bu birimler Geç Kretase yaşlı volkanik kayaçlar tarafından uyumlu olarak örtülmüş olup [39], [40], [41], [42], [43], [44], Geç Kretase yaşlı plütonik kayaçlar tarafından kesilmişlerdir [3], [4], [45], [46], [47], [48], [49], [50], [51], [52], [53]. Bölgede Geç Kampaniyenden Maastrihtiyen sonuna kadar devam eden yüksek-K'lu magmatizma gözlenir [54], [55]. [56] ve [57]'ya göre Anatolid-Torid bloklarının çarpışması Geç Paleosen ila Erken Eosen döneminde meydana gelmiştir. Bölgede Erken Eosen yaşlı adakitik kayaçların varlığı [58], [59], [60], [61], [62], [63], yay-kıta çarpışmasının son evresini ifade eder. Doğu Pontidlerde Eosen yaşlı birimler volkanik ve volkanoklastik kayaçlardan, bazik ila orta dereceli piroklastik kayaçlardan, lav akıntılarından ve dayklardan oluşmuş olup [1], [5], [64], [65], [66], [67], aynı yaştaki kalk-alkalen plutonlar tarafından kesilmişlerdir [2], [6], [63], [68], [69], [70], [71], [72], [73], [74]. Bölgede Eosen sonrasında Geç Miyosen-Pleyistosen yaşlı volkanik ve kırıntılı kayaçlar ile Neojen yaşlı volkanik kayaçlar (alkalen karakterli) yaygın olarak gözlenir [1], [56], [64], [75], [76]. Doğu Pontidler'in en yaşlı kayaçlarını Kuvaterner yaşlı traverten, alüvyon ve yamaç molozları oluşturur.

B. *İnceleme Alanının Jeolojisi*

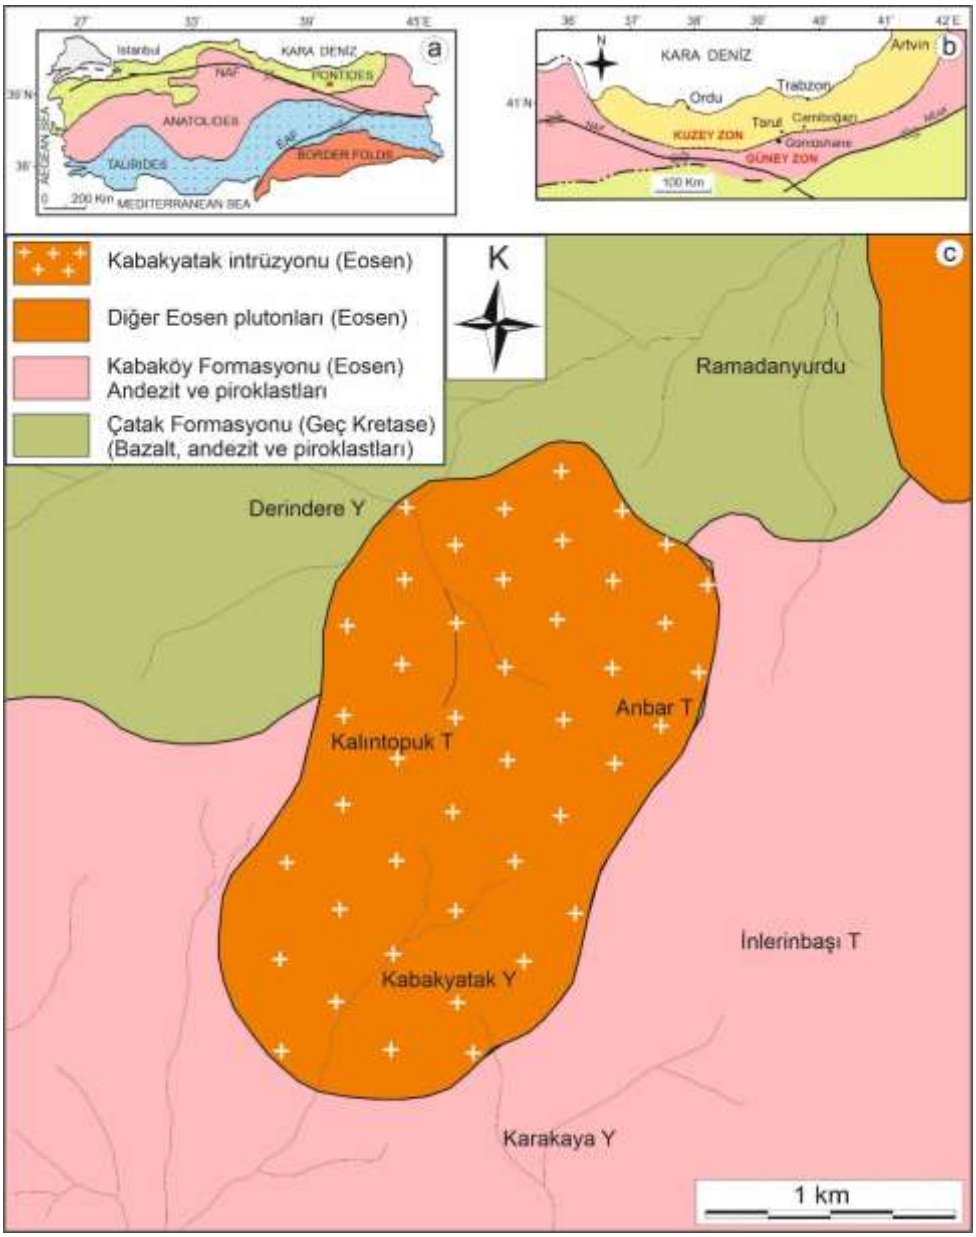
İnceleme alanı Doğu Pontidler'in kuzey zonunda yer alır. Yörede, Geç Kretase ve Eosen yaşlı birimler yüzeylenmektedir (Şekil 1).

Çalışma alanındaki en yaşlı kayaçları bazalt, andezit ve piroklastlardan oluşan Geç Kretase yaşlı Çatak Formasyonu oluşturur. Bu birimler üzerine uyumsuz olarak Eosen yaşlı Kabaköy Formasyonu gelir ve bu formasyon başlıca andezit ve piroklastlarından oluşur. Tüm bu birimler Orta Eosen yaşlı Kabakyatak intruzyonu ve aynı yaşlı diğer plutonlar tarafından kesilmişlerdir.

Kabakyatak intruzyonu yaklaşık elips şekilli olup, uzun ekseni KD-GB istikametinde uzanım göstermektedir (Şekil 1c). İntrüzyon kuzey sınırlarında Geç Kretase yaşlı Çatak Formasyonu ile dokanak

halinde iken, güney kısımlarda Eosen yaşlı Kabaköy Formasyonu ile dokanak oluşturur. Ayrıca, inceleme alanının kuzeydoğusunda Orta Eosen yaşlı plutonik kayaçlar yer alır (Şekil 1c).

Kabakyatak intrüzyonu inceleme alanında başlıca Kabakyatak Yaylası olmak üzere, Kalıntopak Tepe ve Anbar Tepe civarında yayılım gösterir (Şekil 1c). İntrüzyon genelde granodiyorit bileşimli olup, kenar kısımlarda tonalit bileşimlerine de rastlanır. Tonalitler açık gri-pembe renklerde gözlenirken, granodiyoritler ise genellikle gri, açık gri renklerde görülürler. Kayaçlar da gözle görülebilen feldispat, kuvars ve koyu renkli mineralleri yer alır.

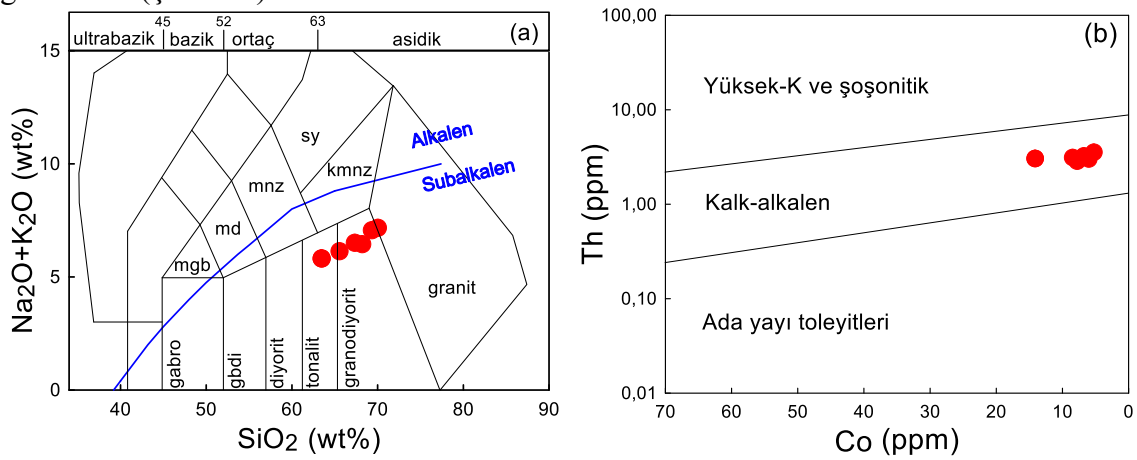


Şekil 1. (a) Türkiye ve çevresinin tektonik yapısı [11]'dan değiştirilerek); (b) Doğu Pontid orojenik kuşağının (EPOB) ana yapıları; (c) İnceleme alanının jeolojik haritası

C. *Tüm Kayaç Jeokimyası*
Ana ve iz elementler

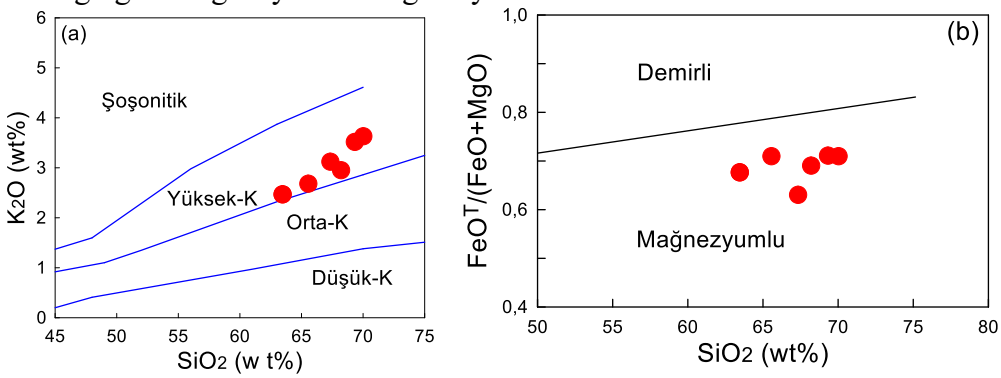
Kabakyatak intruzyonunu oluşturan kayaçlara ait jeokimyasal analiz sonuçları SiO_2'ye karşı (Na_2O+K_2O) diyagramında büyük çoğunlukla granodiyorit alanına, az oranda da tonalit alanına düşerler ve subalkalen

karakter sunarlar (Şekil 2a). Th'a karşı Co diyagramında [77] subalkalen örneklerin tümü kalk-alkalen karakter gösterirler (Şekil 2b).



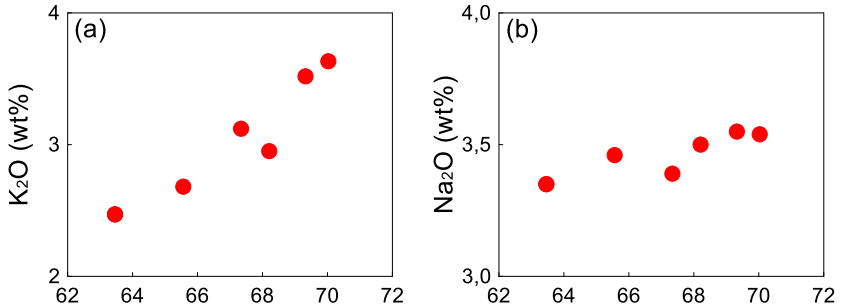
Şekil 2. Kabakyatak intruzyonunu oluşturan kayaçların, (a) SiO_2'ye karşı (Na_2O+K_2O) diyagramı [78], (b) Th'a karşı Co diyagramındaki [77] konumları

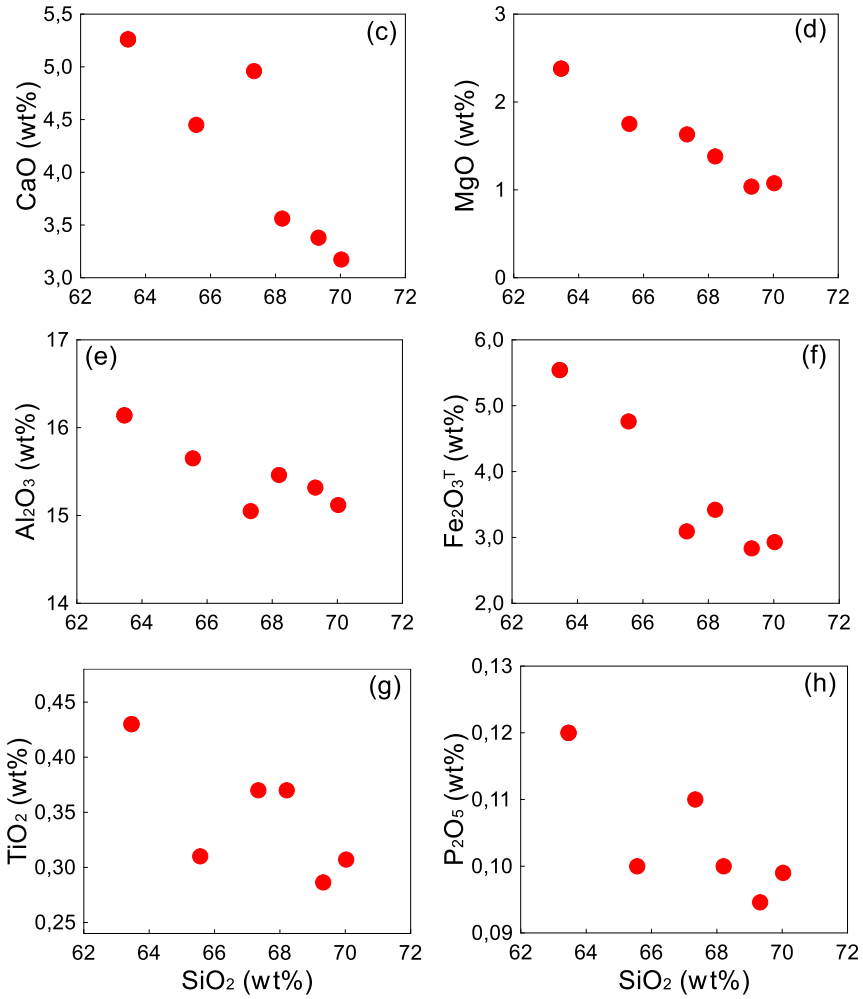
SiO_2'ye karşı K_2O diyagramında tüm örnekler yüksek-K'lu kalk-alkalen karakter sunarlar (Şekil 3a) ve Şekil 3b'de görüldüğü gibi mağnezyumlu bölgede yer alırlar.



Şekil 3. Kabakyatak intruzyonu kayaçlarına ait örneklerin (a) SiO_2'ye karşı K_2O diyagramı [79], (b) $FeO^t/(FeO^t+MgO)$ - SiO_2 (%) diyagramındaki [80] konumları

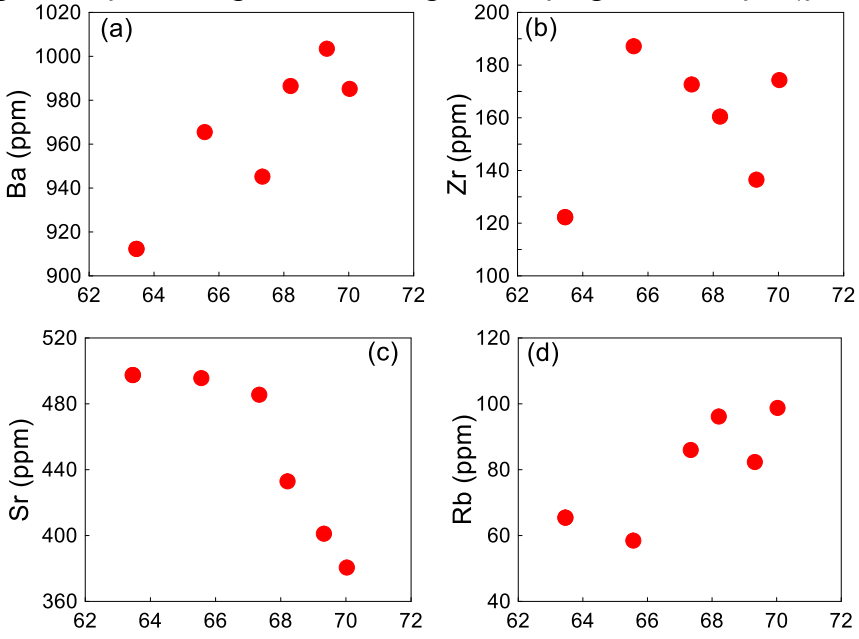
İncelenen örneklerin yer aldığı SiO_2'ye karşı ana elementler değişim diyagramlarında (Şekil 4), örneklerin SiO_2 değerleri ile CaO, MgO, $Fe_2O_5^T$, Al_2O_3, P_2O_5 ve TiO_2 değerleri negatif bir korelasyon gösterirken, K_2O ve Na_2O değerleri pozitif bir ilişki sunarlar.

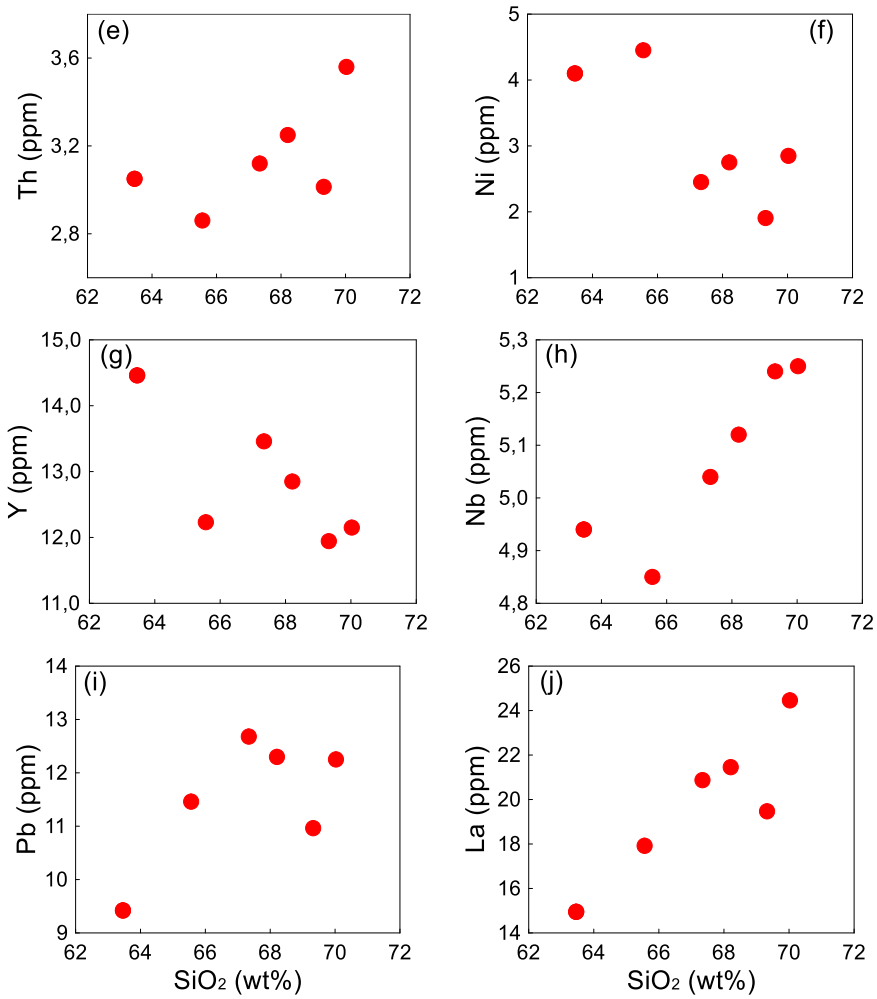




Şekil 4. Kabakyatak intruzyonu kayaçları örneklerinin SiO_2'ye karşı ana element değişimi diyagramları

İncelenen örneklerin yer aldığı SiO_2'ye karşı iz elementler değişim diyagramlarında (Şekil 5), kayaçların SiO_2 değerleri arttıkça Sr, Ni ve Y değerleri negatif bir ilişki gösterirken; Rb, Ba, Th, Nb, Pb ve La değerleri pozitif bir korelasyon göstermiştir. Zr değerleri ise belirgin bir ilişki göstermemiştir (Şekil 5).

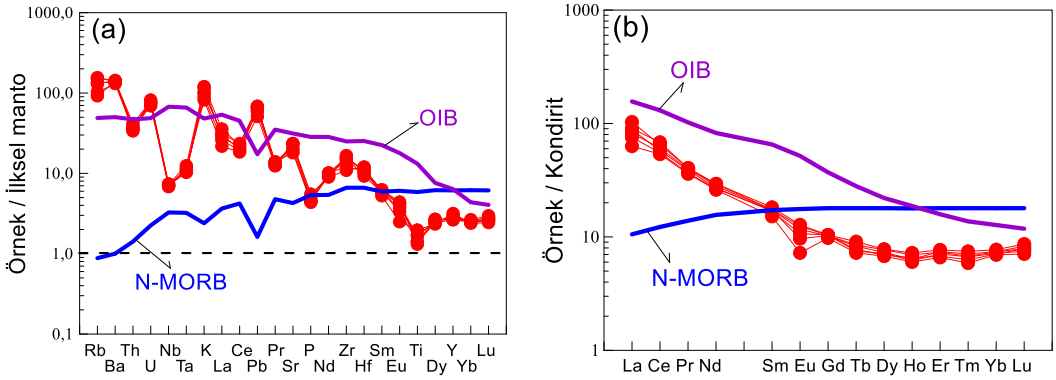




Şekil 5. İncelenen kayaç örneklerin SiO_2'ye karşı iz element değişimi diyagramları

İlksel (primitif) mantoya göre normalleştirilmiş iz element dağılım diyagramları (normalleştirme değerleri [81]'dan alınmıştır) (Şekil 6a), incelenen örneklerde genel bir zenginleşme eğilimini göstermektedir. Bu zenginleşme, Nb, Ta, P ve Ti gibi elementlerde negatif anomaliler ve Pb gibi elementlerde ise pozitif anomali şeklinde kendini göstermektedir.

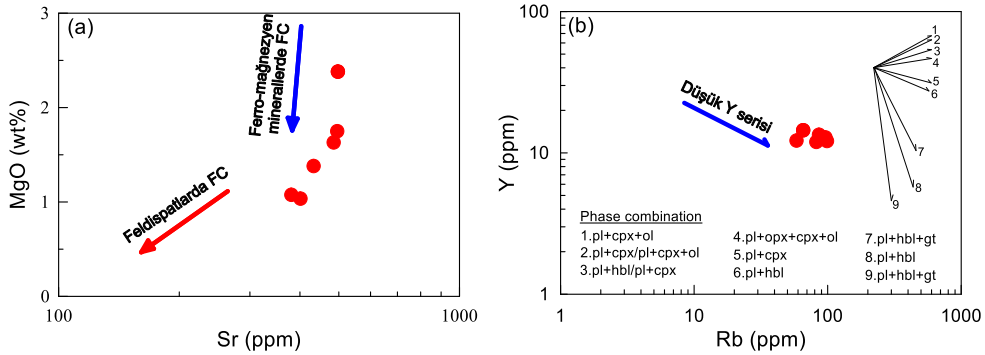
Kondrite göre normalleştirilmiş NTE diyagramları (normalleştirme değerleri (normalleştirme değerleri (Taylor and McLennan, 1985a)'den alınmıştır) (Şekil 6b), örneklerin genel olarak hafif NTE'lerde (LREE) daha belirgin olmak üzere NTE'ler bakımından zenginleştiğini göstermektedir. Bu zenginleşme, kayaçların oluşum ortamında magmatik fraksiyonel kristalleşme süreçlerin sonucudur. LREE'lerde gözlenen zenginleşme, örneklerin magmatik kaynaklı olduğunu ve kayaç oluşum ortamında fraksiyonel kristalleşmeye maruz kaldıklarını göstermektedir. Ağır NTE'lerde (HREE) gözlenen nispeten düz eğilim ise kayaçların ilkel mantodan türemiş magmatik kayaçlarla jeokimyasal benzerlik gösterdiğini işaret etmektedir. Örneklerdeki Eu_N değerleri 1'den küçük olup, negatif Eu_N anamolisi gösterirler (Şekil 6b).



Şekil 6. Kabakyatak intruzyonu örneklerinin normalleştirilmiş dağolımları, (a) ilksel mantoya göre, (b) Kondrite göre

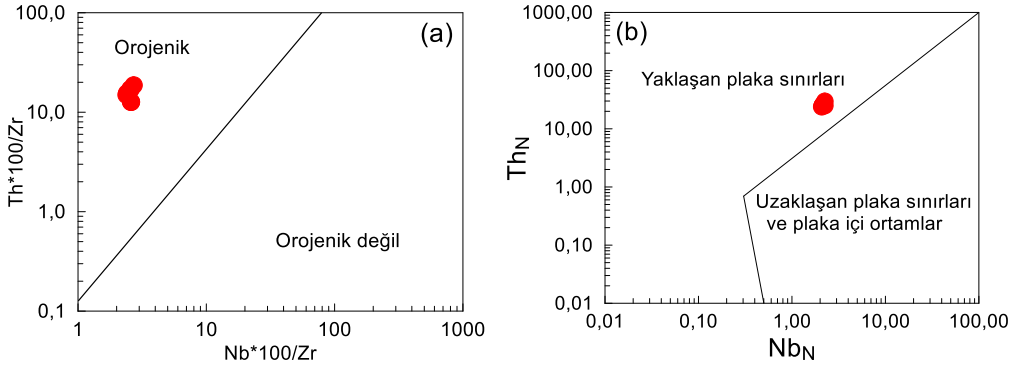
Tektonik konum ve petroloji

Kabakyatak intruzyonuna ait örnekler MgO'ya karşı Sr diyagramında (Şekil 7a) daha ziyade ferromagnezyen minerallerinde gözlenen fraksiyonlaşma trendi gösterirler. Y'a karşı Rb diyagramında tüm örneklerdüşük-Y serisi eğilimine sahip olup, plajiyolas ve hornblend fraksiyonlaşması gösterirler (Şekil 7b).



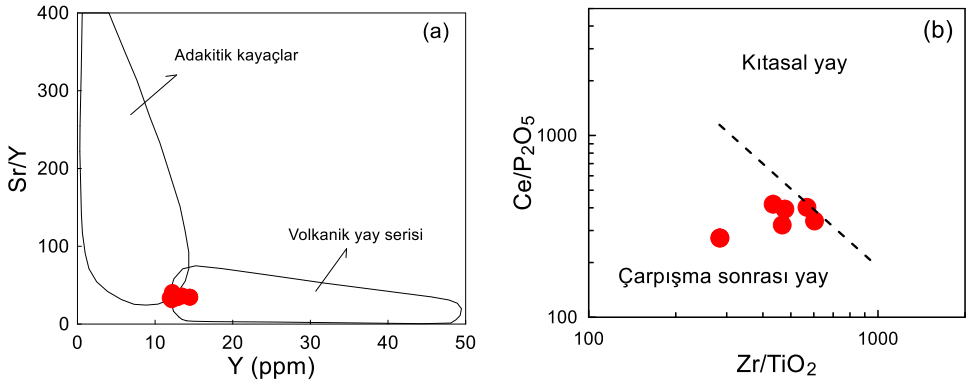
Şekil 7. Kabakyatak intruzyonu kayaçlarına ait örneklerin, (a) MgO-Sr diyagramındaki, (b) Y-Rb diyagramındaki konumları

Th/Zr'a karşı Nb/Zr ve Th_N'e karşı Nb_N diyagramlarında (Şekil 8a ve b), tüm örnekler orojenik alanda yer alırlar.



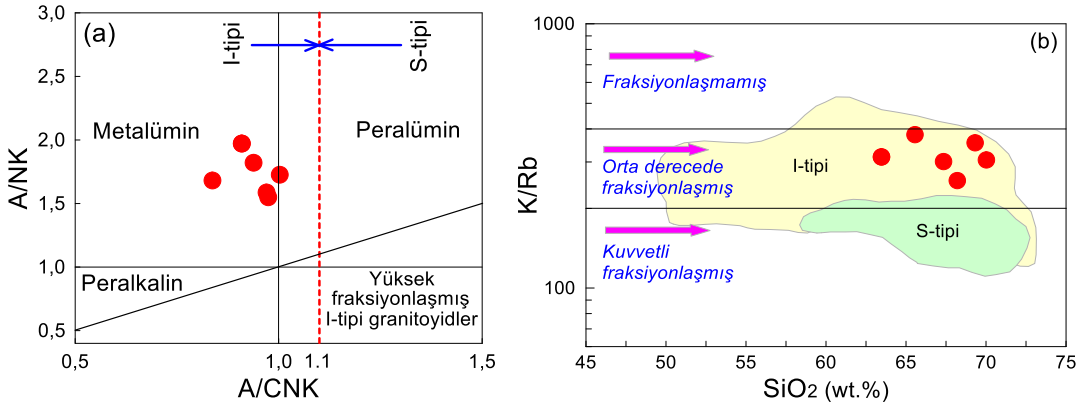
Şekil 8. Kabakyatak intruzyonu kayaçlarına ait örneklerin, (a) Th-Zr diyagramındaki, (b) Th_N-Nb_N diyagramındaki [80] konumları

Örnekler Sr/Y'a karşı Y diyagramında adakitik özellik göstermeyip, volkanik yay serisi alanında bulunurlar (Şekil 9a). Ce/P_2O_5 – Zr/TiO_2 diyagramında (Şekil 9b) ise çarpışma sonrası yay alanında yer alırlar.



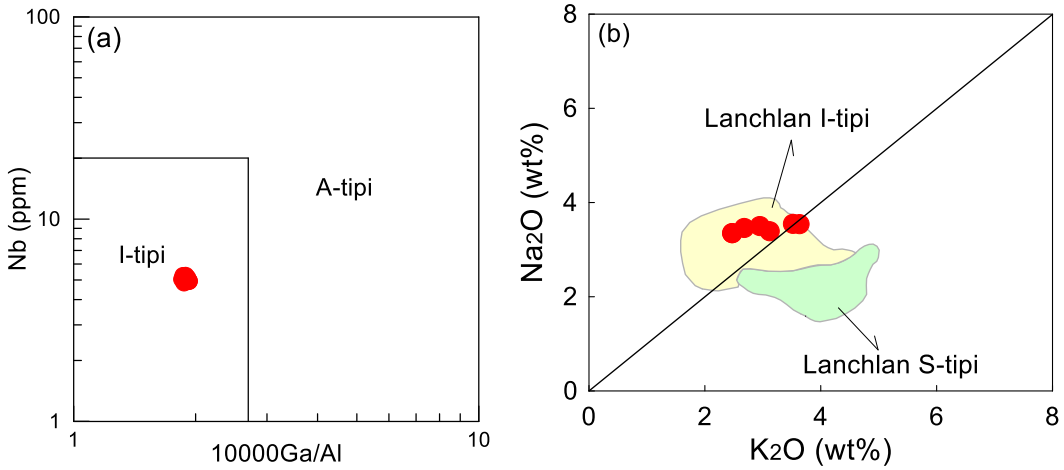
Şekil 9. Kabakyatak intruzyonu kayaçları örneklerinin, (a) Sr/Y'a karşı Y [83], (b) Ce/P_2O_5 - Zr/TiO_2 diyagramındaki konumları

Örneklerin A/CNK (molar olarak $Al_2O_3/(CaO+Na_2O+K_2O)$ içerikleri 1.1'den düşük olup, A/CNK – A/NK diyagramda (Şekil 10a) metalümin karakter gösterirler. SiO_2'ye karşı K/Rb diyagramında, tüm örnekler I-tipi bölgede yer alıp, orta derecede fraksiyonlaşma gösterirler (Şekil 10b).



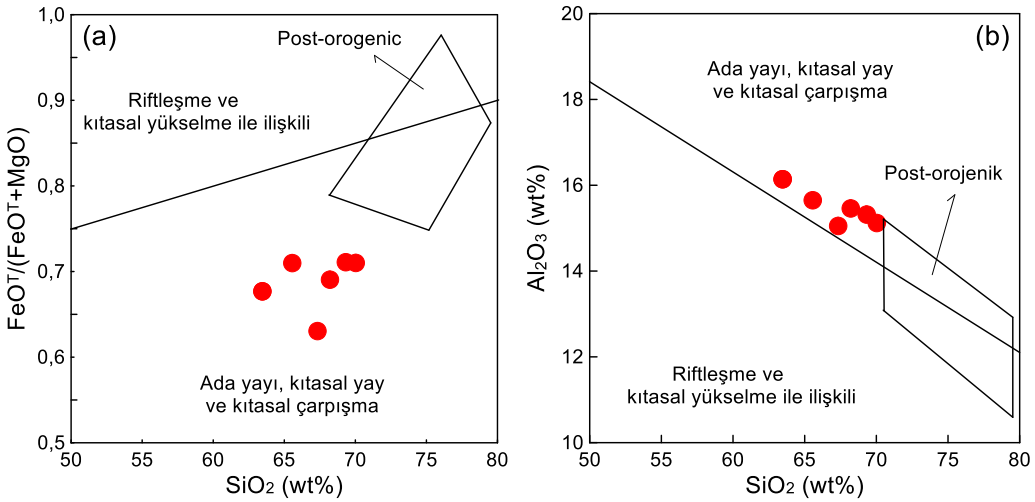
Şekil 10. Kabakyatak intruzyonu kayaçlarına ait örneklerin, (a) molar A/NK'ya karşı molar A/CNK diyagramındaki [84], (b) SiO_2'ye karşı K/Rb diyagramındaki konumları

Örneklerdeki I-tipi karakter Nb'ye karşı Ga/Al diyagramında (Şekil 11a) da gözlenmekte olup, Na_2O – K_2O diyagramında Lanchlan I-tipi granit alanında yer alırlar (Şekil 11b).



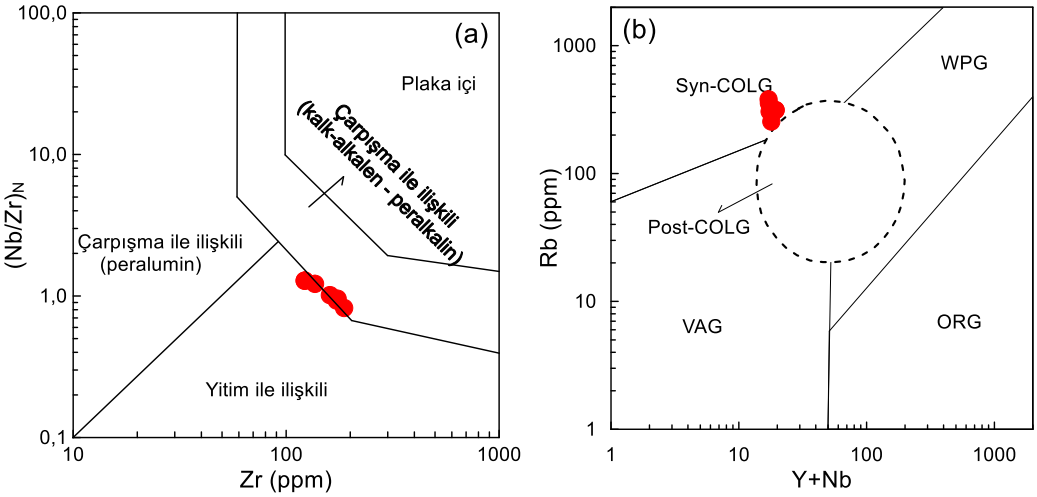
Şekil 11. Kabakyatak intruzyonu kayaçlarına ait örneklerin, (a) Nb'ye karşı 10000Ga/Al [85], (b) Na_2O-K_2O (%) [86] diyagramlarındaki konumları

İncelenen örnekler genelde çarpışma ile ilişkili bölgede yer alırlar (Şekil 12 a ve b).



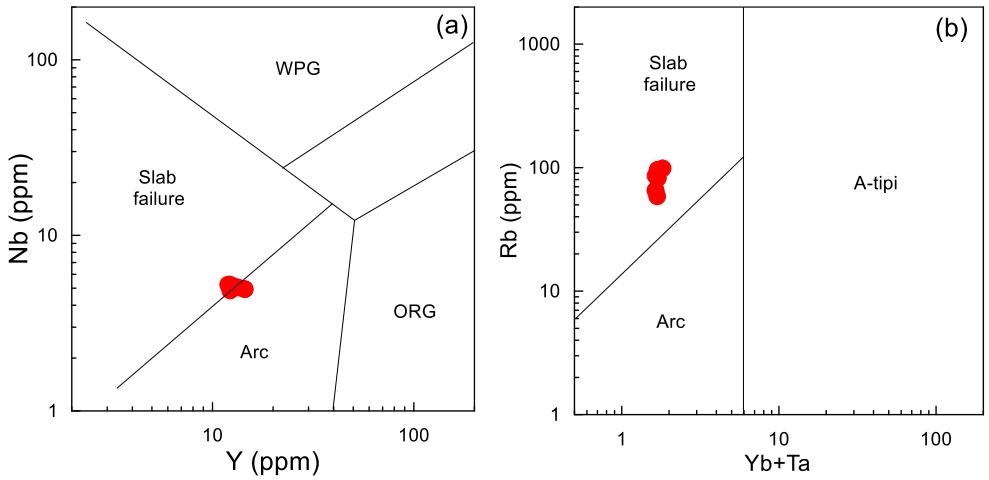
Şekil 12. Kabakyatak intruzyonu kayaçlarına ait örneklerin, (a) $FeO^T/(FeO^T+MgO)$, (b) Al_2O_3 – SiO_2 diyagramlarındaki konumları

Nb/Zr'a karşı Zr ile Rb'a karşı (Y+Nb) diyagramlarında (Şekil 13 a ve b), tüm örnekler çarpışma ve çarpışma sonrası alanlarda yer alırlar.



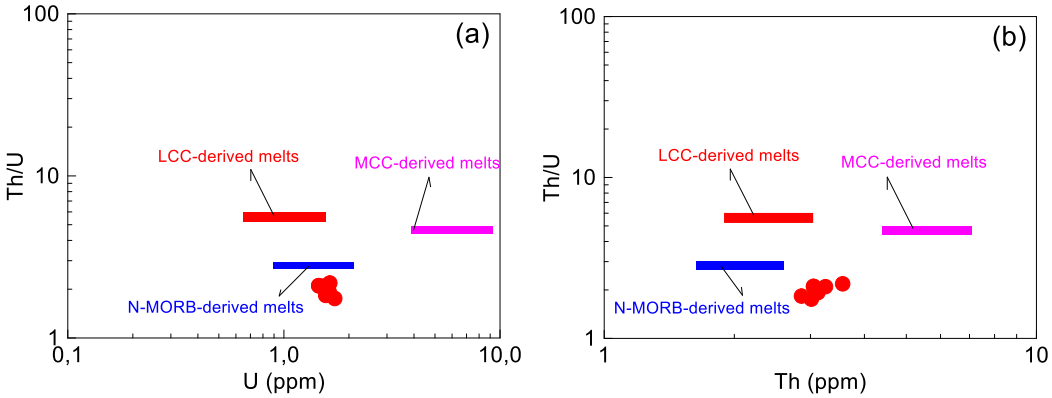
Şekil 13. Kabakyatak intruzyonu kayaçlarına ait örneklerin, (a) $(Nb/Zr)_N$ – Zr [87], (b) Rb – (Y+Nb) diyagramındaki [88] konumları

İncelenen örnekler Nb – Y diyagramında (Şekil 14a) slab ve yay (arc) dokanağında yer alırken, Rb – (Yb+Ta) diyagramında (Şekil 14b) yay değil de slab alanında yer alırlar.



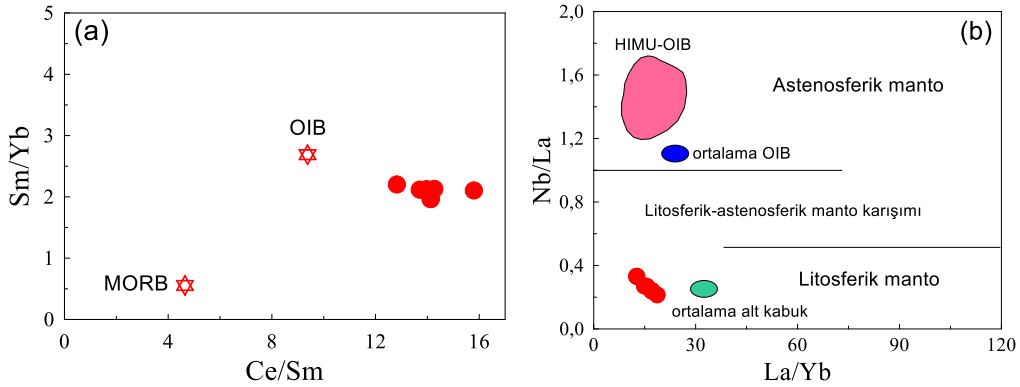
Şekil 14. Kabakyatak intruzyonu kayaçlarına ait örneklerin, (a) Nb – Y [88], (b) Rb – (Yb+Ta) [88] diyagramları

İncelenen örnekler Th/U – U ve Th/U - Th (Şekil 15a ve b) kabuktan ziyade, MORB alanlarında yer alırlar.



Şekil 15. Kabakyatak intruzyonu kayaçlarına ait örneklerin, (a) Th/U'a karşı U, (b) Th/U'a karşı Th diyagramları. LCC ve MCC değerleri [89]'den, MORB değerleri [90]'den alınmıştır

İncelenen örnekler Sm/Yb – Ce/Sm diyagramında (Şekil 16a) zenginleşmiş bölgede yer alırlar. Nb/La – La/Yb diyagramında (Şekil 16b) düşük Nb/La oranları ile litosferik manto bölgesinde yer alırlar.



Şekil 16. Kabakyatak intruzyonu kayaçlarına ait örneklerin, (a) Sm/Yb – Ce/Sm, (b) Nb/La – La/Yb diyagramlarındaki konumları. (a) MORB ve OIB değerleri [91]'den, (b) Litosferik manto, astenosferik manto ve karışım cizgi değerleri [92], HIMU-OIB alan değerleri [93]'den alınmıştır.

IV. SONUÇLAR

1. Çalışma alanında başlıca Geç Kretase yaşlı Çatak Formasyonu, Eosen yaşlı Kabaköy Formasyonu ve bu formasyonları kesen Orta Eosen yaşlı plutonik kayaçlar yer alır.

2. İncelenen Kabakyatak intruzyonuna ait kayaçlar yaygın olarak granodiyorit, az oranda da tonalit bileşimindedir. Tonalitler intrüzyonun kenar kısımlarında yer alırlar.

3. Kabakyatak intruzyonuna ait kayaçlar, jeokimyasal analizler ışığında genel olarak I-tipi, yüksek-K'lu kalk-alkalen ve metalümin özellik göstermektedir.

4. Tektonik yerleşim diyagramlarına yapılan analizler sonucunda, Kabakyatak intruzyonuna ait kayaçların çarpışma ile ilişkili jeokimyasal ve petrolojik özellikleri gösterdiği belirlenmiştir.

5. Kabakyatak intruzyonuna ait kayaçların jeokimyasal analizleri, kayaçların köken magmasının zenginleşmiş bir litosferik manto kaynağı olabileceğini göstermektedir

.

Özet – Bu çalışmanın amacı, mevcut jeokimyasal verilerin jeoistatistiksel yaklaşımlarla değerlendirilerek farklı kayaçların birbirleriyle kökensel ilişkisinin irdelenmesi/tanımlanmaya çalışılmasıdır. Bu amaçla Doğu Pontidlerin Kuzey zonunda yüzlek veren Derinoba ve Kayabidi (GB Trabzon, Türkiye) granitlerinin tüm kayaç analiz sonuçları değişik istatistiksel yaklaşımlarla değerlendirilmiştir. Çalışma için Derinoba granitine ait 15 ve Kayadibi granitine ait 5 adet tüm kayaç analizi işleme tabi tutulmuştur. İncelemeye konu veri setinin elaman sayısı (özellikle Kayadibi graniti) sınırlı sayıda olduğu için analizlerde parametrik olmayan istatistiksel yöntemlerin tercih edilmiştir. Çalışma kapsamında iki granit kütlesinin tanımlayıcı istatistik parametreleri hesap edilmiştir. Böylelikle jeokimyasal verilerin merkezi dağılım parametreleri belirlenmiş ve veri setinin genel karakteri anlaşılmaya çalışılmıştır. Bu çalışma akabinde ise ilgili veri setlerine Mann Whitney U testi uygulanmış ve bu iki granit kütlesinin birbirleri ile kökensel ilişkileri irdelenmiştir. Çalışma sonucunda Derinoba ve Kayadibi granitlerinin SiO_2, Gd, Tm, Er, Rb/Sr, La_{CN}/Lu_{CN}, La_{CN}/Yb_{CN}, ASI parametrelerince sig. %1 ve/veya %1-3 aralığında aynı kökensel kaynağı sahip temsil ettiği, SiO_2 dışındaki diğer ana oksitlerce ve Sr, Ta, Nb, Hf, Zr, U, Ga, La, Ce, Pr, Nd, Sm, Eu, Tb, Dy, ve Ho elementlerince ise %95 (1-sig.) güven aralığında aynı/benzer kökene sahip olduğu görülmüştür. Elde edilen sonuçlar bahse konu granitlerin kökeni yönelik yapılan konvansiyel çalışma sonuçları teyit etmiştir.

Anahtar Kelimeler – Doğu Pontidler, Tanımlayıcı İstatistik, Mann Whitney U testi, Derinoba graniti, Kayabidi granati, Trabzon, Türkiye

I. GİRİŞ

İstatistiksel yaklaşımlar yerbilimlerinde özellikle de maden aramaya yönelik jeokimya çalışmalarında 1900'lerin başlarından beri önemli yer tutmaya başlamıştır. Bu çalışmaların yaygınlığı ile birlikte de jeoistatistik kavramı literatürde önemli yer bulmuştur. Günümüzde de başta maden yatakları ve jeokimya anabilim dalı almak üzere bir çok yerbilimci istatistiksel prensiplerden yararlanmaktadır [1], [2], [3], [4], [5]. Jeolojik amaçlı çalışmalarda elde edilen birçok sayısal verinin toplu olarak değerlendirilmesinde ve çıkarımlar yapılmasında başta tanımlayıcı istatistik olmak üzere, t-testi (bağımsız tek örnek t-testi, bağımsız iki örnek t-testi, bağımlı iki örnek t-testi), varyasyon (ANOVA) analizleri ve faktör analizleri kullanılmaktadır. Özellikle t-testi ve ANOVA testi, duruma göre de bunların nonparametrik eşlenikleri petrolojik çalışmalarda kayaçların kökensel benzerliklerinin karşılaştırılmasında kullanıma uygun jeoistatistiksel yöntemlerdir.

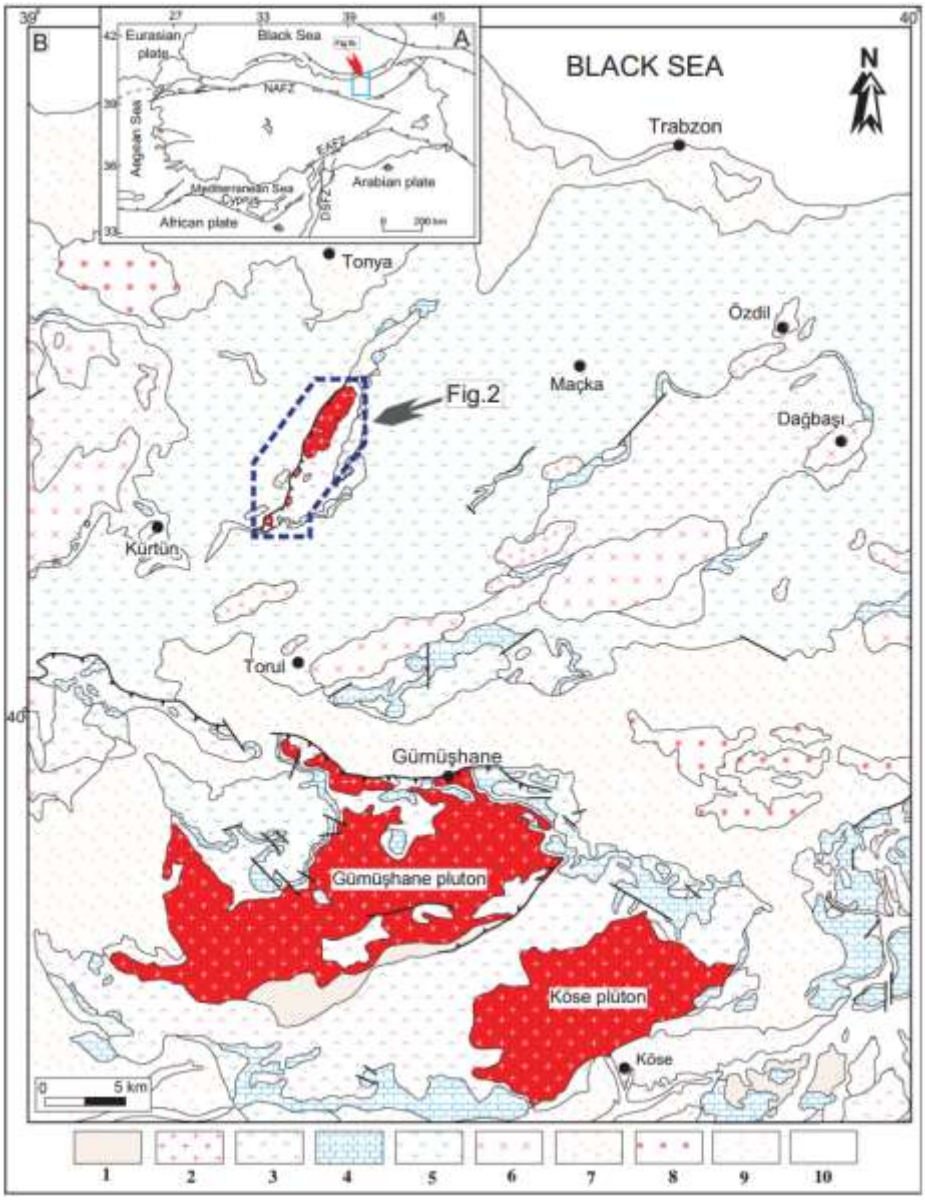
Pontid tektonik birliği bölgesel ölçekte pek çok magmatik kayacı içerir [6], (Şekil 1A). Bunların çoğunluğu Avrasya-Gondwana kıtalarının yaklaşan/çarpışan sınırları ile ilişkili kayaçlardır. Bölgenin

zengin jeolojik özellikleri ve ilişkili maden yatakları potansiyeli araştırmacıların dikkatini çekmiş ve yerbilimleri bağlamında geçmişten günümüze birçok çalışma gerçekleştirilmiştir [7], [8], [9], [10], [11], [12], [13], [14], [15], [16], [17], [18], [19]. Bölgedeki magmatik kayaçlar geniş bir yaş aralığına sahip olup [20], [21], [22], [23], [24], [25], [26], [27], benzer yaşta ve kökene sahip, farklı lokasyonlarda da irili ufaklı bir çok magmatik kütle de yapılan çalışmalarla ortaya konmuştur [28], [29], [30], [31]. Bölge kayaçlarının bileşimi düşük-K, yüksek-K kalk-alkalin metalümina-peralümina granitoyidlerden alkalin siyenitlere kadar değişim göstermektedir (Yılmaz and Boztuğ, 1996; Kaygusuz et al., 2008, 2010, 2016, 2024). Bölgedeki Paleozoyik temel kayaçlarının büyük çoğunluğu granitoyidlerdir. Bunların birbirleriyle kökensel ve yaş ilişkilerine yönelik çalışmalar özellikle son zamanlarda yoğunluk kazanmaya başlamıştır. Değişik jeolojik-jeokimyasal ve izotop (duraylı-radyojenik) çalışmalarıyla bu ilişkiler ortaya konulmaya çalışılmıştır. Bu ilişkilerin sayısal verilerinin jeoistatistiksel irdelenmesine ise genellikle yapılan çalışmalarda çok yer verilmemiştir. Bu çalışmada jeokimyasal verilerin jeoistatistiksel yaklaşımla değerlendirilmesi ve böylelikle kayaçların kökensel ilişkilerinin jeoistatistiksel değerlendirilmesinin yapılması amaçlanmıştır. Örnek çalışma olarak Kaygusuz vd. [28] tarafından Derinoba ve Kayadibi granitlerinin jeokimyasal parametreleri kullanılmıştır. Verilerin genel değerlendirilmesi tanımlayıcı istatistik parametreleri ile gerçekleştirilmiş olup, verilerin azlığı dikkate alınarak jeoistatistiksel yöntem olarak da Mann Whitney U testi kullanılarak kökensel değerlendirme yapılmaya çalışılmıştır.

II. BÖLGESEL JEOLOJİ

Doğu Pontidler yapısal ve litolojik özellikleri de dikkate alınarak, genel manada kuzey ve güney zon olarak bölümlenmiştir [34], [35]. Güney zonda ağırlıklı olarak Paleozoyik'ten Neojen'e kadar volkanik, plütonik, sedimanter ve metamorfik kayalar yer alırken, kuzey zonda ise Karbonifer'den Neojen'e kadar volkanik (yer yer tortul ara katkılı) ve plütonik kayalar baskın durumdadır (Şekil 1 A) [17], [36], [37], [38], [39], [40], [41], [42].

Doğu Pontidler'de temel kayaları Variskan öncesi şistler ve gnayslar [43] ile bunları kesen Silüriyen-Devoniyen yaşlı metagranitler ve Orta-Geç Karbonifer yaşlı plutonlar oluşturur [21], [28], [44], [45], [46], [47], [48], [49], [50]. Bu temel kayaçlar Erken-Orta Jura yaşlı volkano-tortul istif tarafından uyumsuz olarak örtülürler [51], [52], [53], [54], [55] ve Erken-Geç Jura yaşlı intrüzyonlar [56], [57], [58], [59] tarafından kesilirler. Geç Jura-Erken Kretase aralığında yoğun bir karbonat çökelimi yer alır (Berdiga Formasyonu, [60]). Bu birimler Geç Kretase yaşlı volkanik kayaçlar tarafından uyumlu olarak örtülürler [29], [31], [61], [62] ve Geç Kretase yaşlı plütonik kayaçlar tarafından kesilirler [26], [63], [64], [65], [66], [67], [68]. Bölgede Geç Kampaniyenden Maastrihtiyen sonuna kadar devam eden yüksek-K'lu magmatizma yer alır [69]. Anatolid-Torid bloklarının çarpışması Geç Paleosen ila Erken Eosen döneminde meydana gelmiştir [70], [71]. Bölgede Erken Eosen yaşlı adakitik kayaçların varlığı [72], [73], [74], [75], [76], [77], yay-kıta çarpışmasının son evresini ifade eder. Doğu Pontidlerde Eosen yaşlı birimler volkanik, volkanoklastik, piroklastik, lav akıntıları ve dayklardan oluşmuş olup [15], [78], [79], [80], [81], [82], aynı yaştaki kalk-alkalen plutonlar tarafından kesilmişlerdir [39], [83], [84], [85], [86], [87], [88], [89], [90], [91], [92]. Bölgede Geç Miyosen-Pleyistosen yaşlı volkanik ve kırıntılı kayaçlar ile Neojen yaşlı alkalen volkanik kayaçlar yaygın olarak gözlenir [16], [35], [80], [93]. Bölgenin en genç birimleri Kuvaterner yaşlı yamaç molozu, traverten ve alüvyonlardır [94], [95]..



Şekil 1. A. Türkiye ve yakın çevresinin tektonik haritası [33]'den değiştirilmiştir. B. Plütonik ve volkanik kayaçların dağılım. (1) Palezoyik metamorfik kayaçlar, (2) Paleozoyik plutonlar, (3) Liyas-Dogger volkanik kayaçlar, (4) Malm-Alt Kretase sedimanter kayaçlar, (5) Üst Kretase volkanik kayaçlar, (6) Üst Kretase plutonlar, (7) Paleojen-Neojen kalkalkalin volkanik kayaçlar (8) Paleojen-Neojen alkalin volkanik kayaçlar, (9) Eosen plutonlar, (10) Alüvyon, NAFZ: Kuzey Anadolu Fay Zonu, EAFZ:Doğu Anadolu Fay Zonu Haritanın orjinali için bakınız: , [28].

III. JEOİSTATİSTİKSEL DEĞERLENDİRME

Bu çalışmada toplamda 20 örneğe ait jeokimyasal veriler değerlendirmeye alınmıştır. Örneklerden 15 tanesi Derinoba granitine ait olup, 5 tanesi ise Kayadibi granitine ait aittir. Verilerle ilgili detaylı bilgiler Kaygusuz vd. [28]'da görülebilir. Tanımlayıcı istatistiksel yaklaşımlar bilimsel araştırmalardaki verilerin toplu olarak değerlendirilmesindeki güçlükleri aşmada yaygın olarak kullanılmaktadır. Örneğin verilerin ortalamaları, ortalama etrafındaki dağılım karakterleri, ortalamadan sapmaları verilerin değerlendirilmesini anlamlı hale getirmektedir. Tanımlayıcı istatistik kategorisinde ortalama, medyan, mod değerleri, standart sapma ve varyans gibi parametreler yer almaktadır. Tüm bu veriler değerlendirilirken bir diğer önemli kavram ise istatistiksel önem, anlamlılık düzeyi veya olasılık kavramıdır. Bu kavram genel olarak P ile gösterilir. $P \leq 0.05$ veya $P > 0.05$ gibi ifadelerle önem seviyeleri ile ilgili bilgi verilir. P değeri %95 güven aralığını temsil eder ve genel olarak istatistiksel değerlendirmelerde "sig." olarak ifade edilir. Bu çalışmada

daha çok ortalama (mean), standard sapma (Std.Deviation), standard hata (Std. Error Mean) parametreleri dikkate alınarak değerlendirme yapılmıştır.

Mann Whitney U testi bağımsız iki örnek t-testinin parametrik olmayan alternatifidir. Bağımsız iki örnek t-testinden farkı ise bu yöntemde grupların ortalama değerleri yerine medyan değerlerinin karşılaştırılmasına dayanır. Bizim verilerimizin istatistiki olarak az sayıda olması nedeniyle bu test yöntemi tercih edilmiştir [96].

IV. BULGULAR

A. Arazi gözlemleri ve petrografik özellikler

Sahada 4 ayrı granit kütlesi mevcut olup (Derinoba, Kayadibi, Şahmelik ve Kızılağaç), bu çalışmada Derionaba ve Kayadibi granitleri değerlendirmeye alınmıştır. Çalışmaya konu intrüzyonlar yaklaşık KD-GB yönelimli kütlelerdir ve bölgede yüksek kodları temsil etmektedirler. Bu kayaçlar genellikle Jura öncesi volkanik ve piroklastiklerle sınırlandırılmıştır.

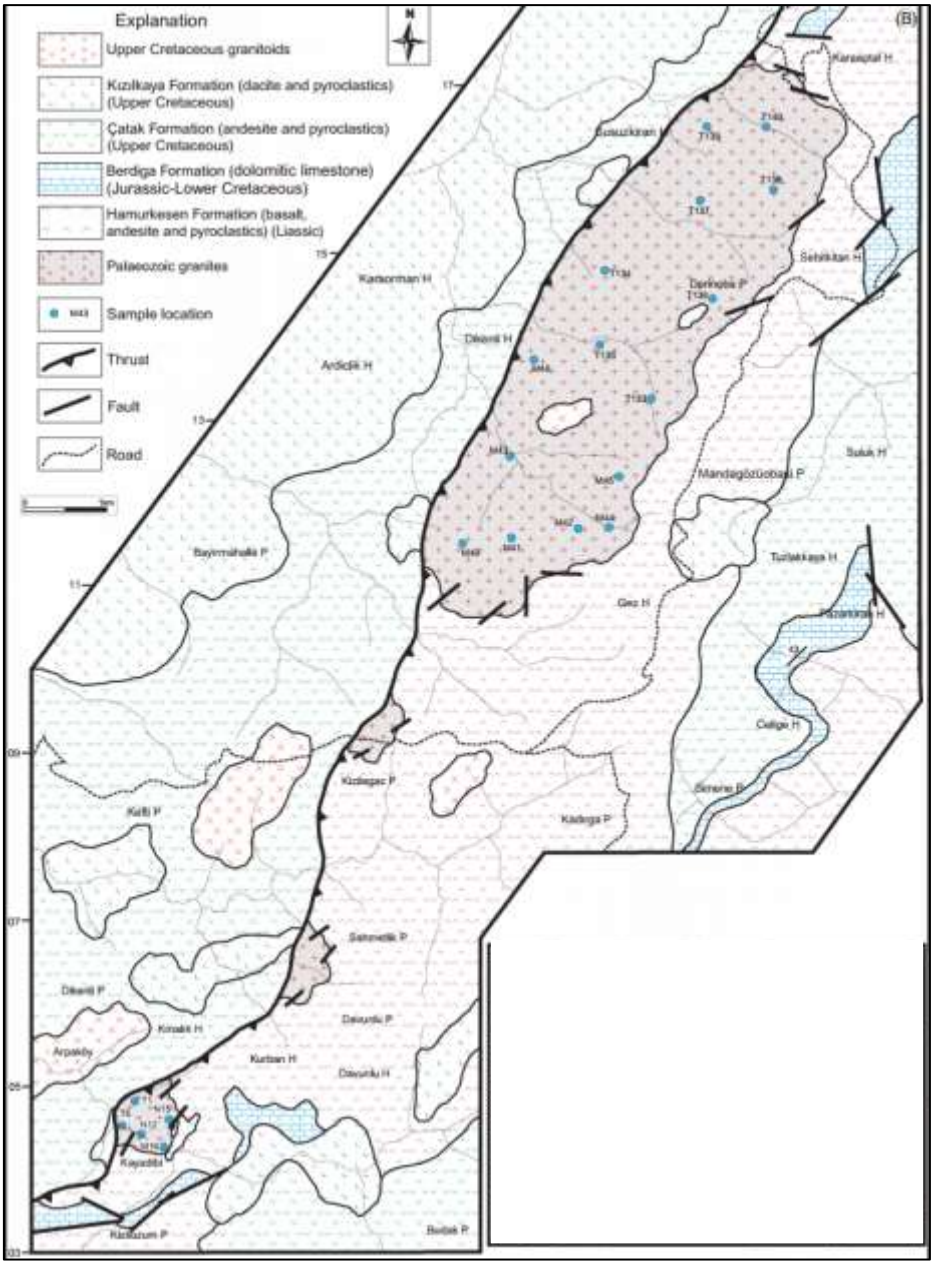
Derinoba graniti Trabzon'un 65 km güneybatısında yer almaktadır. Derinoba graniti yoğun alterasyon ve günlenmeye maruz kalmıştır. Kayabidi graniti ise elipsoid şeklinde daha küçük kütle şeklinde olup, 1 km^2'lik bir alanda yüzeylenmektedir ve Derinoba granitinin güney batısında yüzeyleme vermektedir (Şekil 2).

Granitlerin genel karakteri orta-kaba taneli monzogranit karakterindedir. Mineralojik olarak eş taneli K-feldispat, kuvars, plajiyoklas, biyotit minerallerinden oluşmaktadır. Aksesuar olarak ise zirkon, apatit, allanit, manyetit mineralleri rapor edilmiştir. Alterasyon ürünü mineraller ise serizit, klorit, epidot, kil mineralleri, karbonatlar ve beyaz mika mineralleridir.

B. Jeoistatistiksel Değerlendirmeler

Derinoba ve Kayadibi granitlerinin tanımlayıcı istatistikleri Tablo 1'de verilmiştir. Tanımlayıcı istatistik değerleri incelendiğinde ana oksitlerin ortalama (Mean) değerlerinin birbirine yakınlığı dikkat çekicidir. Standart sapma değerlerinin düşüklüğü verilerin normal dağılımına işaret etmekle birlikte aradaki farkların (sig. 0.05) kayaçların benzerliğinin (dolayısıyla kökensel ilişkisinin yakınlığı bağlamında) daha detaylı test edilmesi gerekliliğini doğurmaktadır.

Kökensel değerlendirmelerde dikkate alınan parametreler için benzerliğin tespit edilmesi amacıyla Mann Whitney U Testi dikkate alınmıştır (Tablo 2 ve 3). Verilerin Rank değerlerinin düşük olanları ilgili parametre için de elde edilen sonuçların düşük olduğuna işaret eder. Örneğin SiO_2 için Kayadibi granitinin değerinin düşük olduğu, TiO_2 için ise Derinoba granitinin ilgili değerinin düşük olduğu ifade edilir.



Şekil 2. Çalışma sahası jeolojik haritası ve örnek alım yerleri [28]'den alınmıştır.

Tablo 1. Derinoba ve Kayadibi granitlerinin bazı parametrelerine ait tanımlayıcı jeoistatistik parametreleri (kayaçlar için ortalamaların belirlenmesinde ortalama+standard hata değerlerinin dikkate alınmalıdır, tabloda ilgili bölümler koyu işaretlenmiştir)

Mann Whitney U test istatistikleri için ise Asymp. Sig değeri dikkate alınır. Şayet sig. değeri <0.05 ise granitik kayaç için ilgili parametreler açısından %5 önemlilik değerinde farklılığın olduğu ifade edilir. Bu değer %5'ten büyük ise ilgili parametreler için iki kayaç grubu arasında (%95 olasılıkla) anlamlı bir farkın olmadığı belirtiler. Sig. değerinin 0.01 değeri için ise benzer durum bu değerin küçüklüğüne göre %1 önemlilik düzeyinde incelenen kayaç grupları için ilgili parametre bağlamında bir farklılığın olduğu şeklinde yorumlanır. %1-%5 aralığında ise %99 olasılıkla kayaçların ilgili parametreler için benzer kökene sahip olduğu ifade edilir.

Bu açıklamalar ışığında Derinoba ve Kayadibi granitleri değerlendirldiğinde; Y, Th, Yb ve Lu elementlerince granitlerin farklılığa sahip olduğu gözlenmiştir (Sig. <0.01). SiO_2, Gd, Tm, Rb/Sr parametrelerine göre %1 önemlilik değerinde (%99 güven aralığında) Derinoba ve Kayadibi granitlerinin benzer kökene sahip olduğu tespit edilmiştir. Benzer bulgular Er, La_{CN}/Lu_{CN}, La_{CN}/Yb_{CN}, ASI parametreleri için de söz konusu olup, ortak kaynağa işaret etmektedir. Bunun dışındaki incelenen diğer parametreler de %95 güven aralığında Derinoba ve Kayadibi granitleri için ortak kaynağa işaret etmektedir. Dolayısıyla kayaçların kökensel ortaklığı jeoistatistiksel olarak da tespit edilmiş olup, Kaygusuz vd. [28] bulguları jeoistatistiksel olarak da teyid edilmiştir.

V. SONUÇLAR

Bu çalışma kapsamında, Doğu Pontidlerin kuzey zonunda yeralan Derinoba ve Kayadibi granitlerinin (GB Trabzon, Türkiye) belli başlı jeokimyasal parametreleri jeoistatistiksel yaklaşım ve yöntemlerle incelenmiş ve kökensel olarak ilişkisi ortaya konmaya çalışılmıştır. Çalışılan granitler birbirine komşu olup, Derinoba graniti Trabzon'nun 65 km güney batısında yeralmakta, aynı istikamette ve devamında ise Kayadibi granit yüzeylenmektedir. Bu çalışmada granitlerin belli başlı jeokimyasal parametrelerinin tanımlayıcı istatistik parametreleri yardımıyla genel karakterleri ve aralıkları tespit edilmiştir. Akabinde ise Mann Witney U testi ile Derinoba ve Kayadibi granitlerinin kökensel benzerliği istatiksel olarak irdelenmiştir. Yapılan çalışma sonucunda Derinoba ve Kayadibi granitlerinin SiO_2 içeriklerinin >%70, TiO_2 içeriklerinin >%0.1, Al_2O_3 içeriklerinin >%12, $Fe_2O_3^T$ içeriğinin >%1.40, toplam alkali içeriklerinin >%6, olduğu tespit edilmiştir. La_{CN}/Lu_{CN}, La_{CN}/Sm_{CN}, Gd_{CN}/Lu_{CN}, La_{CN}/Yb_{CN}, Eu_{CN}/Eu^*, Mg# ve ASI değerlerinin ise sırasıyla, >5, >3, >1, >4, >1, >0.3, >20 ve >1 olduğu tespit edilmiştir. Derinoba ve Kayadibi granitlerinin kökensel olarak ilişkili olup olmadıkları jeoistatistiksel olarak Mann Whitney U Testi ile irdelendiğinde; Y, Th, Yb ve Lu elementlerince granitlerin aynı kökensel kaynağı sahip olduğu belirlenememiştir. SiO_2, Gd, Tm, Rb/Sr, Er, La_{CN}/Lu_{CN}, La_{CN}/Yb_{CN}, ASI parametreleri açısından aynı kökensel kaynağa sahip olduğu (sig. %1 ve/veya sig. %1 -%5 aralığında), söylenebilir. Derinoba ve Kayadibi kayaçları bunun dışındaki diğer incelenen parametreler açısından ise %95 güven aralığında kayna kökensel kaynağa sahip oldukları tespit edilmiştir. Jeoistatistiksel olarak ulaşılan bu sonuçlar Kaygusuz vd. [28]tarafından ulaşılan sonuçları teyid etmiştir.

Abstract **–** This study shows analytical data regarding the physical-chemical parameters and organic pollutant levels in water samples of Fierza Lake which is the largest artificial lake in Albania. It is formed by the flows of White Drin River (Peja, Kosovo) and Black Drin River (Lake Ohrid, Struga, North Macedonia) which join together near Kuksi city, North-East Albania. This transboundary ecosystem has a large water basin area that lies in Kosovo, North Macedonia and Albania and for that, this waterbody could be affected by the pollution from the human activities. Water samples from Fierza Lake were taken in May 2024 at 10 different stations. The physical-chemical parameters that were determined in the water samples from this station were: temperature, pH, DO, BOD_5, COD, conductivity, turbidity, TDS, TSS, Nutrients (nitrates, nitrites, ammonium ions, N-total, phosphates, P-Total), the main ions (sulfates, chlorides, calcium and magnesium ions). Organochlorine pesticides, PCB, PAH and BTEX were organic pollutants that were also evaluated in this lake. Water quality in Fierza Lake for this study period can be classified from moderately good to good. This fact was supported by presence of organic pollutants almost in all analyzed samples. This could be related with intense human activity in its water basin. Urban pollution, agricultural activity and transport are the main sources that cause the decrease of water quality in this ecosystem. The physical-chemical parameters and organic pollutant should be analyzed continuously from respective institutions in order to have a complete assessment of the environmental problems in the lake.

Keywords – Water quality, Water analyzes, Physical-Chemical parameters, Organic pollutants, Fierza Lake

I. INTRODUCTION

Fierza Lake is the largest artificial lake in our country. It was built to generate electricity. The Fierze Dam on the Drin River has a length of 70 kilometers and a maximum area of 7,000 hectares, of which 5,000 hectares are used for raising and cultivating fish. This lake has a height of 167 meters, a water surface area of 72.5 km², a maximum depth of 128 meters, and a volume of 2.7 billion cubic meters of water. The total area of the watershed is 11,829 km² [1, 2]. Fierza Lake is formed by the River Drin, one of the largest rivers in our country. It is formed near the city of Kukës by the confluence of its two main branches: The White Drin River (*alban*. Drini i Bardh) and the Black Drin River (*alban*. Drini i Zi).

The White Drin River originates near Peja, Kosovo, in Radavc. It crosses the Dukagjin Plain and flows into Fierza Lake. It is 160 km long; however, together with its longest branch, the river reaches a length of

335 km. The Black Drin River originates in Struga, North Macedonia, from the northern part of Lake Ohrid, which is supplied with water from Lake Prespa.

The catchment area of the Drin, including its two main branches, spans several countries (Kosovo, Albania, North Macedonia, and Greece), thereby raising the possibility of pollution in Fierza Lake, which collects water from these rivers [1, 2, 3]. Some of the main sources of pollution in Fierza Lake include spills of liquid/solid urban waste, agriculture, industrial waste, transport, and mechanics. Anthropogenic sources of water pollution are divided into two groups: point and non- point sources.

Point sources include discharges of urban liquid waste (wastewater) and livestock farms, industrial waste discharges, leaching water from solid waste disposal sites, and more. Non-point sources include agricultural land drainage water discharges, polluted rainfall, wastewater pipe leaks, etc. These wastes directly affect the values of pH, nutrients, different ions, and the presence of various organic pollutants, which are reflected in the quality of the waters, making them suitable or unsuitable for the organisms living there. It must be noted that fish is grown in Fierza Lake and consumed by the residents of the area [3-9].

Therefore, the purpose of this research was to evaluate the water pollution of the Fierze lake, whose water is used for drinking but also for fishing. Knowing these data, we can see how endangered the population is from using this water, either for drinking or through food chain.

II. Materials and Method

A. Water sampling in Fierza Lake

Water samples from Fierza Lake were collected in May 2024. At 10 stations, samples with volumes of 2.5 liters were taken in Teflon containers. The sampling was realized according to the ISO 5667- 14:2016 methodology. Transport and storage before analytical analysis in the laboratory were at a temperature of +4°C. Field measurements of various physico-chemical parameters, such as temperature, pH, conductivity, turbidity, TDS, and DO, were measured in the field at each sampling station using a Hanna model portable multimetric device. In the figure 1 are sampling sites for Fierza Lake:

Fig 1. Sampling stations in Fierza Lake.

B. Determination of Physical-Chemical parameters

pH, conductivity, DO (dissolved oxygen), TDS, turbidity and temperature were determined in field (for each station) by using Hanna Multiparameter meter portable equipment (HI98194 Model). VELP brand automatic sensors (respirometers) were used to estimate the 5-day (BOD_5) in water [10]. Pre-prepared SPEC COD digestion tubes with mercury sulfate were used for determination of COD assisted by thermo-reactor ECO 16 and a PF-3 spectrophotometer suitable for COD analysis [10]. The UV-VIS measurements of nutrients (nitrates, nitrites ammonium, N-Total, Phosphates and P-Total) and sulfate ions were carried out in the UV 31 SCAN ONDA model spectrophotometer as follows: The analysis of nitrates (NO_3) in water is based on the ISO 7890-3: 1988; the analysis of nitrites (NO_2) in water is based on the ISO 6777: 1984 method; the analysis of ammonium (NH_4^+) in water is based on the ISO 7150/1:1984 method; N-total was determined using complete disaggregation of the sample. All forms of nitrogen are oxidized and measured as NO_3 (Screening Method). P-total was determined using the disaggregation method, which aims to oxidize all forms of phosphorus into PO_4 ions and further make their determination using the spectrophotometer method at 880 nm. The analysis of sulfates in water is based on method 9038 for the determination of sulfates by the turbidimetry method at a wavelength of 420 nm [2, 6, 10]. Chloride ions were determined in water samples using the argentometric method (4500-Cl^- B, Argentometric Method, known as the Mohr method). The data obtained for chloride ions in water were used to calculate the salinity of the samples. The concentration of calcium and magnesium ions in water was realized by using the titration method with EDTA in the presence of different indicators [6, 10]. Finally, the analysis of TSS was based on their determination by the gravimetric method [10].

C. Determination of organochlorine pollutants in water samples

For the determination of organochlorine pesticides (OCPs) and polychlorbifenils (PCBs) in water samples was used liquid-liquid extraction. After extraction, the organic phase was dried with anhydrous sodium sulphate and a florisil column was used for the sample clean-up procedure. After concentration, the samples were injected in GC/ECD technique. OCPs and PCBs were analyzed simultaneously using Rtx-5 capillary column (30m x 0.25mm x 0.25µm) in a Varian 450 GC gas chromatograph equipped with PTV injector and ECD detector. Helium was used as the carrier gas (1 ml/min) and nitrogen as make-up gas (24 ml/min). Manual injection was done in splitless mode at 300°C. The detected pesticides were: DDT (p,p-DDE, p,p-DDD, p,p-DDT), HCHs (a-, b-, γ- and d-isomers), Heptachlor (Heptachlor and Heptachlorepoxide); Chlordanet (alpha and gamma isomers); Aldrins (Aldrin, Dieldrin, Endrin and their derivatives) and Endosulfans (Endosulfan alfa, Endosulfan beta and Endosulfan sulfate). PCB analysis was

based on the determination of seven markers (PCB IUPAC No. 28, 52, 101, 118, 138, 153 and 180). Quantification of pesticides and PCB was based on the external standard method [4, 16-28].

D. Determination of Polyaromatic hydrocarbures (PAHs) in water samples

Two steps liquid-liquid extraction (LLE) was used for extracting PAHs from water samples. Dichloromethane (first step LLE) and n-hexane (second step LLE) were used as extracting solvents. After extraction, the organic phase was dried with anhydrous sodium sulfate (Na_2SO_4) for water removing. Extracts were concentrated and then were injected in GC/FID apparatus. Gas chromatographic analyzes of PAH in water samples were performed with a Varian 450 GC apparatus equipped with a flame ionization detector and a PTV injector. Capillary column VF-1 ms (30m x 0.33mm x 0.25μm) was used for the separation of 13 PAH according to EPA Method 525. Helium was used as carrier gas at 1ml/min. The FID temperature was maintained at 280°C. Nitrogen was used as carrier gas (24 ml/min). Hydrogen and air were the flame detector gases at 30 ml/min and 300 ml/min, respectively. The EPA 525 standard mixture was used for qualitative and quantitative PAH analysis. Acenaphthylene, Fluorene, Phenanthrene, Anthracene, Pyrene, Benzo [a] anthracene, Chrysene, Perylene, Fluoranthene, Benzo [b] fluoranthene, Indeo [1,2,3-cd] pyrene, Dibenzo [a, b] anthracene and Benzo [g, h, i] perylene were determined in water samples. PAH quantification is based on the external standard method [15-32].

E. Determination of BTEX by using HS-SPME Method

Determination of benzene, toluene, ethylbenzene and xylene (BTEX) in water samples was realized using solid phase micro-extraction in static head space mode (HS/SPME) followed by GC/FID technique. 5 ml of water (2 g of sediment) sample was put in a 10 ml head space vial. 100 um PDMS fiber was used to extract BTEX from water samples. Adsorption process was realized in 50^{o}C (using a water bath) for 45 minutes. Desorption process (30 seconds in 280^{o}C) was realized in a PTV injector (HS mode was selected) of a Varian 450 GC instrument. VF-1 ms capillary column (30 m x 0.33 mm x 0.25 μm) was used for separation of Benzene, Toluene, Ethyl benzene and Xylene isomers. Helium was used as carrier gas with 1 ml/min. FID temperature was held at 280°C. Nitrogen was used as the make-up gas (25 ml/min). BTEX Mixture was used for their qualitative and quantitative analyse based on external standard method [4, 28].

III. RESULTS

In this study, water samples from Fierza Lake were analyzed at 10 different stations in May 2024. These samples were used to analyze the physico-chemical parameters important for assessing the water quality of this significant ecosystem, which collects the waters of the White Drin and Black Drin rivers. These rivers have a wide catchment area spread over several states. The physico- chemical parameters determined in the water samples were: temperature, pH, DO, BOD_5, COD, conductivity, turbidity, TDS, TSS, NO_3^-, NO_2^-, NH_4^+, N-total, orthophosphates, P-Total, sulfates, chlorides, calcium, and magnesium ions.nTemperature, pH, conductivity, turbidity, TDS, and DO were determined directly in the water for each station using a

Hanna model portable multimetric apparatus, while other parameters were determined in the laboratory. BOD was determined with automatic sensors. Standard tubes pre- prepared with mercury sulfate and a spectrophotometer PF-3 with suitable wavelengths for COD analysis were used to determine the chemical oxygen demand. The UV 31 SCAN ONDA device was used for measurements of nutrients and sulfates. Cl^-, Ca^{2+}, and Mg^{2+} ions were determined by the titration method. The analysis of TSS was based on their determination by the gravimetric method. The measurements were carried out after the calibration of the equipment and the evaluation of the methods used in these analyses, as recommended by national and international norms [10-17]. The average measurement data for the 10 stations of Fierza Lake are shown in Table 1.

Table 1. Statistical data for physico-chemical parameters from Fierza Lake

Physical-Chemical parameters	Mean	Min	Max	Median	STDEV
PH	7.85	7.45	8.24	7.74	0.24
Temperature (oC)	24.25	22.86	24.90	11.57	0.63

Mg+2 (mg/l)	24.18	22.35	28.10	25.17	3.28

The analysis of organic compounds was based on the determination of 21 chlorogenic pesticides and their degradation products according to EPA 8081B, 7 marker PCBs, 13 PAHs according to EPA 525 Method, and BTEX. The analysis of these micropollutants in the water samples was carried out using the gas chromatography technique. The ECD detector was used for qualitative/quantitative analysis of organochlorinated pollutants (OCPs and PCBs), while the FID detector was used for the identification of PAHs and BTEX. Liquid-liquid extraction was used for the isolation of OCPs, PCBs, and PAHs from water samples, while the HS-SPME technique was used for volatile compounds (BTEX). The summarized data for the classes of pesticides, tracer PCBs, PAHs, and BTEXs are given in Table 2.

Table 2. Statistical data for organic pollutants in Fierza Lake

Organic pollutants	Mean	Min	Max	Median	STDEV
∑HCHs	0.19	0.00	0.58	0.13	0.22

∑BTEX	0.36	0.01	1.14	0.27	0.39

IV. DISCUSSION

In this study, the highest physico-chemical parameters for the water ecosystem of Fierza Lake were analyzed. From the data obtained, we see that the highest temperature of the lake water at the time of collection was about 24.3°C, which is normal for the month of May. The average value for pH of water samples was 7.9. This value may result from the discharge of urban waters along the entire length of the White Drin and Black Drin rivers. The average value for dissolved oxygen in the lake water was 8.5 mg/l, which is higher than the norm (> 5 mg/l), classifying its water as suitable for aquatic life. The BOD measured over five days had an average value of 42.3 mg/l, classifying the waters of Fierza Lake as moderately polluted. The average chemical oxygen demand (COD) value was 72.1 mg/l, indicating the presence of chemicals in the lake water from urban discharges, agriculture, mechanics, industry, transport, mining, etc. This COD value classifies the lake water as moderately good, supported by the conductivity value of 539.3 µS/cm. The average turbidity was 27.4 FNU, with a large fluctuation (18.3 - 55.3 FNU) depending on the stations where the measurements were taken, particularly differing between the area where the waters of the Drin River flow and the dam. The average TSS value was 21.3 mg/l, with significant differences across different stations. This value classifies the water as good.

The average concentration of NO_3 in water was 7.67 mg/l, a high value compared to previous studies (1, 2, 3, 4), classifying the water as moderately good. The large amounts of nitrates can be a consequence of urban discharge waters and agricultural fertilizer use. The average nitrite concentration in the water was 0.02 mg/l, with a maximum value of 0.03 mg/l. The average NH_4^+ concentration was 0.05 mg/l, while the total nitrogen (N) had an average value of 3.1 mg/l, likely influenced by urban discharge waters and agriculture. The average PO_4^{3-} concentration was 1.2 mg/l, and the average total phosphorus (P) was 0.6 mg/l, both higher than previous studies for surface waters in Albania (1, 3, 4, 5). These nutrient values classify the water of Fierza Lake as moderately good. The average sulfate concentration was 26.4 mg/l, related to natural urban pollution and anthropogenic influences in the catchment area. The average chloride concentration was 36.17 mg/l, a high value for surface waters due to urban spills (hygiene and water chlorination products). The presence of calcium (74.3 mg/l) and magnesium (24.2 mg/l) ions is related to the natural background and geological areas not only of the lake but also of the rivers and effluents supplying it.

Organochlorine pesticides (OCPs) were detected in almost all water samples from Fierza Lake. The total concentration of OCPs ranged from 0.005 μg/l (Fierza dam) to 5.45 μg/l (Kuksi 2 station), possibly due to previous use and new arrivals by the White Drin and Black Drin rivers. The average level was 1.55 μg/l. The wide catchment area of the two main rivers supplying Fierza Lake, which includes many agricultural areas, contributes to the presence of pesticides in the water samples. Soil leaching and the high stability of these substances also influence their presence. The pesticide profile in Fierza Lake was as follows: Aldrines > Endosulfanes > DDTs > Chlordanes > Heptachlors > HCHs. The distribution of average values of organochlorine pesticides was as follows: Total HCHs (α-, β-, γ-, and δ-isomers of Hexachlorocyclohexane) ranged from 0 - 0.4 μg/l, with an average of 0.2 μg/l; Heptachlors (Heptachlor and Heptachlorepoxide) ranged from 0.01 μg/l to 0.46 μg/l (average 0.2 μg/l); Chlordanes (alpha and gamma-Chlordanes) ranged from 0.01 μg/l to 0.6 μg/l (average 0.2 μg/l); Aldrins (Aldrin, Dieldrin, Endrin, Endrin aldehyde, and Endrin ketone) ranged from 0.02 μg/l to 1.2 μg/l (average 0.4 μg/l); DDT-related chemicals (o,p- DDE, p,p-DDE, p,p-DDD, p,p-DDT) ranged from 0.01 μg/l to 1.0 μg/l (average 0.3 μg/l); and Endosulfanes (Endosulfan alpha, Endosulfan beta, and Endosulfan sulfate) ranged from N.D. (not detected) to 1.8 μg/l (average 0.4 μg/l). Degradation products of active substances used as pesticides were found in most samples, likely due to their previous uses.

PCB markers were detected in all analyzed samples from Fierza Lake, with total concentrations ranging from 0.2 μg/l to 7.6 μg/l (average 1.9 μg/l). Their presence may be related to mechanical activity and repair of turbines used for electricity production, atmospheric deposition, and new arrivals from rivers and/or effluents. The presence of volatile PCBs supports this fact. Oil discharges from some mechanical businesses in the Kuksi area could be terrestrial sources of PCBs in water samples. Heavy PCBs were also found in

some stations of Fierza Lake. PAHs were detected in 60% of the water samples analyzed, with an average value for 13 PAHs according to the EPA 525 Method of 0.7 μg/l, ranging from N.D. to 4.4 μg/l. BTEX average levels were 0.4 μg/l, with a range from 0.01 μg/l to 1.1 μg/l. The main reasons for the presence of hydrocarbons could be mechanical businesses near Kuksi and other areas within the water basin of Fierza Lake, motorist transport, possible hydrocarbon accidents, and massive fires near these areas. The presence of PAHs was a combination of non-pyrogenic PAHs (gas station discharges/accidents, hydrocarbon spillage, mechanical activities, etc.) and pyrogenic PAHs (forest and urban waste burning, transport emissions, industrial activities, etc.). Benzene and toluene were found in higher concentrations than other derivatives, supporting this fact.

V. CONCLUSION

The aim of the study was to evaluate the physico-chemical parameters and the presence of organic pollutants in the water samples from Fierza Lake. This important water ecosystem gathers the waters of the White Dri and Black Drin rivers, with water basins spread over several Balkan states. This wide spread and other effluents are the main reasons for the pollution of the waters of this lake. From the analysis of these parameters, we can conclude that the water in this area has a slightly basic pH due to urban water discharge at various points in the area. The average values for DO, BOD_5, and COD indicate that the lake water is suitable for the growth of organisms in this area. The high value for COD is mainly related to the presence of chemicals from urban discharge water, agriculture, and mining. The levels found for nutrients (NO_3, N-total, PO_4, and P-total) were higher than in previous reports for this area. Urban discharge wastwater and agriculture are the main factors influencing these levels. Interestingly, nitrite and ammonium ions were not detected in most of the analyzed stations. The presence of sulfates is mainly related to urban pollution and mining spills. Concentrations of ions (Cl^-, Ca^{2+}, and Mg^{2+}) can also be related to the natural background and geology of the lake area and the riverbeds that supply it with water. The levels found in the water of Fierza Lake classify these waters as moderately good. Pesticides, PCBs, and PAHs were detected in water samples from Fierza Lake. Their presence could be due to ship/motorist transport, elevated activity near port areas, new arrivals from rivers, water currents, point sources, accidents, etc. Pesticide degradation products were found in high concentrations because of their previous use. The presence of PCBs and PAHs can be related to transport, industrial/mechanical activity, atmospheric deposition, and water currents. Analyses of the physico-chemical parameters in the water of the lake and not only (this should also be extended to rivers and its effluents) should be periodically conducted by the laboratories of the responsible institutions because there are tendencies to damage the quality of these waters mainly from anthropogenic activity. Continuous analysis of organic pollutants is recommended using GC/MS/MS and LC/MS/MS technique.

ACKNOWLEDGMENT

Abstract – One of the factors that causes embankment dams to fail is internal erosion. Internal erosion transports soil particles through seepage and pressurized pipe flow. Forms of internal erosion are seen in cohesive and non-cohesive soils. While Backward Erosion (piping) and Suffusion/Suffosion are seen in cohesionless soils, Concentrated Leak Erosion (CLE) and Contact Erosion occur in cohesive soils. Concentrated Leak Erosion is the transportation of particles with pressurized pipe flow in cracks and gaps. The erosion rate and critical shear stresses determine the resistance of fine-grained soils to Concentrated Leak Erosion. Some geotechnical properties of soils also determine this erosion resistance. In this study, Based on the results obtained from past research, the effect of molecular attraction forces, one of the components of the cohesion intercept value, on the erosion resistance of fine-grained soils is evaluated and discussed while taking into account the clay factor that affects the erosion resistance and cohesion intercept value. As a result, it has been determined that the clay ratio and mineralogy affect the cohesion intercept value in non-dispersive soils, and as the cohesion intercept value increases, the erosion resistance of fine-grained soils increases.

Keywords – Cohesion intercept, Cohesive soil, Concentrated leak erosion, Embankment dam, Internal erosion

I. INTRODUCTION

The increase in the world's population and people's efforts to sustain their economic gains have greatly increased the number of dams built in recent years. Again, with the increase in the world population, urban areas have expanded and increased. With the rise in the number of dams and residential areas, many metropolitan areas and economic activity areas have remained in the downstream region of these dams. One of the disasters that will threaten the downstream regions, where residential areas and financial activities are located, will undoubtedly be the collapse of these dams. The erosion resistance of fine-grained soils used due to their impermeability properties in water-retaining structures such as embankment dams is an important factor in ensuring the safety of these structures.

Failure in dams is defined by ICOLD [1] as the inability to retain water in the reservoir due to the collapse of dam structures or deterioration of their stability. 78% of the total dams in the world are embankment dams [2]. The causes of failure of embankment dams were listed as overtopping, internal erosion (piping), and sliding. It was revealed that 46.1% of embankment dams collapsed due to internal erosion [3]. As seen in many cases in the past, the loss of life and property due to the collapse of embankment dams and the wasted investments have revealed that the issues related to the safety of these dams need to be investigated. One of these safety points is that embankment dams are exposed to the danger

of internal erosion. Internal erosion is not a cause of collapse that can be analyzed entirely with numerical formulas or models. It is necessary to have sufficient data about the dam and to know the erosion resistance of the soil to be eroded [4].

The most effective factors that cause embankment dams to collapse are overtopping and internal erosion. Surface erosion occurs on upstream and downstream slopes of embankment dams due to overtopping and slope protection defects. If the upstream slopes are not protected with a suitable covering material such as riprap, collapse may occur due to overtopping along with the scours. Erosion develops when the shear stresses created by the overhead flow exceed the critical shear stresses that enable the transport of the embankment material, and the breach, which initially forms a V (triangle), takes the shape of an inverted trapezoid over time [5]. Water leaks occurring in the fill and foundation cause internal erosion. CLE, one of the internal erosion modes, occurs in fine-grained plastic soils containing clay. CLE is defined by USACE (US Army Corps of Engineers) as the erosion of soils due to transverse cracks in embankment dams and gaps formed along conduits and spillways [4].

Different test equipment was used to investigate fine-grained soils' resistance against surface and internal erosion. In this paper, evaluations will be made on the fact that cohesion intercept is a basic factor affecting the erosion resistance of fine-grained soils, considering the clay factor that affects cohesion intercept and erosion resistance in previous studies.

II. CONTROL PARAMETERS OF CONCENTRATED LEAK EROSION

Internal erosion is the movement of soils in the filling and foundations of embankment dams by seepage and pressurized pipe flow. Internal erosion manifests itself as water leakage in structures that store water. The statistics regarding dam failures show no uniform internal erosion mechanism in embankment dams. In addition, the concept of piping, which is one of the types of internal erosion, was used instead of internal erosion in the statistics given. ICOLD (The International Commission on Large Dams) and USACE stated that internal erosion occurs in five modes: backward erosion (piping), concentrated leak erosion (CLE), global backward erosion, contact erosion, and suffusion [4]. CLE and backward erosion (piping) modes are confused [6]. In both of them, a pipe-like channel is formed due to erosion. However, this channel expands due to soil erosion in the existing crack due to the effect of pressurized flow in CLE. In backward erosion, this channel develops and grows due to the material carried downstream to upstream under the seepage's influence. While CLE occurs in cohesive soils, Backward erosion, on the contrary, develops in cohesionless soils.

Factors affecting the formation of CLE can be examined under three main headings: material properties, hydraulic factors, and crack/gap properties. Material and crack properties are the factors that determine the potential for CLE to occur. Hydraulic factors like hydraulic gradient must be large enough for this potential to turn into CLE. Material properties are parameters that affect the erosion resistance of fine-grained soils. One of these material properties is clay ratio and mineralogy. Transverse cracks extending in the upstream-downstream direction must occur for CLE. Differential settlements, longitudinal arching, insufficient compression and lack of kneading between layers, drying cracks, local compressions, slides, and tectonic movements affect the formation of transverse cracks [7]. In addition, CLE can also be observed due to the erosion of the core material in the gaps formed on the surfaces where the filling materials come into contact with the spillway wall and conduit pipe [8]. CLE can also be seen as a result of hydraulic fracturing [9]. With these cracks, CLE can also occur due to gaps created by tree roots and burrows created by animals [10].

The geometric parameters that control the initiation and progression of CLE determine the magnitude of the hydraulic gradient and shear stresses. For CLE caused by pressurized flow to occur, a closed

environment, such as cracks and voids, is required. As the shear stresses due to flow on the walls of these cracks or gaps increase, the amount of material carried by erosion also increases. The reservoir water height above the crack/gap where the pressurized flow occurs, and the width of the crack affect these shear stresses. According to the basic principles in pipe hydraulics, shear stresses increase as the reservoir water height above the crack/gap increases and the width of the crack decreases. As the crack/gap length increases, the hydraulic gradient decreases, and the amount of material carried by erosion decreases.

III. COHESION INTERCEPT IN SOILS

Soils are divided into two cohesive and non-cohesive soils in soil mechanics. If the particles are connected and adhered to each other, it is defined as cohesive soil; if not, it is cohesionless soil. Cohesionless soils are granular soils. They are soils with a high sand and gravel ratio. Cohesive soils are fine-grained soils. They are soils with high clay and silt content and show plastic deformation behavior. The "cohesion" mentioned here is the soil particles influenced by molecular attraction forces.

The shear strength (τ) of soils is generally determined by the internal friction angle (φ) and cohesion intercept (c) components, as shown in equation (1), according to the Coulomb failure theory.

$$\tau = c + \sigma.\tan(\varphi) \quad (1)$$

The angle of internal friction depends on the normal stresses (σ) applied to the soil. It is caused by the interaction of soil particles with each other (friction, locking, etc.).Cohesion intercept, unlike the cohesion described above, is a mathematical parameter. It is independent of the normal stresses applied to the soils. When σ = 0, the shear strength of the soil is equal to the cohesion intercept.

Cohesion intercept includes intermolecular forces of attraction (true cohesion), capillary forces, and cementation [11]. Intermolecular forces of attraction consist of van der Waals and electrostatic attraction forces, primary valence bonding, ionic lattice attraction, and cation linkage. Negative pore water pressure is effective in the formation of capillary forces in partially saturated soils. Suction pressures developing due to negative pore water pressures are another component that provides the shear strength of soils without affecting stress and is also defined as "apparent cohesion". When soils are completely saturated with water, apparent cohesion becomes zero. Carbonates, aluminates, silicates, iron oxide, and organic substances carry out cementation by causing the particles to bond chemically in fine-grained soils [12].

IV. DETERMINATION OF EROSION RESISTANCE OF FINE-GRAİNED SOILS

In order to evaluate the effect of cohesion intercept on the erosion resistance of fine-grained soils in the context of clay factor, the results obtained from erosion tests performed in the past using different test equipment and materials were considered. Erosion resistance of fine-grained soils is measured by the "critical shear stress", which includes the flow velocity at which erosion begins, and the "erosion rate", which shows the amount of material transported over time. As critical shear stresses increase and/or erosion rate decreases, erosion resistance of fine-grained soils increases. Critical shear stress and erosion rate can be determined by surface erosion and internal erosion tests. Surface erosion tests include laboratory flume erosion tests [13], rotating cylindrical erosion tests [14], and jet erosion tests [15]. Internal erosion tests include the hole erosion test [16], slot erosion test [17], and pinhole test [18]. The pinhole test is insufficient to determine fine-grained soils' critical shear stresses [19]. With the test equipment developed by Topçu and Tosun [20], critical shear stresses of dispersive soils can be compared qualitatively, while erosion rates can be determined quantitatively. Based on the internal erosion problems experienced in embankment dams, Sherard [21] determined the erosion resistance of non-dispersive soils. He categorized well-compacted cohesive soils with a plasticity index greater than 15 as having the highest erosion resistance. However, uniform fine sands with a plasticity index of less than 6 will have the lowest erosion resistance. According to the ICOLD [22], the erosion resistance of soils classified as dispersive soil based on a pinhole

test and silty sands with a fine content greater than 30% is very low. On the contrary, high plasticity clays with a liquid limit (LL) value greater than 65 have very high erosion resistance.

V. EFFECT OF CLAY RATIO AND MINERALOGY ON EROSION RESISTANCE

It is known that the cohesion intercept value in fine-grained soils can be measured with the help of triaxial and shear box tests. The findings of the internal and surface erosion tests were compared and evaluated, with the tests determining the shear strength and considering the clay ratio and mineralogy that affect the molecular attraction forces, one of the components of the cohesion intercept value.

One of the most important parameters affecting the behavior of fine-grained soils is the clay mineralogy and ratio that the soils contain. Warkentin and Yong [23] performed a shear box test on fully saturated, disturbed, fine-grained soil consisting entirely of clay. The strength component determined from shear strength tests performed on fine-grained soils consisting entirely of clay and fully saturated with water is true cohesion. It is only under the influence of molecular attraction forces. In such soils, cementation and capillary forces, components of cohesion intercept, are not observed due to disturbance and are fully saturated. In soils with the same NaCl concentration in the pore fluid, the strength value of Montmorillonite clay soil, when the void ratio (n) is approximately eight, is the same as the strength value of kaolinite clay soil when n = 2.2. It is seen that the strength value decreases as the void ratio increases. Accordingly, the montmorillonite clay soil's strength was higher than the kaolinite clay soil at the same void ratios (Fig. 1).

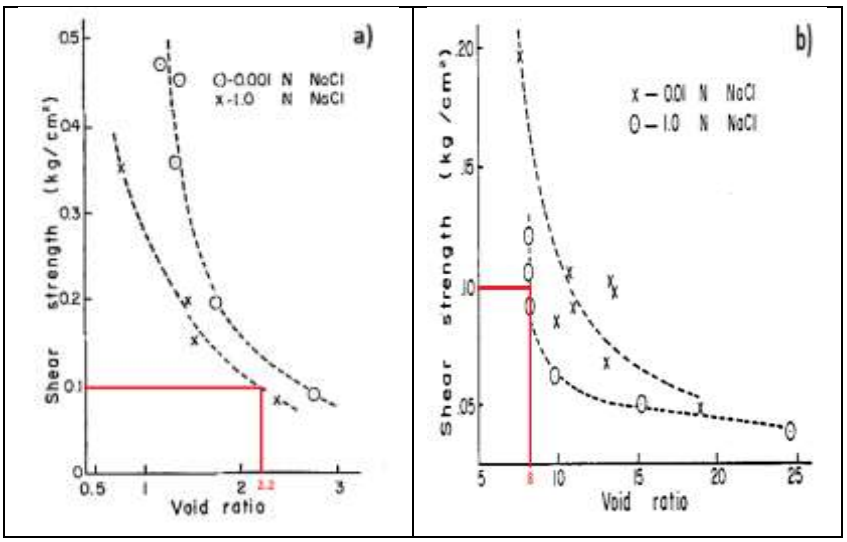

Fig. 1 Shear strength of entirely of clay soils a) Kaolinite b) Montmorillonite

Arulanandan and Perry [24] showed that the critical shear stresses of soils containing montmorillonite are greater than kaolinite soils, based on the dielectric dispersion index in their rotating cylindrical and flume test on fully saturated fine-grained soils (Fig. 2). As the dielectric dispersion index increases, critical shear stresses increase. Especially in conditions where physical testing is not possible, the erosion resistance of soils can be evaluated with this index value, which reflects the electrical properties of the pore fluid of soil.

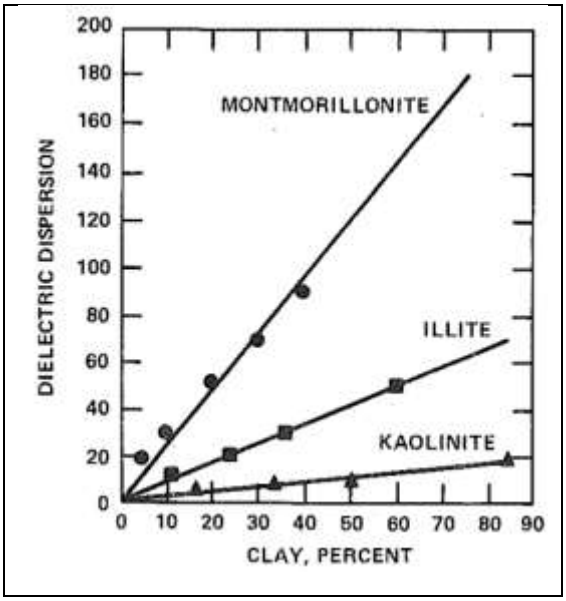

Fig. 2 Effect of clay mineralogy on dielectric dispersion

Djarwadi et al. [25] determined that the cohesion intercept value increased as the clay ratio increased in the undrained, unconsolidated (UU) triaxial test performed on fine-grained soils with different clay ratios that were partially saturated. However, in hole erosion tests conducted on unsaturated fine-grained soils, critical shear stresses increase as the clay ratio increases [26], as shown in Fig. 3.

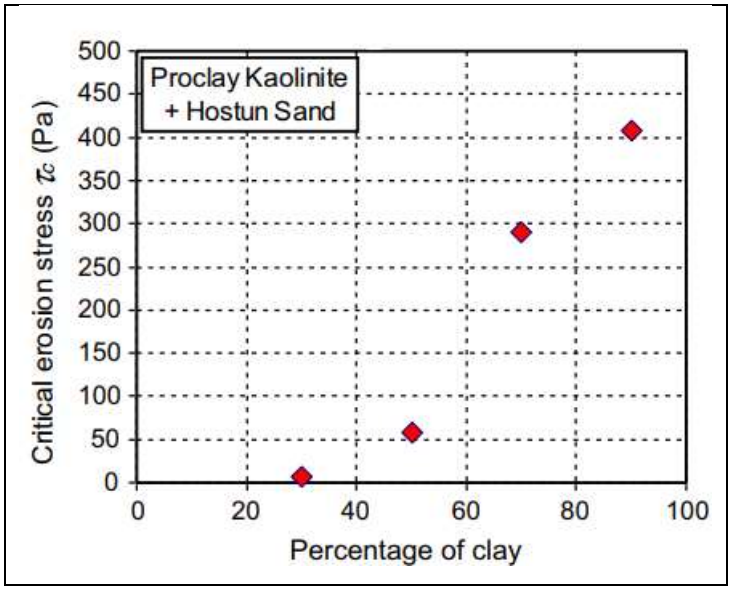

Fig. 3 Effect of clay ratio on critical shear stresses

VI. CONCLUSION

Based on the results obtained from previous studies, the effect of molecular attraction forces, one of the components of the cohesion intercept value in non-dispersive soils, on the erosion resistance of fine-grained soils is evaluated and discussed, taking into account the clay factor. Accordingly, the cohesion intercept value of montmorillonite clays is greater than that of kaolinite clays under the same conditions. At the same time, the erosion resistance of montmorillonite clays is higher than that of kaolinite clays. Likewise, cohesion intercept value and erosion resistance increase as the clay ratio increases. As a result, the erosion resistance of fine-grained soils increases as the cohesion intercept value increases in the context of clay factor (clay ratio and mineralogy) in non-dispersive soils.

Abstract – Fertilization biology is one of the most essential factors used to select potential genotypes and varieties. Plant sexual reproduction relies heavily on pollen germination and pollen tube growth. It has been observed that the coordinated action of hormones secreted in the ovary during pollination or fertilization controls fruit set and development. A healthy pollen is used for pollen germination in vitro and in vivo because it has the same nutritional storage and composition as a seed. Nevertheless, the nutrients in pollen are usually inadequate for pollen tubes to reach the seed drafts. As a result, the use of nutrients in the stigma helps to promote the formation of pollen tubes after a certain stage. Pollens from six wild-grown blackberry plants in Atabey/Isparta were used in this study, Turkey, to investigate pollen germination and pollen tube length in several bioregulators. Considering our prior findings, the control germination medium for the study was adopted consisted of 0.5% agar agar + 15% sucrose + 5 ppm boric acid. Brassinolide (24-epibrassinolide-24-EBL) (0.1 ppm, 0.01 ppm and 0.001ppm) was added to the control medium and incubated at 20^0C. The development of pollen germinaion tubes was examined using an ocular micrometer 24 hours after germination. The statistical analyses were carried out using SPSS 22.0. Adding 0.1 ppm 24-EBL to the media resulted in the greatest pollen germination rate and longest pollen tube length across all genotypes (N6 pollen germination rate: 78.65%; tube growth: 185.34 µm). As a consequence, 0.1 ppm 24-EBL is an appropriate dosage for promising genotype N6 and other genotypes.

Keywords – Brassinolide, Rubus canescens, bioregulators, fertilization biology, berries

I. INTRODUCTION

Turkey is positioned at the junction of three phytogeography areas. Turkey's flora contains 11,466 plant species, while Europe as a whole has over 12,000 species. The Rosaceae family includes thorny and trailing plants that are seldom green and can be shrub or tree. This family includes 115 genera and around 3200 species worldwide. Turkey has 35 genera and 318 species belonging to the Rosaceae family.

Blackberry bushes feature long, thorny canes that arch and trail across the ground. Some cultivars have been created withless thorniness to make harvesting simpler.

The blackberry plant's blossoms produce blackberries. As the fruit ripens, it converts from green to crimson, deep purple, and black. Blackberry harvest season varies by area, but normally occurs from May to August, depending on climate [1]

Flowering branches are erect, 15-40 cm long, angled, pubescent to slightly tomentose, and armed like turions. Sepals are ovate to oblong, acute, hairy, and tomentose. They reflex after blooming. Petals are white (drying pale yellowish), obovate-oblong (occasionally wider), and measure 5-8 (-10 mm). Fruits are around 1 cm in size and a red-purple tint. drupelets are black, tiny, and glabrous [2]. It's a plant that is half light and half dark. It is resistant to both cold and heat. It prefers wetness but may also thrive in arid environments. The fruit juice can be used as a mouthwash to treat tonsil irritation [3]. Plants' fertilization

success depends on progamic processes [5;6]. Fruit tree fertilization success relies heavily on pollen germination and tube development [7]. Pollen ingredients contained in pollen tubes are often insufficient to reach the seeds. As a result, pollen tubes go from one stage to the next, with future growth occurring in the stigma as nutrients are used. These compounds contain sucrose. Pollen germination and tube development are valuable study materials for several disciplines, including morphology, physiology, biotechnology, ecology, evolution, biochemistry, systematics, and molecular biology. Boron, calcium, potassium, and particular mineral components like magnesium are essential for pollen germination and tube growth. Boron, an inorganic substance, plays an important role in pollen germination and tube growth in the form of boric acid and borate. The first plant growth regulator found in steroid structure was isolated from brassinosteroid rapeseed pollen (*Brassica napus* L.) shown to be effective at extremely low concentrations, may be used safely on plants and may have promising future results [8]. 24-epibrassinolide (EBL) is a molecule created during BL biosynthesis that promotes plant metabolism, including carbon absorption, nucleic acid biosynthesis, ROS metabolism, and light harvesting. In plants, EBL promotes enzyme activity during photosynthesis [9]. Brassinolide and 24-epibrassinolide (24-EBL) are the most stable and bioactive among the 60 discovered brassinosteroids. On the steroidal side, all BRs have a 22R and 23R-diol structure. Compounds with 22R and 23R-hydroxyls are much more active than synthetic counterparts with 22S and 23S-hydroxyls. However, in the original 22R and 23R configurations Brassinolide promotes plant cell elongation, vascular bundle development, photomorphogenesis, fruit quality, and gene expression [10].

In this research, we attempted to investigate the effect of various dosages of Brassinolide (24-epibrassinolide-24-EBL) on *in vitro* pollen germination studies in blackberries.

II. Materials and Method

Pollen was collected from the blooms of six wild blackberries plants (N1, N2, N3, N4, N5, and N6) during the balloon stage. The 50 flowers on the balloon stage were picked. The flowers were immediately sent to the laboratory. Anthers were eliminated. Store in a dark-colored container to aid in dehiscence at ambient temperature [11].

For germination tests, the "agar in plate" method [12]. was used, Control germination medium and optimal germination temperatures recorded previously were provided for the same genetypes. which contained 0.5% agar agar + 15% sucrose + 5 ppm boric acid and added Brassinolide (24-epibrassinolide-24-EBL) (0.1 ppm, 0.01 ppm, and 0.001 ppm) to the control medium and incubated at 20^0 C [13]. Tree different concentrations of 24-EBL were tested in the germination medium for the *in vitro* germination test.

I. Control: 0.5% agar agar + 15% sucrose + 5 ppm H_3BO_3 (Boric Acid)
II. 0.5% agar agar + 15% sucrose + 5 ppm H_3BO_3+**0.1 ppm 24-EBL**
III. 0.5% agar agar + 15% sucrose + 5 ppm H_3BO_3+ **0.01ppm 24-EBL**
IV. 0.5% agar agar + 15% sucrose + 5 ppm H_3BO_3+**0.001ppm 24-EBL**

Pollen tubes were classified as "germinated" if they were at least twice as long as broad [14]. The length of the pollen tube was measured using an ocular micrometer under a 40X light microscope. Four Petri plates were utilized for the germination and polen tube studies. Four independent microscope fields, each with 100-150 pollen grains, were counted on a separate petri plate. SPSS 22.0 was used for the statistical analysis, with a significance level of 0.05. Duncan's multiple range test was used to analyze the mean ranges.

III. RESULTS

Our investigation demonstrated that varied dosages of 24-EBL, a brassinosteroid from the new generation hormone group, had statistically significant impacts on pollen germination and tube development ($p<0.05$).When the average application dosages were examined, the medium that boosted pollen germination the most compared to the control group and obtained the greatest germination rate was

the medium with 0.1 ppm 24-EBL (45.60%). All 24-EBL dosages enhanced pollen germination rates relative to the control group for all genotypes. Although 0.01 and 0.001 ppm dosages of 24-EBL boosted pollen germination more than the control group, they were statistically comparable (35.64% and 34.49%) respectively. Once the genotypes were examined for pollen germination rate, the N6 genotype had the highest rate at 58.89%. This was followed by N5 (44.77%) and N1 (51.73%).

Table 1. Effects of different doses of 24-EBL *in vitro* pollen germination of six blacberry genotypes (%)

	Control	**0.1ppm 24-EBL**	**0.01ppm 24-EBL**	**0.001ppm 24-EBL**	**Mean**
N1	45.17	62.51	51.00	48.27	**51.73b^{y}**
N2	11.74	29.86	24.16	24.03	**22.44d**

Mean	**27.30c^{x}**	**45.60a**	**35.64b**	**34.49b**	

^{x,y}The difference between values shown in different letters in the same row and column is statistically significant ($p<0.05$)

Table 2 shows pollen tube lengths determined using an ocular micrometer 24 hours after pollen sowing. The longest pollen tubes (147.26 µm) were measured in the germination media supplemented with 0.1 ppm 24-EBL, similar to pollen germination rates. The control condition produced the shortest pollen tube, measuring 122.30 µm. The N6 genotype had the longest pollen tube length (171.26 µm) among the assessed genotypes. The N4 genotype's pollen tube length was measured to be 150.63 µm, whereas the N5 genotype's was 141.09 µm. The N3 genotype had the shortest pollen tubes, measuring 101.22 µm.

Table 2. Effects of different doses of 24-EBL *in vitro* pollen tube growth of six blacberry genotypes (µm)

	Control	**0.1ppm 24-EBL**	**0.01ppm 24-EBL**	**0.001ppm 24-EBL**	**Mean**

III. DISCUSSION

Pollen tubes play a crucial part in fertilization and have been used to research the biology and biochemistry of polarity and tip development. This has helped identify key actors in the cell polarity machinery. Inorganic ions and proteins are two examples of factors that are known to influence pollen tube development or directionality. Brassinosteroids (BRs) promote cell elongation, and some BR synthesis or perception mutants have severe dwarf phenotypes[15]. BR signaling affects the development and establishment of reproductive organs, among other physiological responses.. BRs increase the quantity of ovule primordia in female plants, leading to more seeds. The pollen particles contain a large amount of vitamins,hormones, and amino acids as well. They rarely require an external source of such substances for germination and tube growth.

Several studies have shown that auxins, gibberellins, and cytokinins enhance germination and tube development. These hormonal substances strongly enhance pollen germination and pollen tube growth. Brassinosteroids, like other plant hormones, have an impact on cell elongation and division, DNA, RNA, and protein synthesis, organ enlargement and development, senescence, and stress [16;17]. All 24-EBL

concentrations tested in our study, particularly 0.1 ppm, increased pollen germination and tube development compared to the control group. Parallel to our results Research has shown that BRs improve pollen germination and development in *Prunus avium, Prunus dulcis* [18], tomato [16] and rice [19]. However, in tobacco, the growth-promoting effects of BRs on pollen are inconsistent. Also brassinosteroids increased in vitro pollen tube growth and pollen germination" A. Thaliana [20]. Furthermore, *Prunus avium, Camellia japonica*, and *Prunus dulcis* have been demonstrated to enhance pollen germination and pollen tube growth in response to brassinosteroids [21]. Brassinosteroids improved pollen germination and fruit set in rice, as well as pollen viability and loss during heat stress [22]. The researchers inveatigated that gibberellic acid, followed by epibrassinolide, had an inciting impact on grapevine pollens [23]. Also showed that adding individual growth regulators to the growth medium improved pollen germination in Cabernet Sauvignon and Merlot (*Vitis vinifera* L.) [24]. Similarly our results 0.1 ppm 24-EBL situmulated pollen germination and pollen tube growth in two currant species [25]. Pollen germination and tube development serve as useful research tools for changing morphology, biological, biotechnological, ecologically sound, progressive biochemical, organized, and molecular studies. Also, evaluating pollen performance may be important for fruit growth of genetic progeny for breeding reasons, particularly in choosing which cultivars should be applied by researchers and producers. *In vitro* pollen germination is important for determining the physiological and biochemical parameters required for pollen germination and tube development. In vitro pollen germination may be used to evaluate pollen conditions such as reserved food material, membrane conditions, and conversion rates. *In vitro* germination studies are beneficial for researching the genetic, physiological, biochemical, and cytochemical features of different plant species. These studies are also an excellent predictor of in vivo pollen behavior, but only throughout the autotrophic period, when style nutrients, carbohydrates, and plant growth regulators have little effect on the early stages of pollen germination and pollen tube extension. *In vitro* assessments aid in breeding program selection and can forecast sterility issues in commercial orchards [26].

IV. CONCLUSION

In comparison to the control group, both bioregulators provide beneficial effects at all dosages in terms of pollen germination and tube development.0.1 ppm of 24-eBL gave the highest results pollen germination and pollen tube lenght. In vivo research on fertilization biology should be pursued. Standardizing optimal conditions can improve the accuracy and ease of in vitro pollen germination. We anticipate that these findings will be valuable to scholars and producers for future breeding studies.

Değerli maden üretiminde insan güvenilirlik analizleriyle risklerin değerlendirilmesi

Nurgül Zengin[1*], Ertuğrul Ayyıldız [1]

Endüstri Mühendisliği, Karadeniz Teknik Üniversitesi, Türkiye

(nbirinci93@gmail.com)

Özet – İnsan güvenilirlik analizi , insandan kaynaklı risklerin incelenmesi ve iyileştirilmesi için kullanılan bir yöntemdir. Kazaya sebep olabilecek fiziksel, bilişsel, içsel ve dışsal faktörler üzerinde çalışmaların yapıldığı çeşitli yöntemler mevcuttur. Özellikle iş kazalarının birçoğunun insandan kaynaklandığını düşünürsek çalışmanın tehlikeli iş kolları sınıfında yer alan tüm işyerlerinde yapılması gerekmektedir. Çalışma değerli maden üretimi (trabzon hasırı) gerçekleştirilen bir firmada yapılmıştır. Trabzon hasırının en önemli özelliği insan işçiliği ile üretiliyor olmasıdır. Tel halindeki altın, örücüler tarafından iğne yardımıyla örülür. Örme işlemi biten yarı mamul atölyeye gönderilir. Kuyumculukta üretilen takılar, kullanıma bağlı olarak zamanla yüzey kalitesini yitirerek yüzeyinde kirli veya oksitli katmanlar oluşur. Bu katmanların temizlenebilmesi ve altının renginin bozulmaması için belli başlı işlemlerden geçmektedir. İşlemler esnasında birçok kimyasal madde kullanılmaktadır. Ayrıca makine ve ekipmanlar tehlike barındırdığından çalışma için bu alan seçilmiştir. Yöntemler arasında SPAR-H (Standartlaştırılmış Tesis Analizi Risk-İnsan Güvenilirliği Analizi) yöntemi uygulanmıştır. Bunun için atölyedeki tüm görevler tanımlanır. Her görev için operatörlerin performanslarını etkileyen faktörlerin seviyesi belirlenir. Bu faktörler yöntem için belirlenen faktörlerin dışında bizim tarafımızdan probleme özgü de belirlenebilmektedir. Faktör seviyeleri çarpılarak görevlerin insan hata olasılığı belirlenir. Alınması gereken güvenlik önlem ve tedbirleri firmaya bildirilir. İnsan güvenilirlik analizi, insandan kaynaklanabilecek olası hataları tespit etme ,önleme ve olasılıklarını düşürme fırsatı verir. SPAR-H yöntemi SCOPUS veri tabanında tarandığında değerli maden üretiminde bir çalışma yapılmadığını gördük. Türkiyede ise çalışmaların sınırlı olduğu, yapılan çoğu çalışmanın ise denizcilik ile ilgili olduğu gözükmektedir. Bu çalışma sayesinde literatüre değerli madenlerin işlenmesi alandaki bir çalışmanın SPAR-H yöntemi ile uygulanabilir olduğunu göstermiş olacağız.

Anahtar Kelimeler – İnsan Güvenilirlik Analizi, SPAR-H, Değerli Maden, İnsan Hata Olasılığı

I. GİRİŞ

Sanayi devriminden sonra yaşanan kazalarda ilk hedef noktası olarak teknik hatalara yoğunlaşılmaktaydı. İlerleyen yıllarda bu durum yerini, insan kaynaklı hatalara odaklanmaya bıraktı ve bu hataların çok ciddi sonuçlara yol açtığı tespit edildi. Uzmanlar insan performansını ölçmeye, performansı etkileyen nedenlere yöneldi. Böylece insan hatası olasılığını hesaplamak için çok sayıda yöntem de gelişmeye başladı.. Yapılan literatür taramasında ülkemizde konuyla ilgili fazla bir çalışmaya rastlamadık. Değerli maden üretimi (trabzon hasırı) yapan bir firmada bu yöntemler ile risk analizi yapılmıştır. Tel halindeki altın örülerek atölyeye geldikten sonra bir çok kimyasal maddenin kullanımı ile son halini almaktadır. Yöntemler arasında SPAR-H yöntemi uygulanmıştır. Bunun için atölyedeki tüm görevler tanımlanır. Her bir görev için operatörlerin performanslarını etkileyen faktörlerin seviyesi belirlenir. Bu faktörler yöntem için belirlenen faktörlerin dışında probleme özgü de belirlenebilmektedir. Risk analizi sonucunda en riskli görev ortaya çıkmaktadır.

Günümüzde halen popülaritesi devam etmekte olan Trabzon hasırının en önemli özelliği insan işçiliği ile üretiliyor olmasıdır. Bu da ürünü daha da değerli kılmaktadır. Altının işlenmesi esnasında kullanılan kimyasal maddeler ve makineler sebebiyle değerli olduğu kadar da tehlikelidir. İnsan emeği ve gücü ile ortaya çıkan bu ürün müşterilere sunulmadan önce hasır atölyesinde bir takım temizleme ve kaplama işlemlerinden geçmektedir.

Kuyumculukta üretilen takılar, kullanıma bağlı olarak zamanla yüzey kalitesini yitirerek (çizilme, kirlenme vb.) yüzeyinde kirli veya oksitli katmanlar oluşur. Bu katmanların temizlenebilmesi ve altının renginin bozulmaması için bir takım kimyasal maddeler kullanılmaktadır [1] . İmalat yapılan ve kimyasal maddelerin sıklıkla kullanıldığı sektörlerde tehlike ve riskler göz ardı edilemez. İnsanın olduğu her yerde kazaya sebebiyet verecek durumlar yaşanabilmektedir. Tüm bunlar düşünüldüğünde hasır atölyesinde insan güvenilirlik analizi ihtiyacını ortaya çıkmıştır. İnsan güvenilirlik analizi yöntemleri incelendiğinde SPAR-H yöntemi uygulanması tercih edilmiştir.

II. LİTERATÜR TARAMASI

SCOPUS veritabanında yapılan tarama sonucu Tablo 1de verilmiş olup insan güvenilirlik analizlerinden SPAR-H yöntemi 146 makale bulunmuştur bunlardan erişime açık olan 40 tanesi incelenmiştir. SPAR-H yöntemi en çok nükleer santralde daha sonra denizcilik çalışmalarında kullanıldığı görülmüştür.

Tablo 1. SCOPUS veritabanında literatür taraması

Aranan kelimeler	**Bulunan Çalışma Sayısı**
SPAR-H	160
human reliability analysis AND SPAR-H	146
precious AND metal AND human AND reliability AND analysis	8
precious AND metal AND SPAR-H	0

Jahangiri ve diğerleri (2016) İran'da bir kimya fabrikasında ki insan hata olasılığını hesaplamak için SPAR-H metodunu kullanmışlardır. Ortalama insan hatası olasılığını 0,11 olarak en yüksek insan hata olasılığı olan görevin olasılığını ise 0,50 olarak tespit etmişlerdir. Hata olasılıklarını azaltıcı tedbirler sunulmuştur. [2]

Zhao ve diğerleri (2017) Nükleer santral içindeki digital kontrol sistemi için insan güvenilirlik analizi yapmışlar. SPAR-H yöntemini uygularken Görev Karmaşıklığının buradaki kazalarda önemli yer tuttuğunu belirttiler. Karmaşıklık faktörünü PSFlerden ayırarak insan hata olasılığı hesaplamışlardır. Geliştirilmiş yöntemin standart yönteme göre daha iyi sonuç verdiğini ifade ettiler. [3]

Eyvazlou ve diğerleri (2018) İran'da bir jeneratör üretim tesisinde insan hatası olasılığını ölçmek için SPAR-H yöntemini kullanmışlardır. Görevler için 8 adet PSF'ye (performans şekillendiren faktör) göre değerlendirildi. En yüksek ve en düşük insan hata olasılığının olduğu görevler belirlendi. Bu olasılıkların azaltılması için stresin azaltılması, prosedürlerdeki eksiklerin tamamlanması, insan makine uyumunun artırılması operatörlerin tecrübeli kişilerden seçilmesi gibi önlemlerde bulunmuşlardır [4].

Zhan ve diğerleri (2019) Metro Hattı kapı operasyonları için SPAR-H yöntemini kullandılar. Standart 8 PSF için seviyelerini belirlediler. Çalışmalarının neticesinde personelin deneyim/eğitim seviyesinin iyileştirilmesinin, çalışma güvenilirliğini önemli ölçüde artıracağını öngördüler. [5]

Najafi ve diğerleri (2022) bir Nükleer Santralin ana buhar hattı kesintisi üzerine çalışma yapmıştır. İnsan hatası olasılığılını hesaplarken SPAR-H yöntemi ile olasılık değerleri tahmin edilmiştir. Çalışmanın sonuçlardan biri de kullanılabilir sürenin operatör için yetersiz olduğudur. [6]

He ve Diğerleri (2024) Çin'de labaratubar kazalarının sık sık yaşanması ve ciddi sonuçlar doğurmasından kaynaklı, bir üniversite labaratuvarında insan güvenilirlik analizi yapmışlardır. İnsan güvenilirlik metodlarından CREAM ve SPAR-H kullanmışlardır. CREAM yöntemi ile psikolojik faktörler dikkate alınarak hesaplama yapılmıştır. Çalışamının sonucunda önleyici tavsiyeler verilmiştir. [7]

III. MATERYAL VE YÖNTEM

Çalışmayı yaparken kullanılan materyalleri ve yöntemleri ayrıntılı olarak açıklayın. Farklı kaynaklardan yaptığınız alıntılar referanslarda verilmeli ve kaynak gösterilmelidir.

A. İnsan Güvenilirlik Analizi

İnsan güvenilirlik analizi yöntemleri farklılıklarından dolayı üç nesil olarak tanımlamıştır: ilk nesil 1975'ten 1990 yılına kadar , ikincisi 1990'dan 2005 yılına kadar üçüncüsü ise 2005'ten günümüze kadar devam etmektedir. Bir operasyonda tanımlı olan alt görevler için insan hatası olasılıklarını vurgulayanlar birinci nesil yöntem olarak adlandırılır. Birinci nesil teknikler, daha sofistike yöntemlerin yerini almasına rağmen, birçok endüstriyel uygulamada hala kullanılmaktadır İkinci nesil yöntemler ise, Performansı Şekillendiren Faktörleri (PSF'ler) (çalışanın bilişsel süreçlerini de içine katarak) tanımlamaktadır. Üçüncü nesil yöntemler ise bu faktörler arasındaki etkileşimlerin açıklanmasını içermektedir [8].

Catelani ve ark. (2021) çalışmasına göre, birinci nesil yöntemler genellikle görevi yapan kişilerin performanslarını başarılı veya başarısız olarak neticelendirmek üzere puanlar. İkinci nesil yöntemlerde kullanılan PSF'ler genellikle çalışanların iş yükü, stres, toplumsal sorunlar, psikolojik sorunlar, hastalık, çevresel etkiler gibi çalışma performanslarını etkileyen içsel ve dışsal faktörleri içermektedir. İnsan hatalarının nedenlerini ve ne sıklıkta gerçekleştiğini dikkate alır. Yaklaşık 20 yıl önce tanıtılan üçüncü nesil yöntemler ise, insan performansını şekillendiren faktörler arasındaki dinamik ilişkiler ve bağımlılıklarla ilgilenmektedir [9].

İnsan güvenilirlik analizi yöntemlerden bazıları aşağıdaki gibidir;

THERP: İnsan Hata Oranı Tahmini Tekniği , 1983 yılında Swain ve Guttmann tarafından geliştirilen bir HRA yöntemidir. "Olay ağacı" yaklaşımı, eylemler ve hatalar arasındaki bağımlılığın nicel modellemesine izin verir. Ortaya çıkan olay ağacı, olayların gerçekleşme sırasını ve her düğümde oluşabilecek olası hataları ifade eder [8].

SLIM: Başarı Olasılık İndeksi Yöntemi (SLIM), Embrey ve arkadaşları tarafından 1983 yılında tanıtılan ve ABD Nükleer Düzenleme Komisyonu'nun sponsorluğunda geliştirilen bir tekniktir. Bir süreçteki alt görevlerin başarı veya başarısızlık olasılığını değerlendirmeyi amaçlar; SLIM uygulamasında, PSF'ler önemlerine göre ağırlıklandırılır. PSF etkisinin doğru ölçeklendirilmesi, SLIM analizinin kritik bir yönüdür[8].

HEART: İnsan Hatası Değerlendirme ve Azaltma Tekniği (HEART) 1986 yılında Williams tarafından tanımlanmıştır. HEART tekniği, nükleer endüstri, havacılık, demiryolu, tıp ve kimya gibi çeşitli endüstrilerde yaygın olarak uygulanmaktadır. HEART tekniği, ortak görev türleri ve Hata Üreten Koşullar (EPC'ler) ile ilgili bir anket içerir. Yönteme göre, ortak görev türleriyle ilgili otuz sekiz hata üreten koşul ve dokuz insan hata olasılığı değeri vardır. İnsan güvenilirliği göreve bağlı olarak değerlendirilir [8].

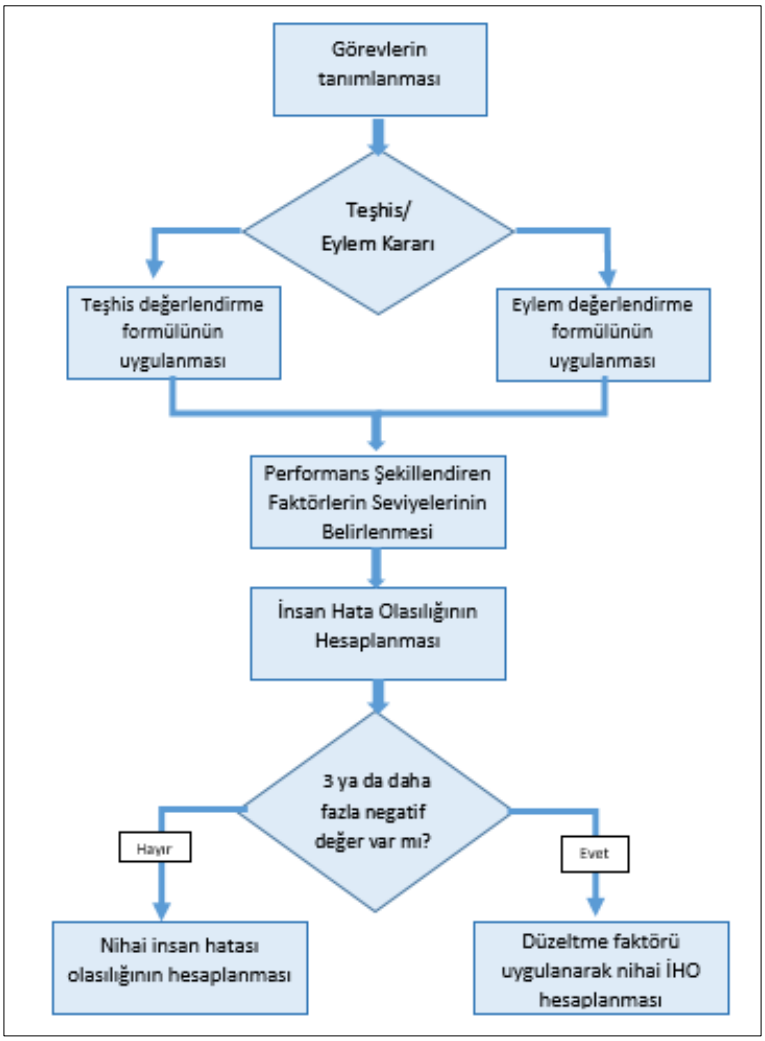
SHERPA: Sistematik İnsan Hatası Azaltma ve Tahmin Yaklaşımı , Embrey (1986) tarafından geliştirilmiştir ve ilk olarak nükleer enerji üretim endüstrisinde uygulanmıştır. Genel bir süreci alt görevlere dönüştürür ve olası hata modlarını belirlemek için bir sınıflandırma sistemi sağlar [8].

CREAM: Bilişsel Güvenilirlik ve Hata Analizi Yöntemi, 1998 yılında Eric Hollnagel tarafından önerilmiştir. CREAM'in insan hatası değerlendirme teknikleriyle karşılaştırıldığında temel avantajları, zihinsel süreçlerin insan performansındaki önemini belirlemek için bilişsel bir modelin dahil edilmesi; ve her adımda hem ileriye dönük hem de geriye dönük olarak analiz etme yeteneği [8].

B. SPAR-H Yöntemi

SPAR-H (standartlaştırılmış tesis analizi risk-insan güvenilirliği analizi) tekniği, ABD nükleer düzenleme komisyonu tarafından 1994 yılında tanıtıldı ve 1999'da son halini aldı. Yöntemin amacı, insan güvenilirliği açısından bir tesisteki belirli görevler için hata olasılığını, nominal hata oranını, Performans Şekillendirme Faktörünü ve görevler arasındaki hata bağımlılığını hesaplamaktır. SPAR-H yöntemi birinci nesil ve ikinci nesil insan güvenilirliği analizi yöntemlerinin yetersiz kaldığı noktalarda, hepsini kapsayan ve araalrındaki etkileşimi açıklayan üçüncü nesil analiz yöntemidir [10].

SPAR-H yöntemi genel adımları aşağıdaki şekilde gösterilmiştir.



Şekil 1. SPAR-H yöntemi uygulama akış diyagramı

Adım 1. Görevler tanımlanır.

Adım 2. Görevlerin eylem mi teşhis mi olduklarına karar verilir.

Adım 3. PŞF seviyeleri belirlenir. SPAR-H insan hata olasılığını ölçmek için sekiz PŞF önermektedir. Bunlar;

- Kullanılabilir Zaman: PŞF'sinin değerlendirilmesinde ilgili görevi tamamlamak için gereken süre ile mevcut süre karşılaştırılır.
- Stres faktörü: aşırı ısı, gürültü, yetersiz havalandırma veya kimyasala maruz kalma gibi kişide stres yaratacak çevresel faktörlerdir.
- Karmaşıklık, görevin ne derece zor olduğunu ifade eder.
- Tecrübe ve eğitim için, göreve dahil olan operatör(ler)in tecrübe ve eğitimi seviyelendirilir. Operatör eğitim aldığı halde yetersiz geldiği durumlarda bu PŞF olumsuz seviye ile ilişkilendirilir.
- Prosedür, tanımlanan görevler için resmi bir işleyiş belgesinin varlığını ve kullanımını ifade eder.
- Ergonomi işin insana uyumudur. Sadece ekipmanlar değil bilgisayar yazılımı gibi bileşenler de de bu PŞF'ye dahildir. Göreve uygunluk, operatörün yaptığı işe bedenen ve zihnen uygunluğudur.
- İş Süreçleri, çalışanlar arasındaki iletişim, planlama, ve yönetim desteği dahil iş yapmanın tüm yönlerini ifade eder. [11]

Adım 4. İnsan hata olasılığı hesaplanır. Her bir hata türü için nominal hata olasılıkları (NİHO), sırasıyla teşhis için 0,01 ve eylem için 0,001 olarak tanımlanmıştır. Bir PŞF'nin insan performansı üzerinde etkisi yoksa nominal olarak yani çarpanı 1 olacak şekilde seviyelendirilir.

İHO= 0,01x her bir PSF seviyesi (1)

Eğer üç yada daha fazla olumsuz seviye varsa denklem 2 kullanılır.

$$\text{İHO}=\frac{N\text{İ}HO.PSF_{bileşen}}{N\text{İ}HO\ (\ PSF_{bileşen}-1)+1} \quad (2)$$

Tablo 2. Teşhisler için PSF Seviyeleri

PSFs	**PSF Seviyeleri**	**Teşhis için Çarpan**
Kullanılabilir Zaman	Yetersiz Zaman	100
	Yaklaşık yeterli zaman (≈ 2/3 x nominal)	10
	İdeal Zaman	1
	Ekstra Zaman (yarım saat 1 saat)	1
	Aşırı Zaman> 2 katı kadar	0.1
	Yetersiz Bilgi	
Stres	Aşırı	5
	Yüksek	2
	Nominal	1
	Yetersiz Bilgi	1
Karmaşıklık	Yüksek Karmaşıklık	5
	Orta Derecede	2
	Nominal	1
	Belirgin adımlar	0,1
	Yetersiz Bilgi	1
Tecrübe/Eğitim	Düşük	10
	Nominal	1
	Yüksek	0,5
	Yetersiz Bilgi	1
Prosedürler	Mevcut değil	50
	Eksik	20
	Mevcut ancak zayıf	5
	Nominal	1
	Mevcut ve yeterli	0,5
	Yetersiz Bilgi	1
Ergonomics/ İnsan Makine Uyumu	Eksik	50
	Zayıf	10
	Nominal	1

IV. UYGULAMA

Uygulama için Uğurlu Kuyumculuk Trabzon hasır atölyesi seçilmiştir. Altın telinin istenen uzunluk ve ölçüde örülmesinden sonra atölyeye gönderilir ve sırasıyla aşağıdaki işlemler uygulanmaktadır.

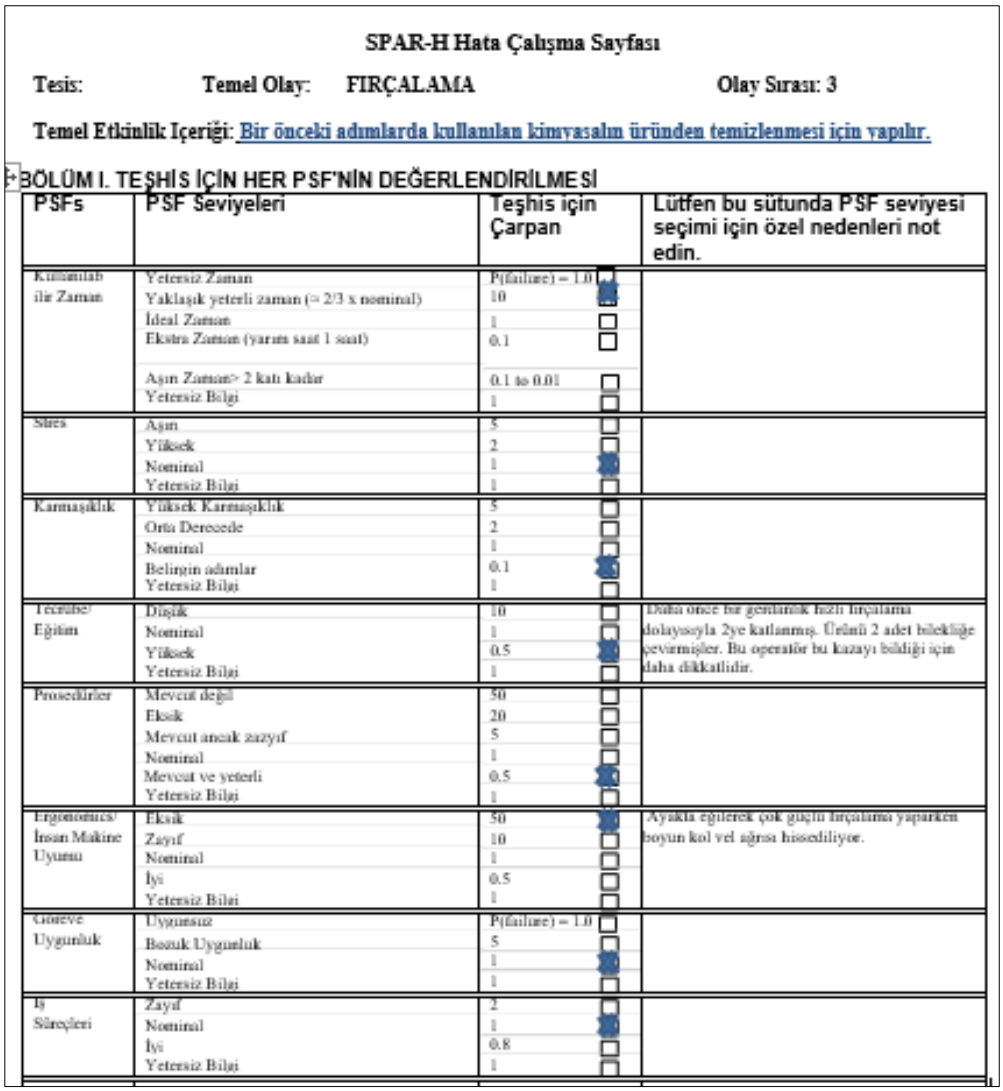
1. Tavlama : Altının yumuşaması istenilen yapıya gelmesi için yapılmaktadır.
2. Sıcak Zaç Yağı : Ateş gören altın kararır. Sülfirik asit ve su ile ürün temizlenir.
3. Patlatma: Hidrojen, siyanür ve sıcak su ile patlatma makinesine ürün yerleştirilerek üstündeki tüm pislik temizlenmektedir.
4. Fırçalama: Bir önceki adımlardan üzerinde kalan kimyasalı temizlemek için deterjan kullanılarak yapılır. Fırçalama işlemi basit gözükse de sürekli aynı yönde yapılması gereken kol kuvveti gerektiren bir işlemdir. Bu işlemde fırçanın sert olmasından dolayı ürünün hasar alma ihtimali yüksektir.
5. Cilalama: Ürünün parlaması için cila makinesi kullanılır. Ellerin makineye çok yakın olduğu parmakların sürtünmeden dolayı hasar alma olasılığı yüksek bir işlemdir.
6. Cırcır: Cila lekelerini temizlemek için kimyasal suya sabun katarak tekrar temizlik yapılır.
7. İslim: Basınçlı su buharı ile üründe kalan yabancı maddeler temizlenir.
8. Soğuk Zaç Yağı: Cırcırda kullanılan sabunun üründe kalmaması için bu suya batırılarak temizlenir.
9. Yaldızlama: Ürünün temizlik işlemi bittikten sonra, bakır teller yardımıyla sıcak kimyasal karışım için yapılan kaplama (renklendirme) işlemidir. Bu aşamada fosfat, sülfit, karbonat, siyanür, kezzap, tuz ruhu, kostik ve bir miktar toz altın kullanılmaktadır.Yaldızlama öncesi ve sonrası ürün renk değişimi aşağıdaki gibidir;

Şekil 2. Yaldızlama öncesi ve sonrası ürün rengindeki değişim

Ürünün renginde kızarıklık olması durumunda bu ürünün yeterince temizlenmediği anlamına gelir. Böyle bir durumda patlatma işlemine dönerek adımlar takip edilir.

V. BULGULAR

Her görev için PSF seviyeleri belirlendikten sonra Denklem 1 ve denklem 2 kullanılarak İHO değerleri hesaplanmıştır Teşhis için her performans faktörünün değerlendirilmesi aşağıdaki form örneğinde gösterildiği gibi doldurulmuştur. Örnekte “fırçalama” görevi gösterilmiştir . Hasır atölyesinde uygulanan SPAR-H yöntemi sonucunda insan hata olasılığı değerleri Şekil 4te verilmiştir. En yüksek görev 0,29 olasılık ile patlatma çıkmıştır. Ardından 0,20 olasılık ile yaldızlama, 011 insan hata olasılığı ile cilalama işlemi gelmektedir. Patlarma görevinin yüksek hata olasılığa sahip olmasının başlıca sebepleri; proesdür eksikleri ve işin insana uyumundaki eksiklerdir. Ayrıca bu görev için operatörün alduğı eğitim yetersiz gelmektedir. Operatör geçmişte patlatma makinesinde iş kazası meydana geldiğini de ifade etmiştir.



SPAR-H Hata Çalışma Sayfası

Tesis: Temel Olay: FIRÇALAMA Olay Sırası: 3

Temel Etkinlik İçeriği: Bir önceki adımlarda kullanılan kimyasalın üründen temizlenmesi için yapılır.

BÖLÜM I. TEŞHİS İÇİN HER PSF'NİN DEĞERLENDİRİLMESİ

PSFs	PSF Seviyeleri	Teşhis için Çarpan	Lütfen bu sütunda PSF seviyesi seçimi için özel nedenleri not edin.
Kullanılabilir Zaman	Yetersiz Zaman	P(failure) = 1.0	
	Yaklaşık yeterli zaman (= 2/3 x nominal)	10

İslim	0,1	1	0,1	1	5	0,5	1	1	0,00
Soğuk Zaçyağı	0,1	1	0,1	1	5	0,5	1	1	0,00
Yaldızlama	10	5	5	1	1	10	1	1	0,20

Şekil 4. Nihai insan hatası olasıkları

VI. TARTIŞMA

Ulusal tez merkezinde daha önce hasır atölyesinde SPAR-H ile yapılmış insan güvenilirlik analizi çalışmasına rastlanmamıştır. Ülkemizde sadece 2022 yılında sigortalı çalışanların 589.271 adeti iş kazası geçirmiştir. Bunların 1.520 tanesi ise ne yazık ki ölümle sonuçlanmıştır[12].

İş kazalarının sayısının her geçen yıl artması sebebiyle insan güvenilirlik analizinin önemi de artmıştır. Çalışma ortamının çok sayıda yanıcı ve yakıcı kimyasal barındırmaktadır. İnsan hata olasılığını artırdığını düşündüğümüz havalandırma , yorgunluk, ara ürün kalitedi gibi faktörlerin de PSFlere dahil edilmesi uygun olacaktır. Şekil 5'te görülen patlatma makinesinde çalışan operatörün daha önce iş kazası geçirdiği öğrenildi. Ürün atlama riskine karşı makineye bir cam kapak önerisinde bulunuldu. İçindeki maddelerin yanıcı etkisi bulunmakta olduğundan alınacak önlemler ile insan hata olasıkları azaltacaktır. İkinci en yüksek hata olasılığı çıkan görev ise yaldızlama aşaması olmuştur. Bu işlem esnasında iki elin sabit kalması gerektiğinden ergonomi seviyesi olasılığı artıran önemli bir faktör olmuştur. Ayrıca yaldızlama temizlik ve renklendirmenin son aşaması olduğundan genellikle bu görevdeki sürenin yetersiz olduğu ifade edilmiştir. Bu da insa hata olasılığını olumsuz anlamda etkilemiştir.

Şekil 5. Patlatma Makinesi

VII. SONUÇLAR

Bu çalışma ile ilk defa değerli maden üretiminde SPAR-H yöntemi kullanılmış olacaktır. Ayrıca ülkemiz madenler açısından çok zengin bir bölgeye sahiptir. İnsan hatası ciddi kazalara yol açabilmektedir. İnsan güvenilirliği analizi insan hata olasılığını hesaplayarak aslında bize daha önlenebilir riskleri göstermektedir. Bu yöntemin uygulanabilir olduğunu göstererek diğer alanlarda da güvenilirlik analizi yapılması için yol açmış olacağız. Çalışmanın birçok sektörde olduğu gibi değerli maden işlenen bu sektörde de iyi sonuçlar verdiği ortaya çıkmıştır. SPAR-H yönteminin avantajları kullanımının kolay olması ve kullanıcının uzman gerektirmemesidir.

Yöntem sekiz standart performans şekillendiren faktörü içermektedir. Çalışmayı probleme özgü farklı performans faktörleri ile geliştirebiliriz. Bunun için operatörler ile beyin fırtınası yaparak insan hatasına sebep olan faktörler belirlenerek insan güvenilirlik analizindeki diğer yöntemler ile de çalışmayı ele alabiliriz. Çalışmada faktörlerin eşit önem seviyesinde olduğu düşünülerek yapılmıştır. Uzman görüşü ile ağırlıklar değiştirilebilir.

Bilinen değerli metallerden biri olan altının işlendiği bu atölyede yaşanacak insan hatası, maddi ve manevi olumsuz sonuçlara yol açabilmektedir. Bu yüzden de hata olasılığının düşük olması önemlidir. SPAR-H yönteminin uygulandığı bu çalışma sektör için özgün bir çalışma olmuştur.

HEART MONITORING DEVICE: Electrocardiography

Arafa MAHAMAT YOUNOUS[*1], Modou CEESAY[1] and Mutlu Tekir[1]

[1]*Medical Engineering, Karabuk University, TÜRKİYE*

[*]*(arafajose1@gmail.com) Email of the corresponding author*

Abstract – This project aims to measure heart electrical activity and save lives through early diagnosis by making the final product widely accessible for everyone to own their own device. The electronic sensor used in the project accurately detects heart rate and transmits this data to a microcontroller. The microcontroller processes and displays the data in a user-friendly manner on screen, enabling users to easily monitor their own heart health. The latest version of the product has been successfully tested on five different users with positive results, demonstrating its reliability and effectiveness. Another crucial objective of our project is to ensure the product is affordable by minimizing costs, thus reaching a broader audience. This initiative will empower more individuals to identify and proactively address potential health risks through early diagnosis. Looking ahead, as this innovative approach gains traction in the healthcare industry, awareness and accessibility to heart health will continue to improve.

Keywords – heart electrical activity, electronic sensor, microprocessor, affordable healthcare.

I. INTRODUCTION

The heart is a fist-shaped organ located in the chest [1]. It has four chambers—two atria and two ventricles—that are responsible for the vascular circulation of blood throughout the body, making it one of the vital organs of the human body. The prevalence of cardiovascular diseases (CVDs) globally is linked to the failure of the heart's functioning. This underscores the critical need for accessible and efficient monitoring solutions as device, therefore an electrocardiography device called ECG [2].

An ECG, or electrocardiogram, is a medical test that measures and records the electrical activity of the heart over a period. This non-invasive test is commonly used to detect and monitor various heart conditions by recording the electrical impulses generated by the heart's natural pacemaker (the sinoatrial node) as they spread through the heart muscle.

Traditional ECG systems, while effective, often pose challenges in terms of cost, portability, and user-friendliness. This literature review explores recent advancements and existing technologies in portable ECG monitoring, aiming to highlight gaps that can be addressed by innovative solutions like the one proposed in this study.

Cosoli G. et al. [3] discusses the development of a portable ECG monitoring system utilizing wireless technology for real-time data transmission. It emphasizes the system's effectiveness in remote monitoring and its impact on improving patient compliance and outcomes. Tai Le; H. Han; T. Hoang; Vu C.N and C. K. N. discuss in "A low cost mobile ECG monitoring device using two active dry electrodes.” the use of two active dry electrodes is used as touch sensors. A buffer circuit is applied to remove the over-sensitivity effect of the electrodes, this showing the use of more components means a little bit more cost [4].

While existing studies have made significant strides in portable ECG monitoring, the proposed system in this study stands out in several ways: Leveraging the Arduino UNO board and AD8232 sensor, the system

is designed to be lightweight and easily deployable in various settings, making it accessible to a broader population. By utilizing open-source hardware and software components, the system aims to reduce manufacturing costs without compromising on functionality or accuracy. The graphical user interface (GUI) provides real-time visualization of ECG data, enhancing user interaction and facilitating proactive management of heart health. Integration of advanced signal processing algorithms ensures accurate parameter extraction, improving diagnostic capabilities and enabling timely intervention.

II. MATERIALS AND METHOD

The ECG monitoring system developed for this study integrates several key components to facilitate portable and effective cardiac monitoring.

Arduino UNO Board is the core of the system, handling data processing and user interaction then AD8232 Sensor is utilized for signal acquisition directly from the patient via electrodes, capturing cardiac electrical activity also electrodes are used for contact to the patient's skin to ensure optimal signal acquisition for ECG monitoring. Amplification Circuit is embedded within the AD8232 sensor sense the electrical activity of the heart and converts it into usable type of data, i.e digital data ,conditions and amplifies raw ECG signals to improve signal quality. Arduino UNO board is connected to Graphical Display Unit (PC) via USB port to provide real-time visualization of processed ECG signals using Arduino IDE's Serial Plotter. Finally as power supply, the used computer supplies necessary electrical power to all components of the system, ensuring continuous operation.

ECG signals are acquired using the AD8232 sensor connected to electrodes placed on specific body locations. The sensor's integrated amplification circuit ensures signals are conditioned to enhance quality and facilitate accurate parameter extraction. The sensor pin L0+ and L0- are connected to the digital pins D10 and D11, Ground pin and 3.3 V pins from the sensor are connected respectively to ground pin and 3.3 V pins of the Arduino board, finally we also connect the output pin of the sensor to analog pin A0 of the microprocessor[5]. The code will in the first time check with L0+ and L0- connection setup if there is leads-off connection, if not then reads analog input from A0 and send the value and finally delay for fourty seconds to prevent saturating serial data. Electrodes cconnected to the sensor’s board are attached to patient skin with gel(so wet electrodes), respectively according to Eindhoven triangle, right and left hand and then to roght leg as grounfd of the circuit[6].ECG signal are displayed are called electrocardiogram [7]. Processed ECG signals and extracted parameters are displayed in real-time on a graphical unit connected to the Arduino UNO board via Arduino IDE's Serial Plotter. This immediate visualization allows for real-time monitoring and assessment of the patient's cardiac activity. Signal processing algorithms implemented on the Arduino UNO board include digital filtering techniques to reduce noise and enhance the clarity of ECG waveforms. These algorithms are crucial for accurate parameter extraction, such as heart rate and rhythm analysis. The system's software is developed using the Arduino IDE, providing an integrated development environment for programming the Arduino UNO board. This environment supports the implementation of signal processing algorithms and real-time data visualization through its Serial Plotter feature.

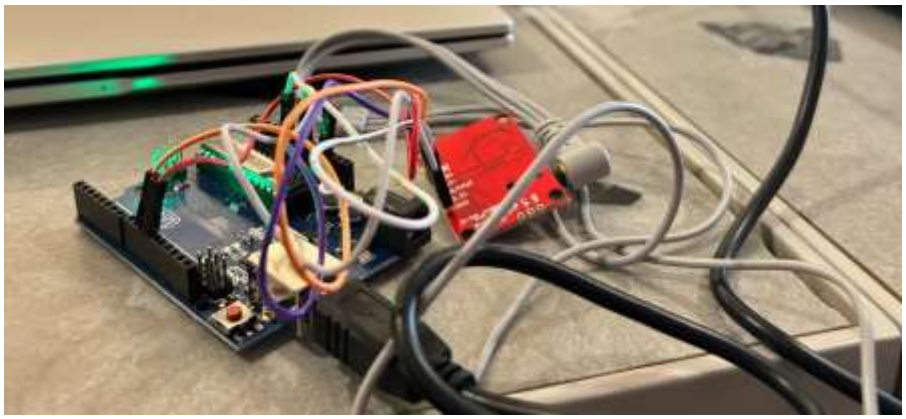

Fig. 1 connection between Arduino Uno Board and AD8232 Sensor

III. Results and Discussion

In summary, ECG monitoring system utilized in this study effectively acquired, processed, and visualized cardiac signals in real-time. It accurately extracted key parameters such as heart rate and rhythm, demonstrating high correlation with standard medical devices. While the system showed promising clinical feasibility and performance metrics, challenges such as signal artifacts require further refinement.

Future iterations could focus on improving signal processing algorithms to enhance noise reduction and incorporating wireless communication for seamless data transmission. Overall, this system represents a promising tool for early detection with implementation of Machine Learning tools for accurate, early and precise heart disease and continuous monitoring of cardiovascular health, with implications for improving patient outcomes and reducing healthcare costs.

Fig 2: Electrocardiogram displayed on Arduino IDE Serial Plotter [8].

IV. CONCLUSION

In conclusion, the development of a portable, cost-effective, and user-friendly ECG monitoring solution is essential to address the limitations of traditional bulky equipment, particularly in continuous monitoring outside clinical settings. Using Arduino Board and biosensor enable getting electrical signal from heart to proceed diagnosis. Further implementation of machine learning methods to this device will help with accuracy in diagnosis for healthcare.

Acknowledgment

We would like to acknowledge the invaluable contributions and support that made this study possible. Our sincere thanks go to:

- **Arduino Community**: For developing the Arduino UNO board, which served as the backbone of our ECG monitoring system for data processing and user interaction.
- **Supervisor**: to our project Supervisor Mutlu Tekir guiding us until the accomplishment of the project
- **Teachers**: to Ahmet Reşit KAVSAOĞLU and Abdullah Talha SÖZER for their expertise in developing the signal processing algorithms, assembling the hardware components, and conducting rigorous testing.
- **Karabük University Support**: For providing the necessary resources and facilities to carry out this research effectively.

Yarn Design as an Influencing Factor on the Tensile Properties of Sports Materials

Ivana Salopek Čubrić*, Barbara Zrno

University of Zagreb Faculty of Textile Technology, Croatia

**ivana.salopek@ttf.unizg.hr*

Abstract – Sports physiology, a branch of sports medicine, studies how the body responds and adapts to physical activity. Coaches must understand modern scientific knowledge in sports and related disciplines to optimize training and care for athletes' health, while the sportswear must assist in the retaining of optimal comfort during the activity. Football jerseys, once simple garments for team distinction, have evolved into high-tech equipment designed for performance, breathability, and moisture management. Initially made of cotton, jerseys now use synthetic materials, transforming them into crucial tools for player comfort and advertising space for brands. In this study, tensile properties of different knitted fabrics produced of polymer yarns were tested. The results indicated that the inclusion of elastane increases the fabric's flexibility and stretch but results in a reduction in breaking strength. A fabric made of 100% polyester yarn exhibits the highest breaking strength, particularly in the wales direction. Adding elastane to polyester fabrics significantly enhances their elongation properties, making them more stretchable and durable under stress.

Keywords – yarn, fabric, material, polymer, tensile, properties

I. INTRODUCTION

Sports physiology is part of sports medicine (a branch of medicine that includes all types of sports and physical exercise), and deals with the study of the organism and body functions related to the response and adaptation to physical activity. In order for a coach to contribute in the best way to all aspects of leading and training a football team, he must be familiar with modern professional and scientific knowledge in the field of sports, as well as other related scientific disciplines. A good knowledge of the physiological processes related to sports training and competition enables the coach not only to better program the training process and better results, but also to take better care of the health of his athletes [1]. Usually, during a football match, a player finishes the game with a wet shirt. In football, one can burn as many as 752 - 937 calories per hour. Football is great for supporting healthy bones, physical motor skills, or building healthy self-confidence. Sport requires body work and running, among other things, the result and teammates motivate one to have better results [2]. Sweating during physical activity is completely natural because the body needs to cool down.

When it comes to football jerseys, it's not only appearance and design that matters, but also functionality. Football jerseys are an important piece of equipment for both players and fans. The latest technological innovations that provide players with the best performance, breathability and laser production of specially located meshes keep the body cooler in the places where it heats up the most. A special production system also controls the player's sweating, where high breathability is enabled so that the sweat is transferred from the skin to the outer part of the jersey, where it evaporates faster and does not bother the player. On the parts of the body where the most heat is generated, such as the armpits, there are laser-cut openings and

mesh, which provide additional breathability to these parts [3]. At the beginning of the development of football, the meaning of football jerseys was not great. The players were usually dressed in white short-sleeved T-shirts, and the teams recognized each other by their caps, which were in different colors [4]. This lasted until 1870 and the establishment of the English FA Cup competition. That competition attracted unprecedented media attention, so the spectators demanded that t-shirts be worn to distinguish the teams from each other. The colors were chosen according to the club or school that the team represented. The poorer teams wore simple white shirts, while the richer ones could afford jerseys in different colors. The players would bear the cost of acquiring the jerseys themselves until football became professional when the clubs started to provide the necessary equipment. It was then that a process was started that has been perfected to the extent that jerseys are no longer just a means of recognition and equipment, but real aids to players that facilitate their performance [4].

The jerseys worn by players at the beginning of the twentieth century were made of durable, natural fibers, most often cotton, and were produced in different colors. Wide vertical and horizontal stripes were often seen on the jerseys, which became a very popular design. In the thirties of the 20th century, in Great Britain, numbers began to be placed on the jerseys to indicate the position in which the player plays, which quickly spread to the rest of the world. In the middle of the twentieth century, natural materials began to be replaced by light synthetic materials. During the following decades, different designs of jerseys were alternated, which especially came to the fore in the 1980s, when large sports companies began to produce jerseys emphasizing their brands on them. With the entry of large sports companies into the jersey production business, the era began when the jersey was no longer just an article of clothing, but also an advertising space. In those years, jerseys were made of durable low-mass polyester [4].

Although the field of sportswear materials is very interesting and intriguing, the number of related studies is still limited. Recent studies have focused at investigation of mechanical properties and its retention over time [5-7].

II. MATERIALS AND METHOD

In the Experimental part of this paper, the analysis of materials used for the football sportswear, primarly jerseys was conducted. The materials consisted of different ray materials, i.e. 100% polyester yarn, as well as the combination of polyester and elastane in different ratios. The details of the used materials are shown in Table 1.

Table 1. Overview of materials

Material ID	Yarn composition	Nominal mass per unit area, g/m^2
F10	92% PES, 8% EA	197
F11	84% PES, 16% EA	180
F15	100% PES	126
F16	100% PES	150
F17	100% PES	130

All selected materials were tested for tensile properties, focusing at breaking force and breaking elongation. The Statimat M tensile tester from the German company Textechno was used to test the breaking force and elongation of the knitting, and the test was performed in accordance with the HRN ISO 2062:2009 standard [8]. The tensile tester is fully automated, microprocessor-controlled, which works according to the principle of constant stretching speed. It is equipped with the Testcontrol computer system, which provides static evaluation of measurement data and adjustment of test conditions. The printout of the computer program contains the following data used in the test, for example stretching force (1000 N), distance between clamps (amounts to 100 mm), stretching speed (100 mm/min), preload (0.00 N) and number of measurements (5). The tensile tester contains two clamps, the spacing of which was 100 mm for testing this thesis.

For testing, the specimen is inserted inside the upper clamp and fixed to the lower clamp. Than the tensile tester is started, and the lower clamp starts moving downwards. From the moment the sample is stretched, the computer program records the parameters: breaking elongation (%), breaking force (N), work until breaking (N*cm), strength (cN/mm) and time until breaking (s). When the sample breaks, the computer program reads all the results and prints them graphically. For each material sample, five tests were carried out in the dry state, five in the wet state and for each in the direction of the row and row of meshes. In order to obtain samples in the wet state, they were made identically to those in the dry state, but it was necessary to dip them in a previously prepared artificial sweat solution. The purpose of this test was to compare the quality and relationship of materials, as well as the suitability of such materials for sports purposes, i.e. football jerseys. Fabrics intended for sportswear should possess certain properties when sweating, in such a way that they absorb sweat quickly, while not making the material heavier.

Fig. 1 Phases in material testing using tensile tester [9]

III. Results and Discussion

The figures 2 and 3 show the breaking forces of different knitted fabric compositions measured in two directions: courses (i.e. horizontal) and wales (i.e. vertical), measured in dry and wet conditions [9].

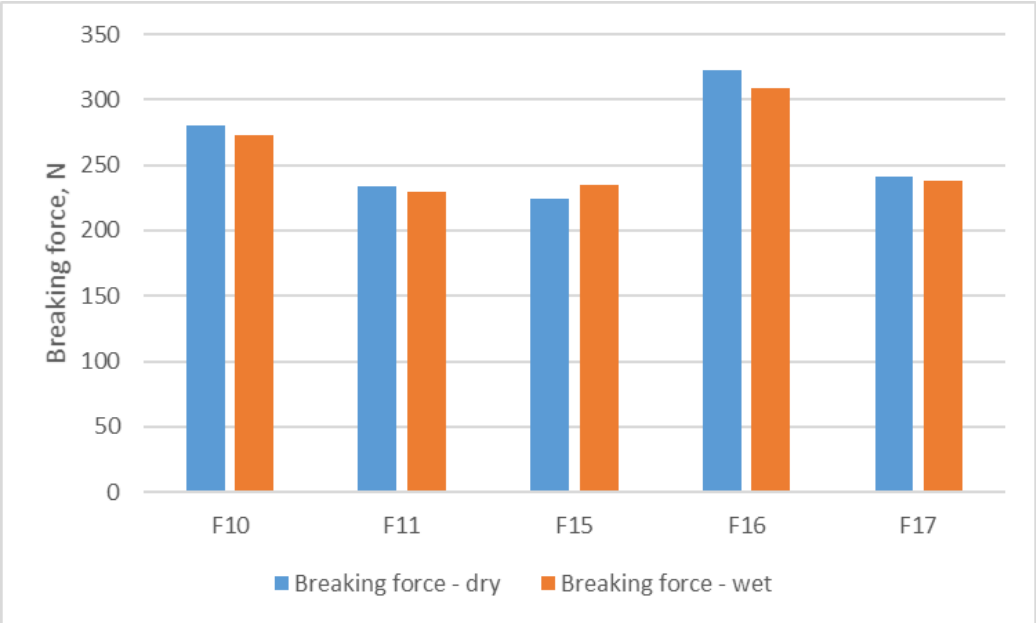

Fig. 2 Breaking force of fabrics measured in the direction of courses

As can be seen from the results, breaking force in dry condition and direction of courses is highest for 100% PES (323 N) and lowest for 100% PES (224 N). The fabrics with elastane have intermediate breaking forces, with the 92% PES and 8% elastane combination being stronger than the 84% PES, 16% elastane combination. Breaking force in wet condition for the same measurement direction is again highest for 100% PES (309 N) and lowest for 84% PES, 16% elastane (230 N). The trend is similar to the dry condition results, with the fabric containing less elastane (92% PES, 8% elastane) showing higher strength compared to the one with more elastane (84% PES, 16% elastane).

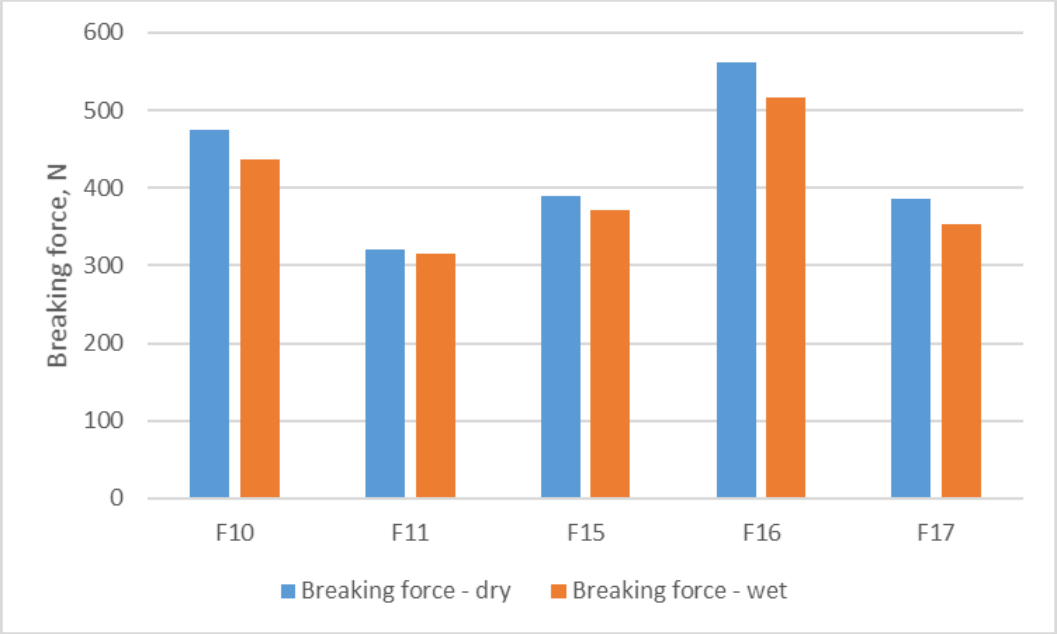

Fig. 3 Breaking force of fabrics measured in the direction of wales

Breaking force in dry condition for the direction of wales is highest for 100% PES (561 N) and lowest for 84% PES, 16% elastane (321 N). The fabric with 92% PES and 8% elastane shows a higher breaking force compared to the one with more elastane. In wet condition, for the same direction of measurement, the breaking force is highest for 100% PES (517 N) and lowest for 84% PES, 16% elastane (316 N). Similar to the dry conditions, the fabric with less elastane (92% PES, 8% elastane) is stronger than the one with more elastane.

Within these measurements, the influencing effects can be observed at four different levels, i.e.:

- effect of elastane plating,
- effect of knitted fabric mass per unit area,
- effect of measuring direction (wales vs. courses)
- effect of condition (dry vs. wet).

As far as the effect of elastane content is concerned, fabrics with lower elastane content (92% PES, 8% elastane) generally have higher breaking forces compared to fabrics with higher elastane content (84% PES, 16% elastane), both in dry and wet conditions. This indicates that increasing elastane content reduces the breaking strength of the fabric.

Among the 100% PES samples, there is variability in the breaking force. One sample consistently shows the highest breaking forces (323 N in courses dry, 309 N in courses wet, 561 N in wales dry, and 517 N in wales wet), suggesting that the mass per unit area of this fabric results in superior strength.

Regarding the influence of measuring direction, it was seen that breaking forces are generally higher in the wales direction compared to the courses direction for all fabric compositions. This suggests that the fabric is stronger along the vertical structure compared to the horizontal.

Finally, regarding the measurements in wet vs. dry conditions, it is seen that the breaking forces are slightly lower in wet conditions compared to dry conditions for most compositions, indicating that the fabric's strength is somewhat compromised when wet. However, the reduction is not drastic.

Overall, the data suggests that while the addition of elastane adds flexibility and stretch to the fabric, it reduces its breaking strength. The pure polyester fabric demonstrates the highest strength, particularly in the wales direction.

The results of measured breaking elongation are shown in figures 4 and 5.

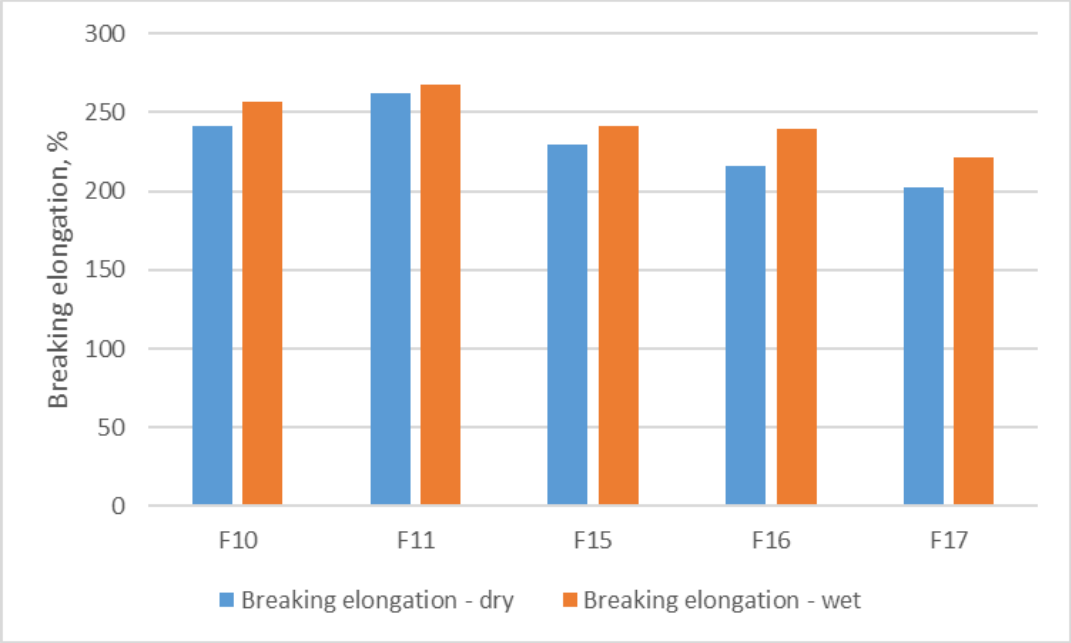

Fig. 4 Breaking elongation of fabrics measured in the direction of courses

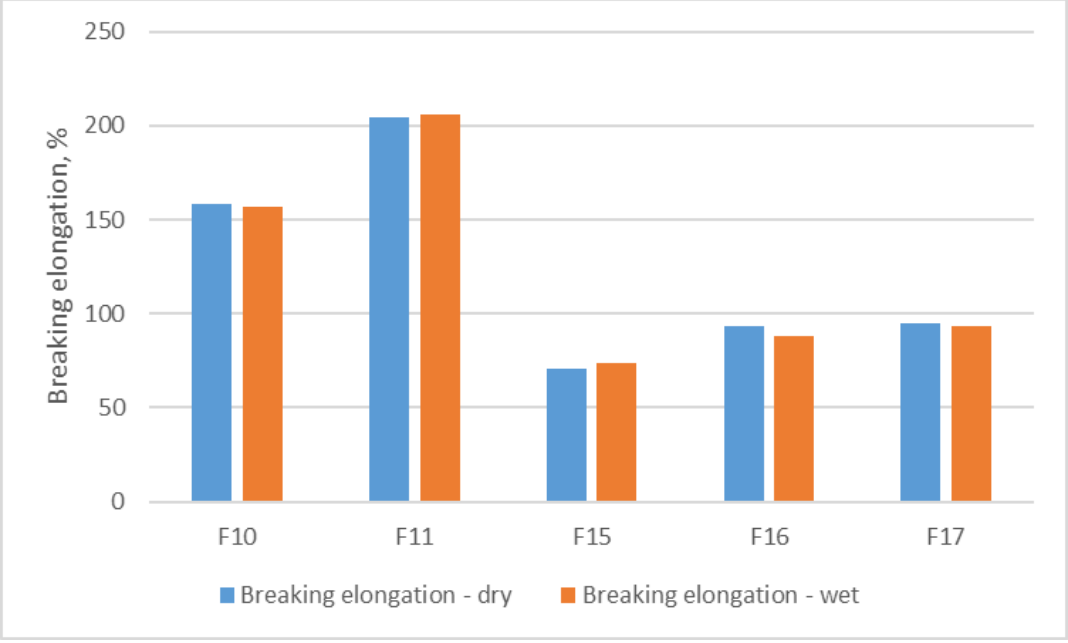

Fig. 5 Breaking elongation of fabrics measured in the direction of wales

Fabrics with elastane (either 8% or 16%) show higher breaking elongation values in both the dry and wet conditions compared to those with 100% PES. The fabric with 84% PES, 16% elastane consistently shows the highest breaking elongation across all conditions and measuring directions. Breaking elongation values in the courses direction are generally higher than those in the wales direction. Wet conditions result

in slightly higher breaking elongation compared to dry conditions across all fabric compositions and directions.

This analysis indicates that adding elastane to polyester fabrics significantly enhances their elongation properties, making them more stretchable and durable under stress.

IV. CONCLUSION

The results of the study have brought to the following concluding remarks:

- the inclusion of elastane increases the fabric's flexibility and stretch but results in a reduction in breaking strength.
- pure polyester fabric exhibits the highest breaking strength, particularly in the wales (vertical) direction.
- adding elastane to polyester fabrics significantly enhances their elongation properties, making them more stretchable and durable under stress.

The outcomes of the study are further to be used when designing highly functional materials for optimal performance of athletes.

Abstract – A simple method for synthesising efficient ternary nanocomposites samples based on Mg, Zn and Co has been divesting using hydrothermal method, Mg molar fractions were varied to observe their effect on the nanostructured materials. The nanocomposites were characterized using structural. XRD diffraction confirmed the formation of different complex crystalline nanocomposite phases MgO, ZnO, Co_3O_4, while FTIR, identified the vibration modes and provided information on functional groups and chemical bands present in samples. An investigation into the photocatalytic degradation of methylene blue (MB) in an aqueous environment using nanocomposites containing magnesium (Mg), zinc (Zn), and cobalt (Co) revealed a composition-dependent photocatalytic efficiency. Notably, the nanocomposite with the highest Mg content exhibited superior photocatalytic activity compared to the initial sample with a lower Mg concentration. This enhanced performance can be attributed to the advantageous electronic properties and increased surface area associated with Mg. These factors promote the generation of reactive oxygen species (ROS) under light irradiation, leading to more efficient MB degradation. Furthermore, a synergistic effect between Mg and the other constituent elements may contribute to improved charge carrier separation and reduced recombination rates of photogenerated electron-hole pairs. This ultimately translates to a faster degradation of the MB pollutant. As a result, Mg-rich nanocomposites hold significant promise as efficient photocatalysts for water treatment applications.

Keywords – Hydrothermal synthesis, X-Ray Diffraction, Nanostructure, mixed-phase, photocatalysis

I. INTRODUCTION

Nanocomposites have garnered significant attention in recent years due to their unique properties and potential applications across various fields, including environmental remediation, energy conversion, and catalysis [1-2]. Photocatalysis has emerged as a promising and eco-friendly technique for the degradation of many organic pollutants[3]. However, current photocatalytic systems face challenges that limit their industrial applications, such as limited visible light utilization, rapid charge recombination, and the low migration ability of photo-generated electrons and holes [4]. To address these issues, various elements, including noble metals, transition metals, non-metals, and metalloids (e.g., graphene, carbon nanotubes, and carbon quantum dots), are doped into photocatalysts as co-catalysts to enhance photodegradation performance [4].

Photocatalysis activity operates through two primary mechanisms: oxidation and reduction reactions in the presence of a photocatalyst. Efficient photocatalytic reactions require photogenerated holes in the valence band (VB) with high oxidation power and photogenerated electrons in the conduction band (CB)

with sufficient reduction power. These fundamental processes can be illustrated using the photocatalytic degradation of organic dyes such as Methylene Blue (MB) [5].

Magnesium oxide (MgO), zinc oxide (ZnO), and cobalt oxide (Co_3O_4) are three vital transition metal oxides (TMOs) widely reported for various applications, including CO oxidation, photocatalysis, biosensors, supercapacitors, fuel cells, batteries, and solar cells [6]. These TMOs are favored due to their physiochemical and electrocatalytic properties, such as their high surface-to-volume ratio, chemical stability, structural variety, non-toxicity, and intrinsic catalytic activity. Mixed metal oxides (MMOs), which consist of two or three transition-metal cations in various nanostructures, have attracted significant attention in electroanalytical techniques due to their improved electrocatalytic activity compared to their individual component oxides [6] [7].

The synthesis of MMOs has been reported using various methods, including the sol-gel technique, the molten salt method, co-precipitation, electrospinning, and the hydrothermal method. In this work, we demonstrate a one-pot hydrothermal synthesis of MgO/ZnO/Co_3O_4 ternary mixed metal oxides. The aim of this study is to synthesize samples of MgO/ZnO/Co_3O_4 nanocomposites using the hydrothermal method and evaluate their photocatalytic activity for the degradation of Methylene Blue dye. This research seeks to enhance our understanding of photocatalytic mechanisms and improve the performance of nanocomposite photocatalysts for environmental applications.

II. Materials and Method

1. Sample preparation

A single-step hydrothermal synthesis method was utilized to fabricate a magnesium-zinc-cobalt (Mg-Zn-Co) ternary nanocomposite oxide. Stoichiometric amounts of magnesium acetate tetrahydrate ($Mg(CH_3COO)_2 \cdot 4H_2O$), zinc acetate dihydrate ($Zn(CH_3COO)_2 \cdot 2H_2O$), cobalt acetate tetrahydrate ($Co(CH_3COO)_2 \cdot 4H_2O$), and urea ($CH_4N_2O$) in a 1:1:1:1 molar ratio were employed as precursors. These precursors were dissolved in deionized (DI) water under continuous stirring to achieve a homogeneous solution. The resulting mixture was maintained at ambient temperature for 30 minutes to ensure complete dissolution and mixing of the precursors.

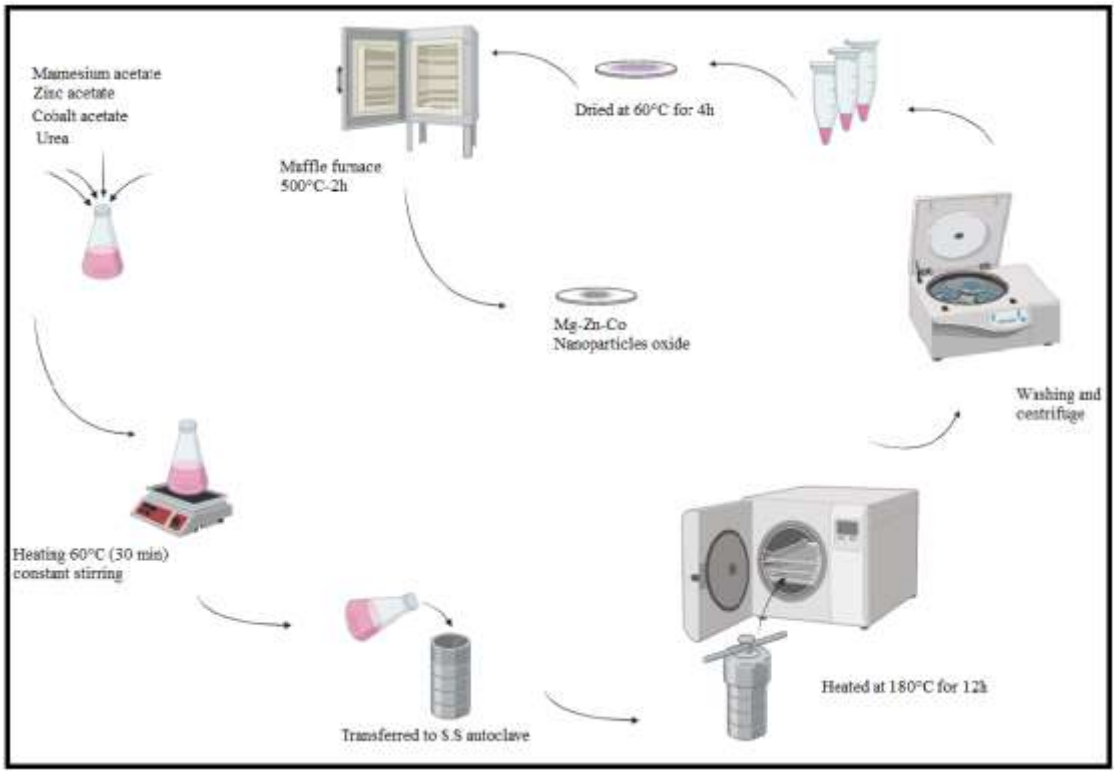

Figure 1. Synthesis of Mg-Zn-Co nanocomposite oxide by Hydrothermal method

Subsequently (Figure 1), the homogeneous solution was transferred to a Teflon-lined stainless steel autoclave and subjected to hydrothermal treatment at 180 °C for 12 hours. Upon completion of the reaction, the autoclave was allowed to cool naturally to room temperature. The resultant solid product was isolated by centrifugation, followed by thorough washing with DI water and ethanol to remove any residual byproducts or unreacted precursors. The washed product was then dried in an oven at 60 °C for 4 hours to eliminate residual solvent. Finally, the result powder was subjected to calcination at 500 °C for 2 hours in air to yield the Mg-Zn-Co nanocomposite oxide. Following the same experimental protocol, three samples with different Mg compositions are prepared, as given by Table 1.

Table 1. Molar fraction ternary samples composition

Samples	**ECH 1**	**ECH 2**	**ECH 3**
Mg:Zn:Co	1 :1 :1	2 :1 :1	3:1 :3

2.a. Characterization methods

The crystallographic phases present in the synthesized nanocomposites were meticulously analyzed using X-Ray Diffraction (XRD) and Fourier Transform Infrared (FT-IR) spectroscopy. XRD measurements were performed on an XPERT-PRO diffractometer to investigate the crystal structure and identify the presence of specific crystalline phases. The diffractometer was operated under controlled conditions with a Cu Kα radiation source (λ = 1.5405 Å) at an accelerating voltage of 45 kV and a current of 40 mA. The diffraction patterns were collected over a 2θ range of 10° to 80° with a step size and scan rate optimized for peak resolution and data quality. The measurements were conducted at a constant temperature of 25 °C to ensure reproducibility. In addition to XRD analysis, FT-IR spectroscopy was employed using a Jasco FT/IR-6300 instrument to characterize the functional groups present in the nanocomposite samples. FT-IR spectra were acquired in the mid-infrared region (400-4000 cm^{-1}) with a high resolution of 4 cm^{-1} for accurate identification of vibrational modes. The scanning speed was set at 2 mm/s to optimize the signal-to-noise ratio, particularly for analyzing surface functional groups.

2.b. Photocatalytic activity measurements

For the investigation of the photocatalytic properties of Mg-Zn-Co nanocomposites, methylene blue (MB) was selected as a model water pollutant. The degradation of MB by Mg-Zn-Co nanocomposites was conducted in a photocatalytic reactor equipped with a 265 nm visible lamp and a quartz tube with a capacity of 100 mL. An aqueous solution of MB (100 ppm) and the fabricated catalyst (10 mg) were subjected to photocatalysis in the quartz reactor at ambient temperature under UV light irradiation.

Prior to irradiation, the prepared suspension was sonicated in the dark to ensure proper dispersion and to establish adsorption–desorption equilibrium between MB and the catalyst. Following this, 2 mL of the centrifuged solution was extracted from the reactor, and its absorbance was measured using a UV-Vis spectrophotometer. The absorbance was recorded at a wavelength of 649 nm within the spectral range of 300–800 nm over a period of 170 minutes.

III. RESULTS AND DISCUSSION

1. XRD Results

The X-ray diffraction (XRD) patterns presented in Figure 2 confirm the formation of crystalline phases corresponding to magnesium oxide (MgO), zinc oxide (ZnO), and cobalt oxide (Co_3O_4) in the synthesized nanocomposites. The MgO phase is identified by its characteristic diffraction peaks at 2θ values of 37.0°, 42.9°, 61.9°, and 64.3°, corresponding to the (111), (200), (220), and (544) reflections of a single-phase

cubic system (JCPDS database card numbers: 087-0653, 030-0794). The Co_3O_4 phase exhibits cubic crystal structure, as evidenced by peaks at 30.8°, 37.9°, 47.5°, 51.0°, 55.4°, 56.3°, 65.2°, and 73.9°, which can be indexed to the (220), (311), (400), (422), (511), (440), (531), and (642) planes, respectively (JCPDS database card numbers: 74-1656, 80-1443, 30-1533). Additionally, the XRD pattern reveals the presence of ZnO nanoparticles with a hexagonal crystal structure, evident from peaks at 31.7°, 34.4°, 68.3°, 72.7°, and 76.0°, corresponding to the (100), (002), (101), (004), and (200) reflections (JCPDS database card numbers: 75-1565, 79-0205).

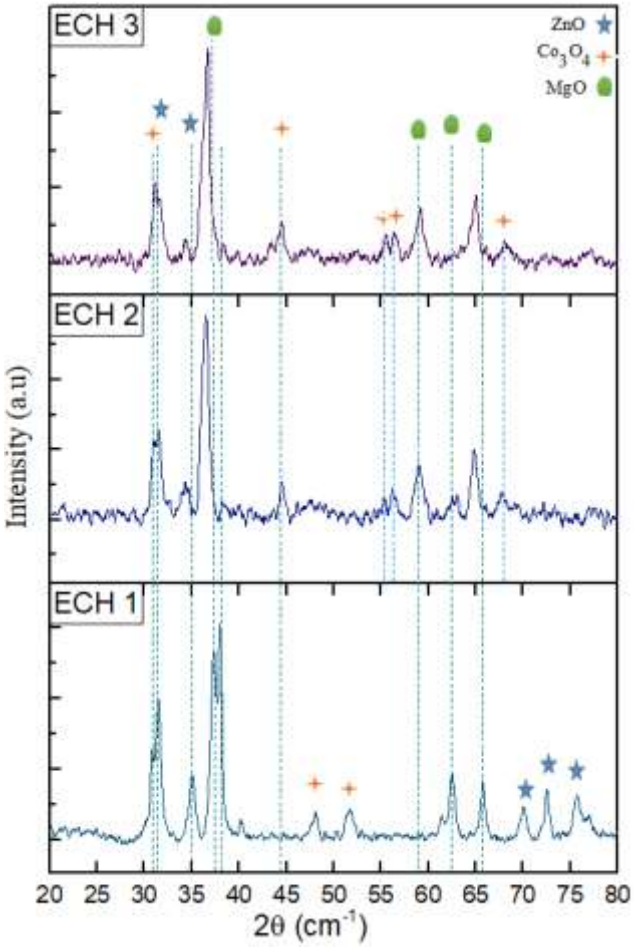

Figure 2. XRD pattern for the samples synthesis

It is worth noting that the observed variations in peak intensities within the XRD patterns can be attributed to two key factors. Firstly, differences in the magnesium concentration between the samples can influence the relative abundance of each crystalline phase. Secondly, the interaction and mutual influence between the three metal oxide phases: MgO, ZnO, and Co_3O_4 may also contribute to these intensity variations. These interactions, along with changes in concentration, can affect the crystal structure and preferential orientation of the crystallites within the samples, ultimately leading to the observed variations in the diffraction patterns.

The Scherrer equation (1) was employed to calculate the crystallite size of the samples [8]:

$$D = \frac{K\lambda}{\beta COS\theta} \qquad (1)$$

Where D id the crystallite size, K is a dimensionless ship factor (0.9), λ is the X-ray wavelength (1.5406), θ is the Bragg angle, and β is the full width at half maximum intensity (FWHM).

Table 2. Average crystallite size of the synthesized samples

Crystallite size	Samples		
	ECH1	ECH2	ECH3
D(nm)	13.91	15.13	15.16

This analysis revealed an initial crystallite size of 13.91 nm. Interestingly, an increase in magnesium concentration (Figure 3) resulted in a larger crystallite size of 15.13 nm and 15.16. The introduction of magnesium may have promoted the growth of larger crystallites through two possible mechanisms. Firstly, the presence of additional magnesium ions could provide more nucleation sites, facilitating the formation of a greater number of crystallites [9]. Secondly, magnesium might enhance the diffusion processes during crystal formation, allowing existing crystallites to grow larger [10]. Furthermore, the interaction between magnesium ions and the other metal oxides (ZnO and Co_3O_4) could also influence the crystallization dynamics. This interaction might facilitate the aggregation and subsequent growth of existing crystallites.

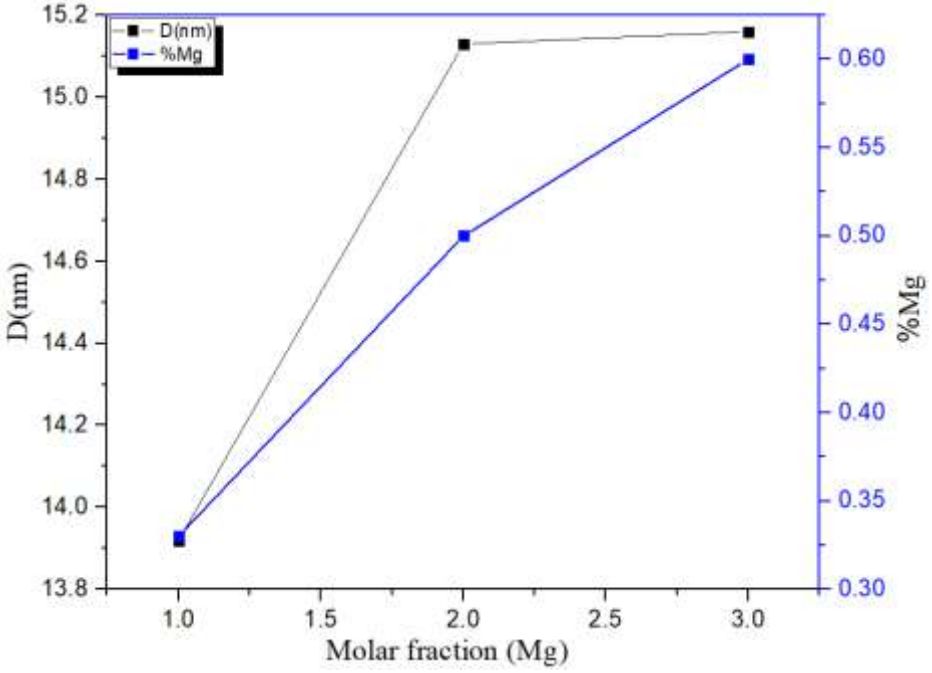

Figure 3. Comparison between the percentage of Mg in the samples and the size of the crystallites in them

2. Ftir spectroscopy

Figure 4 presents the Fourier Transform Infrared (FTIR) spectra of the ternary nanocomposites synthesized using the hydrothermal method. These spectra reveal the characteristic vibrational modes of the chemical bonds present within the materials. Several absorption peaks are observed, including a prominent band at 2330 cm^{-1}. This band can be deconvoluted into two contributing peaks at 2337.3 cm^{-1} and 2360.4 cm^{-1}, which are present in all spectra. The combined band is attributed to the C-O bond stretching vibration, suggesting the presence of adsorbed carbon dioxide (CO_2) from the surrounding atmosphere [11]. Additionally, a peak at 495 cm^{-1} is observed in all spectra, corresponding to the Mg-O bond in the MgO phase [12]. Notably, the intensity of this peak varies with the composition of the samples, being particularly pronounced in samples 2 and 3, which contain the highest magnesium content. Another peak associated with the MgO phase is observed at 548 cm^{-1} in the spectrum of sample 1[13]. Additionally, the peaks located at 560 cm^{-1}, 575 cm^{-1} and 662 cm^{-1} in the spectra of MgZnCo ternary nanocomposites are associated respectively with OB3 (B represents Co^{3+} in an octahedral hole) and ABO (A represents Co^{2+} in a tetrahedral hole) in the in the Co_3O_4 phase [14] [15]. Finally, peaks at 500, 510, and 557 cm^{-1} appear in most spectra, corresponding to vibrations of the Zn-O bond in the ZnO phase [16] [17] [18].

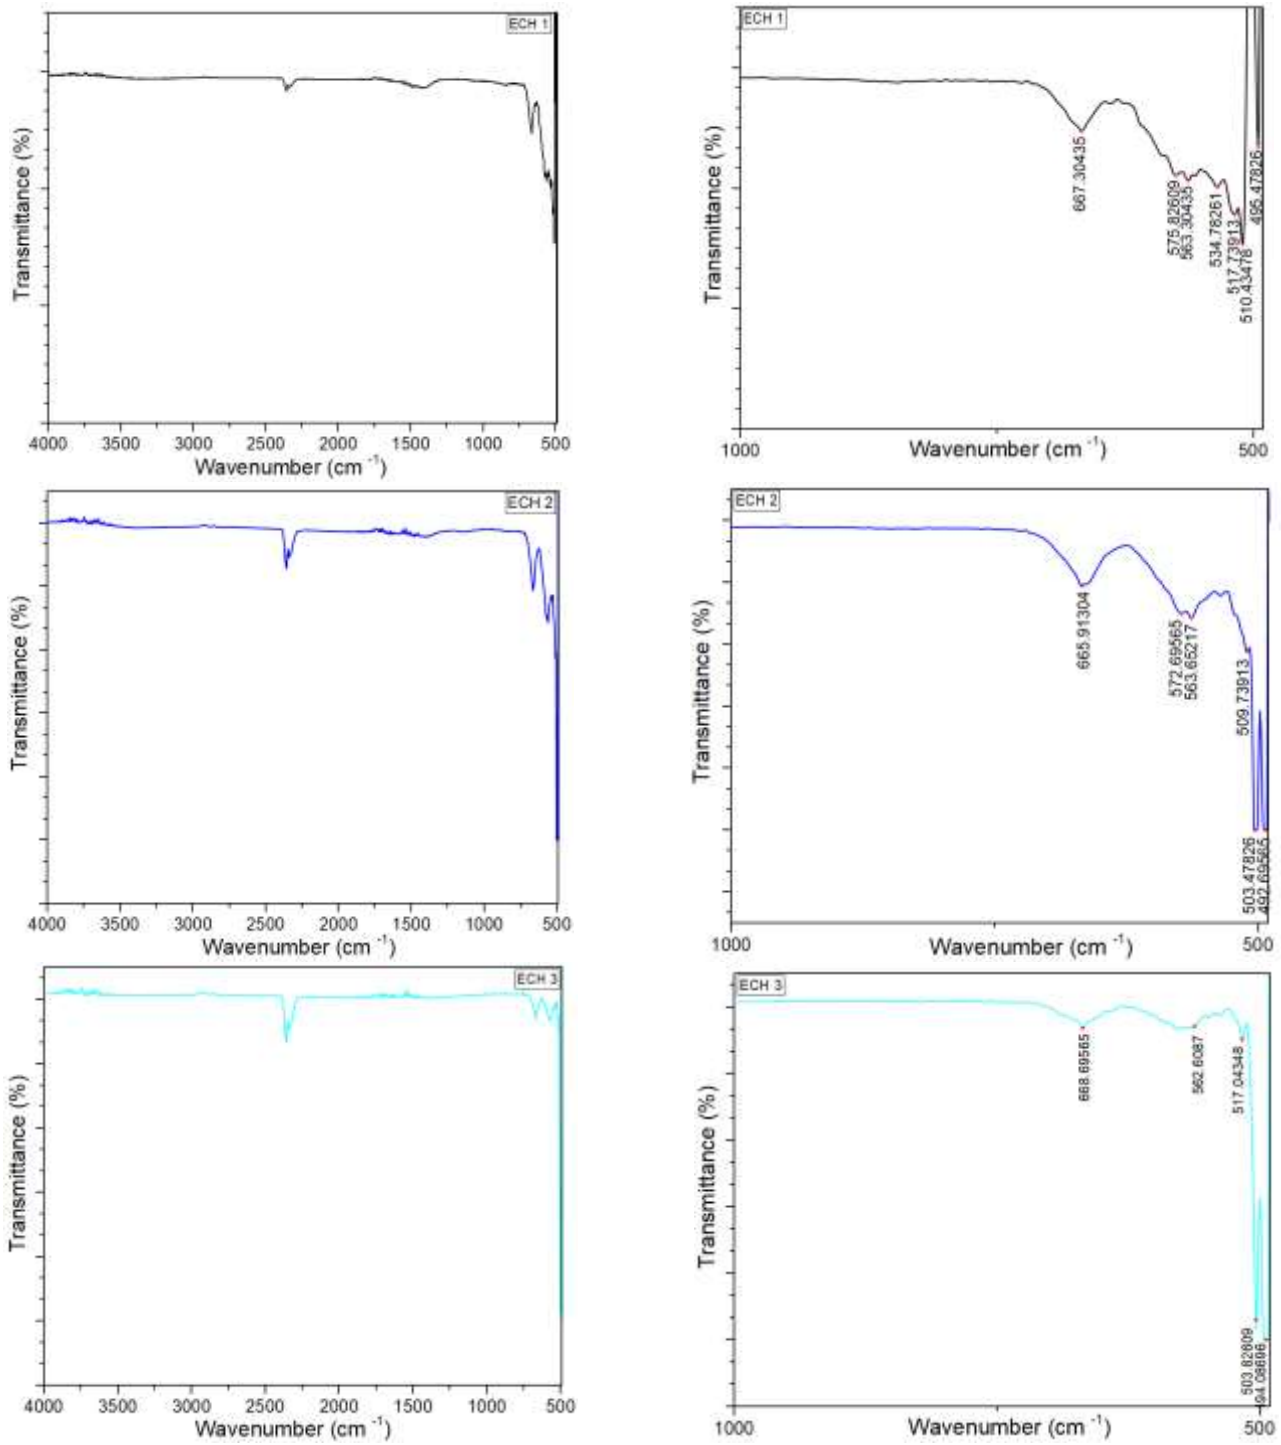

Figure 4. FTIR spectra of the studied samples

3. Photocatalytic degradation of MB

The photocatalytic properties of Mg-Zn-Co nanocomposites with varying cobalt concentrations were investigated through the decomposition of methylene blue (MB). The photodegradation of MB was studied by monitoring changes in absorbance at a wavelength of 649 nm at different time intervals. Figure 5 illustrates the time-dependent absorption spectra of MB aqueous solutions under visible light irradiation with Mg-Zn-Co nanocomposites.

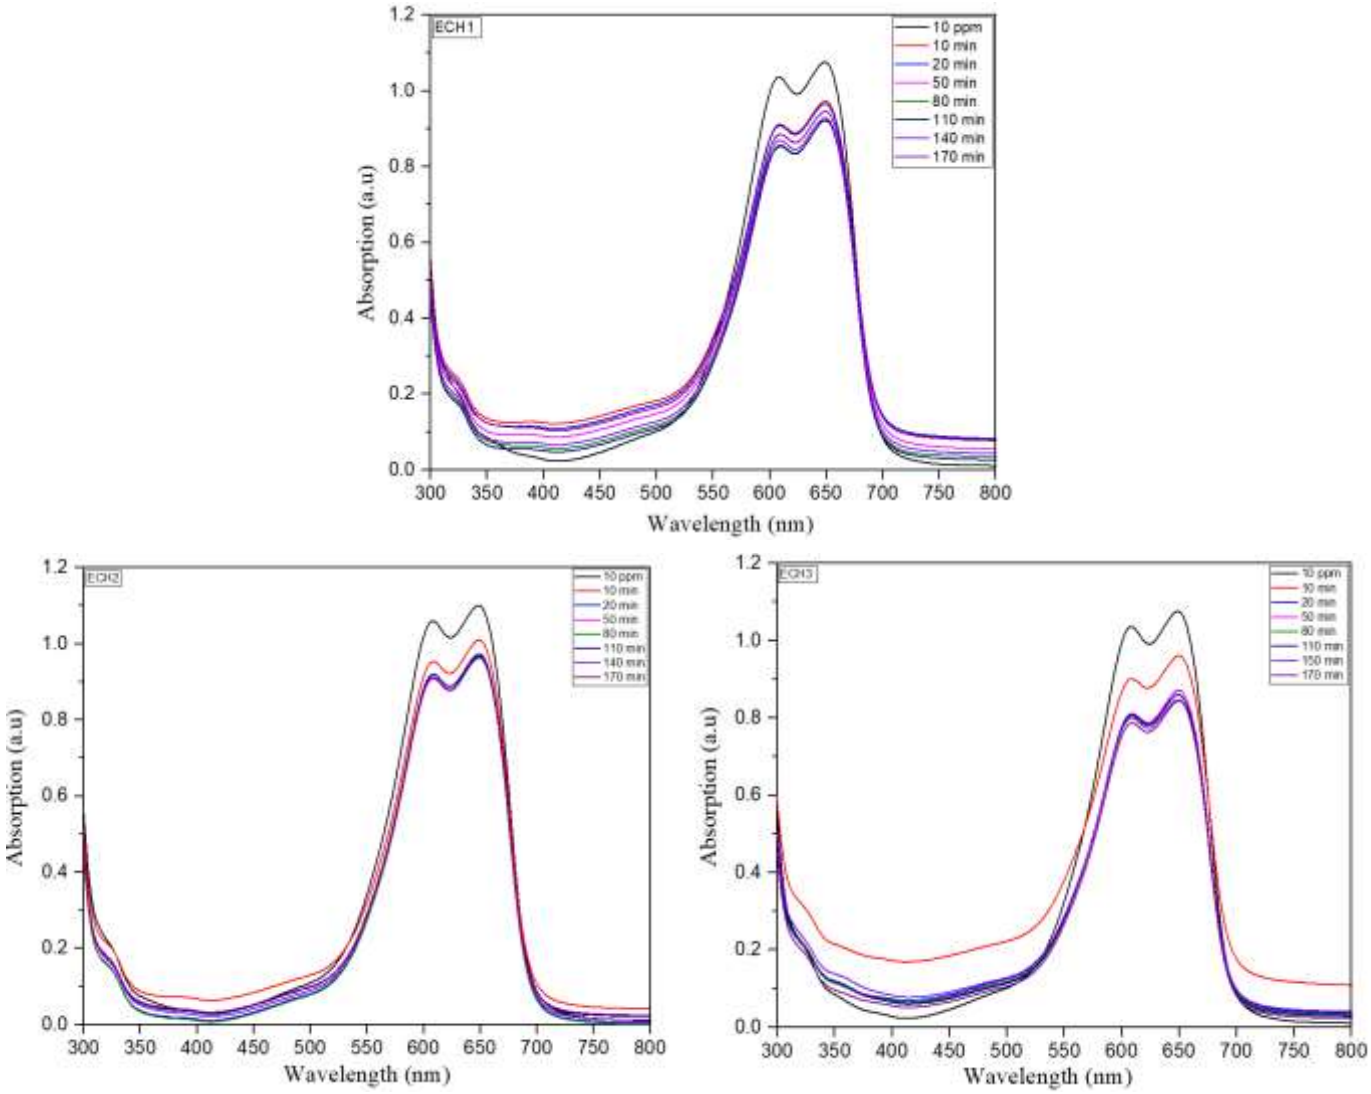

Figure 5. UV–visible absorption spectra of photodegradation of MB for the nanocomposites samples

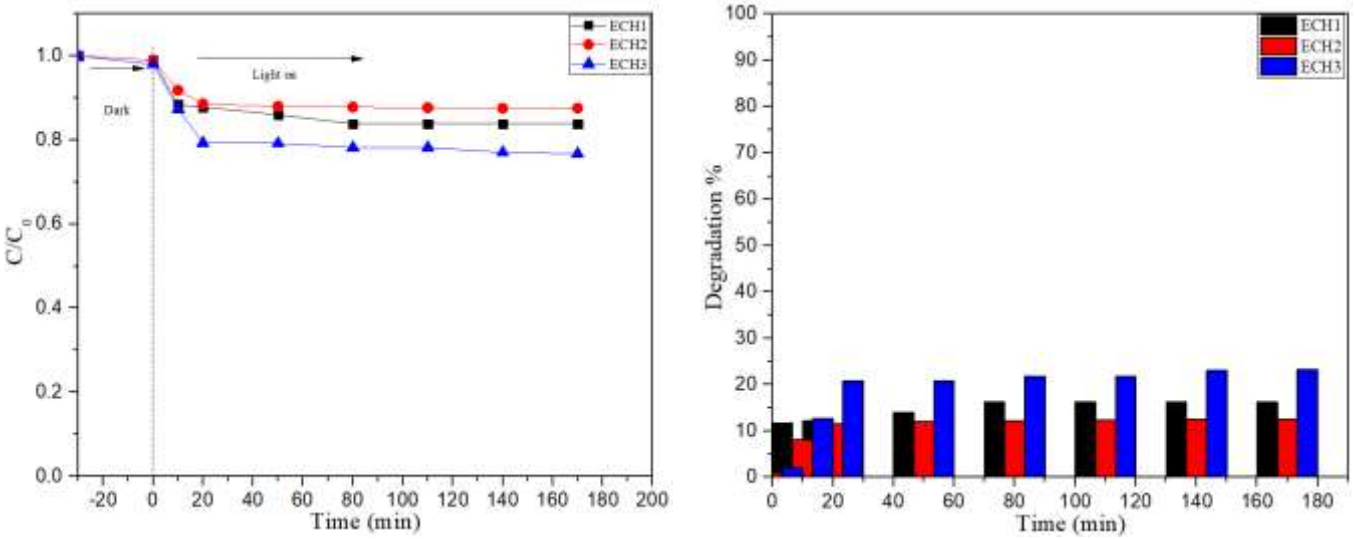
Analysis of the curves in Figure 5 reveals a slight decrease in the purification percentage, with the absorbance (DO) of MB reducing from 1.1 to 0.83 (ECH1), 0.87 (ECH2), and 0.76 (ECH3). It is evident from Figures 6.a that higher magnesium concentrations in the nanocomposites (ECH3) yield improved photocatalytic performance compared to the initial sample (ECH1). Specifically, the maximum absorbance of the MB solution decreased with increased illumination time, and the maximum degradation (~24 %) was achieved after 170 minutes of irradiation for ECH3.

To further elucidate the relationship between photocatalysis and cobalt concentration in Mg-Zn-Co nanocomposites, studies on the relative concentration (C/C_0) of MB were conducted. Figure 6.b depicts the relative concentration (C/C_0) of MB as a function of irradiation time, where C represents the concentration of MB at a given irradiation time (min), and C_0 denotes the initial dye concentration before irradiation. During the magnetic stirring of the suspensions in the dark for 30 minutes to establish adsorption/desorption equilibrium of MB on the sample surfaces, only a slight decrease in MB concentration was observed. This indicates that the adsorption of MB on the nanocomposite surfaces is limited after equilibrium is reached [19].



(a) (b)

Figure 6. (a) C/C_0 vs time (min) plot for the photodegradation of MB, and (b) Percentage degradation of MB dye as a function of time (min)

With the light on and in the sample containing the highest concentration of magnesium, magnesium can influence the band gap of the photocatalyst material, potentially optimizing it for better light absorption, particularly in the visible range. This improved light absorption can lead to a higher generation of electron-hole pairs, which are essential for photocatalytic reactions [19] [20]. Additionally, Mg may enhance charge separation by introducing favorable defects or altering the electronic structure of the photocatalyst. Improved charge separation reduces the recombination rate of electrons and holes, allowing more charge carriers to participate in the degradation of MB [21]. Furthermore, Mg can affect the morphology and surface area of the photocatalyst, with a higher surface area providing more active sites for the photocatalytic reaction, resulting in more efficient MB degradation [22]. Finally, the interaction between Mg, Zn, and Co could produce synergistic effects that enhance overall photocatalytic performance. Mg might modify the electronic structure or surface properties of Zn and Co, leading to improved photocatalytic activity.

IV. CONCLUSION

This study aimed to synthesize mixed metal oxide (MMO) ternary nanocomposites based on Mg, Zn, and Co using the hydrothermal method and to investigate their photocatalytic activity. By varying the Mg molar fractions, the effects on the nanostructured materials were observed. The resulting nanocomposites were thoroughly characterized using various techniques. X-ray diffraction (XRD) confirmed that the samples had a complex crystalline structure consisting of various crystalline phases, including MgO, Co_3O_4, and ZnO, and indicated variations in the average sizes of the nanoparticles. Fourier transform infrared spectroscopy (FTIR) identified the vibration modes and provided information on the functional groups and chemical bonds present in the samples. The photocatalytic activity of the nanocomposites was tested using Methylene Blue (MB) as a model pollutant. The results showed a reduction in the absorbance (DO) of MB from 1.1 to 0.83 (ECH1), 0.87 (ECH2), and 0.76 (ECH3), indicating that higher magnesium concentrations in the nanocomposites (ECH3) yielded improved photocatalytic performance compared to the initial sample (ECH1). Specifically, the maximum absorbance of the MB solution decreased with increased illumination time, and the maximum degradation (~24%) was achieved after 170 minutes of irradiation for ECH3. These findings suggest that the synthesized MgO/ZnO/Co_3O_4 nanocomposites are future effective photocatalysts with potential applications in environmental remediation and pollutant degradation.

Özet **–**Diyabet, vücudun kan şekeri seviyelerini düzenleme yeteneğini etkileyen kronik bir hastalıktır ve tedavi edilmediğinde veya yetersiz yönetildiğinde çeşitli ciddi komplikasyonlara yol açabilmektedir. Beksagliflozin, diyabet tedavisinde kullanılan ve yeni piyasaya sürülen bir etken maddedir. Bu çalışmada Beksagliflozin'in moleküler yapısını, elektronik özelliğini ve kimyasal reaktivitesini daha detaylı incelemek amacıyla kuantum kimyasal hesaplamaları gerçekleştirilmiştir. Beksagliflozin'in optimize moleküler geometrisi, B3LYP fonksiyoneli ve 6-311G(d,p) temel seti ile DFT yöntemi uygulanarak hesaplanmıştır. Molekülün moleküler elektrostatik potansiyel (MEP) diyagramı ve sınır moleküler orbitalleri (HOMO/LUMO) de aynı metot ve temel set kullanılarak elde edilmiştir. Moleküler elektrostatik potansiyel diyagramından Beksagliflozin'in yapısındaki elektrostatik potansiyelin yüksek ve düşük olduğu bölgeler belirlenmiştir. Gerçekleştirilen hesaplamalar molekülün HOMO-LUMO bant boşluk enerjisi değerinin 5,280 eV olduğunu göstermiştir. Beksagliflozin'in molekül içi kovalent olmayan etkileşimleri (NCI) de hesaplanmış ve yapıda bulunan hidrojen bağı, Van der Waals etkileşimi ve sterik etki içeren bölgeleri belirlenmiştir. Moleküldeki kovalent olmayan etkileşimlerin yerlerini, türlerini belirlemek ve görselleştirmek için indirgenmiş yoğunluk gradyanı (RDG) analizi de gerçekleştirilmiştir.

Anahtar Kelimeler – Diyabet, DFT, sınır moleküler orbital, kuantum mekanik, MEP

I. GİRİŞ

Diyabet, dünya genelinde milyonlarca insanı etkileyen kronik bir metabolik hastalıktır ve tip 1 ve tip 2 olmak üzere iki ana formda görülür. Tip 1 diyabet, genellikle çocukluk veya gençlik yıllarında ortaya çıkar ve bağışıklık sisteminin pankreastaki insülin üreten beta hücrelerine saldırması sonucu gelişir. Bu durumda vücut yeterince insülin üretemez ve kan şekeri seviyeleri yükselir. Tip 2 diyabet ise daha çok yetişkinlerde görülür ve genellikle obezite, hareketsiz yaşam tarzı ve genetik faktörlerin birleşimiyle ortaya çıkmaktadır. Bu formda, vücut insüline karşı direnç geliştirir ve pankreas yeterince insülin üretemez. Diyabetin kontrol altına alınmaması durumunda kalp hastalıkları, böbrek yetmezliği, görme kaybı ve sinir hasarı gibi ciddi komplikasyonlara yol açabilir [1].

Beksagliflozin, SGLT2 inhibitörleri olarak bilinen bir grup ilaçtan biridir ve diyabet tedavisinde kullanılmaktadır. Bu tür ilaçlar, idrarda glukoz atılımını artırarak kan şekeri düzeylerini düşürmeye yardımcı olur. Beksagliflozin, özellikle tip 2 diyabet tedavisinde kullanılmaktadır ve hastaların kan şekeri kontrolünü sağlamalarına yardımcı olmaktadır. SGLT2 inhibitörleri, böbreklerdeki SGLT2 proteinini hedef almaktadır. Bu protein glukozun böbreklerde geri emilmesini sağlar, böylece glukoz idrarda atılmamakta ve tekrar kan dolaşımına geri dönmektedir. Beksagliflozin ise, SGLT2 proteinini inhibe ederek bu geri emilimi engeller. Bu durumda daha fazla glukoz idrarla atılmakta ve kan şekeri düzeyleri düşmektedir [2]. Bu çalışmada Beksagliflozin'in bazı kuantum kimyasal hesaplamaları gerçekleştirilmiştir.

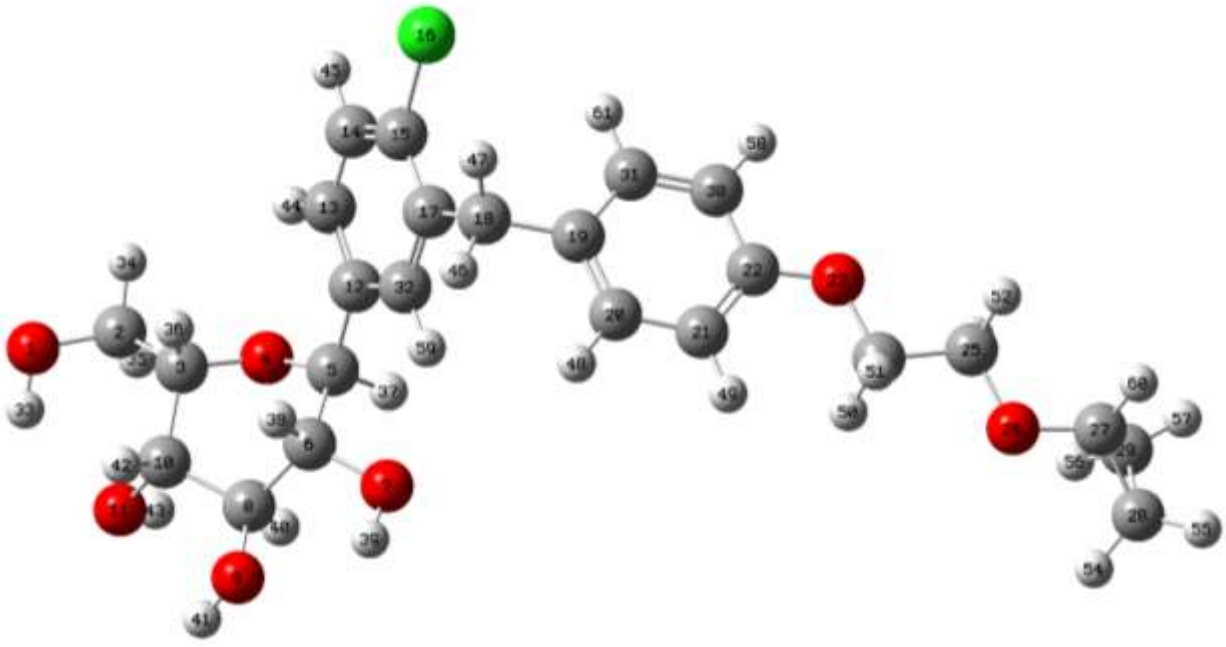
II. MATERYAL VE YÖNTEM

Beksagliflozin'in tüm kuantum kimyasal hesaplamaları Gaussian 09 paket programı kullanılarak yapılmıştır [3]. Moleküle ait görüntüleme işlemleri ise GaussView 5.0.9 programı yardımıyla gerçekleştirilmiştir [4]. Molekülün optimize moleküler geometrisi DFT/B3LYP/6-311G(d,p) seviyesinde hesaplanmıştır [5], [6]. Beksagliflozin'in moleküler elektrostatik potansiyel diyagram ve sınır moleküler orbital hesaplamaları da yine DFT/B3LYP/6-311G(d,p) seviyesinde gerçekleştirilmiştir. Molekülün molekül içi kovalent olmayan etkileşimleri (NCI) ve indirgenmiş yoğunluk gradyanı çalışmaları Multiwfn 3.8 yazılımı ile incelenmiş ve elde edilen sonuçlar VMD 1.9.4a53 programı kullanarak görüntülenmiştir [7], [8].

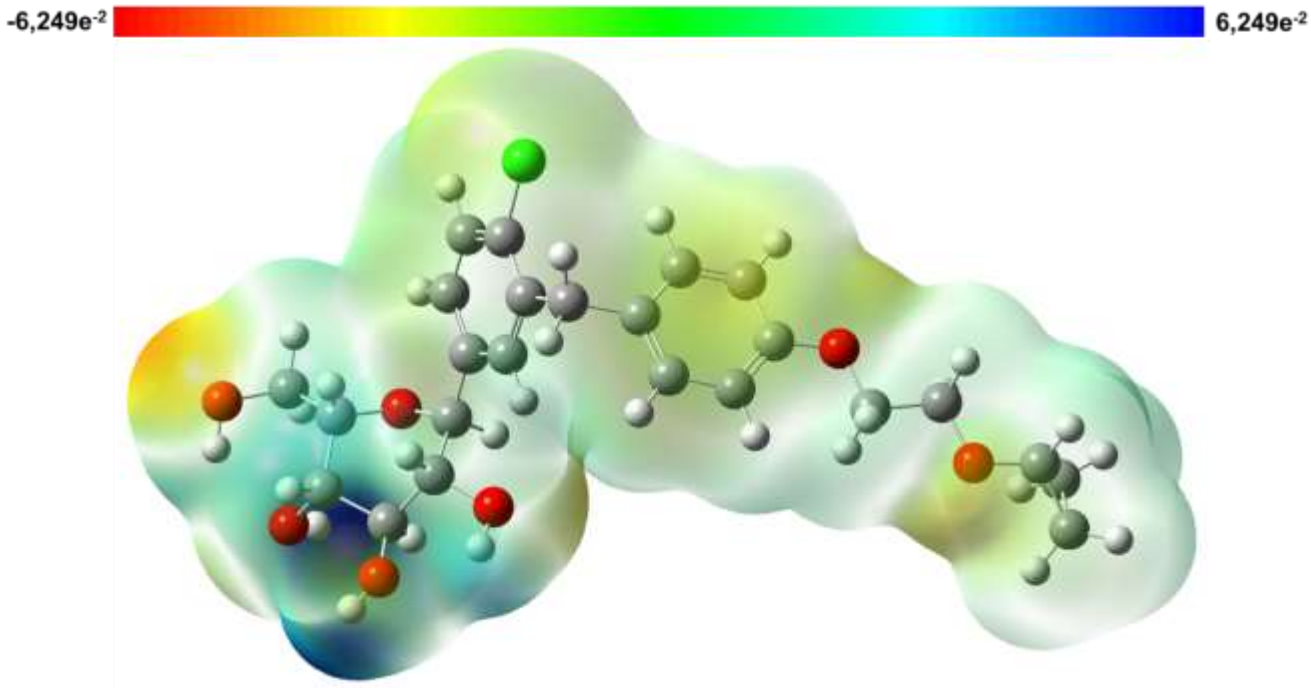
III. BULGULAR

Tablo 1. Beksagliflozin'in DFT/B3LYP/6-311G(d,p) seviyesinde hesaplanmış optimize moleküler geometrisine ait seçilmiş bazı geometrik parametreler

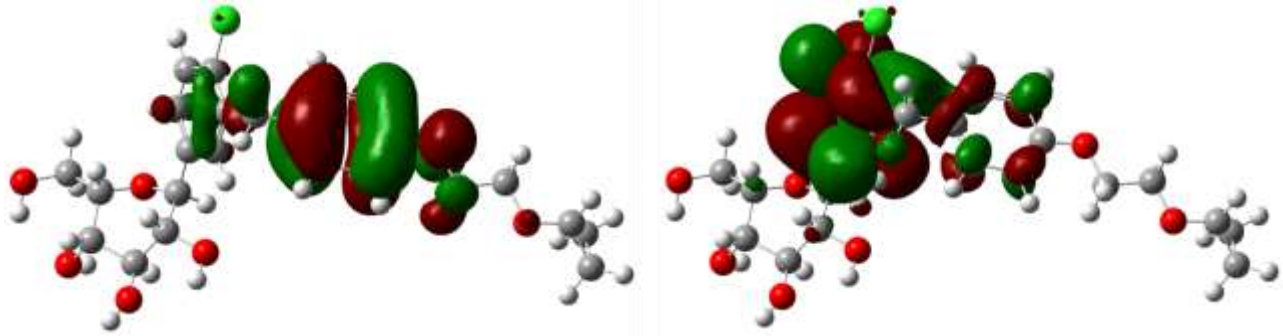
Bağ Uzunluğu (Å)	
O4-C5	1,435
C3-C2	1,531
C5-C12	1,524
C15-Cl16	1,770
C22-O23	1,366
C27-C28	1,492
Bağ Açısı (º)	
C3-O4-C5	113.7
C3-C2-O1	111,9
C17-C18-C19	113,6
C24-C25-O26	106,9
Dihedral Açısı (º)	
O4-C5-C12-C13	-15,3
C15-C17-C18-C19	-102.5
C21-C22-O23-C24	0,6
O23-C24-O25-C26	-179,6



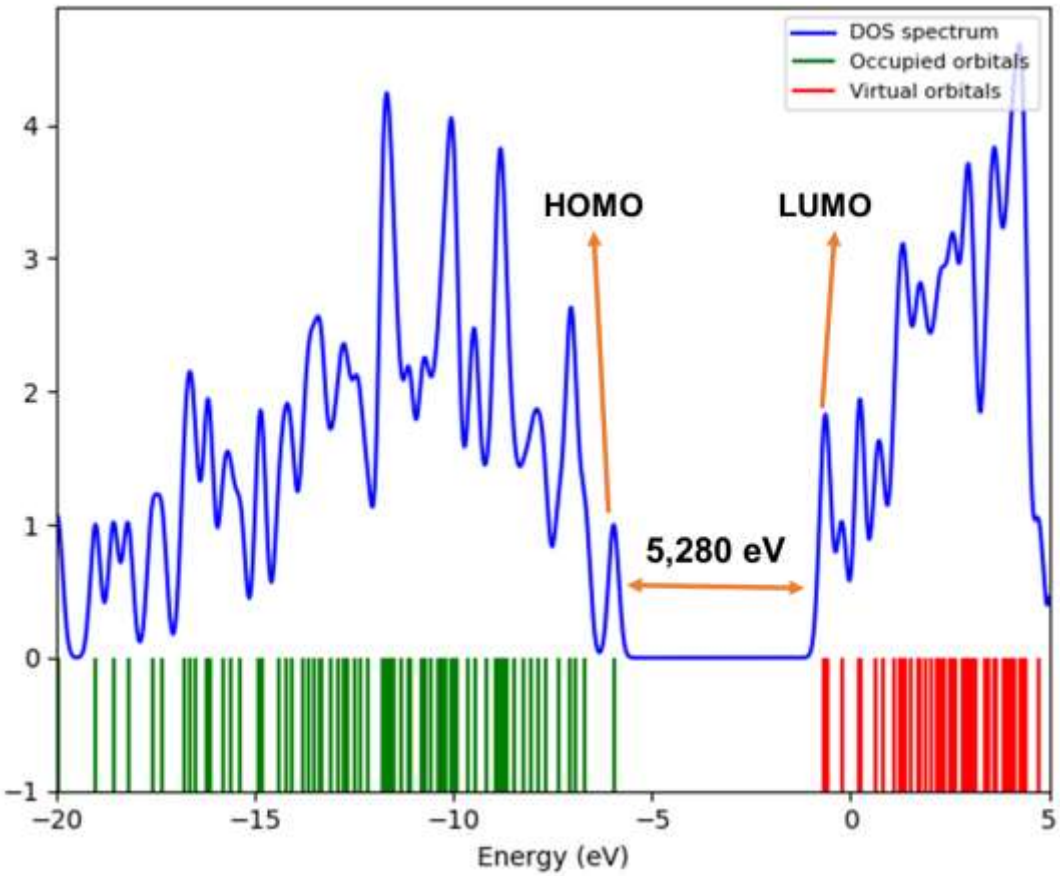
Şekil 1. Beksagliflozin'in DFT/B3LYP/6-311G(d,p) seviyesinde hesaplanmış optimize moleküler geometrisi



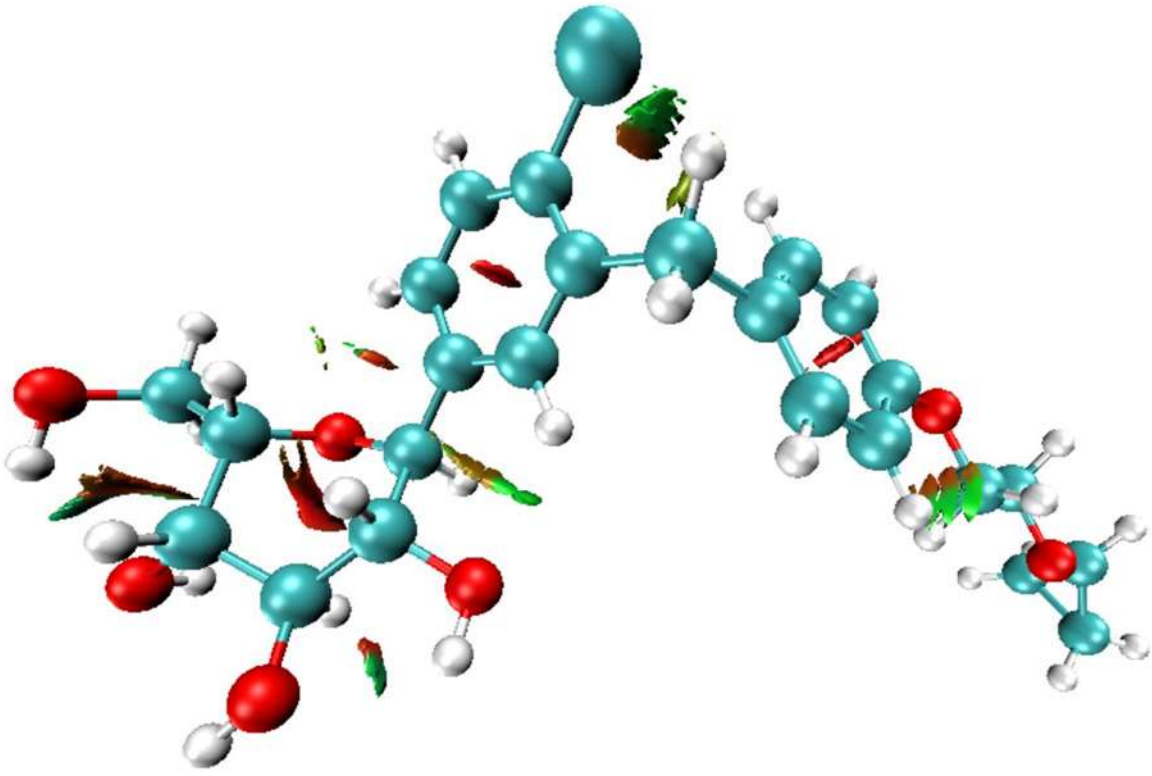
Şekil 2. Beksagliflozin'in DFT/B3LYP/6-311G(d,p) seviyesinde hesaplanmış MEP diyagramı



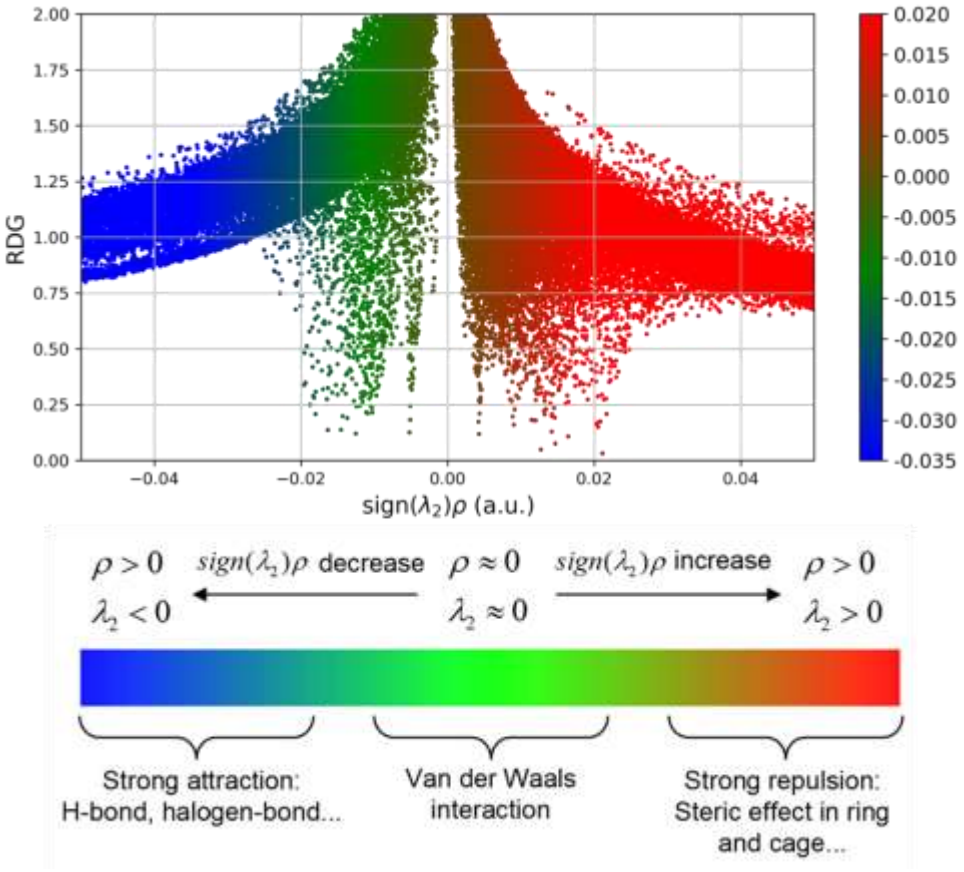
Şekil 3. Beksagliflozin'in DFT/B3LYP/6-311G(d,p) seviyesinde hesaplanmış HOMO (solda) ve LUMO (sağda) orbitalleri



Şekil 4. Beksagliflozin'in DFT/B3LYP/6-311G(d,p) seviyesinde hesaplanmış TDOS grafiği



Şekil 5. Beksagliflozin'in molekül içi kovalent olmayan etkileşimleri (NCI)



Şekil 6. Beksagliflozin'in indirgenmiş yoğunluk gradyanı (RDG) grafiği

IV. TARTIŞMA

Beksagliflozin'in moleküler geometrisinin optimizasyonu DFT/B3LYP/6-311G(d,p) seviyesinde gerçekleştirilmiş ve elde edilen geometri Şekil 1'de gösterilmiştir. Bu moleküler geometriden elde edilen seçilmiş bağ uzunluğu, bağ açısı ve dihedral açısı değerleri ise Tablo 1'de verilmiştir. Molekülün tetrahidropiran (oksan) halkası içinde yer alan O4-C5 bağ uzunluğu 1,435 Å olarak hesaplanmıştır. Tetrahidropiranın kendisine bağlı alkol ve klorofenil birimleri ile yapmış olduğu C3-C2 ve C5-C12 bağ uzunlukları sırasıyla 1,531 ve 1,524 Å olarak elde edilmiştir. Klorofenil ve bu yapıya bağlı oksijen atomunun oluşturduğu C22-O23 bağının uzunluğunun ise 1,366 Å olduğu belirlenmiştir. Beksagliflozin'in bağ açıları incelendiğinde tetrahidropiran halkası içindeki C3-O4-C5 ve bu halkanın alkol birimi ile yapmış olduğu C3-C2-O1 bağ açıları sırasıyla 113.7° ve 111,9° olarak bulunmuştur. Yapıdaki iki fenil grubu arasındaki C17-C18-C19 bağ açısı 113,6°, eterik yapıda bulunan C24-C25-O26 bağ açısı ise 106,9° olarak hesaplanmıştır. Yapıdaki tetrahidropiran ve klorofenil birimleri arasında bulunan O4-C5-C12-C13 ve klorofenil ve fenil birimleri arasında yer alan C15-C17-C18-C19 dihedral açısının sırasıyla -15,3° ve -102.5° olması, bu grupların aynı düzlemde bulunmadığını göstermiştir. Diğer taraftan moleküldeki eter biriminde bulunan O23-C24-O25-C26 ve eter ile fenil grubu arasındaki C21-C22-O23-C24 dihedral açısının sırasıyla -179,6° ve 0,6° olarak hesaplanması, bu birimlerin aynı düzlemde bulunduğunu ortaya koymuştur.

Moleküler elektrostatik potansiyel diyagramı (MEP), bir molekülün elektron yoğunluğunun ve elektrostatik potansiyelinin üç boyutlu bir temsilidir. MEP, molekülün farklı bölgelerindeki elektron yoğunluğunun dağılımını görselleştirmek için kullanılmaktadır. Bu diyagramdan elde edilen bilgiler, molekülün kimyasal reaktivitesini, moleküller arası etkileşimlerini ve molekülün biyolojik aktivitesini anlamak için oldukça önemlidir. Beksagliflozin'in hesaplanan MEP diyagramı Şekil 2'de gösterilmiştir. Molekülün MEP diyagramında negatif elektrostatik potansiyelin çok fazla olduğu herhangi bir bölgeye

rastlanmamıştır. Ancak alkol gruplarında yer alan oksijen atomu üzerinde bir miktar kırmızı renkli alanın bulunması, bu bölgelerde orta düzeyde negatif elektrostatik potansiyelin varlığına işaret etmiştir. Diğer taraftan alkol gruplarındaki hidrojen atomu üzerinde gözlenen mavi bölgeler, bu noktalarda pozitif elektrostatik potansiyelin yüksek olduğunu yani bu bölgelerin elektronca fakir bir özelliğe sahip olduğunu göstermiştir. Alkol gruplarındaki oksijen atomunun yüksek elektronegatifliğinin hidrojenle yapmış olduğu kovalent bağı zayıflatmasının böyle bir sonucu ortaya çıkardığı söylenebilir.

HOMO (Highest Occupied Molecular Orbital), bir moleküldeki en yüksek enerjili dolu moleküler orbitaldir. HOMO, bir molekülün elektron verme (oksidasyon) kapasitesini belirlemektedir. HOMO enerjisi ne kadar yüksekse, molekül elektronlarını o kadar kolay verebilir ve bu da molekülün elektron vericilik (nükleofilik) özelliklerini gösterir. Diğer taraftan LUMO (Lowest Unoccupied Molecular Orbital) da bir moleküldeki en düşük enerjili boş moleküler orbitaldir. LUMO, molekülün elektron alma (indirgeme) kapasitesini belirlemektedir. LUMO enerjisi ne kadar düşükse, molekül elektronları o kadar kolay kabul edebilir ve bu da molekülün elektron çekicilik (elektrofilik) özelliklerini göstermektedir. Beksagliflozin'in HOMO'larının daha çok fenil grubu, eter grubu oksijen atomu ve bir miktar da klorfenil birimi üzerinde bulunduğu belirlenmiştir. Bu bölgeler Beksagliflozin'in nükleofilik olarak davranacağı alanlar olduğu düşünülmektedir. Molekülün LUMO'ları ise en çok klorofenil bir miktar da fenil grubu üzerinde yer aldığı görülmüştür. Beksagliflozin'in başka moleküllerle vereceği reaksiyonlarda bu bölgelerin elektrofilik olarak davranabileceği öngörülmüştür (Şekil 3). Beksagliflozin için elde edilen TDOS grafiği Şekil 4'de verilmiş olup bu grafikten hareketle molekülün dolu orbitallerinin çoğunlukla yaklaşık olarak -15 ile -8 eV arasında yer aldığı görülmüştür.

HOMO-LUMO enerji farkı, bir molekülün bazı kimyasal ve fiziksel özelliklerini etkilemektedir. Özellikle HOMO-LUMO enerji farkı, bir molekülün kimyasal reaktivitesini belirlemektedir. Küçük bir enerji farkı, molekülün kolayca uyarılabileceğini ve reaksiyona girebileceğini gösterirken büyük bir enerji farkı ise molekülün daha kararlı ve inert olduğunu ifade etmektedir. Beksagliflozin'in HOMO ve LUMO enerji değerleri sırasıyla 5,969 ve -0,689 eV olarak hesaplanmıştır. Şekil 4'den de görüldüğü üzere molekülün HOMO-LUMO enerji farkı 5,280 eV olarak elde edilmiştir. Molekülün HOMO-LUMO enerji farkının yüksek olduğu gözlenmiştir. Dolayısıyla Beksagliflozin'in sert bir karaktere sahip ve kimyasal reaksiyonlara daha az eğilimli olabileceği sonucuna ulaşılmıştır.

Moleküllerin kovalent olmayan etkileşimlerini (NCI) incelemek için indirgenmiş yoğunluk gradyanı (RDG) grafikleri kullanılmaktadır ve bu grafiklerde mavi, yeşil ve kırmızı bölgeler, farklı etkileşim türlerini ve yoğunluklarını göstermektedir. Beksagliflozin'in NCI ve RDG grafikleri sırasıyla Şekil 5 ve 6'da gösterilmiştir. Moleküldeki tetrahidropiran ve fenil halkalarında kırmızı bölgelerin bulunması bu kısımlarda sterik etkinin varlığına işaret etmiştir. Tetrahidropiran halkası ve bu halkaya bağlı hidroksil gruplarının iç kısımlarında sterik etki, dış kısımlarda ise Van der Waals etkileşimlerinin bulunduğu belirlenmiştir. Beksagliflozin'in yapısında bulunan kovalent olmayan etkileşimlerden hidrojen bağının -0,05 ile -0,02 au, Van der Waals etkileşiminin -0,02 ile 0 au, sterik etkinin ise 0 ile 0.05 au arasında noktasal saçılmaya sahip olduğu belirlenmiştir.

V. SONUÇLAR

Sonuç olarak, bu çalışmada, Beksagliflozin'in moleküler yapısı, elektronik özellikleri ve kimyasal reaktivitesi incelenmiştir. Kuantum kimyasal hesaplamalar kullanılarak yapılan analizler yardımıyla, Beksagliflozin'in optimize moleküler geometrisi, moleküler elektrostatik potansiyel diyagramı ve HOMO-LUMO bant boşluğu belirlenmiştir. Beksagliflozin'in optimize moleküler geometrisi, B3LYP fonksiyoneli ve 6-311G(d,p) temel seti kullanılarak DFT yöntemi ile hesaplanmış ve molekülün HOMO-LUMO bant boşluk enerjisi 5,280 eV olarak bulunmuştur. Moleküler elektrostatik potansiyel diyagramı ile, molekülün yüksek ve düşük elektrostatik potansiyele sahip bölgeleri ortaya konmuştur. Ayrıca, indirgenmiş yoğunluk gradyanı (RDG) analizi ile, moleküldeki kovalent olmayan etkileşimlerin türleri ve

yerleri belirlenmiş, hidrojen bağlarının, Van der Waals etkileşimlerinin ve sterik etkilerin yer aldığı bölgeler görselleştirilmiştir. Elde edilen sonuçlar, Beksagliflozin'in moleküler yapısının ve etkileşimlerinin nasıl olabileceği konusunda bazı bilgiler sunmaktadır. Ayrıca elde edilen bulguların, Beksagliflozin'in diyabet tedavisindeki rolünün daha iyi anlaşılmasına ve konu ile ilgili gelecekteki araştırmalara yön verilmesine yardımcı olabilecek potansiyele sahip olduğunu düşünmekteyiz.

Protein Metabolizması Bozukluklarının Sağlık Üzerindeki Etkileri: Fenilketonüri (PKU) ve Çölyak Hastalığı

Özen Sökmen[1*], Ayşe Neslihan Dündar [2]

[1]*Gıda Mühendisi/ Bağımsız Araştırmacı, Natura Gıda, Türkiye*
[2]*Gıda Mühendisliği Bölümü, Bursa Teknik Üniversitesi, Türkiye*

[*]*(ozensokmen@gmail.com)*

Özet **–** Proteinler, canlı hücrelerin temel yapı taşlarını oluşturan ve yaşamın devamı için elzem olan organik bileşiklerdir. Metabolik tepkimeleri katalize eden enzimlerin yapısında yer alırlar ve vücudun birçok bölümünde önemli fonksiyonları üstlenirler. Ancak bazı genetik ve metabolik bozukluklar, proteinlerin ve amino asitlerin vücutta doğru bir şekilde işlenmesini engelleyebilir. Bu bozuklukların en dikkat çekici örneklerinden biri fenilketonüri (PKU) olup, fenilalanin hidroksilaz enzimi eksikliği nedeniyle fenilalaninin tirozine dönüştürülememesi sonucu ortaya çıkar. Bu durum, fenilalaninin kanda ve beyinde birikmesine neden olur, bu da ciddi nörolojik hasarlara ve zihinsel geriliğe yol açabilir. Diğer yandan çölyak hastalığı, gluten proteininin sindirilememesi sonucu bağırsaklarda alerjik reaksiyonlar oluşturur ve besin emilimini bozar. Her iki hastalıkta da erken teşhis ve uygun diyet tedavisi hayati öneme sahiptir. PKU'da fenilalanin içeriği düşük diyetler ve çölyak hastalığında glutensiz beslenme, hastaların yaşam kalitesini artırmada kritik rol oynar. Bu nedenle, doğru beslenme ve tedavi yöntemleriyle bu protein temelli hastalıkların etkileri yönetilebilir ve hastaların sağlıklı bir yaşam sürmesine yardımcı olunabilir.

Anahtar Kelimeler – Fenilketonüri (PKU), Çölyak Hastalığı, Protein Metabolizması, Fenilalanin, Gliadin

I. GİRİŞ

Protein kelimesi, eski Yunanca'da "ilk önce gelen" anlamındaki " Proteom" kelimesinden türemiştir. Canlılar için elzem olan bu bileşikler, %50-55 karbon, %6-7 hidrojen, %20-23 oksijen, %12-19 azot ve %0.2-3.0 kükürt içermektedir ve yalnızca ribozomlarda sentezlenirler. Hücrenin temel yapısını oluşturur, yıpranan dokuların onarımını sağlar, enerji kaynağı olarak kullanılır ve vücudu mikroplara karşı savunan antikorların yapısında bulunurlar. Ayrıca hücre içi ve dışı sıvıların ozmotik dengesini sağlar, hemoglobindeki globin kısmını oluşturur ve pH değişikliklerini tamponlarlar. Canlı bir hücrenin kuru ağırlığının %50'sini oluştururlar [1]. Örneğin; karaciğer, yağsız çizgili kas ve böbrek dokularının kuru ağırlığının %70-80'i proteindir. Memelilerin çizgili ve çizgisiz kaslarının %18-20'si, kan plazmasının %6,5-7,5'i, beynin yaklaşık %8'i ve yumurta sarısının %15'i proteinlerden oluşur. Bitkilerde ise yaprak, sap, kök ve yumrularındaki protein miktarı tohumlarına oranla daha azdır. Marulda %1,2, kuşkonmazda %1,8, lahanada %1,6, patateste %2 protein bulunurken bazı hububat ve baklagillerde protein oranı daha yüksektir. Kuru fasulyede %18-22, soya fasulyesinde %37-39 civarında protein bulunur [2,3]. Proteinler, vücut dokularının yapımında ve onarımında görev alırlar. Enzimlerin tümü, hormonların birçoğu ve virüsler protein yapısında yer alır. Vücudun elzem amino asit ihtiyacını giderirler ve gıdaların duyusal özelliklerini ve besleyici değerini belirleyen önemli bir etkendir [3]. Organizmada taşıma ve depolama görevlerinde yer alırlar ve bağışıklık sisteminde görev alarak vücudun kendine ait olan ile olmayanının ayrımında önemli bir rol oynarlar. Canlıda büyüme ve değişimden sorumludurlar.

Amino asitler, değişik kimyasal yapıda bir köke (R) bağlı bir karboksil (COOH) ve bir amin (NH_2) grubundan oluşan organik yapılardır. Birbirleriyle karboksil ve alfa amino gruplarından bir molekül su

çıkararak birleşmeleri ile peptitler oluşur. Bu bağa "peptit bağı" denir ve peptit bağında amino asitlerin diziliş sırası o proteinin özelliğini belirler. Peptit bağlarının sayısı, amino asitlerin türü ve polipeptit içinde bulunma sırası gibi faktörler vücuttaki her organın ve bireyin kendine özgü bir protein yapısını oluşturur. DNA'da meydana gelen herhangi bir bozulma sonucu protein zincirine farklı bir amino asidin gelmesi o proteinin işlevini bozar ve görevini yerine getiremez [5].

Proteinler ve amino asitler canlı hücreler için çok önemliyken bazı hastalıkların temel nedeni olabilmektedir [6]. Örneğin, çölyak hastalığında gluten proteini ve fenilketonüri hastalığında fenilalanin bu duruma örnektir.

A. Amino Asit Metabolizması Bozuklukları

Amino asitler, canlılar için kritik öneme sahip olmasına rağmen bazı metabolik bozukluklara da neden olabilirler. Öne çıkan amino asit metabolizması bozuklukları şunlardır:

- Akçaağaç şurubu hastalığı (MSUD): Lösin, izolösin ve valin amino asitlerinin metabolizmasında yer alan enzimlerin eksikliği veya yokluğundan kaynaklanır. Bu durum ciddi nörolojik fonksiyon bozukluklarına, nöbetlere, komaya, solunum yetmezliğine ve birçok hastada ölüme neden olur. Hayatta kalan hastalar genellikle zihinsel gerilik yaşar. İdrar ve kan örneklerinde yüksek seviyelerde lösin, izolösin ve valin amino asitleri bulunur. İdrarda ise akçaağaç şurubu veya yanmış şeker kokusu hissedilir [7].
- Histidin Metabolizması Bozuklukları: Enzim eksikliği çocukta konuşma kusuru gibi belirtiler gösterir [8].
- Glisin Metabolizması Bozuklukları: Enzim sorunları, çocukluk ya da yetişkinlikte böbrek yetmezliği veya hipertansiyondan ölüme yol açabilir [9].
- Triptofan Metabolizması Bozukluğu: Hartnup hastalığı, triptofanaz enzim eksikliği sonucu idrarda bol triptofan bulunur [10].
- Fenilalanin ve Tirozin Metabolizması Bozuklukları (PKU): Fenilalanin hidroksilaz kusuru zekâ geriliğine neden olur [11].

B. Fenilalanin ve Tirozin Metabolizması Bozuklukları (PKU)

Fenilalanin, temel bir amino asit olup, insan sağlığı için hayati öneme sahiptir ve diyetle alınması zorunludur. Proteinlerin yaklaşık %4-5'ini oluşturur ve özellikle jelatin (%2) ve yumurtada (%6) yüksek oranda bulunur [11]. Fenilalanin, vücutta tirozine dönüşerek dopamin, norepinefrin, melanin, adrenalin ve tiroksin gibi önemli bileşiklerin yapımında kullanılır [12].

Fenilalanin vücutta protein sentezi için kullanılmayan fazla kısmı (%75), fenilalanin hidroksilaz (FAH) enzimi tarafından tirozine dönüştürülür [11]. Bu dönüşüm sırasında, norepinefrin gibi önemli nörotransmitterlerin sentezi gerçekleşir. Fenilalanin eksikliği, zihinsel düzensizlikler, anksiyete, depresyon ve kronik yorgunluğa yol açabilir [11, 12].

PKU, fenilalanin hidroksilaz enzimini kodlayan gendeki mutasyon sonucu ortaya çıkan kalıtsal bir metabolizma bozukluğudur. Bu mutasyon, enzimin yetersizliğine veya eksikliğine neden olarak fenilalaninin tirozine dönüşümünü engeller ve fenilalanin plazma düzeylerinin normalin 20-30 katı artmasına yol açar. Beyinde biriken fenilalanin, mental gerilik ve diğer nörolojik bozukluklara neden olur [13]

PKU'nun tedavisinde erken teşhis ve fenilalanin kısıtlı diyet uygulanır. Bu diyet, protein ve fenilalanin içeriği düşük, yaşa ve kiloya uygun vitamin-mineral eklenmiş aminoasit karışımlarından oluşur. PKU hastaları için yasak olan gıdalar arasında etler, süt ürünleri, baklagiller ve aspartam içeren gıdalar yer alırken, sınırlı tüketilebilecek gıdalar sebzeler, meyveler ve bazı yağlardır [14, 15].

PKU teşhisi, yenidoğan tarama programları ile topuk kanı alınarak yapılır. Hastalığın sıklığı etnik gruplara ve coğrafi bölgelere göre değişiklik gösterir. Avrupa'da 10.000 canlı doğumda 1, ABD'de 1/13.000, Asya'da ise 1/15.000 sıklığında görülür. Verilen bilgilere göre, fenilketonüri (PKU) hastalığının Türkiye'de diğer ülkelere kıyasla daha sık görüldüğü görülmektedir. 2007, 2008 ve 2010 yıllarında Türkiye'de doğan yenidoğanlarda PKU tanısı konmuş vakaların sayıları sırasıyla 246, 217 ve 182 olarak

verilmiştir. Ülke genelinde PKU sıklığı 1/6228 olarak belirtilmiştir, bu da Türkiye'de her 6228 doğumdan birinin PKU hastası olduğunu göstermektedir. PKU hastalığının bu kadar sık görülmesinde etkili olan faktörlerden biri, Türkiye'de taşıyıcı oranının %4 olmasıdır. Taşıyıcı olma durumu, genetik geçişin anne-baba arasında veya akraba evliliklerinde daha sık olmasıyla ilişkilendirilmektedir. Bu durum, akraba evliliklerinin PKU hastalığının sıklığını artırıcı bir faktör olarak gösterilmesine yol açmaktadır. Türkiye'nin PKU hastalığının sıklığı açısından diğer ülkelere göre önemli bir durumda olduğu ve bu konuda genetik danışmanlık ve erken teşhisin önemli olduğu vurgulanmaktadır. Bu bilgiler, ülkemizdeki sağlık politikalarının bu tür kalıtsal hastalıkların yönetimi ve tedavisi için nasıl şekillendirilmesi gerektiğine dair önemli ipuçları sunmaktadır [16, 17].

Sonuç olarak, PKU'nun tedavisinde diyetin önemli rolü vardır. PKU hastaları için fenilalanin içeriği düşük özel gıdaların geliştirilmesi ve kullanılması, bu hastaların yaşam kalitesini artırmada kritik öneme sahiptir Türkiye'de bu hastalığın taşıyıcılık oranı %4'tür ve bu durum her yıl 250-300 çocuğun bu hastalıkla doğmasına neden olmaktadır [18].

C. Çölyak Hastalığı

Çölyak hastalığının başlıca nedeni, gluten proteininin bir alt fraksiyonu olan gliadindir. Gluten, yulaf, buğday, çavdar, pirinç, darı, kuş yemi gibi tahıllarda bulunan proteinlerdir ve insanoğlu için vazgeçilmez bir besin kaynağı olmuştur. Özellikle buğday, un, irmik, nişasta, bulgur, ekmek, makarna, kek, bisküvi gibi yarı mamül veya mamüllerin üretiminde önemli bir yer tutar. Gluten proteini, buğday tanesinin büyük bir kısmını oluşturmaktadır ve kimyasal yapısı protein (%7-18), su (%8-14), mineral madde (%1-2), karbonhidrat (%65-75), lipit (%1-3), eser miktarda vitamin ve enzimden oluşur [19,20,21].

Unda bulunan proteinler hamur oluşturmayan (%15 albumin, globulin, peptidler ve aminoasitler) ve hamur oluşturanlar (%85 Gliadin ve Glutenin) olarak ikiye ayrılır. Gliadin, alkol ile çözünür ve hamurun uzayabilirliğinden sorumludur. Glutenin ise asidik ortamlarda çözünür, hamurun elastikiyetinden sorumludur ve toplam protein miktarının %40-50'sini oluşturur [21, 22]. Glutenin hamurun reolojik ve pişme özelliklerinin gelişmesinde önemli bir rol oynar. Ayrıca et, sosis, çorba gibi hazır gıdalarda tekstür geliştirici, inceltici, su veya yağı tutucu olarak da kullanılır [23].

Çölyak hastalığı, gluten veya bazı tahıl proteinlerine karşı bağırsaklarda görülen bir alerjik reaksiyondur ve genetik bir hastalıktır. Çölyak hastaları gluten içeren gıdalar tükettiklerinde ince bağırsağındaki villus yapısı zarar görerek tahriş olur ve gerekli vitamin ve minerallerin emiliminde güçlük yaşarlar. Bu durum, vücuttaki tüm sistemleri olumsuz yönde etkiler ve besin yetersizliğine yol açarak birçok hastalığa sebep olabilir [21, 22].

Çölyak hastalığının klasik belirtileri arasında ishal, kusma, iştahsızlık, karın şişliği, kilo kaybı, kabızlık ve büyüme geriliği yer alır. Büyük çocuklar ve yetişkinlerde ise tedavi edilemeyen veya nedeni bulunamayan kansızlık, kemik zayıflığı gibi belirtiler gözlemlenir. Erken teşhis edilmezse, depresyon, osteoporoz ve tümör gibi ciddi sağlık problemlerine yol açabilir. Kesin tedavi yöntemi glutensiz bir yaşam şeklidir, buğday, arpa ve çavdar unu içeren her türlü besin maddesi glutensiz beslenmede sakıncalıdır [24].

Dünya genelinde çölyak hastalığının yaygınlığı, bazı ülkelerde yapılan araştırmalara göre değişiklik göstermektedir. Çölyak hastalığı, tüm dünyada oldukça yaygın olan ve nüfusun yaklaşık 100 de 1'i ile 300'de 1'ini etkileyen önemli bir hastalıktır. Hastalığın geniş bir klinik yelpazeye sahip olması, atipik seyir gösterebilmesi veya hiç belirti vermemesi nedeniyle gerçek prevalansı belirlemek zordur. Bu nedenle, çölyak hastalığı olan bireylerin yalnızca %10'una tanı konulabildiği tahmin edilmektedir [25]. Ülkemizde çölyak hastalığının görülme sıklığının 100 de 1'i ile 300'de 1'ini arasında olduğu düşünüldüğünde, en az 280 bin ve en çok 850 bin hastanın olması beklenmektedir. Sağlık Bakanlığı Sağlık Bilgi Sistemlerinden elde edilen verilere göre, 2022 yılı sonu itibariyle Türkiye'de tanı konmuş çölyak hastası sayısı 154.027 olarak belirtilmiştir. Ayrıca, Türkiye'de çölyak hastalığı oranının yüksek olmasının bir nedeni de akraba evliliklerinin yaygın olmasıdır. Glutensiz beslenme, çölyak hastaları için zorunlu hale gelmiştir ve gıda sektöründe bu tür ürünlerin üretimi önem kazanmıştır[26].

Glutensiz ürünler ile ilgili yasal düzenlemeler, 2012 yılında Türk Gıda Kodeksi Yönetmeliği Glutensiz Ürünler Tebliği ile belirlenmiştir [27]. FAO ve WHO tarafından kabul edilen ve gluten içermeyen gıdalar

için geliştirilen Kodeks Standardı'na göre, glutensiz gıdalar, buğday prolamini ile çavdar, arpa, yulaf veya bunların melez varyetelerini içermeyen ya da bu bileşenlerin gluten miktarı 200 ppm'i geçmeyen şekilde hazırlanan gıdalar olarak tanımlanır [28, 29].

II. SONUÇ

PKU, fenilalanin hidroksilaz enziminin yetersizliği veya eksikliği nedeniyle fenilalaninin tirozine dönüşümünü engeller ve fenilalanin plazma düzeylerinin normalin 20-30 katına çıkmasına yol açar. Bu durum, beyinde birikerek mental gerilik ve diğer nörolojik bozukluklara neden olur. PKU'nun tedavisinde erken teşhis ve fenilalanin kısıtlı diyet uygulanması büyük önem taşır. Bu diyet, protein ve fenilalanin içeriği düşük, yaşa ve kiloya uygun vitamin-mineral eklenmiş aminoasit karışımlarından oluşur. PKU hastaları için özel olarak geliştirilen fenilalanin içeriği düşük ürünler, hastaların yaşam kalitesini artırmada önemli bir rol oynar.

Çölyak hastalığı ise gluten proteinlerine karşı bağırsaklarda görülen alerjik reaksiyonlar sonucu ortaya çıkar. Bu hastalık, genetik bir yatkınlığa bağlı olarak gelişir ve gluten içeren gıdaların tüketimi sonucu ince bağırsakta hasara yol açar. İnce bağırsağın villus yapısının zarar görmesi, vitamin ve mineral emiliminde güçlük yaratır ve besin yetersizliklerine yol açar. Çölyak hastalığının kesin tedavisi, ömür boyu glutensiz bir diyet uygulamaktır. Bu diyet, buğday, arpa ve çavdar unu içeren her türlü besin maddesini dışlar ve glutensiz alternatifleri tercih eder. Glutensiz beslenme, çölyak hastalarının yaşam kalitesini önemli ölçüde iyileştirir ve hastalığın belirtilerini kontrol altına alır.

Her iki hastalıkta da erken teşhis ve bilinçli beslenme büyük önem taşır. Yenidoğan tarama programları, PKU'nun erken teşhisi ve tedavisinde kritik rol oynar. Aynı şekilde çölyak hastalığının teşhisinde de doğru ve zamanında yapılan tanı testleri hayati öneme sahiptir. Bu hastalıkların yönetiminde, hastaların ve ailelerinin bilinçlendirilmesi, uygun diyetlerin uygulanması ve düzenli tıbbi takip, yaşam kalitesini artırmada ve uzun vadeli komplikasyonları önlemede önemli katkılar sağlar.

Şarap ve Fransız Paradoksu

Özen SÖKMEN[1*], Ayşe Neslihan DÜNDAR[2]

[1]*Gıda Mühendisi/ Bağımsız Araştırmacı, Natura Gıda, Türkiye*
[2]*Gıda Mühendisliği Bölümü, Bursa Teknik Üniversitesi, Türkiye*

[*]*(ozensokmen@gmail.com)*

Özet – Fransız Paradoksu, Fransızların doymuş yağ oranı yüksek bir diyet tüketmesine rağmen koroner kalp hastalığı (KKH) oranlarının nispeten düşük olmasını ifade eder. 1980'lerde fark edilen bu durum, dengeli ve ölçülü şarap tüketiminin sağlıklı bir yaşam tarzının parçası olabileceği öne sürülmüştür. Bu paradoksun önemli bir nedeni, antioksidanlar ve polifenoller, özellikle resveratrol açısından zengin kırmızı şarap tüketimidir. Bu bileşiklerin inflamasyonu azaltarak, LDL kolesterolün oksidasyonunu engelleyerek ve genel damar sağlığını destekleyerek kardiyovasküler sağlıkta önemli bir rol oynadığı düşünülmektedir. Modern şarap üretim teknikleri, faydalı bileşiklerin konsantrasyonunu maksimize etmeye odaklanarak üzüm çeşitlerinin dikkatli seçimi, fermantasyon süreçleri ve yaşlandırma yöntemleri üzerinde yoğunlaşmaktadır. Bu süreç, şarabın antioksidan kapasitesini artırarak sağlık üzerindeki olumlu etkilerini maksimize eder. Ayrıca, yaşlandırma yöntemleri de şarabın kimyasal bileşimini ve dolayısıyla sağlık faydalarını etkileyebilir. Şarap teknolojisindeki yenilikler, sadece sağlık açısından değil, aynı zamanda tat ve kalite açısından da şarabın geliştirilmesine katkı sağlar. Modern ekipman ve tekniklerle, üreticiler üzümün en iyi özelliklerini koruyarak yüksek kaliteli şaraplar üretebilmektedir. Bu teknolojik yenilikler, şarabın hem lezzet profilini hem de sağlık yararlarını artırmaktadır. Sonuç olarak, Fransız Paradoksu ve modern şarap teknolojisi arasındaki ilişki, şarabın doğru tüketildiğinde sağlık üzerinde olumlu etkiler sağladığını göstermektedir. Dengeli ve ölçülü şarap tüketimi, modern üretim teknikleriyle birleştiğinde hem sağlık hem de tat açısından üstün özelliklere sahip şarapların üretilmesine olanak tanır. Bu çalışmada, mevcut araştırmaları ve teknolojik yenilikleri sentezleyerek Fransız Paradoksu 'nu ve şarap teknolojisini anlamayı amaçlamaktadır.

Anahtar Kelimeler – Fransız Paradoksu, Antioksidanlar, Polifenoller, Şarap, Kardiyovasküler

I. GİRİŞ

Fransız paradoksu" terimi, bazı Fransız popülasyonlarının, doymuş yağ asitlerinin nispeten yüksek olduğu bir diyet tüketmelerine rağmen, koroner kalp hastalığı (KKH) insidansının nispeten düşük olması gözlemine dayanmaktadır. İlk olarak 1819'da İrlandalı doktor Samuel Black tarafından tanımlanan bu olgu, 1992'de Bordeaux Üniversitesi'nden bilim adamı Dr. Serge Renaud tarafından "Fransız paradoksu" olarak adlandırılmıştır [1]. Renaud, bu paradoksu ılımlı kırmızı şarap tüketimine bağlamış ve orta derecede alkol alımının, yüksek yoğunluklu lipoprotein-kolesterol (HDL-C) seviyeleri üzerindeki olumlu etkileriyle aterosklerozu azaltarak KKH'yi önleyebileceğini öne sürmüştür. Ancak, Renaud, Fransız toplumundaki plazma HDL-C seviyelerinin diğer Batılı ülkelerle kıyaslandığında anlamlı derecede yüksek olmadığını, dolayısıyla başka mekanizmaların da rol oynadığını savunmuştur. Daha önce yayımlanmış çalışmaları yeniden değerlendirdikten sonra, KKH'deki azalmanın HDL-C seviyelerindeki artıştan ziyade, hemostatik dengedeki iyileşme, yani azalmış trombosit agregasyonu kaynaklı olduğunu sonucuna varmıştır [1].

Birleşmiş Milletler Gıda ve Tarım Örgütü'ne (FAO) göre, 2003 yılında Fransa'daki toplam diyetsel yağ tüketimi yaklaşık 168 g/kişi/gün iken, Amerika Birleşik Devletleri'nde 155 g/kişi/gün, Birleşik Krallık'ta

134 g/kişi/gün ve İsveç'te 126 g/kişi/gün idi. Fransa'da hayvansal yağ tüketimi 47 g/kişi/gün iken, Amerika Birleşik Devletleri'nde 16 g/kişi/gün, Birleşik Krallık'ta 19 g/kişi/gün ve İsveç'te 52 g/kişi/gün idi. Alkollü içeceklerin genel tüketimi Fransa'da ~255 g/kişi/gün, Amerika Birleşik Devletleri'nde 269 g/kişi/gün, Birleşik Krallık'ta 340 g/kişi/gün ve İsveç'te 211 g/kişi/gün olmasına rağmen, şarap tüketimi Fransa'da 145 g/kişi/gün, Amerika Birleşik Devletleri'nde 19 g/kişi/gün, Birleşik Krallık'ta 49 g/kişi/gün ve İsveç'te 47 g/kişi/gün idi. Böylece, Fransa'da toplam alkollü içecek tüketiminin yaklaşık %57'sini şarap oluştururken, Amerika Birleşik Devletleri'nde %7'sini, Birleşik Krallık'ta %15'ini ve İsveç'te %22'sini oluşturmaktaydı [2,3,4].

Dünya Sağlık Örgütü'nün yayımladığı küresel kalp hastalığı ve felç salgını atlasına göre, 2002 yılında Fransa'da KKH'den ölüm oranı (%0,8), Amerika Birleşik Devletleri (%1,8), Birleşik Krallık (%2,1) ve İsveç'ten (%2,3) iki ila üç kat daha düşüktü. Bu, hayvansal (doymuş) yağlar açısından zengin bir diyete ve dünya çapında en yüksek şarap tüketimine rağmen, Fransa'nın 1994 yılında en düşük ikinci KKH ölüm oranına sahip olduğunu bildiren Criqui ve Ringel'in bulgularıyla tutarlıdır [4].

A. Şarap

Fransa, kırmızı, rose, beyaz, köpüklü ve zenginleştirilmiş şaraplar gibi tüm şarap türlerini üretmektedir. Ayrıca, Cabernet Sauvignon, Chardonnay, Pinot Noir, Sauvignon Blanc, Syrah veya Shiraz gibi birçok üzüm çeşide yetişmektedir. Fransız şarapları, farklı bölgelerdeki üzüm çeşitleri, üretim yöntemleri ve sınıflandırma sistemleri nedeniyle ulusal olmaktan çok bölgesel bir kimliğe sahiptir [5].

Her ne kadar herhangi bir alkollü içecek türünün orta düzeyde alımının kardiyovasküler sistem için faydalı olduğu düşünülse de kırmızı şarabın ek kardiyovasküler faydalar sağlayabileceğine dair kanıtlar mevcuttur [6]. Kopenhag Şehir Kalp Araştırması'nda, 30 ila 70 yaşları arasındaki 13.285 erkek ve kadının yaklaşık 12 yıl boyunca takip edilmesi sonucu, kırmızı şarap alımının artmasıyla kardiyovasküler hastalık riskinin azaldığı gözlemlenmiştir. Hiç şarap içmeyenler için bağıl risk 1,00 iken, günde üç ila beş bardak içenler için bu oran 0,51 olarak bulunmuştur. Ancak yüksek alkollü içki alımında ölüm oranı, hiç içmeyenler için 1,00'den, günde üç ila beş içki içenler için 1,34'e yükselmiştir [7].

Şarabın ana bileşenleri su ve alkol olmasına rağmen, şarapta 500'den fazla bileşik tanımlanmıştır. Su, üzüm suyundan elde edilir ve biyolojik olarak saftır. Alkol içeriği, şaraplar arasında %10'dan %17'ye kadar değişir ve esas olarak mayalar tarafından parçalanan şekerlerden elde edilir. En yaygın alkol etanoldür; ancak şarapta bulunan diğer alkoller arasında 1-propanol, 2-metil-1-propanol, 2-metil-1-butanol ve 3-metil-1-butanol yer alır. Gliserol de mevcut olup genellikle bir miktar tatlılık katar. Asitler, şaraba ekşi veya keskin bir tat kazandırır ve üzüm kaynaklı tartarik asit, malik ve sitrik asitler şaraptaki toplam asitliğin temel bileşenleridir. Fermantasyonla üretilen süksinik, laktik ve asetik asitler de şarapta bulunur [8,9].

Üzümlerden elde edilen fenolik bileşikler, şaraba rengini ve tat farklılıklarını verir. Flavonoidler ve flavonoid olmayan bileşikler şarapta önemli yer tutar ve özellikle kırmızı şaraplarda bu bileşiklerin miktarı daha yüksektir. Resveratrol, özellikle kırmızı şarapta bulunan ve kardiyovasküler faydaları olduğu düşünülen bir fitoaleksindir. Beyaz şarap, kırmızı şaraba göre daha düşük miktarda resveratrol içerir çünkü üretiminde daha kısa maserasyon süresi kullanılır. Fransa'nın Beaujolais, Midi, Rhone, Bordeaux ve Burgundy bölgelerinden gelen kırmızı şaraplar, resveratrol açısından zengin olup, konsantrasyonları 3,7 ila 7,1 mg/L arasında değişir [10].

B. Şarap ve Resveratrol

Şarap, çok çeşitli polifenoller içeren karmaşık bir içecektir. Polifenoller, doğal antioksidanlardır ve insan sağlığı üzerinde çeşitli olumlu etkileri olduğu bilinmektedir [9].

Modern şarap üretim teknikleri, faydalı bileşiklerin konsantrasyonunu maksimize etmeye odaklanmaktadır.

Bu süreçte dikkat edilen başlıca unsurlar şunlardır:

Üzüm Çeşitlerinin Seçimi: Üzüm çeşitlerinin dikkatle seçilmesi, şarabın polifenol ve resveratrol içeriğini önemli ölçüde etkileyebilir. Kırmızı üzüm çeşitleri genellikle daha yüksek polifenol ve resveratrol içeriğine sahiptir. Bu nedenle, şarap üreticileri, yüksek polifenol ve resveratrol içeriği ile

bilinen üzüm çeşitlerini tercih ederler. Özellikle, Cabernet Sauvignon, Merlot ve Pinot Noir gibi kırmızı üzüm çeşitleri, yüksek polifenol içeriği ile öne çıkar [11].

Fermantasyon Süreçleri: Fermantasyon süreçleri, şarabın antioksidan kapasitesini artırmak için optimize edilebilir. Kırmızı şarap üretiminde, üzüm kabukları fermantasyon sırasında şarap ile daha uzun süre temas halinde tutulur. Bu süreç, polifenol ve resveratrol gibi biyoaktif bileşiklerin şaraba geçişini artırır. Fermentasyon süresinin uzatılması, şarabın antioksidan kapasitesini ve dolayısıyla sağlık faydalarını artırabilir. Fermantasyon sürecinin optimize edilmesi, sıcaklık kontrolü ve fermantasyon süresinin dikkatli bir şekilde yönetilmesi ile sağlanabilir. Kontrollü sıcaklık altında yapılan fermantasyon, polifenol ve resveratrol miktarını artırırken istenmeyen yan ürünlerin oluşumunu engelleyebilir. Ayrıca, üzüm kabuklarının fermantasyon sırasında karıştırılması, polifenol ekstraksiyonunu artırabilir [5,12].

Yaşlandırma Yöntemleri: Yaşlandırma yöntemleri, şarabın kimyasal bileşimini ve sağlık faydalarını önemli ölçüde etkiler. Meşe fıçılarda yaşlandırma, şarabın lezzet profilini ve polifenol içeriğini zenginleştirir. Meşe fıçılarda yaşlandırma, şaraba odunsu ve baharatlı tatlar katarken, polifenol miktarını da artırabilir. Bu süreç, meşe odununun şaraba tanen ve diğer biyoaktif bileşenler salması ile gerçekleşir. Fıçılarda yaşlandırma dışında, alternatif yaşlandırma teknikleri de kullanılabilir. Örneğin, çelik tanklarda yaşlandırma, şarabın daha taze ve meyvemsi bir profil kazanmasını sağlayabilir. Bununla birlikte, polifenol içeriği açısından fıçılarda yaşlandırmanın yerini tutmayabilir. Alternatif yöntemler, şarap üreticileri tarafından belirli bir lezzet profili ve kimyasal bileşim elde etmek için kullanılabilir [5,12]. Polifenoller ve sağlık üzerindeki etkileri;

Ateroskleroz ve Koroner Kalp Hastalığı: Polifenoller, kan damarlarını genişleterek ve kolesterol oksidasyonunu önleyerek kalp hastalıklarına karşı koruma sağlar. Antioksidan özellikleri sayesinde, damar sertliğini ve kalp krizi riskini azaltabilirler [13].

Kanser Kemoterapi Önleyici Özellikler: Polifenoller, hücre çoğalmasını kontrol eden ve kanser hücrelerinin büyümesini engelleyen mekanizmaları destekler. Bu nedenle, kanser riskini azaltmada potansiyel kemoterapi önleyici ajanlar olarak görülmektedirler [14].

C. Polifenollerin İçeriği ve Profili

Polifenollerin içeriği ve profili, şarap yapımında kullanılan üzüm çeşidine, coğrafi kökene, yetiştirme yöntemlerine ve şarap yapım süreçlerine bağlı olarak değişir [5,11,12].

Örneğin:

Üzüm Çeşidi: Farklı üzüm çeşitleri, farklı polifenol profilleri sunar. Kırmızı üzüm çeşitleri, genellikle beyaz üzüm çeşitlerine göre daha yüksek polifenol içerir. Bunun sebebi, kırmızı üzümün kabuklarının ve tohumlarının yüksek miktarda polifenol barındırmasıdır. Kırmızı şaraplar, üzüm kabukları ve tohumları ile birlikte fermente edildiği için polifenol içeriği daha yüksektir [5,12].

Coğrafi Köken: Üzüm bağlarının bulunduğu bölgenin iklim ve toprak özellikleri, üzümlerin polifenol içeriğini etkiler. Sıcak ve kuru iklimlerde yetişen üzümler, daha yüksek polifenol seviyelerine sahip olabilir. Toprak yapısı da üzümlerin besin alımını ve dolayısıyla polifenol sentezini etkileyebil [15].

Yetiştirme Yöntemleri: Organik tarım yöntemleri, genellikle daha yüksek polifenol konsantrasyonlarına katkıda bulunabilir. Kimyasal pestisitler ve gübreler kullanılmadan yapılan organik tarım, bitkilerin doğal savunma mekanizmalarını güçlendirir, bu da daha yüksek polifenol üretimine yol açar . [15].

Şarap Yapım Süreçleri: Fermentasyon ve diğer şarap yapım süreçleri sırasında polifenol miktarı ve türü değişebilir. Kırmızı şaraplar, üzüm kabuklarıyla birlikte fermente edildiği için beyaz şaraplardan daha fazla polifenol içerir. Bu süreçte, polifenoller üzüm kabuklarından şaraba geçer ve şarabın antioksidan kapasitesini artırır [15].

D. Resveratrolün Özellikleri

Resveratrol, trans-3,4',5-trihidroksistilben adı verilen bir stilbenoid olup, iki aromatik halkadan oluşan doğal bir fenol ve fitoaleksindir. Bu bileşik, bitkiler tarafından stres durumlarına karşı bir savunma mekanizması olarak üretilir [16,17].

Üretim Mekanizması: Resveratrol, özellikle hayvan veya patojenlerin bitkilere saldırması, bitkilerin yaralanması veya ultraviyole (UV) ışığa maruz kalmaları sonucunda üretilir. Bu durumlar, bitkilerin dayanıklılık mekanizmalarını güçlendirmek için resveratrol sentezlemesini tetikler [17].

Strese Bağlı Sentez: Resveratrol miktarı, bitkilerin maruz kaldığı stres koşullarına bağlı olarak değişir. Daha fazla stres altında, bitkiler daha yüksek miktarda resveratrol üretebilir. Örneğin, bağcılıkta kullanılan bazı tarım teknikleri, bitkilerin strese maruz kalmasını artırarak resveratrol seviyelerini yükseltebilir [18].

E. Sağlık Üzerinde Faydaları

Kalp Sağlığı: Resveratrol, kalp sağlığını iyileştiren önemli bir biyoaktif bileşiktir. Bu polifenol, kan damarlarını genişleterek ve LDL kolesterolün oksidasyonunu önleyerek kardiyovasküler hastalık riskini azaltabilir. LDL kolesterol, okside olduğunda arter duvarlarına zarar verebilir ve ateroskleroz gelişimine yol açabilir. Resveratrol, bu süreci engelleyerek kalp krizi ve felç riskini düşürebilir [19,20].

Kanser: Resveratrolün kanser hücrelerinin büyümesini engelleyebileceği bazı laboratuvar ve hayvan çalışmaları tarafından gösterilmiştir. Bu bileşik, kanser hücrelerinde apoptoz (programlanmış hücre ölümü) indükleyerek ve hücre döngüsünü durdurarak tümör büyümesini baskılayabilir. Özellikle kolon kanseri hücreleri üzerinde yapılan çalışmalar, resveratrolün ribonükleotid redüktaz aktivitesini inhibe ederek kanser hücrelerinin çoğalmasını engelleyebileceğini göstermiştir [20,21].

Beyin Sağlığı: Resveratrol, nöroprotektif özellikleri sayesinde beyin sağlığı üzerinde de olumlu etkiler yapabilir. Bu bileşik, serbest radikallerin neden olduğu oksidatif stresi azaltarak ve beyin hücrelerini koruyarak Alzheimer hastalığı gibi nörodejeneratif hastalıkların riskini azaltabilir. Klinik çalışmalar, resveratrolün beyin hücrelerinin sağlığını koruyarak bilişsel işlevleri iyileştirebileceğini ve yaşa bağlı bilişsel gerilemeyi yavaşlatabileceğini göstermiştir [22].

Şeker Hastalığı: Resveratrol, insülin duyarlılığını artırarak ve kan şekerini düzenleyerek diyabet yönetimine yardımcı olabilir. Bu biyoaktif bileşik, pankreas beta hücrelerinin fonksiyonunu iyileştirerek insülin salınımını artırabilir ve hücrelerin insüline olan duyarlılığını artırarak kan şekerini kontrol altında tutabilir. Ayrıca, resveratrol, diyabetin neden olduğu oksidatif ve nitrozatif stresi azaltarak organ hasarını önleyebilir [23,24].

Sonuç olarak, şarapta bulunan polifenoller ve resveratrol gibi biyoaktif bileşikler, sağlık üzerinde çeşitli olumlu etkiler sağlayabilir. Ancak, bu faydaların sağlanabilmesi için şarap tüketiminde ölçülü olunması önemlidir. Araştırmalar, hafif ila orta derecede kırmızı şarap tüketiminin daha düşük kardiyovasküler hastalık görülme sıklığı ile ilişkili olduğunu göstermektedir. Bu çalışmalar, orta düzeyde tüketimle karşılaştırıldığında, hiç şarap tüketmemenin veya kronik olarak aşırı şarap tüketmenin (günde üç veya daha fazla içecek) ve diğer alkollü içeceklerin artan kardiyovasküler hastalık riskiyle ilişkili olduğunu bildirmiştir.

II. SONUÇLAR

Şarap, 3000 yılı aşkın bir süredir beslenme ve sosyo-dinsel işlevlere hizmet ederek insan kültürünün bir parçası olmuştur. Üretimi her kıtada gerçekleşmekte ve kimyasal bileşimi, şarap üretim teknikleri, üzüm çeşidi ve iklim faktörlerinden etkilenmektedir.

Küresel olarak, şarabın kardiyovasküler faydaları, muhtemelen alkol ve diğer şarap bileşenlerinin (özellikle resveratrol ve diğer polifenolik bileşikler) aterogenez, pıhtılaşma ve fibrinoliz üzerindeki etkilerinden kaynaklanmaktadır. Orta düzeyde kırmızı şarap tüketiminin kardiyovasküler hastalıkları önlemek ve tedavi etmek için umut verici bir "terapötik" seçenek olabileceğini öne süren kanıtlar artmaktadır. Ancak, kırmızı şarap tüketiminin yararlı etkilerinin herhangi bir üzüm türüne atfedilip atfedilemeyeceği belirsizdir ve herhangi bir şarap kaynağının diğerlerinden daha iyi olduğu söylenemez. Ayrıca, alkollü içeceklerin ve özellikle kırmızı şarabın rapor edilen faydalarının sosyoekonomik karıştırıcı faktörler tarafından etkilenip etkilenmediğinin belirlenmesi gerekmektedir. Kırmızı şarap tüketiminin insan sağlığı üzerindeki etkileri daha iyi tanımlanmalı ve alkolden uzak duranlara hafif ila orta düzeyde kırmızı şarap tüketimine başlamaları konusunda kesin tavsiyede bulunulmadan önce ek

araştırmalar yapılmalıdır. Özellikle, resveratrolin sağlık yararlarını en üst düzeye çıkarabilecek optimum dozaj henüz belirlenmemiştir ve bu, kapsamlı bir araştırma alanıdır.

Abstract – Usually, modular construction involves the off-site manufacturing of standard building components in a factory before the components are assembled on the construction site. It is common to use terms like "prefabrication," "off-site construction," and "modular construction" interchangeably. The construction of modular constructions nowadays is flourishing all over the globe. The roots of the Albanian prefabricated constructions are extended for the first time around the 1970s. This paper will indeed analyze some recently built modular construction in Albania, considering and comparing it with international case studies.

The demand for new construction in Albania is rising rapidly. Currently, the most common structures are cast-in-place beam-column designs, driven by both traditional mindsets and industrial capabilities. However, with Albania's economic growth, there is an increasing need for affordable, quickly built, and technologically advanced buildings. Modular construction, which assembles prefabricated modules on-site, offers a solution. This method aligns with bioclimatic design principles, reducing environmental impact and optimizing resources, marking a shift toward sustainability in the construction industry.

The purpose of this article is to explore the potential integration of "modular construction techniques" with "bioclimatic design concepts" to create buildings that are environmentally friendly, energy-efficient, and multipurpose by function.

This study explores the use of modular construction techniques in conjunction with bioclimatic techniques to increase "building sustainability". Combining these tactics encourages energy efficiency and a reduced environmental effect, making people far more resilient and weather-adaptable. The synergy between the two of them is necessary.

Keywords – modular buildings and techniques, prefabricated buildings, cast-in-place structures, prefabrication roots in Albania, bioclimatic principles of buildings

I. INTRODUCTION

For many years, modular building has been an affordable construction choice. Today, it's not just seen as a product type but as a comprehensive method of construction. Modular construction involves building structures—whether apartments, business buildings, or homes from shipping containers—off-site under controlled conditions. These structures use the same materials and adhere to the same codes and standards as traditional buildings but are completed in nearly half the time.

In traditional construction, raw materials are brought to the site, where workers cut and assemble them. However, with modular construction, significant portions of the project are fabricated off-site, sometimes in a different town or even a different country. These prefabricated modules are then shipped and assembled on-site to form a complete building.

Although some consider modular construction a modern method, it has been utilized in various industries for decades. Nowadays, it is mainly used for multi-family apartments, hotels, and commercial buildings. What makes these projects modular is that the factory-produced units are three-dimensional structures with floors, walls, and ceilings. These units come with most of the interior finishes and fixtures already installed.

In recent times, some modular companies have started incorporating traditional stick-building methods and highly automated robotic assembly lines into their processes. This evolution signifies a further advancement in modular construction techniques. Since affordable housing and faster building are essential, the flourishing of such kind of industry over the years was necessary. During the post-war era, it became more and more popular, particularly in the US and the UK. Furthermore, its popularity in the Western World began to vanish somehow, in 1968 when in the UK an apartment tower collapsed and cast doubts and concerns about the safeness of the prefabricated buildings. Meanwhile, they flourished between the 60s and 80s, in Eastern Europe (former communist countries) as an instrument to cope with the boiling housing crisis. However, they lost significance since the collapse of the Berlin Wall, because of the fragmentation of the construction industry. Nowadays, these kinds of structures are becoming again more and more widely recognized, as they are receiving new attention and financial support. Digital tools that operate in the field, have fundamentally altered the idea of modular building. There exists a stronger trend in the private sector toward building more things away from the construction site. “Modular construction” is one approach. In some other cases nowadays, there are also “multiple modular construction techniques” such as in the United States. In such cases, architects, engineers, and contractors planned to fabricate modules very far away from the site, truck them into the site, and then mount them on top of each other to complete apartment buildings. These techniques streamline the logistics of distribution and make module design easier. Also, the customer's perception of such kind of building is rapidly changing, due to more variety in material selections which enhances the aesthetic attractiveness of prefabricated buildings [1].

Housing and administrative building “mass production” has a long tradition in Europe, especially in the northern countries and in the United States. This type of architecture came into life for political and economic reasons, which encouraged the construction of “prefabricated structures” also in the Eastern bloc countries during the 1960s and 1970s. Meantime, Germany, Austria, and Scandinavia which had very ecological mindsets and standards, were converted into the champions of the “eco-architecture”.

Biases on prefabricated structures, which ended up somehow as the symbols of “cheap and unattractive structures”, are changing meantime. The latest technologies such as CAD/CAM/ CAE systems are archiving a wider audience and the supplies are increasing and diversified. These systems get a reduction in execution time, establish a more uniform and perfect finish, and reduce the environmental impact and occupational hazard at the site. The three more common prefabrication systems (wood, steel, and concrete) include a lower cost for the manufacturer and the customers [2].

Modular constructions are considered a preferred typology in comparison with traditional buildings because of several benefits. The decrease in the “competition time” is one of them. There are other components involved in the issue such as better “environmental performance”, better quality of life, structural flexibility, and increases in the safety of workers at the construction site. But nowadays there are still lower rates of acceptance of modular building in emerging nations.

The construction industry is indeed vital to a country's economic growth. The primary goal is to meet the housing and infrastructure demands of societies. Currently, the most common building method worldwide is “on-site construction”. Based on that the project competition time lasts longer, the quality is decreased, the construction waste is increased, the cost overruns are enhanced, and the environmental sustainability becomes inefficient [3], [4], [5].

The shift of focus toward “innovative construction techniques” in many developed countries aims to address the previously pointed problems with traditional building techniques. The procedure includes constructing the buildings and elements separately, which are produced off-site, and then transporting them to the construction site for installation and final assembly [6], [7].

Four forms of off-site construction may be distinguished: modular construction, non-volumetric preassembly, volumetric preassembly, and modular construction [8], [9]. Since 80–85% of the work involved in the building phase is completed in a factory, modular structures are the most comprehensive

type of off-site construction. Meanwhile, extra ground work such as excavations, foundations, and module installation, are completed at the building site [10]. Furthermore, modular constructions benefit from the continuity of workflow [11]; reduction of construction waste [12]; reduction of project competition time [13]; reduction of CO2 [14]; and a drop in the number of contractors on-site; and improvement of the safety of workers [15].

Modular construction has many advantages in comparison to conventional buildings. So, they are being implemented in many countries and regions, including also Australia. "Modular building" has been recognized by construction companies as a critical concept for improving the state of the industry as it is now [16]. About 30% of residences constructed in wealthy nations like the UK are made by using modular prefabricated technologies. In contrast with the national average, up to 70% of residences in Scotland and Ireland are anticipated to be constructed using this technology [17]. Japan is now the world leader in off-site modular building, by constructing over 70,000 prefabricated dwellings annually. As "conventional building techniques" generate a significant quantity of refuse and carbon emissions in China, the implementation of modular construction can achieve a reduction of construction waste up to 74%, as well as a reduction of carbon emissions up to 34% [18].

The unique characteristics of modular constructions are associated with multiple complexities such as collaboration between the developers and other project participants; - like clients, main contractors, sub-contractors, designers, architects, transporters as well as manufacturers [19].

The application of modular construction has a significant initial financial expense, and the payback period could be at risk in achieving the return on the initial investment [20]. As a result of such experiences in the building sector, consisting both of failure and success, the industrialized nations seem to have acquired the ability to manage these kinds of risks.

It must be underlined that "modular constructions" are innovative constructions that have completely transformed the building sector. They have changed the manners of planning, designing, project implementation, and managing performance [21]. Reliability, durability, safety, constructability, and transportability are essential qualities for modular construction [22].

On the other hand, the goal of "bioclimatic design" is to maximize building performance by making use of the regional climate and environmental factors; as it seeks to reduce the need for mechanical systems while maximizing natural light, ventilation, and thermal comfort. Green roofs, thermal mass use, natural ventilation, and passive solar design are important bioclimatic techniques. These tactics minimize energy use and improve occupant comfort while coordinating with the local climate characteristics.

When compared to conventional construction methods, modular construction has fewer environmental drawbacks such as less waste from materials, less energy use, and a smaller carbon footprint. Furthermore, the regulated manufacturing environment enables more economical resource usage.

II. REFLECTIONS ON MODULAR CONSTRUCTIONS

Below are some reflections on (dis-)advantages based on local and international experiences of the modular way of construction.

1. The advantages of modular construction:

- Saves time - It permits certain work to be completed in a factory while foundations and site construction are being done at the location at the same time. The advantage of saving time is that it accelerates construction while maintaining project schedule efficiency. The modular method can reduce the entire timetable by thirty to sixty percent.
- No weather delay - The modules are manufactured in a controlled environment, thus building modular structures is not affected by severe weather. It offers more pleasant and safe working environments for employees. They become more proficient and more productive. The majority of the appliances are included with the modules once they come on-site including flooring, cabinets, countertops, plumbing, and electrical fixtures.
- No need to archive components: Staging and moving materials on a small urban site, like in Tirana, can be challenging. This often leads to clutter, slower production, and concerns about theft. When modules

are constructed in a factory instead, building sites can stay safer and cleaner. This also provides more space for workers to move around freely.

- Lower Labor Costs - One major but sometimes debated advantage of modular construction is its impact on labor costs. Today, skilled construction workers are in short supply in many countries, and in some cities, their services are very expensive. This makes it difficult to complete building projects within budget and on schedule. With modular construction, however, skilled workers can operate in fixed, controlled, and safer environments. Modular plants can draw in top talent and take advantage of easy access to raw materials and transportation links like highways and railways. This method can potentially lower construction costs by up to 25%.
- Reduced waste volume: Recent building experiences in Tirana's downtown area demonstrate that modular building and restricting the quantity of trash on each project may achieve up to a 90% reduction in materials. Even in the factories that assemble the construction components, recycling is being maximized.

2. The challenges of modular construction:

- Mass production vs. Limited Variety: On a large scale, the modular mass manufacturing technique promotes increasingly homogeneous and repetitious areas and goods. For this reason, investors choose a modular strategy when developing hotels and residential buildings, provided that each unit can be standardized and stacked. Unique or non-repetitive construction shapes significantly reduce time and cost benefits for suppliers and buyers.
- Higher number of complex decisions -vs- Front loaded design – The majority of choices and design/engineering work must be finished initially according to the modular method. It necessitates that contractors and architects/engineers understand the nuances of the modular manufacture and construction phases. Additionally, this pushes owners and purchasers to make final decisions considerably in advance of the building's completion, yet last-minute alterations can be quite problematic.
- Independent of how they are built, the approval procedure can be challenging since requirements for compliance with local and federal building standards and laws must be met. However, some countries have more favorable laws for modular production than others. Meantime building inspection systems could also vary a lot and might complicate both the approval and execution phases.
- Few suppliers continue to carry the majority of the risk. While firms that produce commercial and multi-family goods are expanding, their ability to grow depends on other factors such as liquidity. Manufacturers of modular houses are primarily focused on building single-family homes. Before signing a contract that transfers all risks to them, buyers and contractors must exercise adequate caution. Halfway through the project, changing manufacturers might also be disastrous.
- Transportation costs and risk - There is also the risk associated with transporting the modules, as they are prefabricated in a factory far from the construction site. These modules need to be either transported directly to the site or staged at a nearby location for later relocation to the site. However, mistakes during the transportation of the module could lead to serious damages, repair needs, or replacements. This needs previous extra work for planning and tracking the transportation itinerary and its best timing, to avoid situations like bridges, tight turns, traffic problems, crane setup, and temporary road closure permits. This imposes extra costs and expertise on insurance issues.
- Difficult financing process - Since modular construction involves purchasing materials on a faster timeline, the bills tend to be much larger earlier in the construction process than what investors and bankers are typically accustomed to. Therefore, is needed more patience to understand the amounts and timing of the foreseen funding, making sure that the work is not disrupted. This means making sure to explain well investors' building plans via the site and factory visits [23].

III. METHODOLOGY

The methodology is based on the historical, descriptive, and comparative manner of implementing the principles of bioclimatic architecture into modular constructions in some European cases, considering also the Albanian case study as a developing country. In Tirana, prefabricated buildings have a brief historical heritage. Tirana needs to gain experience from international case studies to further advance.

IV. INTERNATIONAL CASE STUDIES

The objectives of bioclimatic techniques and modular building are similar. They emphasize efficiency, sustainability, and less environmental effect. By combining these strategies, structures may be designed that are not only quickly constructed but also naturally energy-efficient and ecologically conscious.

Here are some international examples of modular constructions using some of the bioclimatic principles:

1. School in Leknes, Norway

The school is located in the Norwegian archipelago of Lofoten, a part of the Arctic Circle. Its topography includes dramatic landscapes and mountains, open sea views sheltered bays, untouched land, and beaches.

The prefabricated modules that are used represent the latest advanced technology in the Scandinavian market. The modules are from Cramo's new C90 series. As a result of 30 years of extensive experience in the field, the outcome is categorized by a modern design with a focus on functionality, work environment, and energy consumption. Also, the transportation by ships from the Estonian Factory is completely environmentally friendly and integrated within the green philosophy. The building was completed in a record time. 74 prefabricated modules were positioned within one week. The building has three floors. On the ground floor and first floor are positioned the classrooms; meanwhile on the third floor are positioned the rooms for school administrators and teachers. The building meets all the requirements of a modern school [24].

Fig.1 School in Leknes, Norway [24].

2. Sustainable prototype. Studio 804 (University of Kansas, School of Architecture and Urban Planning), Greensburg, KS, USA.

The project was conducted one year after a devastating tornado in the Greensburg area. The sustainable prototype uses active and passive systems as the main core for the environmental strategy, based on bioclimatic principles and passive sustainable strategies. The building uses recycled materials in full interaction with nature [2].

The Sustainable Prototype became Kansas's first LEED Platinum building. The main goal was to construct a structure that would be open to the town and the southern sun while shielding the artwork from the sun's UV rays. This would prevent the artwork from deteriorating and also create a pleasant viewing area. Studio 804 got in touch with a supplier of airplane hangar doors to find an adaptable simple-to-use and manually controllable method of opening and closing the south wall. The door was designed so that, when closed, it creates louvers to block the sun and, when open, it allows gatherings to spill onto the large buffalo grass lawn to the south [25].

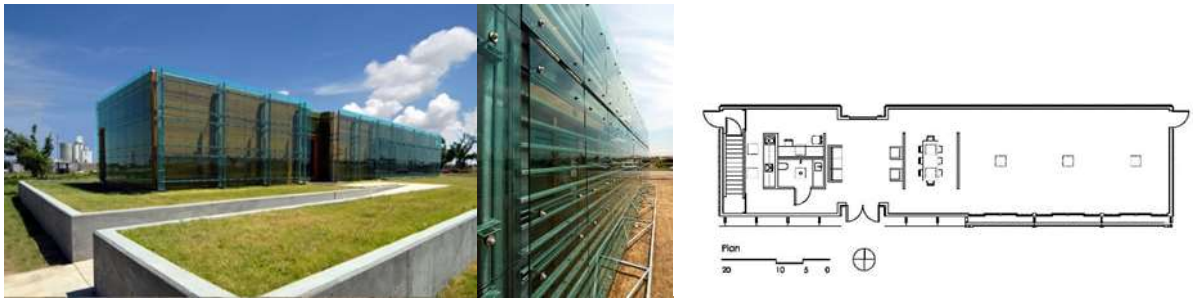

Fig. 2 Sustainable prototype [25].

3. Hedge Building. Atelier Kempe Thill Architects and Planners, Rostock, Germany.

The building is composed of a rectangular floor plan, with dimensions of 6.5x20x10 m. It has a monolithic structure. Within the structure are included two 4m high doors and high ceilings topped with polycarbonate sheets. The volume has a close nature and the green walls fuse it with the exterior [2].

The architects' goal in designing the pavilion was to explore the poetic possibilities inherent in the logic of Dutch agriculture, which is characterized by absolute rationality and industrialization. They attempt to provide a romantic touch to the pavilion solely via objective and logical ways.

The ivy hedge on the smart screen is cultivated in Dutch glasshouses. It is manufactured in garden pieces that are 1.2 by 1.8 meters in dimensions. These plants are essentially industrial products that may be used to construct "green walls." Ivy often takes years to develop to the point where a green building is created. The growing phase of the construction process is shortened by smart displays. A typical wall of ivy has an organic design; which a wall of "smart screens" does not. Rather, it is made up of several almost similar parts, which highlights its industrial nature. The pavilion is like a pergola. Its small size of 4-meter-high doors, and its roof, give it the appearance of an enclosed "house" [26].

Interesting lighting conditions dominate the room. It has the feel of a traditional museum room thanks to light coming in through the ceiling, and more light comes in through the surrounding hedges. An intriguing interplay between the inside and exterior is the end product [26]. The smart building uses bioclimatic principles by creating a heat trap during the winter season and shading with green walls during the summer season, self-efficient in terms of internal thermal comfort.

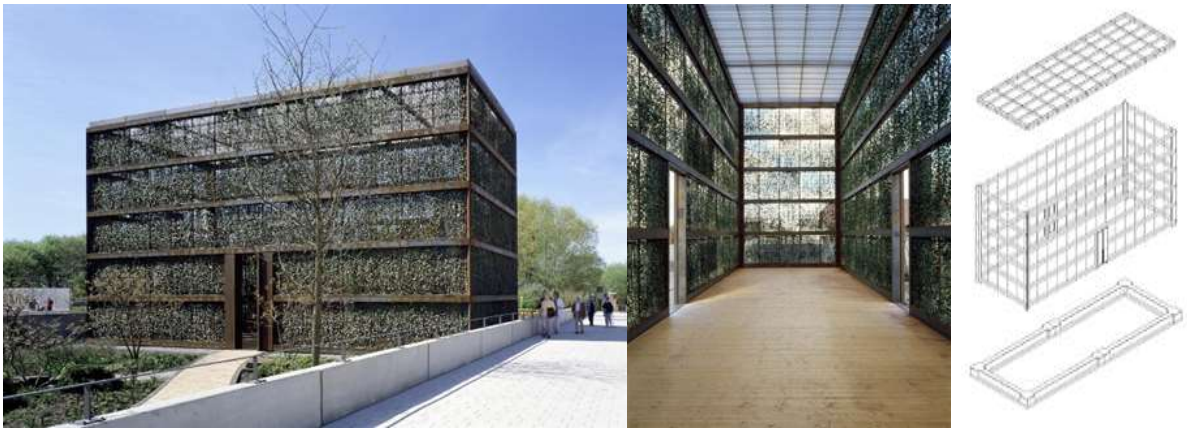

Fig. 3 Hedge Building [26].

V. The Case Study of Tirana, Albania

Due to the war's devastation of cities, the housing crisis following World War II became a pressing national emergency in the first 2 decades of the post-war period. To meet urgent demands, the first homes were constructed by building brick-made blocks, or by using temporary supplies donated voluntarily by other countries. The overtly neoclassical Russian school dominated the architecture of the time for both: the new individual buildings ore the construction of massive and sturdy structures. The motifs of such

architecture were ostentation, domination, and pomposity. The majority of the new buildings constructed between 1950 and 1970 used silicate or red-coated bricks for the retaining walls. The growth of the building materials industry also contributed to the standardization of architectural elements. By bringing the design aspects together, this method significantly aided in the typification of homes and the unification of housing morphology. Many of these systems received criticism in the late 1960s and early 1970s for their compositional remedies for the social repercussions of forced expropriations, for encouraging antisocial conduct, and for rejecting the city's building customs. The kitchen space that was connected to the living room was reduced to adhere to the primary building cost-cutting philosophy. Often, plastering and other elements of the facade were also eliminated to further reduce costs. During this period, the National Architecture and Design Institute created a variety of dispersed and repeatable models to feed local housing initiatives, that had no relation at all with national or local customs, culture, or climatic circumstances, all over the country [27], [28], [29].

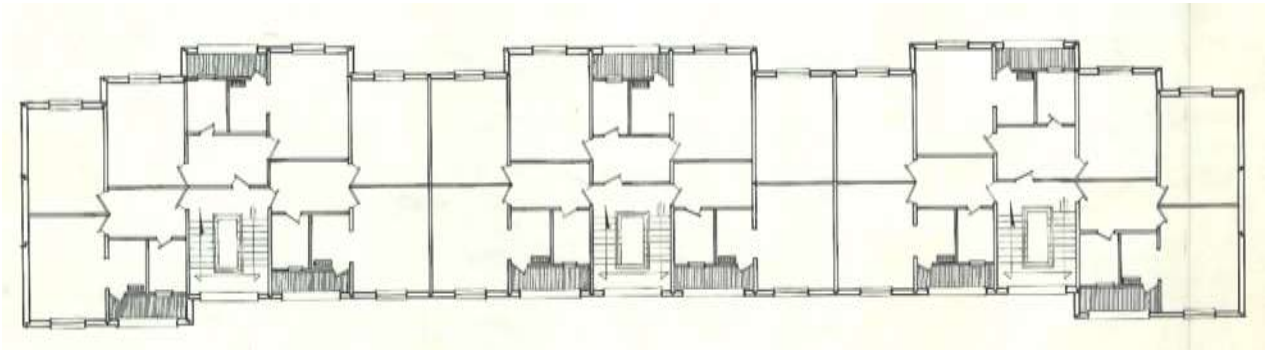

Fig. 4 Prefabricated building in Albania during the 1970s. Typical plan [30].

Albanian authorities of the time invested in the building materials production industry. Therefore, a building materials factory "Josif Pashko" began operations in Tirana for the first time in the country by the beginning of the 70s. However, this factory featured a consistent structure with load-bearing panels, based on Russian and Chinese building technologies. Precast reinforced concrete panels allow rapid construction of residential buildings. The leading institution was the architectural bureau of the “Institute of Design No.1” in Tirana. The Institute developed four different typologies/techniques of intervention, considering precast panels (four different types of modules). These modules could be combined into linear schemes. Furthermore, buildings starting from 2 up to a maximum of 6 floors could be created. The central staircase of the four modules consists of two ramps and two platforms. The intermediate platform is open and shaped like a lodge, and one staircase provides access to two or three apartments per story [31].

Generally, to combine linear plans and to construct urban complexes, the prefabricated structures were mainly made up of four distinct planimetric modules featuring two blind-side walls and bilateral exposure [32].

During the period of socialism, there were constructed a lot of prefabricated buildings at country scale. These buildings often had prefabricated reinforced concrete panels covering them and a concrete core (staircase). They were joined together via the welding of iron/metal parts. The building panels were created by using such materials, while the staircase's reinforced concrete was poured straight onto the building site. They were built quickly and effectively, but hardly provide comfortable temperatures indoors owing to thermal air infiltration and thermal bridges at their sites of interaction [33].

Generally, from the bioclimatic point of view, these buildings were positioned randomly in the area without taking into consideration the solar orientation of the building to maximize the benefit from the sun during the winter. This resulted in a considerable reduction in heating loads [34], [37].

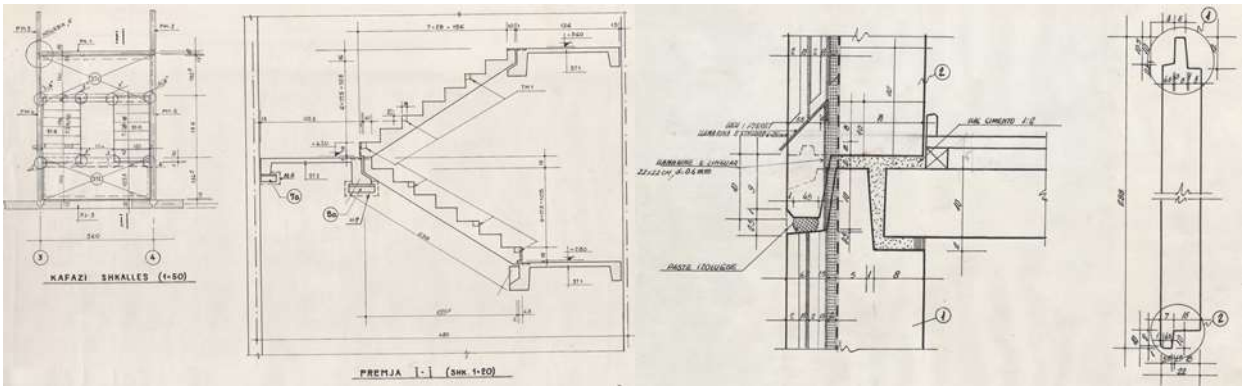

Fig.5 A. Staircase, plan, and section; B. Vertical section of horizontal joint and vertical cut of external panels [30].

Nowadays, the construction of modular buildings in Albania is not so present. Regrettably, despite their limitations in the past, prefabricated initiatives, now are rare in the Albanian construction sector and receive insufficient attention as a result of prejudice, inadequate organizational goals, lack of infrastructure and expertise, and fragmentation of the building industry. Albania has to work more with education and training institutions, industry players, and government regulations, to encourage the adoption of contemporary and new prefabricated and modular building technologies, to meet past and current difficulties [35], [36].

One of the recently built semi-prefabricated buildings in Tirana is a multifunctional one located in the main national infrastructure and economic corridor which connects the capital Tirana with the international airport, and the main port city of Durres. The structure of the NOVA Company building (designed by Arch.4 Studio in Tirana) is a combined one: a cast-in-place beam-column structure, and a prefabricated one (metallic structure). Recently, such kind of structures have gained more popularity in Tirana at least.

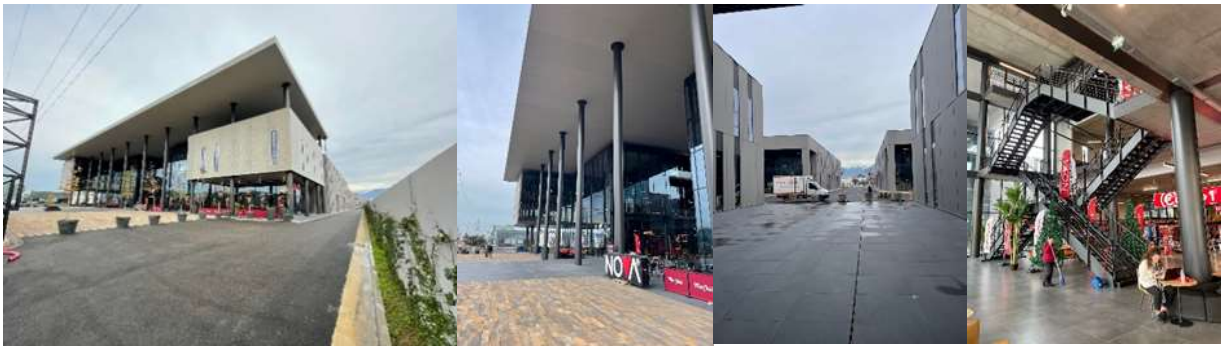

Fig. 6 Semi-prefabricated NOVA building, Tirana, Albania (Source: Authors).

The main building facade faces south, and the overhanging shading platform is designed to provide shade during the summertime. The smart glass facade is withdrawn from the first line of construction to protect against overheating and benefit from solar radiation during the winter season, using bioclimatic principles. The outer coat of the building is realized using prefabricated panels.

Another typical example of a metallic prefabricated structure is at the POLIS University building in Tirana, Albania. The added volume of the existing building was designed by Metro-Polis Architecture Studio of the university and was finished in 2010. The architects involved in the project were Arch. Fagu, E; Arch. Marku, E; Dr. Aliaj, B; and Dr. Dhamo, S. The structural engineer was Eng. Sula, B; and the mechanical engineer was Dr. Alushaj, R. The prefabrication of the metallic structure of the building was carried out by an Italian company "Mangili & Associati" SpA, transported via ship, and then assembled directly on the construction site. The walls and ventilated façade were implemented by FB-ART Shpk Tirana, in cooperation with the German company "Moeding Keramikfassaden".

The orientation of the main facade that was added to the existing warehouse is located at the back of the building toward the south. The principles of bioclimatic design are also applied here to the newly added volume/structure (serving now as the main entry hall of the university). The thermal trap (smart glass facade) faces south and has a direct benefit from solar radiation (as part of the implemented bioclimatic

strategies) and is combined with the thermal mass of the ground floor platform. During summertime, the façade is protected from overheating through aluminum shaders positioned in the structural glass facade. The maximum angle of the sun on the summer solstice in Tirana (21 June) is 75°, hence the shaders were calculated purposely considering such a problem. Meanwhile, on both sides of the glass facade, ventilated facades have been created to increase the thermal performance of the building, and protect it from east and west. A study conducted by Xhexhi, K, and Aliaj, B reveals also that the thermal performance of such type of facades is much higher compared to an external standard wall [38]. The overhanging shader on the top of the building protects further the building, especially in the summertime from solar radiation. The quality of the glass structural facade is essential to be discussed. The glass implanted reflects the sun's rays to avoid overheating during summertime.

VI. DISCUSSIONS

It is imperative to acknowledge the importance of incorporating "bioclimatic concepts" into these initiatives. The case studies that have been examined, including the ones from Tirana, demonstrate a definite tendency to respect nature by employing a variety of construction techniques and materials that both significantly benefit the environment and have no adverse effects on it, starting from the early stages of construction.

The use of bioclimatic concepts is constantly being expanded, particularly in "modular structures" to lower energy consumption, carbon footprint, building time lag, and reducing costs, to create a more sustainable future.

The case of Tirana and the other international case studies is a need and also a demand to change the synergy between bioclimatic architecture and modular buildings, making possible a fusion between them. The symbiosis between the two must be real and necessary.

VII. CONCLUSIONS

The primary goals of bioclimatic techniques and modular building are similar mainly because they emphasize efficiency, sustainability, and less environmental costs or effects. By combining these strategies, structures may be designed that are not only quickly constructed but also naturally energy-efficient and ecologically conscious.

It is important to consider the involvement of economic issues when merging modular construction and bio-climatic design into one entity; this involves complexities of design, constraints on funds and the regulatory environment. Collaboration between bioclimatic technologies and modular buildings necessitates careful consideration of policy proposals, scientific improvements, and industry stakeholders' cooperation. The success of the development process is dependent on resolving these difficulties.

The combination of modular construction economy and the environmental adaptability inherent in bio-climatic design results in a holistic and sustainable approach to building. The recent merger is a big step toward designing more durable, flexible, and environmentally friendly structures that can fulfill the needs

of our modern society. As construction techniques evolve, there is an exciting opportunity to increase sustainability by merging modular building approaches with bioclimatic practices. This fusion has the potential to result in more environmentally friendly constructions and innovative technology.

In countries like Albania, where urban reconstruction is still in its earliest stages, there is much to learn from more prosperous countries' successful initiatives as well as their mistakes. However, it is critical to customize these principles to our specific circumstances. Tirana, Albania's capital city, demonstrates this trend by investigating the incorporation of bioclimatic design principles into modular construction. Furthermore, these structures should fulfill several functions to ensure their maximum utilization in the future.

Abstract – Groundwater pollution is an important problem for agricultural areas. Certain pollutants in movable structure are highly likely to leach into the ground and contaminate the groundwater. In rural areas, groundwater is widely used for drinking and utility water purposes. Therefore, contamination of groundwater with pollutants directly affects the health of human living in rural areas. Nitrate can occur in water resources as a result of agricultural activities especially from chemical fertilizer. The aims of this study are: to investigate the nitrate levels in groundwater in three rural areas (Ugurlu, Doruc and Bolatlar villages) where intensive agricultural activities are carried out, in Şanliurfa, Turkiye and, to calculate the daily nitrate intake from the drinking water of the people living in these regions. In the measurements made in 2 periods, it was determined that the groundwater samples of all villages were above 50 mg/L, which is the acceptable limit value for nitrate. Maximum nitrate concentration was found in samples from Ugurlu village as 283 mg/L and 503 mg/L in January and July 2021, respectively. As a result, insufficient drainage and uncontrolled irrigation in the field brought the groundwater closer to the soil surface and accelerated the soluble nitrate leaching to the shallow aquifer. High nitrate levels in groundwater increase the daily nitrate intake of individuals using this water and increase the risk of nitrate-related diseases.

Keywords – Water, Food Contamination, Nitrate Intake, Human Health

I. INTRODUCTION

Irrigation that started in Harran Plain in 1995 has reached a very large area today, but it has brought various problems caused by excessive water consumption in the plain. It was noticed that the long-term and intensive agricultural activities and irrigation in the region negatively affected the groundwater quality. Based on this consideration, groundwater quality monitoring in the region was carried out and many studies were published on these results in different periods (1, 2, 3, 4).

In rural areas that consume groundwater for drinking and utility water purposes, water quality directly affects human health. Due to high nitrate concentrations above the acceptable limits in the groundwater, it is necessary to pay attention to the daily nitrate intake that enters the body.

II. MATERIALS AND METHOD

Groundwater analyzes were made on the water samples from 10 wells (Fig. 1) reflecting the shallow aquifer characteristics in Harran Plain. Sampling was carried out in 2 periods, January 2021 and July 2021. Nitrate analyses were made with the ion chromatography in Harran University Science Technology Application and Research Center (HUBTAM) Laboratories.

It was reported by the Food and Agriculture Organization in 2003 that the permissible daily intake of nitrate in 1995 was 3.6 mg/kg of body weight [5], according to the European Commission's Food Science Committee. Global health for adults with an average weight of 60 kg 3.7 mg/kg [6].

Fig. 1. Sampling points location map

III. RESULTS

A. *Nitrate Contamination in Groundwater*

The high nitrate values (Table 1) above the 50 mg/L, which is the acceptable limit value for nitrate in drinking water [7] in the Uğurlu, Bolatlar, Kısas, Doruç and Uğraklı wells can be explained by the vertical transport of the fertilizer-derived mobile nitrate ions. These wells draw attention as sampling points where the negative effects of excessive agricultural irrigation are encountered as high nitrate values. During the irrigation period (for July), nitrate leaching occurs due to the applied chemical fertilizers with the excessive irrigation on the cotton and corn.

In other words, it was expected that nitrogen fertilizer would infiltrate into the groundwater with the effect of irrigation and the nitrate amount in the wells would increase in July. Contrary to what was expected, nitrate values in the wells (except the Uğurlu well) decreased after the irrigation compared to pre-irrigation period (to January). It is thought to be caused by the increase in groundwater levels after irrigation (in July) and therefore the decrease in nitrate concentrations with the dilution effect.

Table 1. Nitrate concentration in groundwater for two different periods.

Wells	**Nitrate in January 2021**	**Nitrate in July 2021**
	(mg/L)	(mg/L)
Uğurlu	283,330	502,522
Yardımcı	50,354	47,166
Ozanlar	48,632	32,904
Doruç	102,421	73,034
Uğraklı	67,680	57,138
Bolatlar	153,734	141,592
Yaygılı	28,650	28,726
Olgunlar	45,418	23,222
Kısas	109,109	0
Çamlıdere	44,421	0

IV. DISCUSSION

A. *Dietary and Drinking-Water Exposure*

The current acceptable daily intake (ADI) for nitrates is 3.7 milligrams per kilogram of body weight per day (mg/kg bw/day) [5, 6]. People exposed to nitrates include it in their diet as natural ingredients or intentional additives. The primary nitrate and nitrite source in food are vegetables, cured meat and dairy products [8]. Ignoring the amount of nitrate taken from the food, the daily nitrate intake of human from only water in a region using contaminated groundwater as drinking water are calculated and presented in Table 2. The daily water intake of an adult is taken into account as approximately 2500 ml.

As can be seen in the Table 2, results above the ADI values for nitrate were ob-tained in 3 villages. Even if the amount of nitrate intake with food is not taken into account, villagers living in Uğurlu, Bolatlar and Doruç exceeded the acceptable daily nitrate intake amount from the water they consume during the day. For most of the population, about 97% of daily intake comes from food and only 3% from drinking water [9].

Table 2. Daily drinking water nitrate exposure for human supplying water from contaminated groundwater. *

Wells	**Average nitrate concentration (mg/L)**	**Possible daily nitrate intake from only drinking water Milligrams per kilogram of body weight per day (mg/kg/day)**
Uğurlu	392.9	16.4
Yardımcı	48.8	2.0
Ozanlar	40.8	1.7
Doruç	87.7	3.7
Uğraklı	62.4	2.6
Bolatlar	147.7	6.2
Yaygılı	28.7	1.2
Olgunlar	34.3	1.4
Kısas	54.6	2.3
Çamlıdere	22.2	0.9

*The daily water intake of an adult is taken into account as approximately 2500 ml and calculations were made for 60 kg person.

V. CONCLUSION

High nitrate values above the acceptable limit of 50 mg/L were detected in ground-water in certain villages in the Harran Plain, located in an area with intensive agricul-tural activities. Excess amount of nitrate in the soil enters the drinking water through the leaching or transporting from groundwater to surface water. The intake of the excess amount of nitrate into our bodies from food products and drinking water causes dangerous diseases.

As a result of the nitrate contamination of drinking water sources, villagers living in Uğurlu, Bolatlar and Doruç exceeded the acceptable daily intake (ADI) of 3.7 mg/kg/day for nitrates. It is necessary to pay attention to the issue of toxic and harmful parameters above the acceptable limits entering the body with contaminated water and foods.

Özet – İnsan ölümlerinin en yaygın nedenlerinden biri beyin tümörleri olup, bu hastalıktan ölenlerin sayısı gün geçtikçe artmaktadır. Beyin tümörleri beyindeki hücrelerin kontrolsüz çoğalmasıyla oluşan kitleler olarak tanımlanmaktadır. Bu tümörler kötü huylu veya iyi huylu olabilirler ve erken aşamada doğru bir şekilde tanımlanmazsa ve uygun tedavi uygulanmazsa ölümcül sonuçlar doğurmaktadır. Manyetik Rezonans Görüntüleme (MRG), tümörlerin tespiti ve türlerinin belirlenmesi için uzmanlar tarafından kullanılan en popüler medikal görüntüleme yöntemlerinden biridir. MR görüntü analizi ve segmentasyonu, beyin tümörlerinin erken teşhisinde büyük oranda etkili olup hastaların iyileşmelerinde önemli rol oynamaktadır. Bu çalışmada, beyin MR (Magnetic Resonance) görüntüleri üzerinde lezyon tespit işleminin gerçekleştirilmesinde kullanılan derin öğrenme ve makine öğrenmesi teknikleri incelenmiştir. Çalışma kapsamında, derin öğrenme ve makine öğrenmesi kullanılarak gerçekleştirilmiş çalışmalar analiz edilmiş ve bu doğrultuda yapılan çalışmaların sağladığı katkılar değerlendirilmiştir. Bu çalışmalar arasında, derin öğrenme yöntemleri kullanan ve Geliştirilmiş AlexNet (EAN) ile NASNet mimarilerini içeren araştırmaların daha öne çıktığı görülmüştür. Geliştirilmiş AlexNet (EAN) %99,32 ile en iyi performansı gösterirken, NASNet %99,6 doğruluk elde etmiştir. Makine öğrenmesi alanında incelenen çalışmalar değerlendirildiğinde, en başarılı sonuçların KSVM-SSD (Kernel Support Vector Machine-Social Sürü Optimization) kullanılarak elde edildiği görülmüştür. BRATS 2018, 2019 ve 2020 verilerinde sırasıyla %99,2, %99,36 ve %99,15 doğruluk oranlarına ulaşılmıştır. Ayrıca, bu yöntemin Naive Bayes ve DNN gibi diğer sınıflandırıcılar arasında oldukça iyi performans gösterdiği tespit edilmiştir.

Anahtar Kelimeler – Beyin Tümörü, Görüntü İşleme, Bilgisayar Destekli Tespit, Derin Öğrenme, Makine Öğrenmesi

I. GİRİŞ

Merkezi sinir sistemini etkileyen beyin tümörleri, potansiyel olarak ölüm noktasına götürecek kadar hayatı tehdit eden kanser türleri arasında yer almaktadır. Bu kanserler beyin etrafındaki sıvı akışını bloke ederlerse sorunlara neden olabilirler, bu da kafatası içindeki basıncın artmasına neden olmaktadır. Kanserin beyin dokusuna ve çevresine bu şekilde zarar verdiği belirlenmiştir [1]. Kanserli olmayan (iyi huylu) veya kanserli (kötü huylu) olmak üzere iki çeşidi olan tümörler yeni bir büyüme oluşturan ya da doğum sırasında (doğuştan) mevcut olan anormal hücre kitlesi olarak adlandırılabilirler. İyi huylu olanlar yavaş veya hızlı büyüyebilir, kötü huyludan farklı olarak vücudun diğer bölgelerine yayılmaz ve cerrahi müdahale ile çıkarılması daha kolaydır. Kötü huylu tümörler, çevredeki dokuları istila etme yeteneğine sahiptir. Bazı kanserli beyin tümörleri, ameliyat ile tamamen çıkarılabilirken ileri derecede tehlikeli olan bazı kötü huylu tümörlerin kenarlarının tanımlanması zor olabilir, bu durum cerrahların tümörün tamamını çıkarmasını

zorlaştırır [2]. Amerika Birleşik Devletleri Merkezi Beyin Tümörü Kaydı (CBTRUS), ABD'deki birincil beyin ve CNS tümörlerine odaklanan en büyük popülasyon tabanlı veri kaynağıdır. CBTRUS verilerine göre, kötü huylu beyin tümörlerinin ortalama yıllık yaşa göre ayarlanmış insidans oranı (AAAIR) 7,06, kötü huylu olmayanların ise 17,18'dir. En yaygın kötü huylu tümör glioblastoma, en yaygın kötü huylu olmayan tümör menenjiyomdur. 2014-2018 verilerine göre, glioblastoma erkeklerde, menenjiyom ise kadınlarda daha yaygındır. Beş yıllık sağkalım oranları kötü huylu tümörlerde %66,9, kötü huylu olmayan tümörlerde %92,1'dir. Beyin tümörlerinin teşhisinde en uygun yöntem MRG'dir. MRG, tümörlerin büyüklüğü, şekli ve yerleşimini detaylı gösterir. MR görüntülerinin analizi için yapay zeka algoritmaları kullanılarak, tümör tespiti daha doğru yapılabilmekte ve doktorların işlerini kolaylaştırmaktadır [3].

II. MATERYAL VE YÖNTEM

Beyin tümörleri üzerinde gerçekleştirilen birçok çalışma, Derin Öğrenme (DL) ve Makine Öğrenimi (ML) kullanılarak yapılan bilgisayar destekli tespit sayesinde tıbbi teşhis süreçlerinde daha hızlı ve hassas sonuçlara ulaşmayı mümkün kılmaktadır. Bu teknolojik gelişmeler, hastalara erken teşhis ve daha etkili tedavi seçenekleri sunarak yaşam kalitesini artırmada önemli bir rol oynamaktadır. Tıbbi görüntüler, hastalığın tanısı için gerekli olan uygun bilgilerin gerçek kaynağı olarak kabul edilir [4]. Hastalığın çeşitli yöntemlerle başlangıç aşamasında tespiti, kanser ve tümörlere bağlı ölüm oranlarının azaltılmasında en önemli faktörlerden biridir. Kullanılan yöntemler sayesinde radyologların ve doktorların hastalığı tespit edebilmesi ve iç yapısını inceleyebilmesini kolaylaştırmaktadır.

A. Makine Öğrenmesi

Makine öğrenimi yöntemleri, beyin tümörlerinin tespiti için veri ön işleme, bölütleme, öznitelik çıkarımı, boyut indirgeme ve sınıflandırma olmak üzere beş kritik adımdan oluşmaktadır. Veri ön işleme adımının gerçekleştirilmesi veri setinin temizlenmesi ve düzenlenmesini sağlar bu sayede modelin kalitesi ve etkinliği büyük ölçüde arttırılır [5]. Bölütleme ile yoğunluğa dayalı yöntemler, beyin segmentasyonunda uzaysal alanda etkili olup, piksel değerlerine dayanırlar. Bu tür yöntemler aynı zamanda eşikleme ve bölge tabanlı bir yaklaşımla sınıflandırılabilirler [6]. Özellik çıkarımı sayesinde görüntüdeki önemli bölgeleri temsil ederek boyut azaltma sağlanır. Tümör tespiti için kritik öneme sahip olan özellik çıkarımı, tümörün konumunu ve büyüklüğünü belirleyen bölge bazlı özellikler, tümörün geometrik özelliklerini çıkaran şekil bazlı özellikler ve tümörün iç yapısını ve dokusunu analiz eden doku özellikleri gibi çeşitli yöntemlerle gerçekleştirilebilir. Elde edilen özelliklerle tümörlerin patolojik olarak doğru sınıflandırılması sağlanır [7]. Boyut indirgenmesi, verilerin boyutunu azaltarak hesaplama yükünü ve gürültüyü minimize etme sürecidir. PCA (Principal Component Analysis), Genelleştirilmiş Diskriminant Analizi (GDA), LDA (Linear Discriminant Analysis) ve otoenkoderler gibi tekniklerle veri boyutu küçültülür, bu sayede aşırı uyumun (overfitting) azaltılması, depolama ihtiyacının azalması ve hesaplama verimliliği gibi avantajlar sağlamaktadır [8]. Makine öğrenmesinin en önemli adımlarından biri olan sınıflandırmada, doğruluk ve genelleme optimizasyonunu sağlayan algoritmalar arasında Yapay Sinir Ağları, Destek Vektör Makineleri, En Küçük Kareler SVM'leri, K-En Yakın Komşu ve Naive Bayes gibi yöntemler yaygın olarak kullanılmaktadır [9].

B. Derin Öğrenme

2006 yılında Geoffrey Hinton ve ekibi, yapay sinir ağı temelli derin öğrenme kavramını tanıtarak çalışmalarına başlamışlardır [10]. Derin öğrenme, yapılandırılmamış ve büyük veri setlerini analiz edebilir, bu da karmaşık sorunları çözmede etkili olmasını sağlar. Derin öğrenme algoritmaları, genellikle daha fazla veriyle eğitildikçe daha iyi performans gösterir. Bu, modelin daha genel ve kapsamlı bir anlayış geliştirmesine yardımcı olur. Makine öğrenmesi, manuel özellik çıkarımı ve segmentasyon gibi daha fazla ön hazırlık gerektirirken, derin öğrenme bu adımları modelin içinde otomatikleştirir. Derin öğrenme modelleri, görüntülerden kendiliğinden özellik çıkarabilir ve doğrudan sınıflandırma yapabilir. Bu, makine öğrenmesinde gerekli olan manuel müdahaleleri azaltır ve daha karmaşık verilerle daha iyi çalışmasını sağlar. Özellikle büyük veri setleriyle çalışırken, derin öğrenme, gerekli veri işleme adımlarını entegre bir şekilde ele alarak üstün performans sağlar. Ama derin öğrenme işleyişinde veri artırma ve özellikler çeşitli CNN mimarileri büyük önem taşımaktadır [11]. Tablo 1'de en sık kullanılan veri arttırma teknikleri yer

almaktadır. Veri Arttırma, orijinal veri setini değiştirerek yeni veri setleri oluşturma işlemidir. Çeşitli tekniklerle işlenmiş sentetik kopyalar oluşturulur. Örneğin, görüntülerde, dönme, yansıtma, kırpma, kaydırma ve renk tonu değişikliği gibi yöntemler kullanılarak veri miktarı artırılır [12].

Tablo 1. Veri artırma teknikleri [13]

Sıra No	**Veri Arttırma Tekniği**	**Parametreler**
1	Çevirme	Üst, Sol, Alt, Sağ
2	Döndürme	90°, 60, 45, -45°, -60°
3	Kayma	X-ekseninde 10°, Y-ekseninde 10
4	Çarpıklık (Eğme)	Sol, Sağ, İleri, Geri

Son 12 yıl içerisinde çeşitli CNN mimarileri geliştirilmiştir. Model mimarileri sayesinde kullanılan uygulamalarda performans artırımında büyük rol oynamaktadır. 1989 yılından itibaren CNN mimarisi birçok değişime ve yeniliğe uğramasıyla beraber (yapısal yeniden formülasyonu, düzenlileştirmeyi, parametre optimizasyonlarını vb. içermektedir) CNN'in performansının önemli artışı göz önündedir. Ayrıca işlem biriminin yeniden düzenlenmesinin yanı sıra yeni blokların geliştirilmesi nedeniyle bu performans artışı söz konusudur. En önemli gelişmeler ise ağ derinliğinin kullanımı konusunda gerçekleşmiştir. 2012'de tanıtılan AlexNet modelinden başlayarak, 2020'ye kadar geliştirilen Yüksek Çözünürlük (HR) modeline kadar birçok farklı model bulunmaktadır [14].

C. Veri Setleri

Beyin tümörlerinin tespitinde kullanılmak üzere birçok veri seti geliştirilmiştir. Brain Web, Internet Brain Segmentation Repository (ISBR) ve Multimodal Brain Tumor Segmentation Benchmark (BraTS) tümör segmentasyonu için, felç durumunun değerlendirilmesi için Isles, MS verileri üzerinde lezyon segmentasyonu ve tespiti için ve çeşitli beyin bölgelerinin segmentasyonu için NeoBrainS12, NeoBrainS13, MRBrainS en yaygın kullanılan halka açık veri setleri yer almaktadır [15].

D. Beyin Tümörü Tespiti Çalışmaları

Makine öğrenmesi ile derin öğrenme arasında bazı farklılıklar vardır ve bu da çalışmaların performansını etkilemektedir. Makine öğrenmesi, genellikle sınırlı miktarda veriyle çalışır ve sınırlı veriyle daha etkili sonuçlar elde ederken, derin öğrenme büyük veri setlerinde daha etkili olur çünkü çok katmanlı bir sinir ağı yapısına sahiptir. Geleneksel makine öğrenmesi yöntemleri, veriler arasındaki ilişkileri öğrenmek için önceden tanımlanmış özellikler veya algoritmalar kullanırken, derin öğrenme, veriden özelliklerin otomatik olarak öğrenildiği derin sinir ağlarını kullanır. Derin öğrenme, katman olarak daha karmaşık olduğundan, makine öğrenmesine oranla daha derin ve daha karmaşık ilişkileri öğrenme yeteneğine sahiptir. Bu çalışma, beyin tümörleri tespiti için makine öğrenmesi ve derin öğrenme uygulamalarına ilişkin sistematik bir literatür taraması sunmayı amaçlamaktadır. 2020-2024 yılları arasında tanınmış dergi ve konferanslardan elde edilen 20 birincil çalışmanın ayrıntılı analizi yapılmıştır. Beyin tümörü tespiti için makine öğrenmesi ve derin öğrenmeye dayalı farklı yaklaşımlara genel bir bakış sağlamak amacıyla çeşitli yöntemleri içeren çalışmalar seçilmiştir.

E. Makine Öğrenmesi ile Beyin Tümörü Tespiti Çalışmaları (2020-2024)

Rao ve Karunakara'ın BRATS veri setleri üzerinde gerçekleştirdikleri çalışmada KSVM kullanarak etkili beyin tümörü tespiti için çeşitli aşamaları içeren bir metodoloji önermişlerdir. Bu aşamalarda; ön işleme

olarak görüntü yumuşatma ve kalite iyileştirme için NMF (Normalleştirilmiş Medyan Filtresi), binom eşikleme yöntemiyle segmentasyon, GLCM (Gri Seviye Birlikte Oluşum Matrisi) ve SGLDM (Uzamsal Gri Seviye Bağımlılık Matrisi) tekniklerinin birleşimiyle özellik çıkarımı, Harris Hawks optimizasyon (HHO) algoritmasıyla özellik seçimi gerçekleştirilmiştir. Sınıflandırma olarak KSVM-SSD modeli önerilmiştir ve performansı BRATS 2018, 2019 ve 2020 veri setlerinde sırasıyla %99,2, %99,36 ve %99,15 doğruluk oranları ile analiz edilmiştir [16]. Ansari ve diğerlerinin gerçekleştirdikleri çalışmada, GLCM kullanarak özellik çıkarımı ve DWT tabanlı BT segmentasyonu kullanılarak performans artırılmıştır. Segmentasyon sonrası gürültü morfolojik işlemlerle giderilmiştir. SVM tabanlı sınıflandırıcı ile %98,91 doğruluk elde edilmiştir [17]. Hamid ve Khan'ın çalışmasında, T2-FLAIR MRI görüntülerinde uzaysal filtreler, Laplace filtresi ve medyan filtresi kullanılarak gürültü azaltılmış ve görüntü kalitesi artırılmıştır. Optimal eşikleme ile tümörler ayrılmıştır. DICOM görüntüleri DWT ile küçültülmüş, PCA ile boyutlar daha da azaltılmış ve GLCM'ye uygulanmıştır. SVM tabanlı sınıflandırıcı ile %95 doğruluk oranı elde edilmiştir [18]. Sarkar ve diğerleri, Bangladeş'in Satkhira ve Khulna bölgelerindeki hastanelerden ve web sitelerinden toplanan toplam 60 MRG görüntüsü kullanarak beyin tümörlerini tespit ve sınıflandırmak için bir yöntem önermiştir. Çalışmanın adımları ön işleme, bölütleme, özellik çıkarma, seçme ve tümörün tespiti ve sınıflandırılmasıdır. SVM sınıflandırıcısı kullanılarak tümörlerin benign veya malign olduğu belirlenmiştir. Elde edilen doğruluk, duyarlılık ve özgüllük oranları sırasıyla %98.30, %98 ve %100'dür [19]. Anitha ve diğerlerinin gerçekleştirdikleri çalışmada, GLCM ve Naive Bayes sınıflandırma kullanarak glioma beyin tümörlerini segmentlemeyi amaçlamıştır. Ön işleme aşamasında gürültüler filtrelenmiş, GLCM ve olasılıksal özellikler çıkarılmış, ardından Naive Bayes sınıflandırıcı ile eğitilmiştir. Watershed segmentasyon kullanılarak tümörler izole edilmiştir. BRATS 2015 veri seti kullanılarak normal beyin dokusu MR görüntülerinde %99,2, anormal glioma beyin dokusu MR görüntülerinde %97,3 doğruluk elde edilmiştir [20]. Khan ve diğerleri, T1 ağırlıklı MR görüntülerinden çıkarılan Çok Ölçekli Morfolojik Doku Özellikleri (MMTF) ve En Küçük Kareler Destek Vektör Makineleri (LS-SVM) yöntemini birleştirerek yenilikçi bir metodoloji sunmuştur. 259 beyin MRI taramasından oluşan veri setinde 50 normal ve 209 anormal görüntü bulunmaktadır. Eğitim için 30 normal ve 90 anormal görüntü, test için ise 20 normal ve 119 anormal görüntü kullanılmıştır. Görüntüler Kaggle veri arşivinden ve SIEMENS 1.5 Tesla MR cihazı ile elde edilmiştir. Çeşitli sınıflandırıcıların karşılaştırılması yapılmış olup, RBF, ANN, SVM ve LS-SVM için doğruluk oranları sırasıyla %90.0, %87.0, %95.0 ve %98.97 olarak rapor edilmiştir. LS-SVM tabanlı yaklaşım, %98.97 doğruluk oranıyla diğer sınıflandırıcılardan üstün performans göstermiştir [21]. Türkoğlu, 3024 MRI görüntüsünden oluşan bir beyin tümörü veri seti kullanarak, Bayesian optimizasyon tabanlı SVM sınıflayıcı, dört önceden eğitilmiş CNN modeli ve MrMr özellik seçme yöntemine dayalı bir hibrit model geliştirmiştir. İlk aşamada, önceden eğitilmiş derin mimarilerle temsilci özellikler elde edilmiş, ardından MrMr yöntemiyle bu özellikler arasından en etkili olanları seçilmiştir. Son olarak, Bayesian optimizasyon yöntemiyle SVM sınıflayıcısının hiperparametreleri belirlenmiştir. Bu yöntemle %98.04 doğruluk oranı elde edilmiştir [22]. Tjahyaningtijas ve diğerleri, BraTS 2018 veri setinden elde edilen MRI taramalarını kullanarak beyin tümörü sınıflandırması için Derin Sinir Ağı (DNN) yaklaşımını benimsemiştir. Çalışmada, değiştirilmiş U-Net (mU-Net) segmentasyonu ile beyin tümörleri tanımlanmış ve özellikler çıkarılmıştır. Segmentasyon sonuçlarından elde edilen özellikler, Gri Seviye Birlikte Oluşum Matrisi (GLCM), Gri Seviye Çalışma Uzunluğu Matrisi (GRLLM) ve Gri Seviye Boyut Bölge Matrisi (GLSZM) gibi yöntemlerle çıkarılmış ve Max-Min normalizasyonu ile işlenmiştir. Özellikler, bilgi kazanım oranı yöntemi ile seçilmiş ve DNN modeli kullanılarak beyin tümörleri sınıflandırılmıştır. Elde edilen sonuçlar, DNN sınıflandırma yönteminin %91,3 doğruluk oranına sahip olduğunu ve bu değerin SVM yöntemine göre %2,75 daha yüksek olduğunu göstermektedir [23]. Rezaei ve diğerleri gerçekleştirdikleri çalışmada, 233 hastadan toplanan 3064 MRI görüntüsüyle menenjiyom, glioma ve hipofiz tümörleri için bir sınıflandırma yöntemi geliştirilmiştir. Görüntülerdeki gürültüyü azaltmak için Wiener ve medyan filtreleri kullanılmış, özellik çıkarma için GLCM, DRLM ve BoW yöntemleri kullanılmıştır. KNN, WSVM ve HIK-SVM gibi üç farklı sınıflandırıcı ensemble learning ile birleştirilerek %92,46 doğruluk sağlanmıştır [24]. Chen ve diğerleri tarafından yapılan çalışmada, Tiantan Hastanesi'nden desteklenen 120 hastadan elde edilen beyin MRI görüntülerini kullanarak beyin tümörlerinin otomatik tespiti ve sınıflandırılması için bir çalışma yürütmüştür. Görüntü işleme aşamalarında gürültü azaltma ve

kontrast iyileştirme yöntemleri kullanılmış, eşik segmentasyonu ve bölge büyüme teknikleriyle kafa tası etkisi azaltılmıştır. GLCM ile doku özellikleri çıkarılmış ve SVM-EKF kombinasyonuyla sınıflandırma yapılmıştır. K-ortalamalar kümeleme algoritması ise tümörlerin otomatik segmentasyonunda kullanılmıştır. Çalışma %96,05 doğruluğa ulaşarak başarılı sonuçlar elde etmiştir [25].

F. Derin Öğrenme ile Beyin Tümörü Tespiti Çalışmaları (2020-2024)

Almadhoun ve Abu-Naser, Kaggle'dan alınan 10.000 beyin MRI görüntüsünü kullanarak beyin tümörlerinin sınıflandırılması için çeşitli derin öğrenme modelleri ve kendi modellerini karşılaştırmışlardır. Veri setini döndürme, genişlik kaydırma, yükseklik kaydırma ve yatay-dikey çevirme gibi veri artırma teknikleriyle genişletmişlerdir. Kendi modellerinde %100 eğitim doğruluğu ve %98,28 doğrulama doğruluğu elde etmişlerdir. Diğer modellerde ise VGG16 %99,86, ResNet50 %98,14, MobileNet %88,98 ve InceptionV3 %99,88 doğruluğa ulaşmıştır. En iyi sonuçları InceptionV3 ve VGG16 modelleri elde etmiştir [26]. Sadad ve diğerleri tarafından yapılan çalışmada, Figshare'den elde edilen beyin MRI görüntülerini sınıflandırmak için MobileNet V2, Inception V3, ResNet50, DenseNet201 ve NASNet gibi derin öğrenme modelleri kullanılmıştır. Ayrıca, ResNet50-UNet segmentasyonu ile de bir model oluşturulmuştur. Çalışmada glioma, hipofiz ve meningioma gibi üç farklı beyin tümör türü ele alınmış ve her bir tümör için sagittal, aksiyal ve koronal görüşler kullanılmıştır. Elde edilen sonuçlara göre, MobileNet V2 için %91.8, Inception V3 için %92.8, ResNet50 için %92.9, DenseNet201 için %93.1 ve NASNet için %99.6 doğruluk oranları gözlemlenmiştir. Ayrıca, ResNet50-UNet segmentasyon modeli %95.04 doğruluk sağlamıştır. Modeller karşılaştırıldığında, NASNet en yüksek doğruluğa sahip model olarak öne çıkmıştır [27]. Badža ve Barjaktarović tarafından yapılan çalışmada, beyin MRI görüntülerini sınıflandırmak için veri kümesini genişletmek amacıyla her görüntüyü iki şekilde dönüştürmüşlerdir. İlk dönüşümde, görüntüler 90 derece döndürülmüş, ikinci dönüşümde ise dikey olarak çevrilmiştir. Bu yöntemle veri seti üç kat büyütülerek toplamda 9192 görüntü elde edilmiştir. Geliştirilen yeni bir CNN mimarisi, T1 ağırlıklı kontrastlı manyetik rezonans görüntülerinde Glioma, Hipofiz ve Meningioma olmak üzere üç beyin tümörü sınıfını sınıflandırmak için kullanılmıştır. MRI görüntüleri farklı boyutlarda ve int16 formatında sağlanmış, normalleştirilmiş ve 256 × 256 piksel boyutuna yeniden boyutlandırılmıştır. Çalışmada k-katlı çapraz doğrulama kullanılarak ağın eğitim performansı değerlendirilmiş ve en iyi sonuçlar artırılmış veri seti kullanılarak elde edilmiştir. Bu şekilde yapılan konu bazında çapraz doğrulama ile elde edilen doğruluk %96,56 olarak kaydedilmiştir [28]. Grampurohit ve diğerleri tarafından yapılan çalışmada, yazarlar CNN modeli ve VGG-16 mimarisini kullanılmıştır. Büyütme işleminden önce, 155 tümörlü ve 98 tümörsüz görüntü bulunmaktaydı ve büyütme işleminden sonra 1085 tümörlü ve 980 tümörsüz görüntüye veriseti çıkartılmıştır. Çalışma sonucunda sırasıyla CNN, VGG-16 modelleri için %93,36, %97,16 doğruluk oranları elde edilmiştir. Modeller karşılaştırıldığında VGG-16 en yüksek doğruluğu göstermiştir [29]. Gurunathan ve Krishnan, değiştirilmiş LeNet CNN mimarisini kullanarak beyin MRG görüntülerini sınıflandırmıştır. Kullanılan CNN mimarisi, iki evrişim katmanı ve iki havuzlama katmanı ile bir tamamen bağlı sinir ağından oluşmaktadır. Veri seti olarak 256 beyin MRG görüntüsü BRATS 2015 veri setinden elde edilmiş olup, yetersiz veri sayısını artırmak için görüntü çevirme, sol ve sağ kaydırma gibi veri artırma yöntemleri uygulanmıştır. Local Binary Pattern (LBP) ve Gray Level Co-occurrence Matrix (GLCM) kullanılarak tümör bölgesi segmente edilmiş ve bu bölgelerden özellikler çıkarılmıştır. Elde edilen özellikler sayesinde tümör şiddet seviyeleri hafif veya ciddi olarak sınıflandırılmıştır. Önerilen sistem, normal olarak sınıflandırılan 150 beyin MR görüntüsünde %98,6'lık bir sınıflandırma oranı sağlamıştır. Ayrıca, ciddiyet sınıflandırması için %96,8'lik bir doğruluk elde edilmiş ve önerilen yöntemle elde edilen ortalama teşhis oranı yaklaşık %97,7 olarak belirlenmiştir [30]. Saeedi ve diğerleri tarafından yapılan çalışmada, 3264 adet T1-ağırlıklı kontrastlı manyetik rezonans görüntüsünü (MRI) içeriyordu. Bu görüntüler, glioma, meningioma ve hipofiz bezi tümörleri ile tümörsüz sağlıklı beyinlerden oluşan dört farklı sınıfa ayrılmıştı. Veri setinin kamuoyuna açık bir kaynaktan, GitHub'dan temin edildiği belirtilmiş. Elde edilen doğruluk oranları NN için %86, RF için %82, SVM için %80, LR için %62, SGD için %52 ve MLP için %28 idi. Ancak önerdikleri 2D CNN ve otomatik kodlayıcı ağı(Auto-encoder Network) sırasıyla %96,47 ve %95,63 doğruluk elde edilmiştir [31]. Methil tarafından gerçekleştirilen çalışmada, beyin

tümörü sınıflandırması için Evrişimli Sinir Ağı (CNN) kullanılmıştır. Veri seti, 3762 tümör görüntüsünden ve 253 ek görüntüden oluşmaktadır. Önişleme adımlarında histogram eşitleme ve morfolojik açılma kullanılarak görüntü kontrastı artırılmış ve gürültü temizlenmiştir. Eğitim ve doğrulama için veri seti %70-%30 oranında bölünmüş, upsampling ile veri seti 4222 görüntüye çıkarılmıştır. Test veri seti olarak internetten rastgele seçilen 20 görüntü kullanılmıştır. CNN, eğitim setinde %98,55, doğrulama setinde %99,73 geri çağırma oranı elde etmiştir. Bu, çalışmanın oldukça başarılı sonuçlar elde ettiğini göstermektedir [32]. Pedada ve diğerleri tarafından gerçekleştirilen çalışmada, beyin tümörlerini 3D MRI görüntülerinden doğru bir şekilde segmente etmek için modifiye bir U-Net yapısı önerilmiştir. Önerilen U-Net modeli, giriş katmanı olan kodlayıcı kısmı, önceden eğitilmiş bir ResNet34 modeliyle değiştirilerek, U-Net'in daha iyi özellikler çıkarabilmesi sağlanmıştır. Bu yöntem, BraTS 2017 ve 2018 veri kümelerinde değerlendirilmiş olup, segmentasyon doğrulukları sırasıyla %93,40 ve %92,20 olarak elde edilmiştir, bu da yaklaşımın etkinliğini göstermektedir [33]. Khan ve diğerleri tarafından gerçekleştirilen çalışmada, beyin anormalliklerini tanımlamak ve meningiom, gliom ve hipofiz tümörlerini sınıflandırmak için iki derin öğrenme modeli tanıtılmıştır. 23 katmanlı CNN mimarisi, büyük hacimli verilerle çalışmak için tasarlanmışken, transfer öğrenimi tabanlı VGG16 eklentisi sınırlı veri setleri için optimize edilmiştir. Ayrıca, performansı artırmak için kapsamlı bir veri artırma tekniği uygulanmıştır. Figshare veri seti için %97,8 ve Harvard Medical Veri Seti için %100 tahmin doğruluğu elde edilmiştir [34]. Azhagiri ve Rajesh tarafından yapılan çalışmada, Brats2015 veri seti kullanılmıştır. İlk olarak, görüntüler sabit 224×224 piksel çözünürlüğünde gri tonlamalı hale dönüştürülmüş ve Gauss filtresi ile yumuşatılarak gürültü azaltılmıştır. Veri artırımı için kırpma, döndürme, rastgele döndürme, sabit boyutlu döndürme, renkli kırpma ve gürültü ekleme gibi işlemler uygulanmıştır. Image Data Generator fonksiyonu, tıbbi görüntülerin kalitesini koruyarak veri kümesini genişletmiştir. Model olarak AlexNet'in geliştirilmiş versiyonu olan EAN (Geliştirilmiş AlexNet) kullanılmıştır. Bu model, %99,32 doğruluk oranı ile beyin tümörlerini sınıflandırmada yüksek performans göstermiştir [35].

III. TARTIŞMA VE SONUÇ

Bu çalışmada, 2020-2024 yılları arasında beyin tümörlerinin tespitinde Makine Öğrenmesi (ML) ve Derin Öğrenme (DL) tekniklerinin kullanımına dair sistematik bir literatür taraması gerçekleştirilmiştir. Beyin tümörü tespitinde ve sınıflandırmasında kullanılan çeşitli ML ve DL yöntemlerinin mevcut durumu ve bu yöntemlerin performansı değerlendirilmiştir. İnceleme, çeşitli dergi ve konferanslardan elde edilen 20 birincil çalışmanın detaylı analizini içermektedir. ML tekniklerinden en çok tercih edilenler arasında Destek Vektör Makineleri (SVM), K-en Yakın Komşular (KNN) ve Naïve Bayes algoritmaları bulunmaktadır. Öznitelik çıkarımı adımında gri seviye birlikte oluşum matrisi (GLCM) ve uzamsal gri seviye bağımlılık matrisi (SGLDM) gibi yöntemler kullanılmıştır. DL teknikleri arasında ise Convolutional Neural Networks (CNN), Deep Neural Networks (DNN) ve U-Net en yaygın olarak kullanılanlardan olmuştur. DL teknikleri, daha büyük veri setleri üzerinde çalışarak daha derin ve karmaşık ilişkileri öğrenme kapasitesine sahiptir. DL tekniklerinin değerlendirildiği çalışmalardan biri olan Khan ve diğerleri (2022) tarafından gerçekleştirilen çalışmada, Harvard Medical veri setinde %100 doğruluk oranı elde edilmiştir. Ancak, bu sonucun aşırı uyum (overfitting) gibi durumların etkisi altında kalabileceği değerlendirilmektedir. Geliştirilmiş AlexNet (EAN) ve NASNet, diğer çalışmalarda öne çıkan mimariler olmuştur. EAN %99,32, NASNet %99,6 doğruluk oranı elde etmiştir. VGG16 için %97,16 ile %99,86, InceptionV3 için %92,8 ile %99,88 arasında doğruluk oranları elde edilmiştir. Makine öğrenmesi teknikleri arasında en başarılı sonuçlar KSVM-SSD (Kernel Support Vector Machine-Social Sürü Optimization) kullanılarak elde edilmiştir. BRATS 2018, 2019, 2020 için %99,2, %99,36, %99,15 doğruluk oranları elde edilmiştir. Naïve Bayes ve DNN gibi sınıflandırıcılar da oldukça iyi performans göstermiştir. DL tekniklerinin genel olarak ML tekniklerine göre daha yüksek doğruluk oranları elde ettiği görülmüştür. CNN tabanlı yöntemler %90-98 doğruluk oranlarına ulaşırken, ML tabanlı yöntemler %85-95 aralığında doğruluk göstermiştir. Çalışmalarda yaygın olarak kullanılan veri setleri arasında BRATS (Brain Tumor Segmentation) veri seti, Kaggle veri setleri ve hastanelerden elde edilen MRI görüntüleri yer almaktadır. Veri arttırma teknikleri, veri setlerinin çeşitliliğini arttırmış ve modellerin genelleme yeteneklerini iyileştirmiştir. Döndürme, genişlik ve yükseklik kaydırma, yatay ve dikey çevirme en yaygın veri arttırma

teknikleri arasındadır. Veri arttırma uygulanan çalışmalarda %99 civarı doğruluk oranları elde edilmiştir. Gelecekteki çalışmalar için, daha büyük ve çeşitli veri setlerinin kullanılması, veri arttırma teknikleri ile veri setlerinin zenginleştirilmesi ve hibrit ML-DL modellerinin oluşturulması önerilmektedir. Geliştirilen modellerin hastane ortamında ve gerçek hayatta uygulanarak test edilmesi büyük katkı sağlayacaktır. Sonuç olarak, ML ve DL teknikleri, beyin tümörü tespitinde önemli ilerlemeler sağlamış ve tıbbi teşhis süreçlerini daha hızlı ve hassas hale getirmiştir. Bu teknolojik gelişmeler, hastalara erken teşhis imkanı sunarak tedavi süreçlerinin daha etkili yönetilmesine katkıda bulunmakta ve yaşam kalitesini artırmada önemli bir rol oynamaktadır.

AN APPROACH BASED ON COMBINING DEEP LEARNING MODEL AND ENSEMBLE TECHNIQUE IN AIDS CLASSIFICATION

Nida CANPOLAT[1*], Şengül DOĞAN[2] and Türker TUNCER[3]

[1]*Department of Digital Forensics Engineering, Technology Faculty, Firat University, Turkey*

**(231144110@firat.edu.tr)*

Abstract – AIDS is a disease that's seen quite often these days and can be serious if it's not treated. HIV the virus that leads to AIDS, can weaken the immune system of the infected individual, leading to susceptibility to infections and a compromised ability to fight certain types of cancer. This condition causes heart disease, kidney problems, infections and neurological disorders, which are among the critical health conditions. These types of diseases can have fatal consequences. Therefore AIDS should be diagnosed as early and accurately as possible. In this study an architecture was created by combining the GRU a deep learning model, and the Voting Classifier model an Ensemble technique to accurately classify AIDS disease. GRU model has high processing rate on sequential data. The Voting Classifier model is a type of Ensemble method that combines multiple machine learning classifiers to obtain safe results. In the development of the model, a dataset comprising approximately 35.000 entries with 22 features was utilized. The dataset was trained with GRU and Voting Classifier architecture. Following the completion of the training it was found that individuals with AIDS could be accurately distinguished achieving a 97.84% accuracy rate on the test data set.

Keywords – HIV virus, AIDS disease, Deep learning, Ensemble Technique.

1- Introduction

AIDS is a serious disease caused by a virus known as HIV [1]. It is also known as the advanced stage of the infection caused by the HIV virus which affects the immune system. AIDS disease which is frequently encountered today, weakens the immune system in the human body making it vulnerable to external factors, and if left untreated, it can be a fatal disease. The HIV virus that causes AIDS can be transmitted through blood, sexually, by injection, and from mother to baby during birth. AIDS disease affects people negatively in many ways such as immune system failure, opportunistic infection, lack of resistance to some types of cancer, neurological disorders, heart diseases and kidney disease [2][3][4][5]. As far as is known since the beginning of the virus, approximately 76 million people in the world have been infected with this disease and approximately 33 million people have died. [6]. According to data obtained from the World Health Organization AIDS has become more common and dangerous, especially in low and middle-income countries [7].

In order to prevent all these negative situations, this study aimed to classify AIDS as accurately as possible. Various machine learning methods and neural networks have been used to classify AIDS disease [8][9]. To identify the disease a dataset predominantly derived from laboratory measurements was utilized. Examining the features obtained as a result of the measurement together allows forming an opinion about AIDS disease. The data set used went through a two-stage training. Firstly the dataset was trained with the GRU model

which is a recurrent neural network cell. The results are subsequently integrated into the Voting Classifier through the utilization of the GRU Wrapper. The method used in the training is shown in Figure 1.

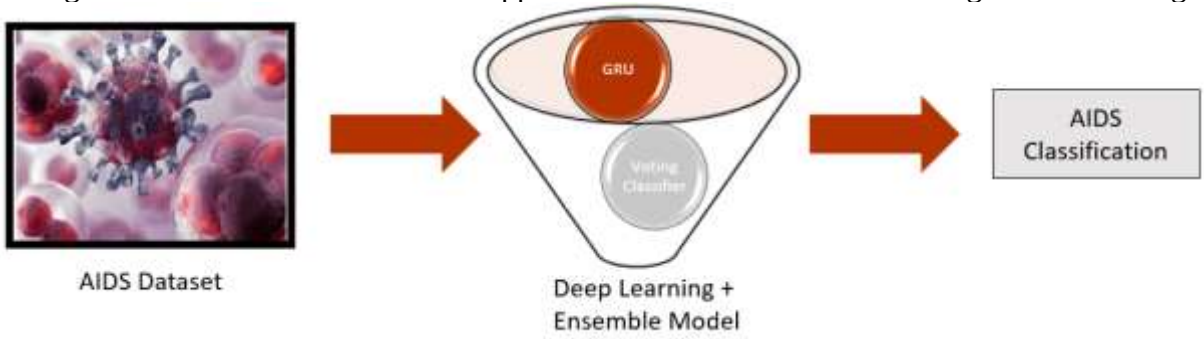

Figure 1 Classification Algorithm with Deep Learning + Ensemble Method

2- AIDS DISEASE

AIDS is a type of disease caused by the HIV virus. This virus targets the immune system and usually proliferates in lymph nodes and lymphoid tissues, leaving the body vulnerable to infections, chronic diseases and some types of cancer. To do this it targets CD4+ cells. In some cases it can also negatively affect the nervous system and cause some neurological disorders. That's why early diagnosis is very important. When diagnosing the disease the CD4+ cell count is usually checked and the disease is diagnosed [10][11]. If treatment is not started on time AIDS can become fatal. In some studies the survival rate of patients infected with AIDS was calculated to be around 60% [12]. AIDS disease consists of four stages. The formation stages are shown in Figure 2.

Figure 2 Stages of AIDS Disease Development

1- This phase is the acute phase covering the first few weeks. It has symptoms similar to flu. At this stage attacks begin on CD4 (helper T cell), an important cell of the immune system.
2- Symptoms decrease and the CD4+ cell count gradually decreases.
3- Some symptoms become visible and the body's immune system begins to weaken.
4- Quite strong infections begin to appear. This condition may also be accompanied by some types of cancer. A critical decrease in CD4+ cell numbers is observed.

Early diagnosis and treatment is very important in AIDS disease. ART treatment type can be applied for the treatment of AIDS disease. With ART treatment the proliferation of the HIV virus is controlled and the patient's quality of life is increased.

2- LITERATURE REVIEW

In this section of the study information on AIDS detection, the data set, the methodology used and the results obtained from the study are presented in a table.

Tablo 1 Literature Table

Referance number	Dataset	Method	Result
[13]	A data set obtained from Data World was used.	Different machine learning and deep learning methods were used. LSTM gave the best results.	%97.65 acc.
[14]	CICIDS2017	10 popular supervised and unsupervised machine learning algorithms have been tested. k-NN-AIDS, DT-AIDS and NB-AIDS gave the best results.	K-NN = %99.49 acc, NB = %98.86 acc, DT = %99.49 acc
[15]	PHIA	XGBoost algorithm was used.	90% F1 Score for women and 92% F1 Score in men.
[16]	A dataset was used from the EDHS repository of the Central Statistical Agency (CSA), which is used for both training and testing purposes.	XGBoost algorithm was used. Eight established machine learning models were used (GB, SVM, KNN, ET, DT, AB, RF and LR).	For GB; %87,67 acc, %87,32 F1 Score.
[17]	EHR data from the Melbourne Sexual Health Center (MSHC) was used.	A number of linear and nonlinear machine learning models have been created that include regression algorithms, including MLR and ENR.	HIV (AUC = 0,72).
[18]	The DHS-HIV/AIDS dataset from the Central Statistical Agency (CSA) was used.	GB, KNN, RF, ET, MLP and BFS method were used for feature selection.	For GB; %87 F1 Score.
[19]	4855 HIV-1 datasets from ChEMBL were used.	15 classification models were used (SVM, DT, KNN, etc.).	For SVM; %83,07 acc
[20]	Data from HIV-1 CRF01 were used.	A deep learning model using CNN has been developed.	%98+ specificity, %92+ Sensitivity.

3- DATASET AND METHOD

3.1 DATASET

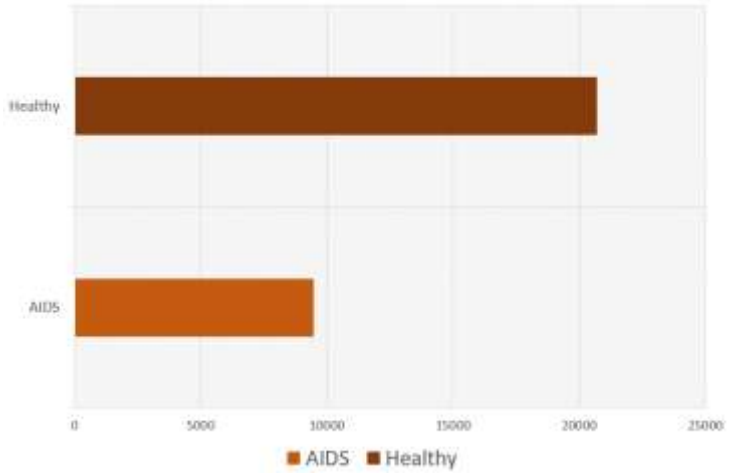
To accurately classify the AIDS disease a dataset consisting mostly of data from laboratory settings was used. The dataset used was obtained from the Kaggle platform and is publicly available. There are a total of 22 features in the dataset. Analyzing these features together plays an important role in the classification of AIDS disease. The dataset used consists of exactly 30.375 data.

Tablo 2 Dataset Components

Dataset Components	
CD40	It indicates the number of CD4 cells in a person's initial white blood cells.
CD420	It indicates the person's CD4 cell count within 20 weeks.
CD80	It indicates the number of CD8 cells in a person's initial white blood cells.
CD820	It indicates the person's CD8 cell count within 20 weeks.
Offtrt	Indicates whether ART treatment is applied to the person.
Treatment Status	It determines whether the person uses medication or not. (0: ZDV drug, 1: others).
Semptom	Indicates the person's symptom indicator.
Strat	It indicates whether the person has previously received ART treatment and, if so, whether it has been for longer than 52 weeks.
Str2	It contains information labeled as 0 and 1 as to whether the person has ever received ART treatment before.
Gender	It is the person's gender status.
Race	It contains two classes where people are divided according to their race (0,1).
Preanti	It indicates the person's condition and viral load before starting treatment.
Z30	It indicates whether the person has used the medicine called ZDV within 30 days.
Oprior	It indicates whether the person uses any medication other than ZDV.
Karnof	It contains data where the person is labeled on the Karnofsky scale between 0 and 100.
Medication	It indicates whether the person generally uses medication or not.
TRT	It provides information about the treatment the person receives. ZDV, ZDV + DLL, ZDV + ZAL, DLL alone.
Homo	It classifies the person with two labels, 0 and 1, according to homosexuality.
Hemophilia	It is the concentration of hemophilia in a person's blood sample.
Weight (WTGK)	Indicates the person's weight.
Age	Indicates the person's age.

Time	It refers to the time it takes until the person does not show the expected result during the clinical study.

The graph of the number of healthy individuals and individuals with AIDS in the data set used is given in Table 3.



Tablo 3 Dataset content distribution table

The matrix created to determine the relationship between variables in a data set is called correlation matrix. This matrix indicates how each value in the data set is related to the others. In other words it represents linear dependence. The correlation matrix of the data set used for accurate classification of AIDS disease is as shown in Figure 3.

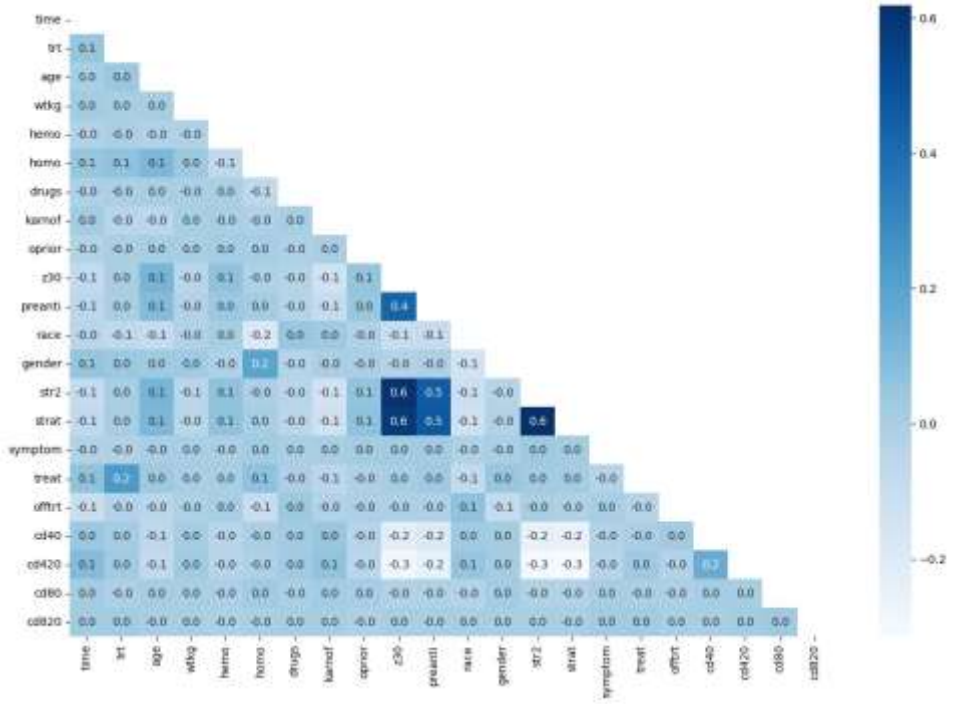


Figure 1 Correlation Matrix

3.2 METHOD

In this study an architecture that uses GRU a deep learning method and Voting Classifier an Ensemble technique, is proposed to accurately classify AIDS disease. The GRU method a type of RNN, can work

successfully on serial data. The GRU method is advantageous because it has a high learning ability in a long context, keeps the flow of information under control by incorporating a gate mechanism, has a less complex structure compared to other models, and completes training quickly. On the other hand, Voting Classifier an Ensemble method in the field of machine learning, increases efficiency by using different models together and using the results obtained from the models together. When diverse models are combined, the strengths of one model can be leveraged to compensate for the weaknesses of another thereby closing the gap. This stabilizes the model and reduces the likelihood of overfitting. For these reasons, GRU and Voting Classifier methods were used together in this study to detect AIDS disease.
In this study the following steps were carried out in order to classify AIDS disease as accurately as possible.

1- The raw data set is processed and made ready for training.
2- The GRU model is defined and the model is compiled.
3- Other machine learning models (including LR, RF and SVM) are defined.
4- With a GRU Wrapper structure LR, RF and SVM models are trained with the outputs from the GRU model.
5- LR, RF and SVM models are combined in a Voting Classifier structure.
6- The performance metrics of the model created as a result of the training are calculated.

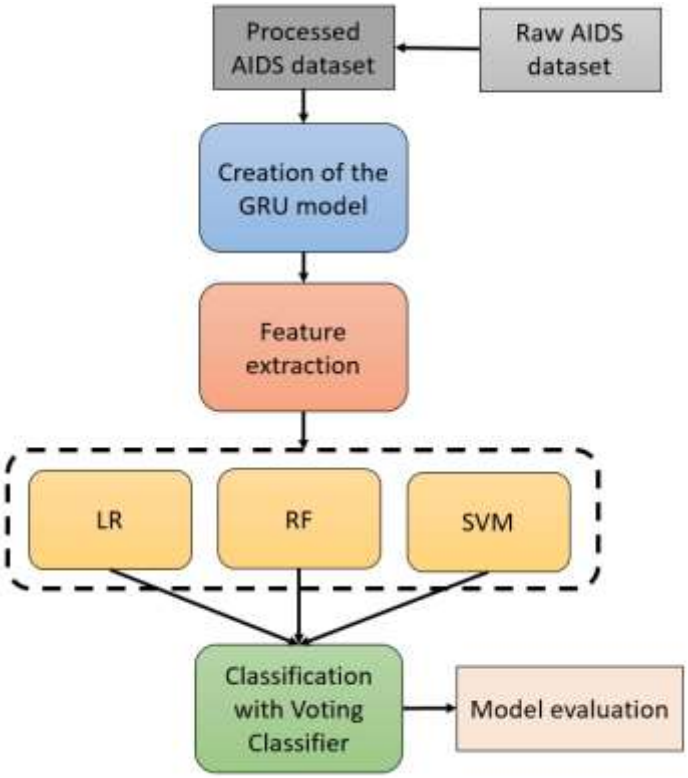

Figure 2 Architecture of the Proposed Method

The layer information of the GRU method used in the classification architecture, whose general architecture is given in Figure 4, and the parameters of the Voting Classifier classifier are given in Figure 5. GRU model is created by using a combination of layers such as Embedding, GRU, DropOut and Dense. Voting Classifier consists of the previously created GRU model, LR, RF and SVM models. While voting the results the 'Soft' type of the Voting Classifier structure was used. When calculating the results the average of the

class predictions made by each model is taken. This increases the likelihood that the model will be more accurate.

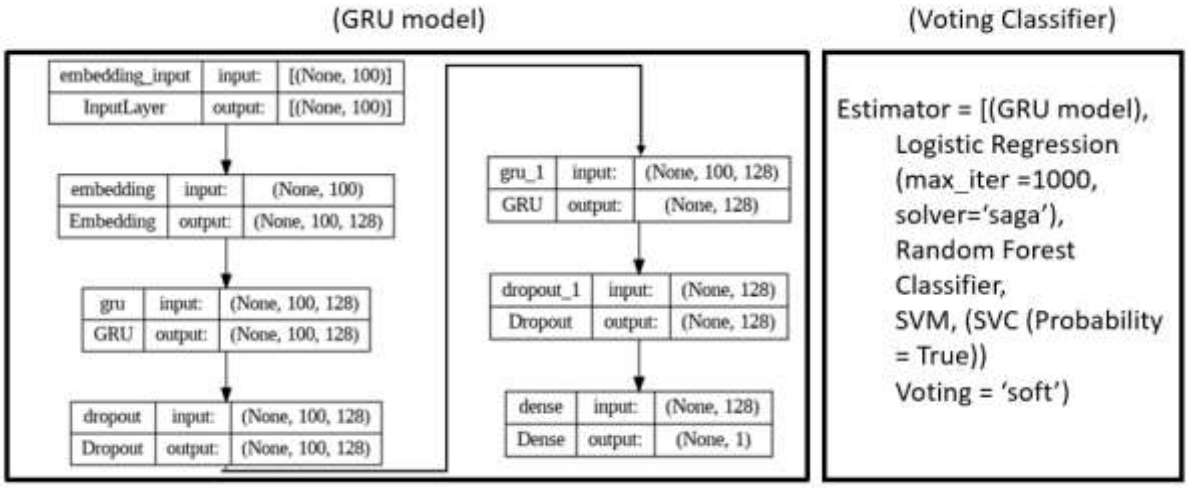

Figure 3 Layers and Parameters of the Recommended System

The general features of the computer used in the classification of AIDS disease are given in Table 4.

Table 4 Computer Properties

CPU	AMD Ryzen 9 5900X
GPU	RTX 3070
RAM	32 GB
OS	Windows 11 Pro

4- EXPERIMENTAL RESULTS

The Complexity Matrix obtained as a result of the training provided by the deep learning and ensemble technique used in the classification of AIDS disease is shown in Figure 6. With the complexity matrix created the Accuracy, Precision, Recall and F1 Score values of the model were calculated with the TN, TP, FN and FP values of the matrix. Calculated performance metrics are stated in Table 5.

Table 5 Performance Metrics

Accuracy	0.97
Precision	0.96
Recall	1.0
F1 Score	0.92

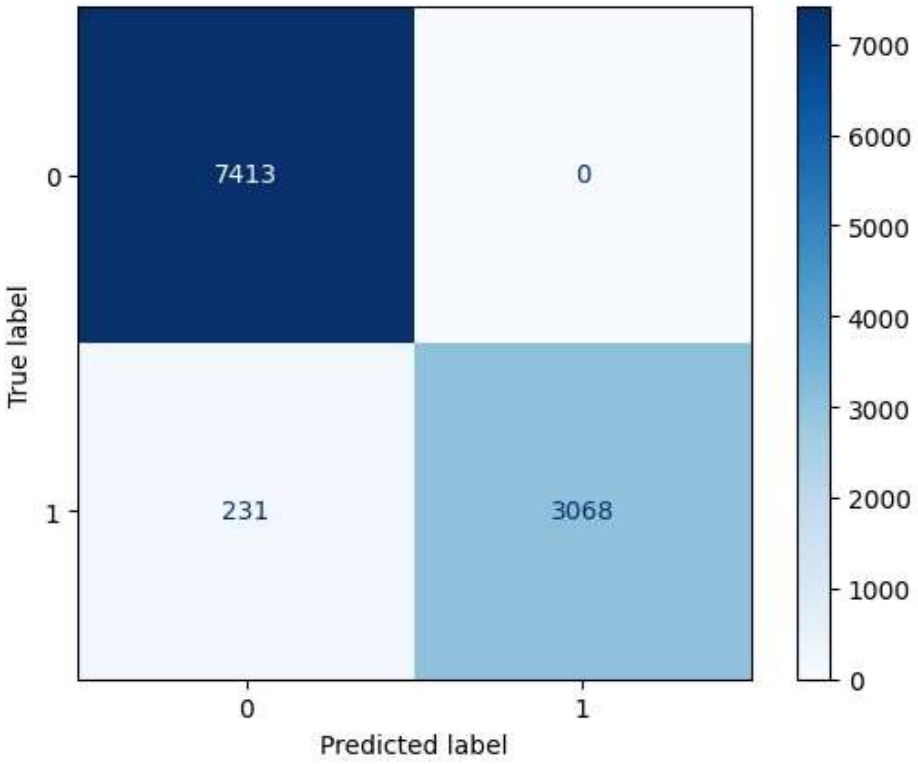

Figure 4 Confusion matrix

5- DISCUSSIONS AND CONCLUSION

In this study GRU a neural network-based method and Voting Classifier method an Ensemble technique, were used together to accurately classify AIDS disease. As far as we know GRU and Voting Classifier methods have not been used together in the classification of AIDS disease. This proposed method was applied to the AIDS disease dataset which is publicly available on the Kaggle platform and consists of 22 features, many of which were collected in the laboratory environment. The created architecture achieved a significant accuracy rate of 97.84% in the test data of the data set used. This rate is an important rate for the classification of AIDS disease.

Abbreviation table

Acc	Accuracy score
AIDS	Acquired Immune Deficiency Syndrome
ART	Antiretroviral Therapy
BFS	Breadth First Search
CNN	Convolutional Neural Networks
DLL	Didanosine
DT	Decision Tree
ENR	Elastic-Net Regresyon
ET	Extra Tree algorithm
GB	Gradient Boost
GRU	Gated recurrent units
HIV	Human Immunodeficiency Virus
K-NN	K-Nearest Neighbor
LR	Logistic Regression
MLP	Multi-layer Perceptron
MLR	Multivariate Logistic Regression

NB	Navie Bayes Algorithm
RF	Random Forest
SVM	Support Vector Machine
ZAL	Zalcitabine
ZDV	Zidovudie

Modal parameter differences of TBDY-2018 and RYTEIE-2019 regulations in the blended brick wall model

Furkan Günday*

[1]*Department of Civil Engineering, Faculty of Engineering, Giresun University, Turkey*

**furkan.gunday@giresun.edu.tr*

Abstract – Masonry structures are generally encountered in historical structure but masonry structures are still used today, both decoratively and depending on the conditions of use. Especially masonry blended brick walls are widely used today. Earthquake-resistant design of newly constructed masonry structures and determination of the safety of existing structure stock can be made in accordance with the provisions of the current Turkish Building Earthquake Regulation (TBDY-2018). However, since these risk determinations are a long-lasting and high-cost process, the Risky Risk Report published in order to eliminate this situation. With the Principles for Identification of Risky Buildings (RYTEIE-2019), it can be determined whether existing buildings are risky in a short time and at low cost. It is known that there are differences in both regulations that will affect modal parameters. These differences need to be investigated in different geometries and structure types with different intended uses. As a result of the study, the blended brick wall model was found to be more rigid according to the TBDY-2018 regulation. As a result, it is thought that the RYTEIE-2019 regulation will give safer results and it is recommended to take the RYTEIE-2019 regulation into consideration in blended brick walls to be newly constructed, also in terms of economic life of masonry blended brick walls.

Keywords –Blended brick wall, TBDY-2018, RYTEIE-2019, Modal parameters, Masonry structures

I. INTRODUCTION

Masonry structures have load-bearing systems created by placing structure materials such as stone, brick, adobe, briquette and wood on top of each other and combining them with their own weight and mortar. They are a type of structure that has been preferred for residential or service purposes since ancient times [1,2]. In stone and brick masonry structure types, which have economical features such as ease of material supply and thermal insulation, walls are constructed with thick walls to ensure a certain stability. These structural parts, which we call brittle materials, show very early deformation under earthquake forces. Thus, the wall elements that crack under the influence of shear force are damaged after a while in such a way that they cannot carry the vertical loads. The strength of the material used, the strength of the adhesive mortar, and good quality workmanship are defined as prerequisites for earthquake-resistant masonry construction [3,4]. Masonry structures are widely used in our country, which is located on an important earthquake zone, and are exposed to earthquake forces along with vertical loads throughout their lifetime. Earthquakes that have occurred in recent years have caused different structural damages in masonry structures [5,6,7]. By evaluating the developments in earthquake engineering and the information obtained in the field studies carried out after the earthquakes, the earthquake regulation in force was updated and the Turkish Building Earthquake Regulation (TBDY-2018) was published and entered into force in 2018 [8]. In order to determine more quickly whether the existing building stock is sufficiently resistant to possible earthquake risks and to solve the problem of

unplanned urbanization, especially in big cities, the "Law on the Transformation of Areas at Disaster Risk" No. 6306 has come into force. The Principles for the Detection of Risky Buildings (RYTEIE-2019) prepared within the scope of this law and the rules and methods to be used in detecting risky buildings have been published [9]. [10].

It is known that there are differences in both regulations that will affect modal parameters. These differences need to be investigated in different geometries and structure types with different intended uses. The aim of this study is to investigate the effect of the calculation conditions given in TBDY-2018 and RYTEIE-2019 regulations on the modal parameters of the blended brick wall model. Knowing the modal parameters allows the response of the structure to be predicted as a function of external stimulation. These parameters therefore constitute a kind of dynamic “identity card” of the structure that can be used for verification, calibration or diagnostic purposes of computational models and provide a baseline in long-term structural monitoring.

II. Materials and Method

Blending brick takes its name from the area where the brick is shaped, dried and fired. All stages of blending brick, also called wedge brick, from raw material preparation to packaging, take place in this area called blending. It is a form of production that is based on human power and is traditional and primitive compared to today's technology. Although it is far behind today's mass production methods, Blended brick is still a preferred material in terms of its firing color, natural appearance and place of use and purposes. It is used in the restoration and repair of many buildings. Again, many architects include designs solved with blended bricks in their designs. The production of blend brick has continued until today, as it is a sought-after material in modern architecture and landscaping [11].

Blended brick is a document that completely bears the traces of the past. It is a reflection of the past, shaped by human hands, combining labor with culture, and occupying an aesthetic place among historical values. Many works made with blended bricks centuries ago are still usable today. It is among the materials frequently used in buildings of historical value.

The blend brick used in the study is given in figure 1 along with its dimensions.

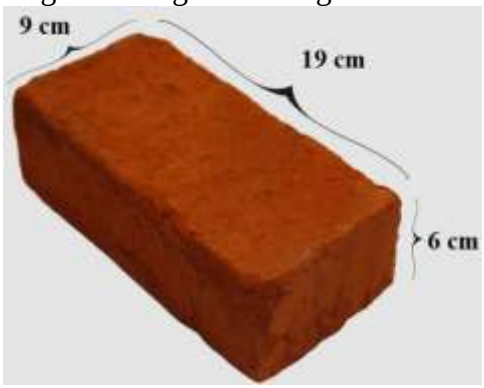

Fig. 1 The blend brick

Blended brick walls are quite common today. It constitutes a large part of the historical buildings in particular. Additionally, blended brick walls are still seen in rural areas. In addition to all these, it is used for architectural and decorative purposes. [12-20] studies have been conducted on blended brick walls, which also contributed to this study. Examples of blended brick walls are given in figure 2.

Fig. 2 Examples of blended brick wall

Finite element method was used in the study. SAP2000 software was used in the finite element modeling and analysis part. In the analysis part, modal analysis method was used. Resources [21-24] were used for the theoretical infrastructure of the methods. During the modeling phase, [25-28] resources were used.

The length of the masonry blended brick wall model is 20 meters. Wall thickness was taken as 20 cm. The wall height is 2.5 meters. The 3D finite element model of the blended brick wall is given in figure 3.

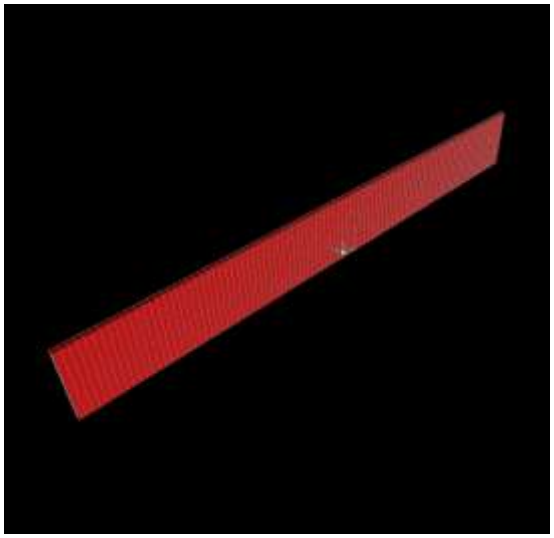

Fig. 3 The 3D finite element model of the blended brick wall

According to TBDY 2018, *"The type of wall materials will be determined visually by removing the plaster of a part of the wall surface. In order to determine the properties of the wall material, at least two wall sample samples will be taken from the building and its strength will be determined by applying compressive strength tests. The lowest characteristic compressive strength of solid brick masonry walls is defined as* f_k*=1.4MPa, and the Elasticity Modulus* E_{duv}*=750*f_k*."* Poisson's ratio is 0.2. Unit volume mass was taken as 2000 kg/m^3 [8].

III. RESULTS

As a result of the modal analysis, the mode shapes of the first five modes of the blended brick wall model created according to TBDY 2018 are given in figures 4,5,6,7,8.

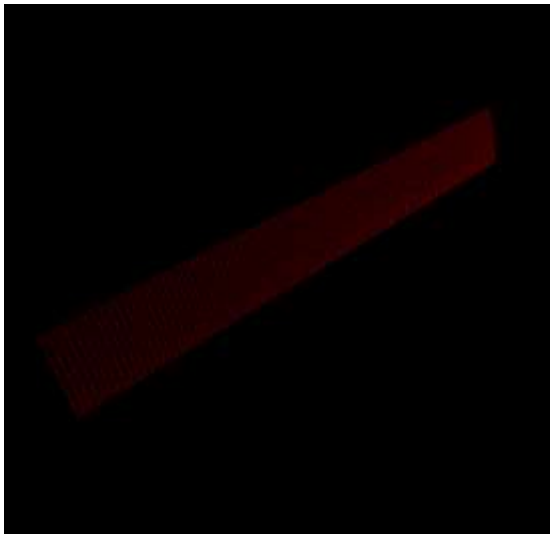

Fig. 4 1. Mode (Period value= 0,920568 s)

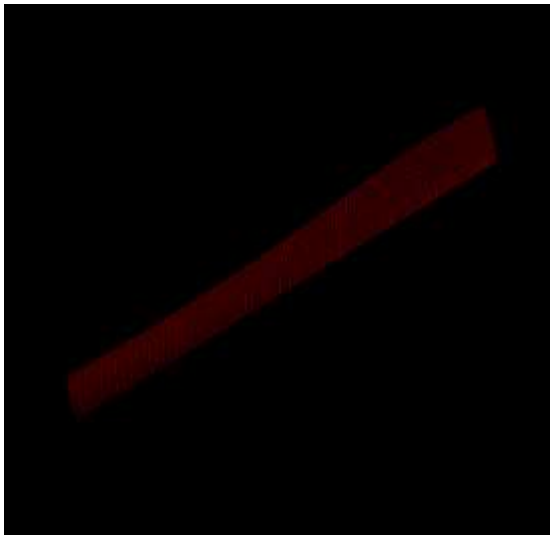

Fig. 5 2. Mode (Period value= 0,882172 s)

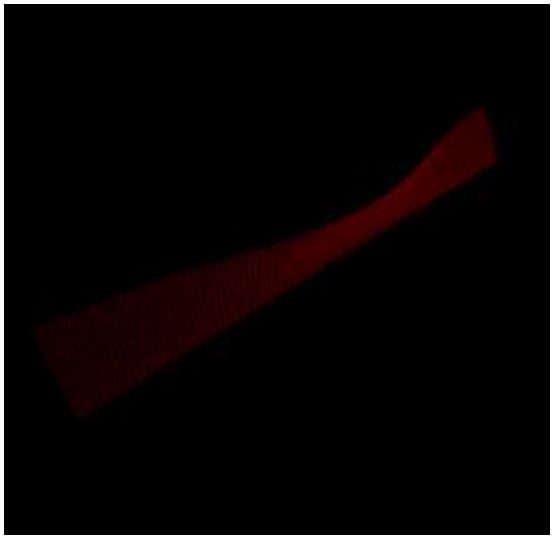

Fig. 6 3. Mode (Period value= 0,785742 s)

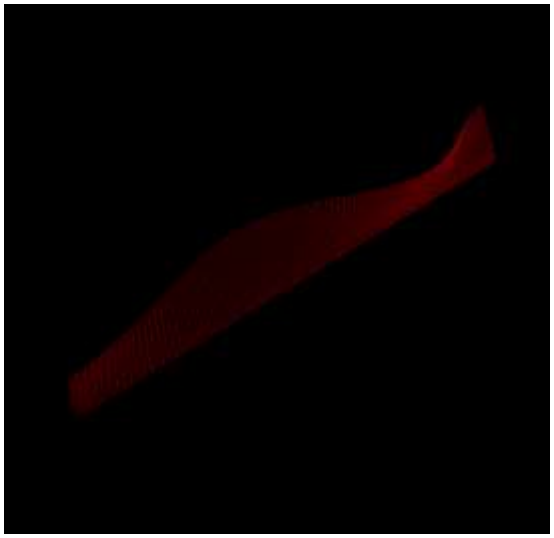

Fig. 7 4. Mode (Period value= 0,669653 s)

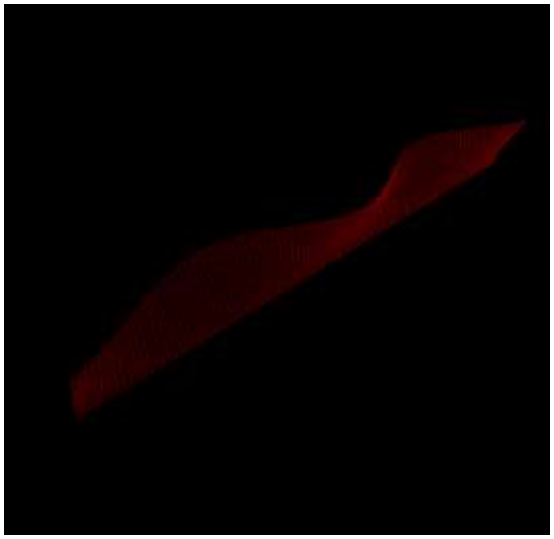

Fig. 8 5. Mode (Period value= 0,558950 s)

According to RYTEIE-2019, *"The type of wall materials will be determined by removing the plaster of a part of the wall surface, at least on one interior and one exterior wall. Apparent quality normal values will be used for the pressure, shear, diagonal tensile strength and specific gravity values of walls constructed with cement reinforced mortar and masonry units. For Solid Brick or Blended Brick masonry walls, the strength value is defined as* f_m*=1.4MPa and the Elasticity Modulus is defined as* E_m*=600*f_m*. Visible quality will be considered Poor for walls where mortar discontinuity or structural cracks are documented by photographs. The lowest characteristic compressive strength of solid brick masonry walls is defined as* f_k*=1.4MPa, Elasticity Modulus* E_{duv}*=750*f_k*."* Poisson's ratio is 0.2. Unit volume mass was taken as 2000 kg/m^3 [9].

As a result of the modal analysis, the mode shapes of the first five modes of the blended brick wall model created according to RYTEIE-2019 are given in figures 9,10,11,12,13.

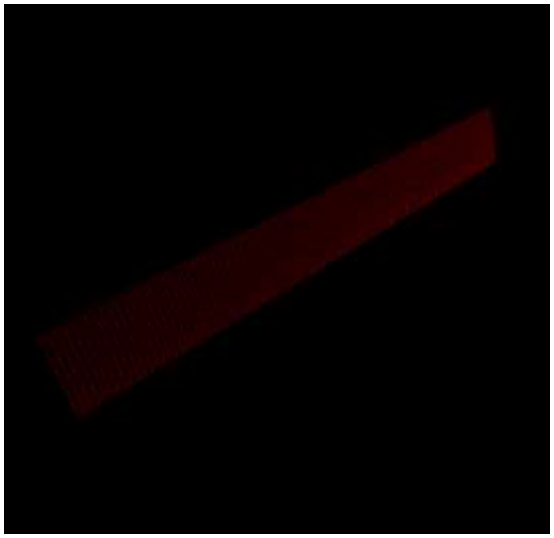

Fig. 9 1. Mode (Period value= 0,823381 s)

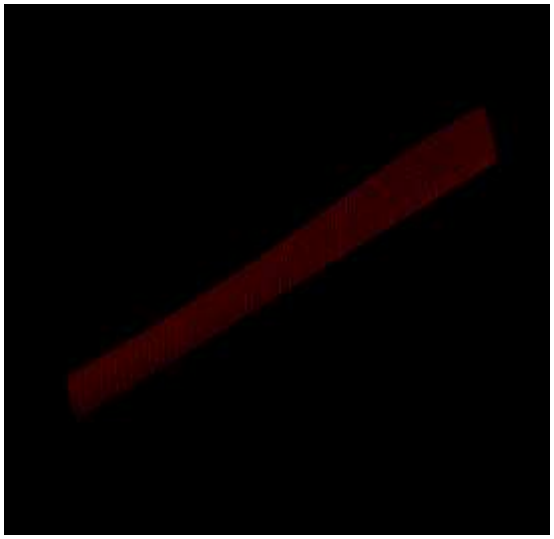

Fig. 10 2. Mode (Period value= 0,789039 s)

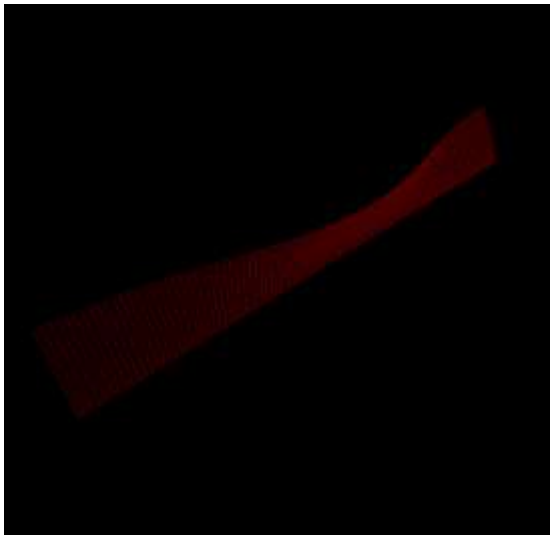

Fig. 11 3. Mode (Period value= 0,702789 s)

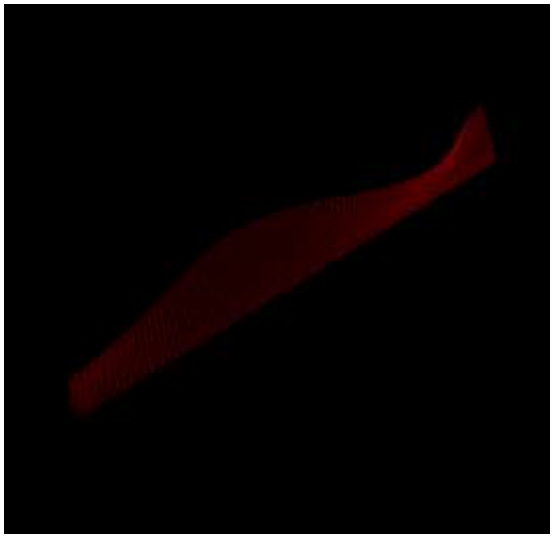

Fig. 12 4. Mode (Period value= 0,598956 s)

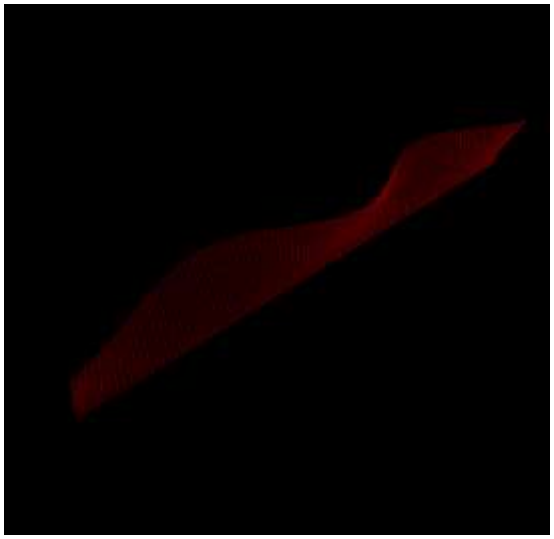

Fig. 13 5. Mode (Period value= 0,499940 s)

The results of the period values according to TBDY 2018 and RYTEIE-2019 are given comparatively in Table 1.

Table 1. Comparison of TBDY 2018 and RYTEIE-2019 period values

	Mode 1	**Mode 2**	**Mode 3**	**Mode 4**	**Mode 5**
TBDY 2018	0,920568	0,882172	0,785742	0,669653	0,55895
RYTEIE-2019	0,823381	0,789039	0,702789	0,598956	0,49994
Difference (s)	0,097187	0,093133	0,082953	0,070697	0,05901
Difference (%)	10,55729	10,55724	10,55728	10,55726	10,55729

The results of the mode shape according to TBDY 2018 and RYTEIE-2019 are given comparatively in Table 2.

Table 2. Comparison of TBDY 2018 and RYTEIE-2019 mode shapes

	Mode 1	**Mode 2**	**Mode 3**	**Mode 4**	**Mode 5**
TBDY 2018	Translational	Torsional	Torsional	Torsional	Torsional
RYTEIE-2019	Translational	Torsional	Torsional	Torsional	Torsional

IV. CONCLUSION

When examined for the first 5 modes, differences were seen between TBDY-2018 and RYTEIE-2019, equal in percentage in all modes. This difference is approximately 10.56%. According to the results of the period data, since there was no change in the geometry and mass of the blended brick wall, the stiffness value decreased by 10.56% in RYTEIE-2019 compared to TBDY-2018. The biggest difference between the two methods in the numerical calculation part is in the calculation of the elasticity modulus. The elasticity module in RYTEIE-2019 is requested to be accepted as 20% lower than TBDY-2018. It is understood that the results obtained are parallel to this demand. When the mode shapes are examined, they do not show significant change in the calculation results according to both regulations.

In light of all these results obtained, it is clearly seen that RYTEIE-2019 accepts the blended brick wall model as less rigid than TBDY-2018. Here, it is understood that the RYTEIE-2019 regulation acts more safely and is closer to the decision on possible reinforcement or demolition. The reason for this situation is the statement in RYTEIE-2019: *"Values given as apparent quality normal will be used for the pressure, shear, diagonal tensile strength and specific gravity values of walls built with cement-reinforced mortar and masonry units."* In TBDY-2018, it is required to calculate the strengths through direct tests. It is understood that having both regulations in force at the same time is a confusing situation. In addition, it is known that the 10.56% stiffness difference in the blended brick wall model is significant. It is understood that a lot of experimental work is needed for new regulations in order to make the percentage differences more sensitive. In addition, it is understood from the analytical analysis that for the blended brick wall model, a 20% decrease in the elasticity modulus should not be assumed to affect the stiffness by 20%. No mistakes should be made based solely on the k=E.I formula. Boundary conditions must be taken into consideration when calculating stiffness. It is recommended to take the RYTEIE-2019 regulation into consideration in order to eliminate confusion, stay on the safe side and in terms of the economic life of blended brick walls.

**furkan.gunday@giresun.edu.tr*

Abstract **–**It is a known fact that earthquakes damage not only buildings but also infrastructure and superstructure facilities. For this reason, the seismic performance of all building types is of vital importance. It is known that seismic performance losses are experienced in various building types with the effect of earthquakes. Due to the masonry wells structures, which are frequently seen especially in rural areas, it is possible to receive great damage in the face of environmental and forced vibrations. Earthquake-resistant design of newly constructed masonry structures and determination of the safety of existing structure stock can be made in accordance with the provisions of the current Turkish Building Earthquake Regulation (TBDY-2018). However, since these risk determinations are a long-lasting and high-cost process, the Risky Risk Report published in order to eliminate this situation. With the Principles for Identification of Risky Buildings (RYTEIE-2019), it can be determined whether existing buildings are risky in a short time and at low cost. It is known that there are differences in both regulations that will affect modal parameters. These differences need to be investigated in different geometries and structure types with different intended uses. As a result of the study, it was seen that the blending brick well model was more rigid in TBDY-2018. As a result, it is thought that the RYTEIE-2019 regulation will give safer results and it is recommended to take the RYTEIE-2019 regulation into consideration in blended brick wells to be newly constructed, also in terms of economic life of masonry blended brick wells.

Keywords –Blended brick well, TBDY-2018, RYTEIE-2019, Modal parameters, Masonry structures

I. INTRODUCTION

Masonry structures have load-bearing systems created by placing structure materials such as stone, brick, adobe, briquette and wood on top of each other and combining them with their own weight and mortar. They are a type of structure that has been preferred for residential or service purposes since ancient times [1,2]. In stone and brick masonry structure types, which have economical features such as ease of material supply and thermal insulation, walls are constructed with thick walls to ensure a certain stability. These structural parts, which we call brittle materials, show very early deformation under earthquake forces. Thus, the wall elements that crack under the influence of shear force are damaged after a while in such a way that they cannot carry the vertical loads. The strength of the material used, the strength of the adhesive mortar, and good quality workmanship are defined as prerequisites for earthquake-resistant masonry construction [3,4]. Masonry structures are widely used in our country, which is located on an important earthquake zone, and are exposed to earthquake forces along with vertical loads throughout their lifetime. Earthquakes that have occurred in recent years have caused different structural damages in masonry structures [5,6,7]. By evaluating the developments in earthquake engineering and the information obtained in the field studies carried out after the earthquakes, the earthquake regulation in force was updated and the Turkish Building Earthquake Regulation (TBDY-

2018) was published and entered into force in 2018 [8]. In order to determine more quickly whether the existing building stock is sufficiently resistant to possible earthquake risks and to solve the problem of unplanned urbanization, especially in big cities, the "Law on the Transformation of Areas at Disaster Risk" No. 6306 has come into force. The Principles for the Detection of Risky Buildings (RYTEIE-2019) prepared within the scope of this law and the rules and methods to be used in detecting risky buildings have been published [9]. [10].

It is known that there are differences in both regulations that will affect modal parameters. These differences need to be investigated in different geometries and structure types with different intended uses. The aim of this study is to investigate the effect of the calculation conditions given in TBDY-2018 and RYTEIE-2019 regulations on the modal parameters of the blended brick well model. Knowing the modal parameters allows the response of the structure to be predicted as a function of external stimulation. These parameters therefore constitute a kind of dynamic “identity card” of the structure that can be used for verification, calibration or diagnostic purposes of computational models and provide a baseline in long-term structural monitoring.

II. Materials and Method

Blending brick takes its name from the area where the brick is shaped, dried and fired. All stages of blending brick, also called wedge brick, from raw material preparation to packaging, take place in this area called blending. It is a form of production that is based on human power and is traditional and primitive compared to today's technology. Although it is far behind today's mass production methods, Blended brick is still a preferred material in terms of its firing color, natural appearance and place of use and purposes. It is used in the restoration and repair of many buildings. Again, many architects include designs solved with blended bricks in their designs. The production of blend brick has continued until today, as it is a sought-after material in modern architecture and landscaping [11].

Blended brick is a document that completely bears the traces of the past. It is a reflection of the past, shaped by human hands, combining labor with culture, and occupying an aesthetic place among historical values. Many works made with blended bricks centuries ago are still usable today. It is among the materials frequently used in buildings of historical value.

The blend brick used in the study is given in figure 1 along with its dimensions.

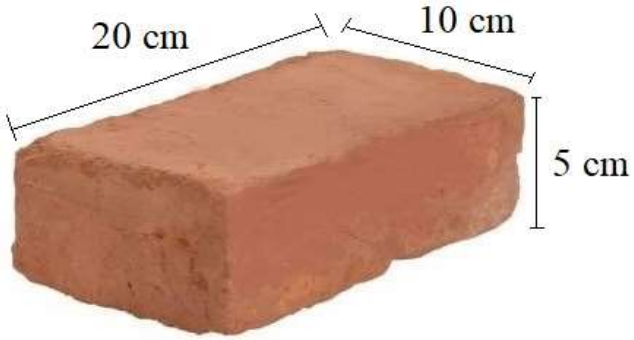

Fig. 1 The blend brick

Blended brick wells are often seen in rural and arid regions. In addition, many of them are historical buildings and their construction dates are known to be very old. The study by Dinc [12]; It is the source where the function of protecting the monuments of original water wells is discussed for the first time in chronological terms. The researcher, during the Konya Museums Directorate; In connection with the well hydraulics, he brought an experimental insight into the deteriorations in interaction with water, which he observed in İnce Minare, Karatay and Sırça Madrasahs. One of the most important functions of the wells, which has been forgotten, is based on their use in managing the soil safety stress due to the damping of the waves during the earthquake. As a result of the earthquake movement, which can be defined as a kind of energy discharge, different types of wave propagation occur at different frequencies. Water hinders the progress of some wave types in the ground layer. As S waves propagate, they shear the rock transversely

perpendicular to the direction of travel. However, the fluid will not rebound or return to its original state when transverse shearing or buckling is attempted. Therefore, S waves cannot propagate in liquid parts of the Earth [13]. [14-16] studies have been conducted on blended brick wells, which also contributed to this study. Examples of blended brick wells are given in figure 2.

Fig. 2 Examples of blended brick well

Finite element method was used in the study. SAP2000 software was used in the finite element modeling and analysis part. In the analysis part, modal analysis method was used. Resources [17-21] were used for the theoretical infrastructure of the methods. During the modeling phase, [22-25] resources were used.

The depth of the masonry blended brick well model is 5 meters. The well model is made of single layer blend brick and laid horizontally. Wall thickness was taken as 9 cm. The diameter of the well is 1 meter. The 3D finite element model of the blended brick well is given in figure 3.

Fig. 3 The 3D finite element model of the blended brick well

According to TBDY 2018, *"The type of wall materials will be determined visually by removing the plaster of a part of the wall surface. In order to determine the properties of the wall material, at least two wall sample samples will be taken from the building and its strength will be determined by applying compressive strength tests. The lowest characteristic compressive strength of solid brick masonry walls is defined as* f_k*=1.4MPa, and the Elasticity Modulus* E_{duv}*=750*f_k*."* Poisson's ratio is 0.2. Unit volume mass was taken as 2000 kg/m^3.

III. RESULTS

As a result of the modal analysis, the mode shapes of the first five modes of the blended brick wall model created according to TBDY 2018 are given in figures 4,5,6,7,8.

Fig. 4 1. Mode (Period value= 0,699614 s)

Fig. 5 2. Mode (Period value= 0,699614 s)

Fig. 6 3. Mode (Period value= 0,161240 s)

Fig. 7 4. Mode (Period value= 0,144123 s)

Fig. 8 5. Mode (Period value= 0,144123 s)

According to RYTEIE-2019, *"The type of wall materials will be determined by removing the plaster of a part of the wall surface, at least on one interior and one exterior wall. Apparent quality normal values will be used for the pressure, shear, diagonal tensile strength and specific gravity values of walls constructed with cement reinforced mortar and masonry units. For Solid Brick or Blended Brick masonry walls, the strength value is defined as* f_m*=1.4MPa and the Elasticity Modulus is defined as* $E_m=600f_m$*. Visible quality will be considered Poor for walls where mortar discontinuity or structural cracks are documented by photographs. The lowest characteristic compressive strength of solid brick masonry walls is defined as* f_k*=1.4MPa, Elasticity Modulus* $E_{duv}=750f_k$*."* Poisson's ratio is 0.2. Unit volume mass was taken as 2000 kg/m3.

As a result of the modal analysis, the mode shapes of the first five modes of the blended brick wall model created according to RYTEIE-2019 are given in figures 9,10,11,12,13.

Fig. 9 1. Mode (Period value= 0,587327 s)

Fig. 10 2. Mode (Period value= 0,587327 s)

Fig. 11 3. Mode (Period value= 0,135361 s)

Fig. 12 4. Mode (Period value= 0,120991 s)

Fig. 13 5. Mode (Period value= 0,120991 s)

The results of the period values according to TBDY 2018 and RYTEIE-2019 are given comparatively in Table 1.

Table 1. Comparison of TBDY 2018 and RYTEIE-2019 period values

	Mode 1	**Mode 2**	**Mode 3**	**Mode 4**	**Mode 5**
TBDY 2018	0,699614	0,699614	0,161240	0,144123	0,144123
RYTEIE-2019	0,587327	0,587327	0,135361	0,120991	0,120991
Difference (s)	0,112287	0,112287	0,025879	0,023132	0,023132
Difference (%)	0,160498503	0,160498503	0,160499876	0,160501794	0,160501794

The results of the mode shape according to TBDY 2018 and RYTEIE-2019 are given comparatively in Table 2.

Table 2. Comparison of TBDY 2018 and RYTEIE-2019 mode shapes

	Mode 1	**Mode 2**	**Mode 3**	**Mode 4**	**Mode 5**
TBDY 2018	Translational	Translational	Torsional	Translational	Translational
RYTEIE-2019	Translational	Translational	Torsional	Translational	Translational

IV. CONCLUSION

When examined for the first 5 modes, differences were seen between TBDY-2018 and RYTEIE-2019, equal in percentage in all modes. This difference is approximately 16.05%. According to the results of the period data, since there was no change in the geometry and mass of the blended brick well, the stiffness value decreased by 16.05% in RYTEIE-2019 compared to TBDY-2018. The biggest difference between the two methods in the numerical calculation part is in the calculation of the elasticity modulus. The elasticity module in RYTEIE-2019 is requested to be accepted as 20% lower than TBDY-2018. It is understood that the results obtained are parallel to this demand. When the mode shapes are examined, they do not show significant change in the calculation results according to both regulations.

In light of all these results obtained, it is clearly seen that RYTEIE-2019 accepts the blended brick well model as less rigid than TBDY-2018. Here, it is understood that the RYTEIE-2019 regulation acts more safely and is closer to the decision on possible reinforcement or demolition. The reason for this situation is the statement in RYTEIE-2019: *"Values given as apparent quality normal will be used for the pressure, shear, diagonal tensile strength and specific gravity values of walls built with cement-reinforced mortar and masonry units."* In TBDY-2018, it is required to calculate the strengths through direct tests. It is understood that having both regulations in force at the same time is a confusing situation. In addition, it is known that the 16.05% stiffness difference in the blended brick well model is significant. It is understood that a lot of experimental work is needed for new regulations in order to make the percentage differences more sensitive. In addition, it is understood from the analytical analysis that for the blended brick well model, a 20% decrease in the elasticity modulus should not be assumed to affect the stiffness by 20%. No mistakes should be made based solely on the k=E.I formula. Boundary conditions must be taken into consideration when calculating stiffness. It is recommended to take the RYTEIE-2019 regulation into consideration in order to eliminate confusion, stay on the safe side and in terms of the economic life of blended brick wells.

Özet – Bu çalışmada EN 10346 standardında tanımlanan 1.0952 çelik numaralı DX54D düşük alaşımlı sıcak galvaniz kaplı çelik numunelerin sıfır altı termal şok döngülerinin tane boyutuna etkisi incelenmiştir. Bu amaçla galvanizli DX54D numuneler -40 ile +40 °C arasında 250, 500 750 ve 1000 döngü termal şok işlemine tabi tutulmuş ve işlemsiz DX54D numunesi ile karşılaştırılmıştır. Termal şok sonrası numunelerin mikro yapıları optik mikroskop ile incelenmiş ve ASTM E112 standardına göre tane boyutları değerlendirilmiştir. Yapılan mikroyapı incelemeleri soğuk termal şok işleminin mikroyapı tane boyutu üzerinde etkili olduğunu göstermiştir. Şöyle ki işlemsiz numunede haddeleme yönünde uzamış ferritik bir tane yapısından oluşmuştur. 250, 500 termal şok döngülerinde ise ferritik yapının korunduğu ancak haddeleme yönündeki uzamanın ortadan kalktığı tespit edilmiştir. 750 termal şok döngüsünde ise çok küçük boyutlu taneler ve yer yer çökelek tipi tanelerin yer aldığı tespit edilmiştir. 1000 termal şok döngüsünde haddeleme yönündeki uzamanın kalkmasına ek olarak küçük boyutlu taneler ve yer yer çökelek tipi tanelerin 750 döngüdeki gibi oluştuğu ancak bunlara ek olarak bazı tanelerde mikro çatlaklar ve çukurcuk oluşumlarının da yapıda yer aldığı tespit edilmiştir. Dolayısıyla soğuk termal şok etkilerinin belirgin olduğu minimum döngü sayısının 1000 çevrim olması gerektiği sonucunda verilmiştir. Tane boyutları bakımından değerlendirildiğinde ise termal sok çevrim sayısı artışı ile tane boyutlarında azalma meydana gelmiş olsa da belirgin farklılığın 1000 termal şoklu numunede elde edildiği ve İşlemsiz DX54 numunesine göre tane boyutunda %10 civarında bir azalmanın meydana geldiği tespit edilmiştir.

Anahtar Kelimeler – Çelik, Galvanizleme, Termal Şok, Mikroyapı, Tane boyutu

I. GİRİŞ

Çelikler esas olarak demir-karbon (Fe-C) alaşımlarından oluşturulmuş olmakla birlikte krom (Cr), nikel (Ni), Molibden (Mo), titanyum (Ti), Niyonyum (Nb) vb. diğer bazı elementlerin yapıya ilave edilmesi şeklinde tanılanabilir. Çelikler kimyasal içerik farklılıkları yoluyla oluşturulabilmelerine ilaveten ısıl işlem prosedürleri yoluyla da farklı türlere dönüştürülebilir. Dolayısıyla çeliklerin mekanik özellikleri içerdikleri başta C alaşım elementi olmak üzere diğer alaşım elementleri ve ısıl işlem prosedürlerine bağlı olarak geniş bir çerçevede üretilebilirler. Endüstride kullanılan çeliklerde aranan önemli parametrelerden biri maliyet olduğundan endüstriyel uygulamalarda genellikle <%1 C ve <%5 alaşım elementi içeren çelikler kullanılmaktadır [1].

Çeliklerin özellikleri, içerdiği elementlerin kimyasal bileşimi ve mikroyapısının etkileşimine dayanır. Çelikler genellikle ısıl işlemlerden etkilenir ve bu işlemlerle birlikte kimyasal bileşim, istenen sertlik, mekanik ve fiziksel özellikler, elektriksel davranış, korozyon ve yüksek sıcaklık direnci gibi nitelikler

kazandırır. Uygun kimyasal bileşime ve mikroyapıya sahip çelikler, soğuk şekillendirme işlemlerine de elverişlidir. Çeliklerin büyük bir kısmı östenitik olmadığından manyetik özellikler sergiler. Doğru kimyasal bileşime sahip çelikler, kaynak yöntemleri ile birleştirilebilir. Çoğu çelik türü metal kaplama, emaye kaplama, boyama ve plastik kaplama gibi işlemlere uygundur. Düşük alaşımlı çelikler, genellikle asitler ve korozif tuz çözeltilerinden etkilenirken alkalilere karşı dirençlidir [2]. Öte yandan özel alaşımlı çelikler ise yüksek korozyon direnci sunar [2], [3].

Dünyada çelik üretimi denildiğinde, Çin, Hindistan, Japonya ve Amerika Birleşik Devletleri gibi ülkeler başı çekmektedir. Çin, dünya çelik üretiminin yaklaşık %50'sini karşılayarak bu alanda lider konumundadır [4]. Hindistan ise son yıllarda yaptığı yatırımlar ve artan üretim kapasitesi ile dikkat çekmektedir. Japonya ve Amerika Birleşik Devletleri de yüksek kaliteli çelik üretiminde önemli birer oyuncu olarak yer almaktadır. Global çelik endüstrisi, sürekli olarak yenilikçi çözümler ve sürdürülebilir üretim yöntemleri arayışı içindedir. Gelişmiş geri dönüşüm teknikleri, enerji verimliliği sağlayan üretim süreçleri ve düşük karbon ayak izi bırakan teknolojiler, modern çelik üretiminde ön plana çıkmaktadır. Türkiye de bu küresel trendleri yakından takip ederek, çelik üretiminde hem kaliteyi hem de sürdürülebilirliği artırmayı hedeflemektedir. Dolayısıyla, Türkiye'nin 2023 yılı itibarıyla 33,7 milyon tonluk ham çelik üretimi, ülkenin çelik sanayisindeki güçlü konumunu ve potansiyelini ortaya koymaktadır. Dünyada ise 3500'den fazla çelik kalitesinin bulunması ve bu kalitelerin büyük bir kısmının son 20 yılda geliştirilmiş olması, çelik üretiminin ne kadar dinamik ve yenilikçi bir sektör olduğunu göstermektedir. Bu bağlamda, Türkiye'nin global çelik pazarındaki rolü ve önemi her geçen gün artmaktadır.

Çelikler, hava, su ve toprak gibi ortamlarda oksijenle temas ettiğinde hızla bozunmakta ve metal yüzeylerde pas oluşmaktadır. Korozyonun ilerlemesi, çeliğin kullanım ömrünü azaltarak uzun vadede hurdaya dönüşmesine neden olmaktadır [5]. Korozyon, metal ile çevresi arasında fiziksel etkileşime neden olup, metalin özelliklerinde ve fonksiyonlarında önemli kayıplara yol açan bir süreçtir [6]. Korozyonun önlenmesi için korozyon hücresini oluşturan elemanlardan en az birinin devreden çıkarılması gerekmektedir [7]. Korozyonu önlemek için kullanılan yöntemlerden biri de yüzey kaplamasıdır.

Metalik malzemelerin yüzeylerinin korozyondan korunması amacı ile uygulanan kaplamanın ilk anda içinde bulunduğu ortama, koruyucu olarak kaplandığı malzemeden daha dayanıklı olması gerektiği akla gelebilir. Bu yaklaşım çok doğru bir yaklaşım değildir. Çelik yüzeylere uygulanan kaplamaların ortama karşı çelikten daha dayanıksız olursa, çelik çözünmeden önce bu kaplama çözünecektir. Yani ana malzemeyi korumak için kaplama kendini feda edicektir. Bu yöntem ise korumada yöntemi her zaman etkisi sonuç vermektedir ve başarısızlık şansı çok azdır. Metalik kaplama yöntemlerinden biri olan çinko kaplama, galvanizleme olarak adlandırılır [6].

Çinko çelik ile birlikte bulunduğu ortamlarda daha önce çözünme eğiliminde olan bir elementtir. Çeliğin üzerine kaplama olarak uygulandığında ise ortam etkilerinin çeliği etkilemesine müsaade etmez, önce kendisi çözünerek çeliği korur. Demir esaslı malzemeler üzerine çinko birçok yöntem ile kaplama uygulanabilir. Galvaniz kaplama genellikle sıcak daldırma, elektroliz veya metal püskürtme prosesleri uygulanarak yapılmaktadır. Sıcak daldırma galvanizleme, günümüzde en yaygın kullanılan kaplama yöntemlerinden biridir [8].

Bu çalışmada kullanılan DX54D çeliği, düşük karbon içeriği ve mükemmel derin çekme özellikleri nedeniyle otomotiv ve beyaz eşya endüstrilerinde yaygın olarak kullanılan bir çelik türüdür [9]. Bu

çeliğin -40 ile +40°C arasındaki termal şoklara maruz kalması, malzemenin faz yapısında, mikro yapısında ve diğer karakteristik özelliklerinde önemli değişikliklere yol açabilir. Termal şok işlemi, malzemenin ani sıcaklık değişikliklerine maruz kalmasıyla meydana gelir ve bu da malzeme içindeki gerilmelerin artmasına neden olabilir. Artan termal şok döngüleri, malzemenin mikro yapısındaki fazların dönüşümlerini tetikleyebilir. Özellikle düşük sıcaklıklarda martensitik faz dönüşümleri, malzemenin sertlik ve kırılganlık özelliklerini etkileyebilir. Yüksek sıcaklıklarda ise, ferrit ve perlit fazlarının yeniden düzenlenmesi gözlemlenebilir. Termal şok döngülerindeki aralık arttıkça, bu faz dönüşümleri daha belirgin hale gelir ve malzemenin mekanik özelliklerinde, özellikle tokluk, çekme mukavemeti ve sertlik gibi özelliklerinde önemli değişiklikler gözlemlenebilir. Ayrıca, termal şokların mikro yapıya etkisi, malzeme yüzeyinde çatlak oluşumuna ve bu çatlakların yayılmasına neden olabilir, bu da malzemenin yorulma ömrünü olumsuz etkiler [10]. Çatlakların yayılması, malzemenin iç yapısındaki gerilim yoğunluklarını artırarak, malzemenin genel dayanıklılığını azaltabilir. Termal şok işleminin tekrarlanan döngüleri, mikro yapısal bozulmalara ve malzemenin iç gerilimlerinde artışa yol açarak, malzemenin genel performansını düşürebilir. Bundan dolayı bu çalışmada DX54D çeliğine uygulanan -40 ile +40°C arasındaki termal şok işlemleri, malzemenin faz ve mikro yapı değişikliklerini tetikleyip tetikleyemeceği tane boyutu üzerinde ne tür bir etkisinin belirlenmesi amacıyla numunler 250, 500, 750 ve 1000 çevrime tabi tutulmuş ve herhangi bir işlem uygulanmamış DX54D numunesi ile kıyaslanmıştır.

II. MATERYAL VE YÖNTEM

Çalışmada sıfır altı termal şoka uğratılmak üzere EN 10346 standardında tanımlanan 1.0952 çelik numaralı DX54D düşük alaşımlı sıcak galvaniz kaplı çelik kullanılmıştır.

Tablo 6.1. 1.0952 çelik numaralı DX54D çeliği kimyasal bileşimi

Malzeme	C	Si	Mn	P	S	Fe
1.0952	0,12	0,50	0,60	0,10	0,045	Kalan

Uygun ölçülerde kesilen numuneleri sıfır altı termal şok işlemini gerçekleştirebilmek için Huber markasının TC50 modeli kullanılmıştır. Bu cihaz -50 °C sıcaklığa düşme kapasitesine sahiptir. Numuneler -40 °C' de stabil hale getirilen alkol ortamında soğutma işleminin gerçekleştirildikten sonra şoklama işlemi için +40 °C' bulunan ısıtılmış su ortamına numuneler alınmıştır. Bu ortam değişikliği bir çevrim olarak kabul edilmiş ve numuneler 5 farklı çevrim sayısında sıfır altı termal şoklama işlemine maruz bırakılmışladır. Bu çevrimler, 250 çevrim, 500 çevrim, 750 çevrim ve 1000 çevrim olarak uygulanmıştır.

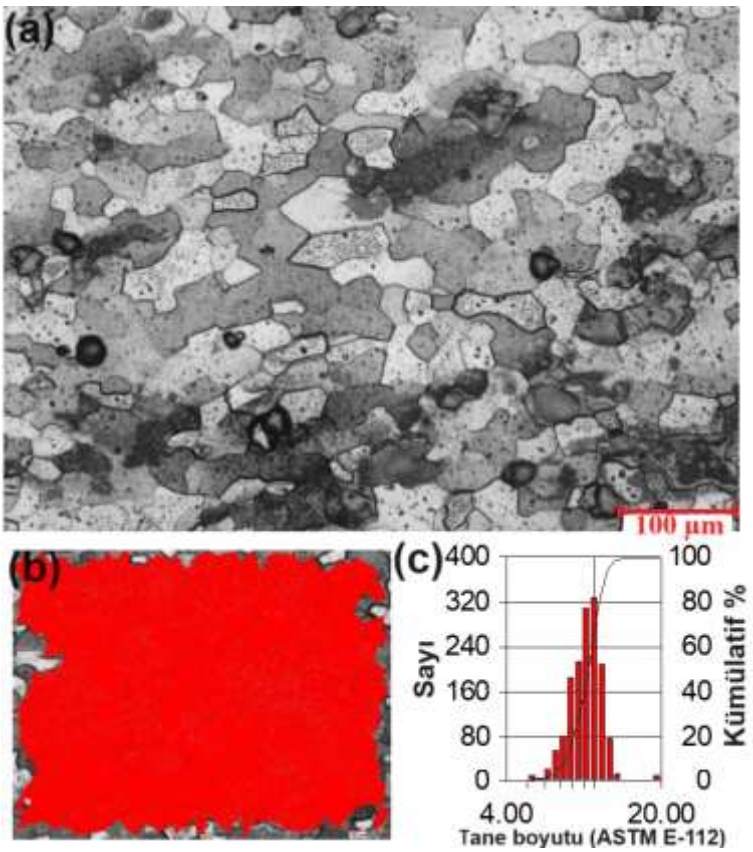
Mikroyapı incelemeleri gerçekleştirilecek numuneler sıcak bakalite alınarak geleneksel zımparalama işlemlerinde 400-1200 SiC zımpara kağıtlarından geçirilerek yapılmıştır. Partlatma işlemleri ise önce 2000 SiC zımparalardan geçirilmiş ardından 3 µm ve 1 µm Al_2O_3 sıvı parlatıcılar ile gerçekleştirilmiştir. Hazırlanan numunelerin mikroyapı incelemeleri NIKON MA2000 model optik mikroskop yardımıyla gerçekleştirilmiştir.

Şekil 6.1 Soğuk termal şok işlemlerinin gerçekleştirildiği Huber soğutma cihazı resmi

Tane boyutunun değerlendirilmesinde ASTM E112 standardına göre, tane boyutu numarası, optik mikroskop altında belirli bir büyütme seviyesinde görülebilen tane sayısına dayanır ve daha büyük tane boyutları daha düşük ASTM numaraları ile temsil edilir. Bu sistemde, tane boyutu numarası ile tane çapı arasında ters bir ilişki vardır. Örneğin, yüksek tane boyutu numarası daha küçük taneleri, düşük tane boyutu numarası ise daha büyük taneleri gösterir. Bu çalışmasında ASTM E112 standardı baz alındığından tane boyutları bu ters ilişkiye göre değerlendirilmiştir.

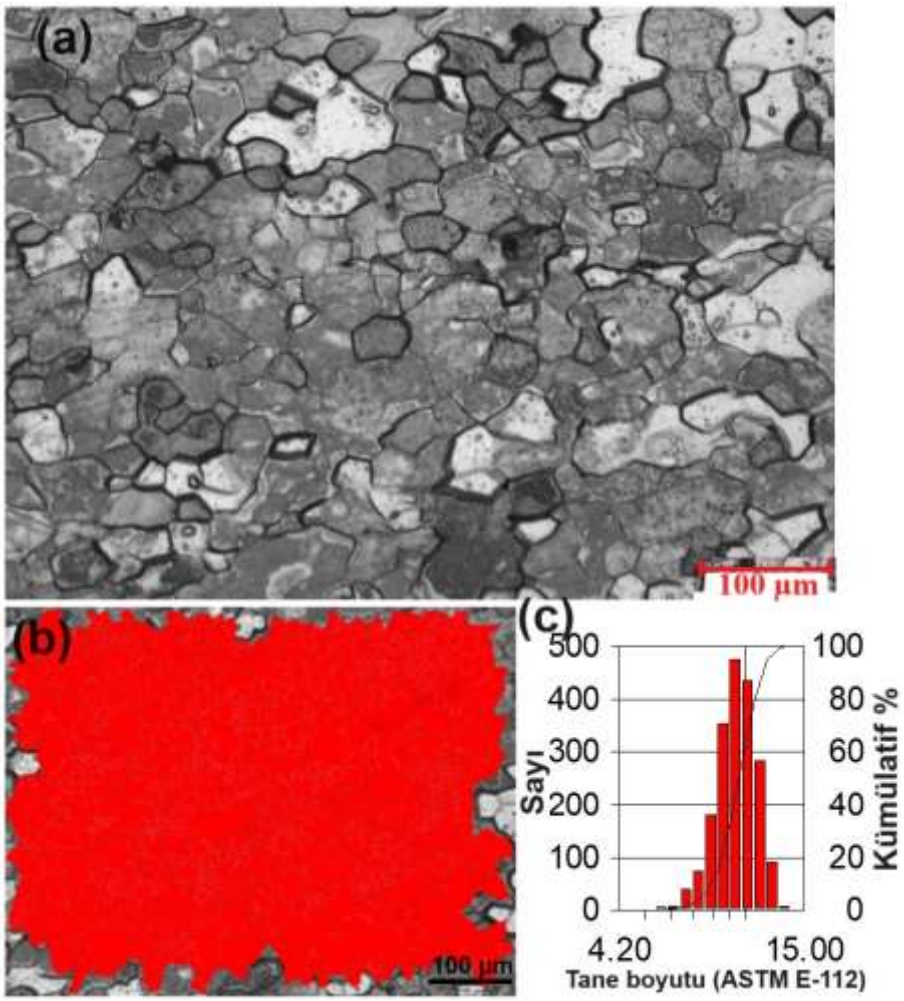
III. BULGULAR VE TARTIŞMA

Gerçekleştirilen mikroyapıları incelemeleri sonucu elde edilen optik mikroyapı görüntüleri ve ASTM E112 standardı esasları doğrultusunda yapılan tane boyutu ölçüm sonuçları Şekil 2- Şekil 7 aralığında gösterilmiştir.



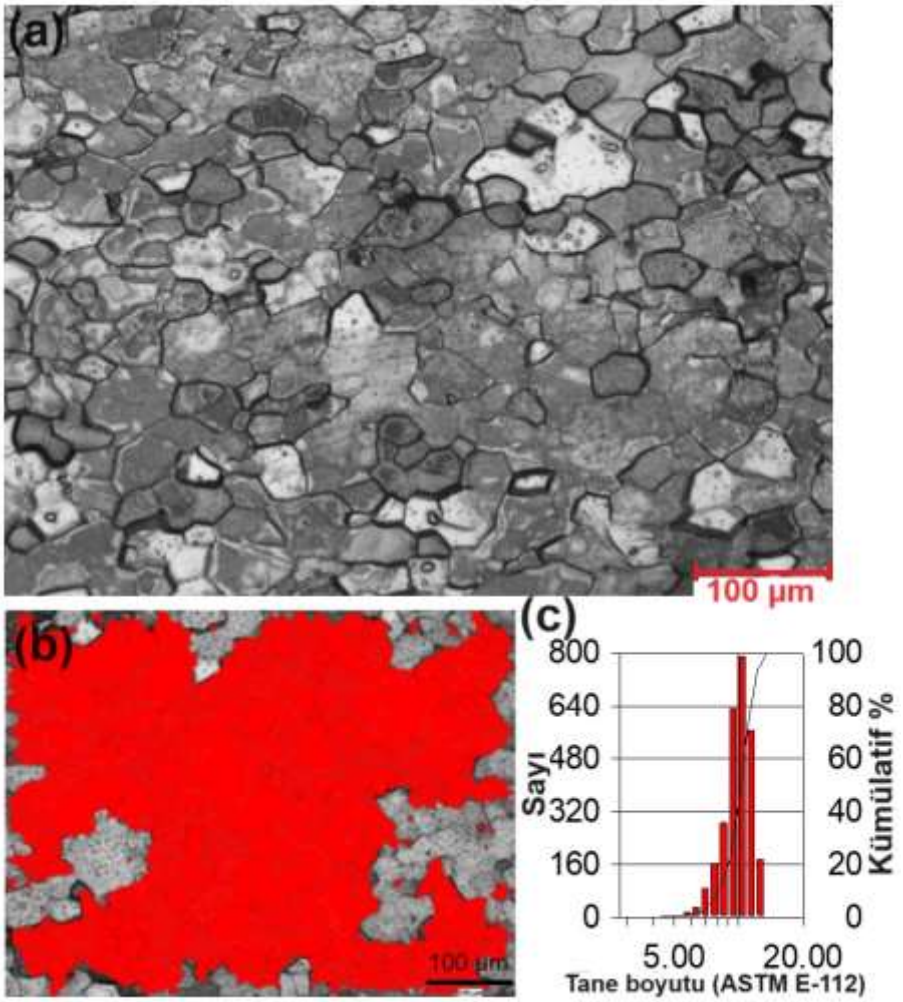
Şekil 2. İşlemsiz DX54 numunesinin a) optik mikroyapı resmi b)tane boyutu ölçümünü alınmasının gösterimi c) tane boyutu dağılımı grafiği.

İşlemsiz DX54 numunesinin optik resmi incelendiğinde ferritik bir mikroyapının olduğu ve tanelerin haddeleme yönünde uzanmış oldukları görülmektedir. İşlemsiz DX54D numunesinin üzerinden alınan Clemex analiz programı ile ASTM E-112 göre gerçekleştirilen tane boyutu analizinden bu numunenin ortalama tane boyutunun 8.55 olduğu tespit edilmiştir.



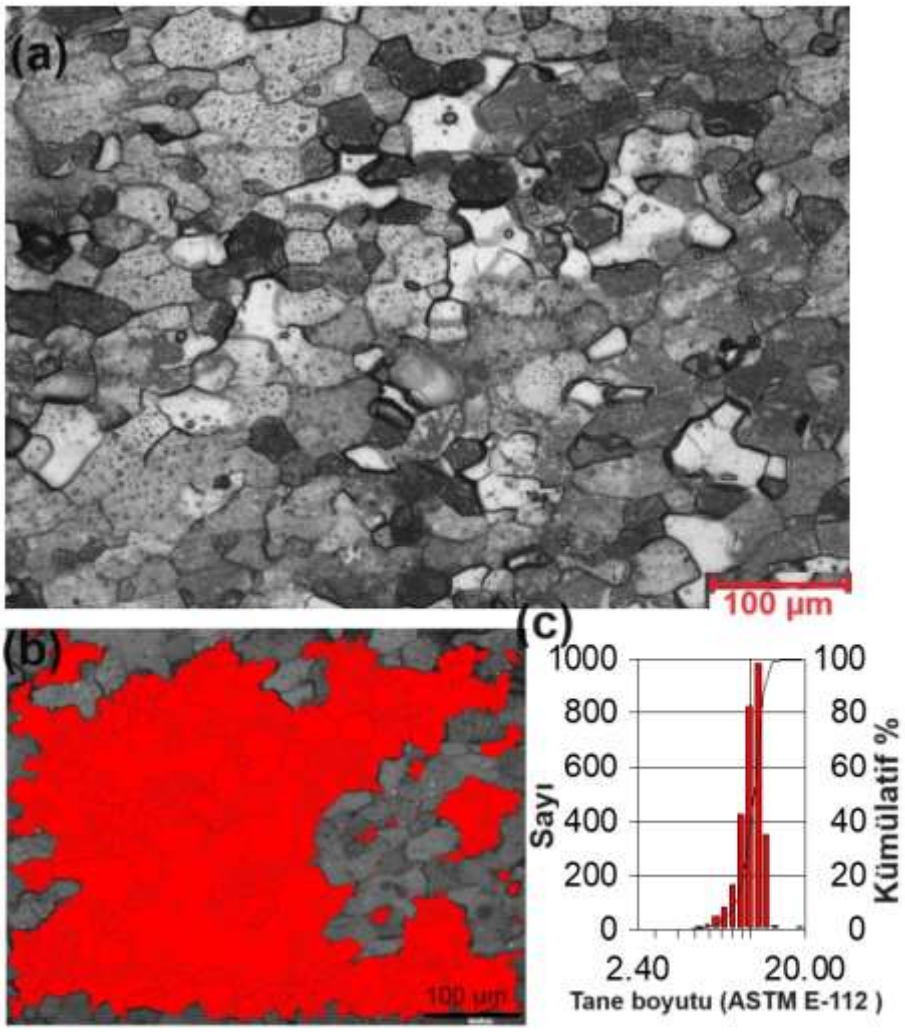
Şekil 3. 250 çevrim sıfır altı soğuk işleme maruz bırakılmış numunesinin a) optik mikroyapı resmi b)tane boyutu ölçümünü alınmasının gösterimi c) tane boyutu dağılımı grafiği.

250 çevrim sıfır altı soğuk termal yorulmaya maruz bırakılan numunenin optik resmi incelendiğinde işlemsiz numunede olduğu gibi ferritik bir mikroyapının olduğu ancak tanelerin haddeleme yönündeki uzanmalarının işlemsiz numuneye göre daha az oldukları görülmektedir. 250 çevrim numunesinin üzerinden alınan Clemex analiz programı ile ASTM E-112 göre gerçekleştirilen tane boyutu analizinden bu numunenin ortalama tane boyutunun işlemsiz numuneye yakın olduğu ve ortalama tane boyutunun 8.83 olduğu tespit edilmiştir.



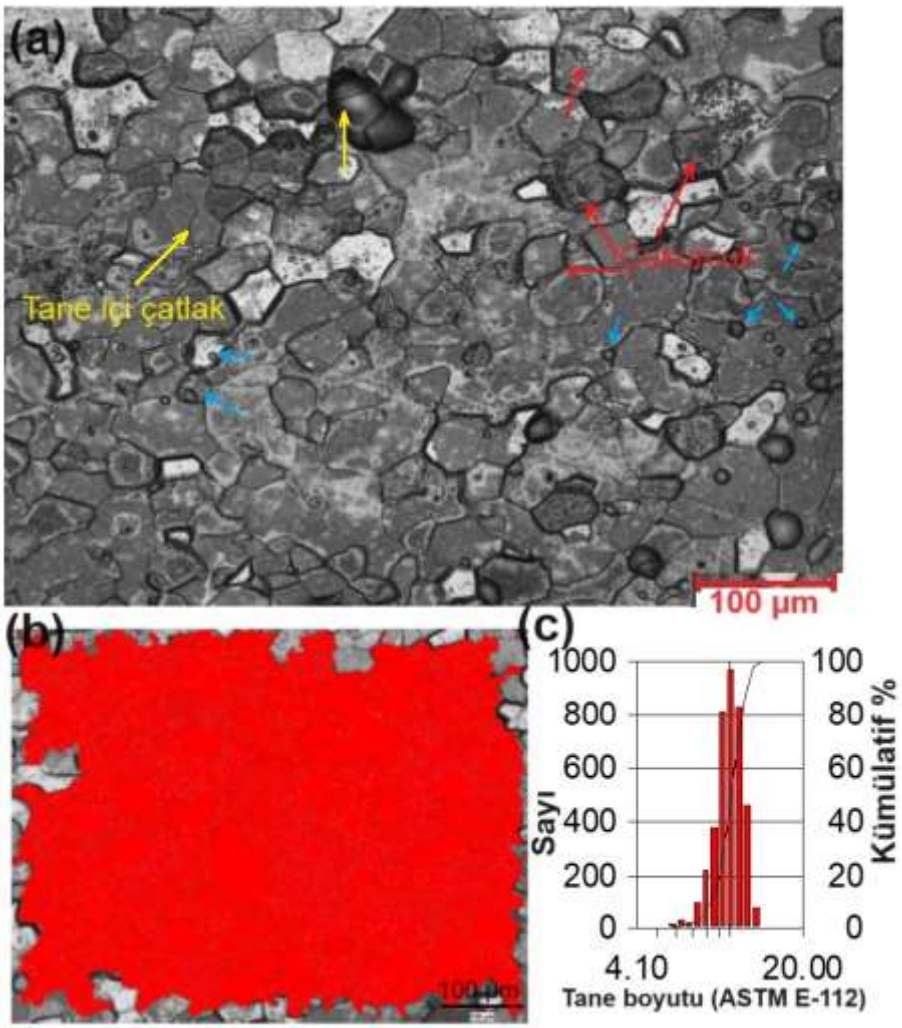
Şekil 4. 500 çevrim sıfır altı soğuk işleme maruz bırakılmış numunesinin a) optik mikroyapı resmi b)tane boyutu ölçümünü alınmasının gösterimi c) tane boyutu dağılımı grafiği.

500 çevrim sıfır altı soğuk termal yorulmaya maruz bırakılan numunenin optik resmi incelendiğinde 250 çevrime maruz bırakılan numunede olduğu gibi ferritik bir mikroyapının olduğu mikroyapı görünümünün bazı bölgelerinde çok küçük boyutlu taneler oluşmuş iken bazı bölgelerde ise büyük tanelerin varlığı dikkat çekmektedir. 500 çevrim numunesinin üzerinden alınan Clemex analiz programı ile ASTM E-112 göre gerçekleştirilen tane boyutu analizinden bu numunenin ortalama tane boyutunun 9,02 olduğu tespit edilmiştir. Bu durum sıfır altı termal çevrim sayısı artışı ile az da olsa tane boyutunda azalma meydana geldiğine işaret etmektedir.



Şekil 5. 750 çevrim sıfır altı soğuk işleme maruz bırakılmış numunesinin a) optik mikroyapı resmi b)tane boyutu ölçümünü alınmasının gösterimi c) tane boyutu dağılımı grafiği.

750 çevrim sıfır altı soğuk termal yorulmaya maruz bırakılan numunenin optik resmi incelendiğinde diğer numunelerde olduğu gibi ferritik bir mikroyapının olduğu ancak mikroyapı görünümünün bazı bölgelerinde çok küçük boyutlu taneler ve yer yer çökelek tipi tanelerin yer aldığı tespit edilmiştir. 750 çevrim numunesinin üzerinden alınan Clemex analiz programı ile ASTM E-112 göre gerçekleştirilen tane boyutu analizinden bu numunenin ortalama tane boyutunun 9,20 olduğu tespit edilmiştir. Bu durum sıfır altı termal çevrim sayısı artışı ile az da olsa tane boyutunda azalma meydana geldiği tespit edilmiştir.



Şekil 6. 1000 çevrim sıfır altı soğuk işleme maruz bırakılmış numunesinin a) optik mikroyapı resmi b)tane boyutu ölçümünü alınmasının gösterimi c) tane boyutu dağılımı grafiği.

1000 çevrim sıfır altı soğuk termal yorulmaya maruz bırakılan numunenin optik resmi incelendiğinde diğer numunelerde biraz farklı bir mikro yapının oluştuğu görülmektedir. Mikroyapı resmi diğer numunlerde olduğu gibi ferritik bir mikroyapının olduğu ancak diğer numunelerden fraklı olarak mavi oklarla gösterilen MC karbürlere benzeyen küresel yapıların, tane içi ve tane sınırlarında çukurcuk (pitting) oluşumlarının ve hatta bazı tane içlerinde sarı ok ile gösterilen bölgelerde mikro çatlakların oluştuğu görülmektedir. Bu durum 1000 çevrim etkisinin diğer numunelerden farklı olarak mikroyapıyı ciddi anlamda etkilediğini göstermektedir. 1000 çevrim numunesinin üzerinden alınan Clemex analiz programı ile ASTM E-112 göre gerçekleştirilen tane boyutu analizinden bu numunenin ortalama tane boyutunun 9.34 µm ile en küçük tane boyutuna sahip numune olduğu tespit edilmiştir. Bu durum sıfır altı termal çevrim sayısı artışı ile DX54 çeliğinin tane boyutunda küçülme meydana geldiği tespit edilmiştir.

IV. SONUÇLAR

Bu çalışma sonucunda DX54D çeliğine uygulanan -40 ile +40 °C soğuk termal şok işleminin mikroyapı ve tane boyutu üzerinde etkili olduğu görülmüştür. Şöyle ki İşlemsiz numunede ASTM E-112 standardına göre 8.55 olarak tespit edilen ortalama tane boyutu artan çevrim sayısına bağlı olarak bir küçülme meydan geldiği ve en belirgin etkinin gözlendiği 1000 çevrim termal yorulmaya maruz bırakılan numunede bu değerin işlemsiz numuneye göre %10'a yakın olduğu tespit edilmiştir. Bu duruma -40 ile +40 °C aralığındaki termal döngülerin tane sınırlarında gerilme birikimine neden olması gösterilebilir. 1000 çevrimli numuneki çatlak ve çukurcuk oluşumları gerilme birikimleri iddasını destekler niteliktedir.

Çünkü ısıtma-soğutma döngüleri tane boyutlarının yeniden düzenlenmesine ve tane sınırlarının hareket etmesine yol açabilir. Bu da tanelerin büyümesi veya küçülmesi gibi etkiler gözlenebilir. Tane küçülmesinin 250 çevrimde %5 civarında iken 1000 çevrimde %10 olması ve nispeten sınırlı olması, uygulanan termal yorulma işleminin -40 ile +40 °C aralığında uygulanmış olması ile ilgilidir. Bu sıcalıklar kriyojenik ısıl işlem sıcaklıkları (-196) ve yeniden kristalleşme sıcaklıklarına (500-600 °C) yakın olmaması dolayısıyla tane boyutlarında dramatik değişikliklere neden olmamasının bir sonucudur. Çünkü bu sıcaklık aralığı yeniden kristalleşme için yeterince yüksek değildir. Ancak, uzun vadede bu döngüler mikro yapı üzerinde kümülatif etkiler yapmasına bağlı olarak 1000 çevrimde %10'luk bir tane küçültme meydana getirmiş ve mikroyapıda değişikliğe neden olmuştur.

TEŞEKKÜR

Yazarlar makaledeki numunelerin temini ve laboratuvar cihazlarının kullanımını sağlayan MMK Metalurji Sanayi Ticaret ve Liman İşletmeciliği A.Ş'ye teşekkür eder.

Abstract – Alternatives to cement that can be used in cement-based systems have an effect on mechanical performance, physical and durability properties, including normal consistency water requirement and setting times. For this purpose, in this study, the results of binary and single substitution of different proportions of fly ash (FA) and wood ash (WA) to cement were investigated. CEM-I 42.5R cement (PC), class F FA, WA and city water was used in the study. In the study, FA and WA were replaced with PC in pairs and singly in the range of 0-18% by mass. The normal consistency water requirement and setting times of the produced cement pastes were determined. Three 50x50x50 mm cube specimens were produced to represent each cement paste with the determined normal consistency water requirement and powder material ratios. After 28 days of lime-saturated water curing, the physical properties of the cube specimens were determined, followed by their compressive strength. The data obtained showed that FA and WA increased the water requirement and setting times at normal consistency. In single substitution mixtures containing the same proportion of WA and FA, WA has a greater effect on the water requirement at normal consistency and setting times. In these mixtures, the use of FA increased the setting times by 33 minutes at most compared to the reference mixture, while WA increased them by 147 minutes. As the amount of WA in the mix increases, the compressive strength decreases. In addition, the mixture with the highest porosity was the mixture containing 18% WA and this mixture had the lowest compressive strength. In the sole use of FA, the replacement rate is 6%, where the compressive strength also increases despite the increasing amount of normal consistency water.

Keywords – Fly ash, wood ash, setting times, normal consistency water, compressive strength, physical properties

I. INTRODUCTION

Directly linked to global population growth and economic growth, the cement and concrete industry is an important branch of industry serving the construction sector. Turkey is one of the top 5 cement producing and consuming countries in the world and accounts for approximately 2% of the world cement market. The most important component of the construction industry is cement. As an energy-intensive sector, cement production is responsible for a significant portion of global CO_2 emissions from industrial production [1]. Therefore, the sustainability of the search for alternative products to cement is important.

FA is one of the leading alternative products to cement [2]. In thermal power plants where lignite coal is burned, a large amount of gas is released by the combustion of pulverized coal during electricity generation. In this process, gases and micron-sized ash particles are also mixed into the atmosphere. These particles are prevented from entering the atmosphere with the help of electro filters. Volatile micron-sized industrial wastes are FA, which is currently used as an important industrial by-product in cement-based systems [3],

[4]. Fly ash is an alternative pozzolanic material to cement. Like all fine-grained pozzolanic materials with an aluminous and siliceous structure, it contributes to the formation of C-S-H gels during hydration. The contribution of FA to compressive strength is influenced by the fineness of the paticle rather than the amount used. FA particles ranging in size from 1-200μm are generally spherical. Its structure usually contains 85% SiO_2, Al_2O_3, Fe_2O_3, CaO and MgO. [5] , [6]. Depending on the grain structure of FA in concrete production, workability becomes easier, water and chloride permeability decreases, and resistance to chemical effects increases. However, FA used in excessive amounts reduces mechanical performance [6]. FA is known to prolong the setting time of concrete. The use of FA increases the water requirement and the setting times are prolonged accordingly. It is considered appropriate to use extra products to move the extended setting times to a safe range [7]. In particular, fine limestone powder is successfully used to increase the reaction rate of cement clinker and partially compensate for the retardation effect [8–10]. It is generally accepted that the use of 10% FA maintains the 28-day compressive strength of concrete at an acceptable level. The use of distilled water in FA-substituted cement systems is also an effective parameter compared to the use of municipal water [4]. FA-substituted concrete is more affected by curing time and curing conditions than conventional concrete [11]. It was also observed that the loss of compressive strength caused by the use of FA at an early age can be compensated by hot water curing [12]. In recent years, there has been a search for additional products not only for the use of FA, but also for the disadvantages of FA that need to be eliminated. The contribution of FA to the compressive strength of concrete can be increased by adding products such as nano silica [2]. Normal consistency and setting times are important preliminary evaluation criteria in the use of alternative products to cement. Because most of the physical, mechanical and durability criteria are directly or indirectly related to normal consistency and setting times. The pozzolanic products and admixtures used to improve setting time and consistency have important effects [13–17]. Especially in tuff and ash waste products, reducing the grain size can prolong setting times and increase compressive strength [18]. In applications where the use of lime is replaced with wood ash, an increase in air content and a decrease in setting times are observed [19]. It is known that Çayca tuff affects the setting times and compressive strength depending on the grain size. As the grain size decreases, setting times and compressive strength increases [18].

In this study, WA and FA were used both singly and in binary to produce cement pastes. The effect of the produced mixtures on the normal consistency water requirement and setting times according to the substitution status was investigated. In addition, physical properties were determined and compressive strength tests were performed with cube specimens after 28 days of water curing. As such, the study provides a comparison of FA, which is widely used in the search for a new product, and WA, which is used in this study.

II. Materials and Method

In this section, the design of 13 different cement pastes produced within the scope of the experimental study, the production process and the experimental studies applied are presented under subheadings. Figure 1 shows the work flow diagram.

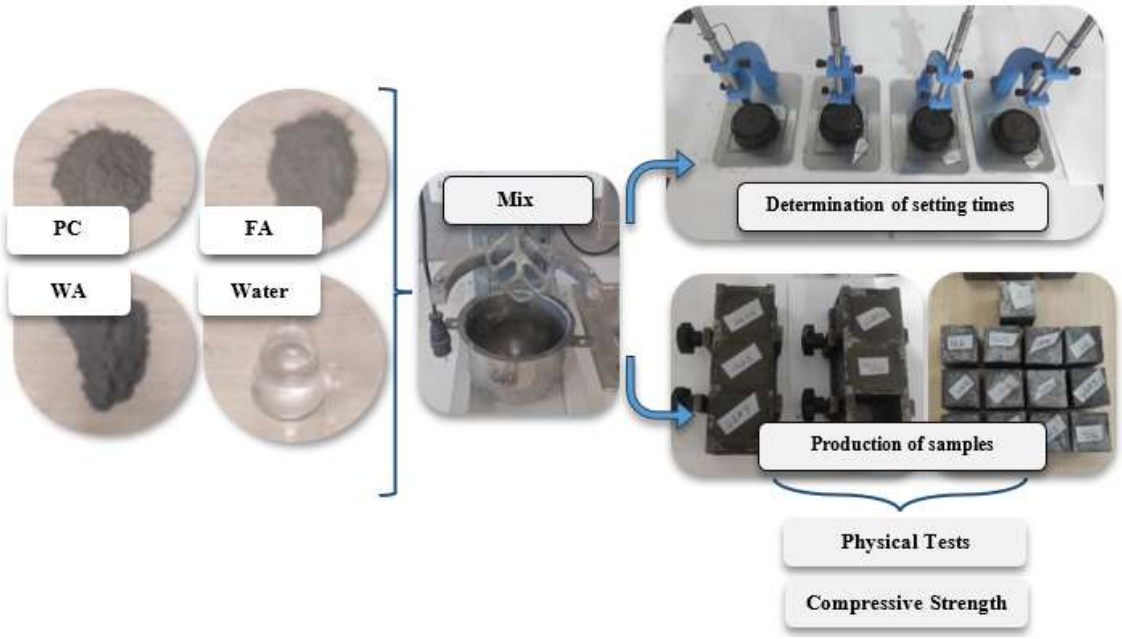

Fig 1. Workflow of the study

A. MATERIAL

Within the scope of the experimental study, 13 different cement pastes were designed. The basic powder material used in all cement pastes is CEM-I 42.5R cement (PC) [20]. Class F fly ash (FA) [21] and wood ash (WA) were substituted into the cement in proportions ranging from 0-18%. WA is the part of the wood burned for bread production that is sieved through a 0.0063 mm square mesh sieve after being reduced to ash. Tunceli municipal water was used as mixing water [22]. Technical specifications of PC and FA are given in Table 1. The determined specific gravities of PC, FA and WA were 3.15, 2.00 and 2.00, respectively.

Table 1. Properties of CEM-I 42.5R cement (PC) and fly ash (FA)

	PC (%)	**FA (%)**
CaO	63.57	2.32
SiO_2	19.34	60.94
Al_2O_3	3.75	20.66
Fe_2O_3	4.15	7.95
MgO	2.9	-----
SO_3	3.15	0.11
K_2O	0.81	---
Na_2O	0.41	1.56
Loss of ignition	1.92	1.92
Blaine (cm^2/g)	3804	3790

B. METHOD

The design of cement pastes produced by substituting FA and WA in the range of 0-18% to PC for a total of 500 grams of powder material is given in Table 2. In the mix designs, the amount of PC was replaced by FA and WA by mass. Cement pastes were coded according to this substitution ratio.

Table 2. Cement paste mix design

ID	PC (g)	FA (g)	WA (g)	Water (g)	W/B
FA0-WA0	500	0	0	156.0	0.312
FA6-WA0	470	30	0	159.0	0.318
FA12-WA0	440	60	0	159.0	0.318
FA18-WA0	410	90	0	154.0	0.308
FA0-WA6	470	0	30	171.4	0.343
FA0-WA12	440	0	60	190.0	0.380
FA0-WA18	410	0	90	225.0	0.450

FA4-WA2	470	20	10	178.0	0.356
FA9-WA3	440	45	15	166.5	0.333
FA3-WA9	440	15	45	187.0	0.374
FA3.6-WA14.4	410	18	72	217.0	0.434
FA14.4-WA3.6	410	72	18	182.0	0.364

W/B: Water /Binder

All experimental studies were carried out in the laboratory. Laboratory type mixer with 2dm^3 capacity, 0.01 precision balance and vicat probe were used in accordance with the relevant standards. While determining the normal consistency water requirement, the vicat probe was zeroed to the glass plate under the vicat ring and the vicat probe was released from the upper surface of the cement paste in a controlled manner. After 30 s, the penetration depth of the probe in the cement paste was determined. The mixture was prepared again by changing the amount of water each time until the penetration reached the relevant standard range (5-7 mm). After the normal consistency water requirement was determined separately for each cement paste, the setting start time and then the setting end time were determined with the same cement pastes. Suitable vicat needles were used separately for setting start and setting end times. The required penetration depth of the vicat needle for the setting start time is 4±1 mm from the glass plate under the vicat ring. When this distance is reached, the setting is considered to start. The end of the setting time is the penetration depth of the vicat needle max. 0.05 mm from the top surface of the cement paste [23]. Depending on the mix design of the cement paste whose water requirement was determined at normal consistency, 3 50x50x50 mm cube samples were produced for each cement paste. A total of 39 cube specimens were kept in lime saturated water at 20± 2 °C for 28 days. After standard water curing, oven dry unit volume weight and porosity ratio were determined with the cube specimens. In addition, compressive tests were performed with cube specimens by applying a compressive load of 1 kN/s with a universal compressive strength test press machine with a capacity of 250 kN [24].

III. RESULTS

The ratio of WA and FA substituted cement pastes in the powder material and setting times are given in Figure 2. Compared to the reference mix, the setting times increase with increasing WA and FA content. Cement paste containing 12% WA has the longest setting start and setting end times. The water requirement at normal consistency also increased for each increasing WA substitution compared to the reference mix (Table 2). In the case of FA-containing cement paste, the mix with 18% FA had a lower normal water demand than the mix with 12% FA. For cement pastes with only FA or WA substitutions, WA has a higher normal consistency water requirement. The setting times also show a similar trend to the normal thickening water requirement. The setting times of CEM I 42.5R cement paste are given in TS EN 197-1 [20]. The setting times of the reference mix meet the time interval given in the standard. When only FA-substituted groups are analyzed; cement paste with 12% FA substitution has the longest setting times compared to the

reference mix. In this mix, the start and end of setting times increased by approximately 16% and 19%, respectively, compared to the reference mix. Mixes with 12% and 18% FA substitution have a setting start time of 190 minutes. The increase in the amount of FA increases the setting start time by maximum 30 minutes and the setting end time by 33 minutes. For cement pastes containing only WA, these results are 142 and 147 minutes respectively. Double substitution was applied in the last 5 mixes shown in Figure 2. In these cement pastes, the increase in FA content brings the setting times closer to the FA range, while the increase in WA content increases the setting times. As in similar studies, the increase in the normal thickening water requirement of FA increases the setting times.[25] .

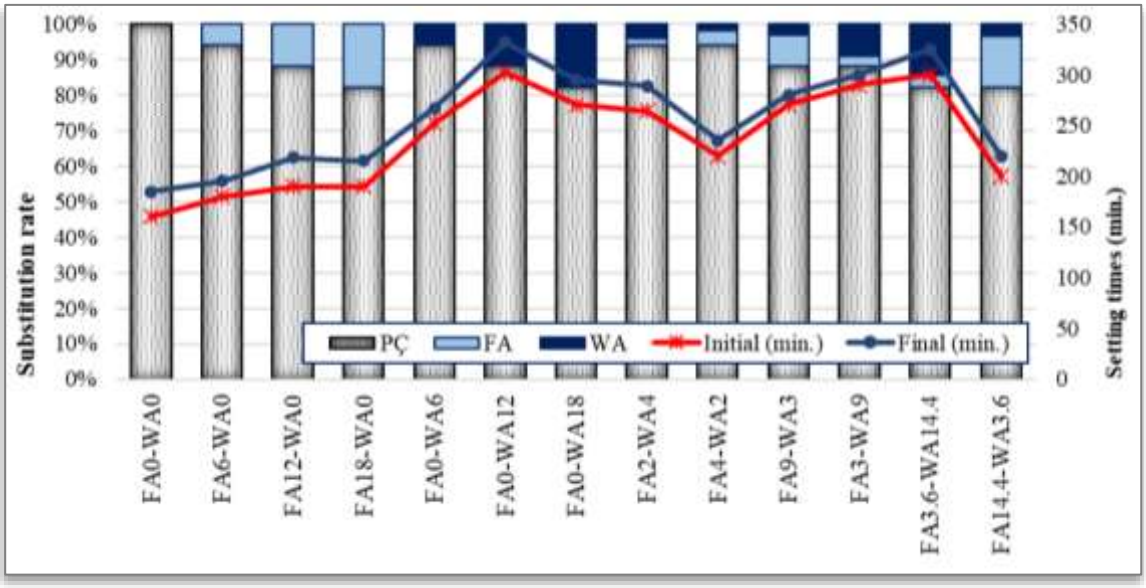

Fig 2. Setting times (min.) results

The variation of oven dry unit volume weight and porosity of cement pastes depending on FA and WA usage ratio is given in Figure 3. The lowest porosity value of the study was obtained in the FA18-WA0 mix where the highest amount of FA was used. In this cement paste, the porosity rate decreases by about 3% compared to the reference mix. These results are in line with the studies where the effect of FA usage on porosity was obtained [26].

The use of WA increases the porosity of the cement paste. Porosity continues to increase from the reference mix to the FA0-WA18 mix, with the highest porosity value of 45.2%. The highest porosity for the double substitution case is 42.5% for the FA3.6-WA14.4 mix.

The oven dry unit volume weight is 1,692 tons/m^3 for the reference mix. The oven-dry unit weight values of FA6-WA0 and FA2-WA4 mixtures are higher than the reference mix. Also, the unit weight of FA12-WA0 and FA18-WA0 mixes decreased by 0.002 t/m^3 and 0.009 t/m^3, respectively, compared to the reference mix. The unit weight decreases with increasing WA content in the cement paste. The lowest unit weight belongs to the FA0-WA18 mix. In this cement paste, the variation of the oven dry unit weight compared to the reference mix is about 21%.

When the results of compressive strength tests with cube specimens are analyzed; the highest and lowest compressive strengths belong to the reference and FA0-WA18 mixtures, respectively. The effect of 6, 12 and 18% substitution of FA on compressive strength is +2.32 MPa, -0.52 MPa and -9.72 MPa, respectively. The effect of FA on compressive strength compared to PC is also related to the amount of water in the mixture, as in similar studies. Therefore, its effect on compressive strength can be improved by water reducing admixtures [27]. With increasing WA substitution, a loss in the compressive strength of the cube specimens occurs in the range of 27-71%. When double substitution cases are analyzed; the highest and lowest compressive strengths of both FA and WA substituted mixtures belong to FA4-WA2 and FA3.6-WA14.4 mixtures, respectively.

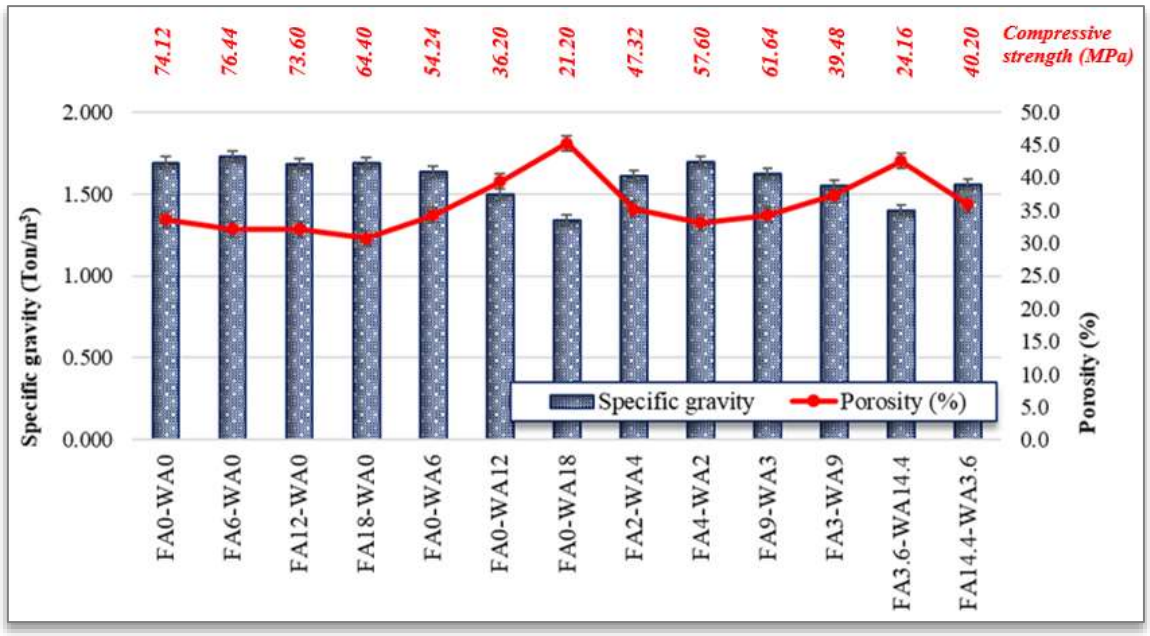

Fig 3. Specific gravity, porosity and compressive strength results

IV. CONCLUSION

In this study, FA and WA were substituted to PC at different ratios as binary and single substitutes. In this way, 13 different cement pastes were produced and the water requirement and setting times of all cement pastes at normal consistency were determined. In addition, 3 cube specimens were produced for each cement paste and their physical properties were determined after 28 days of water curing and compressive strength tests were performed. The results of all experimental studies can be summarized as follows;

- In the case of single substitution, where only FA or WA is substituted, WA has a higher water requirement for normal consistency. Setting times are similarly affected by the water requirement for normal consistency.
- The use of WA and FA results in longer setting times. Cement paste with 12% WA has the longest set start and set end times. Cement paste with 12% FA substitution increases the setting start and setting end times by about 16% and 19%, respectively, compared to the reference mix. The increase in the amount of FA increases the setting start time by a maximum of 30 minutes and the setting end time by 33 minutes. For WA, these results are 142 and 147 minutes respectively.
- The FA18-WA0 blend with the highest amount of FA has the lowest porosity ratio. While the use of FA decreases porosity, the use of WA increases porosity. Porosity continues to increase from the reference mix to the FA0-WA18 mix, with the highest porosity value of 45.2%. For the binary substitution case, the highest porosity is in the FA3.6-WA14.4 blend (42.5%).
- The oven dry unit volume weight is 1.692 tons/m^3 for the reference mix. Only FA6-WA0 and FA2-WA4 mixes have higher drying unit weight than the reference mix. The unit weight decreases with increasing WA content in the cement paste. The lowest unit weight belongs to mix FA0-WA18 with a loss of about 21% compared to the reference mix.
- When the compressive strength test results are analyzed; the highest compressive strength belongs to the mixture with 6% FA substitution. The use of FA in the range of 6-18% changes the compressive strength in the range of +2.32 MPa-9.72 MPa. With increasing WA substitution, a loss of 27-71% occurs in the compressive strength of the cube specimens. When the binary substitution cases are analyzed; the highest and lowest compressive strengths belong to FA4-WA2 and FA3.6-WA14.4 mixtures, respectively. In these mixtures, increasing WA content decreases the compressive strength.

Abstract **–**The domain of free space optical communication (FSOC) represents an innovation which may transfer information rapidly over normal coaxial and RF/microwave paths, regardless of their limitations. FSOC offers rapid data transfer rates as high as 10 Gbps over only a distance of a few kilometres through the use of light waves to carry data between the two points. It offers a variety of upsides, such as resiliency to electromagnetic interference, high security, and unauthorized spectrum usage. FSOC has proven helpful in difficult settings, such as military and remote regions. It provides low latency and outstanding security, and it additionally integrates nicely with applications that use AI. The latest advances in FSOC involve the research and development of lithium niobate (LiNbO3) and photonic integrated circuits (PICs), which increase scale and modulating performance (OAM, CAP). This paper provides an overview of FSOC technology, its applications, challenges, and emerging trends, highlighting its potential to revolutionize communication systems. Future work might look at bromine photonics to make optical communication systems even better.

Keywords – Free Space Optical Communication (FSOC), Artificial Intelligence Integration, Photonic Integrated Circuits (PICs), Lithium Niobate on Insulator ($LiNbO_3$) Technology, Orbital Angular Momentum (OAM) Modulation, Bromine Photonics

I. INTRODUCTION

In such communication structures only the high-speed information transmission is demanding as it has become a trend. The recent explosion of subscriber numbers and the advent of new generation services such as Videos upon request, wireless internet access, televisions with smart technology, 5G technology connectivity for mobile devices, etc. have boosted rapid transfer of data as well as receiving requirement at access points. To date, the access points are coaxial and RF/microwave link interconnected. Low bandwidth, high cost of deployment and insecure data transmission thus adds up to the limitations posed by these communication links in general as well. As is touch on above, optical fiber communication has great progress to 10 Gbps and today well over that in data speed with an attenuation of only 0.2 dB/km but still used debris such as copper wire for defined deposit networks, visual files truly modelling positional backyard peeked circuits coupled down a relatively bit! FSO Communication: FSO are considered to a viable solution as final-mile barrier throughout data connection through wave of light. FSO communication

systems are responsible to transmitting data over a distance of few kilometers at very high rates, up to 10 Gbps [1], between two-point callers. Logical, thin laser rays are utilized in the FSO communications systems. Since of its natural safety, clear tracks, or tolerance to electromagnetic radiation, its layout of space provides an excellent reuse value. Communication over FSO utilizes a frequency (the ISM band) that extends in excess of 300 GHz, that is once time ungoverned globally. FSO systems do not need require ITU permission as such. FSO systems improve performance of networks parameters and are just deployed and removed at any location of your choice. FSO communication involves optical frequencies—that is, those in the infrared (IR), visible, and ultraviolet (UV) light bands—to transfer data throughout an irrational propagating channel. The researchers are motivated to explore the advantages of optical networking within free-space channels through the advantages of FSO, were shown among which are its extremely high bandwidth, not licensed bandwidth, simple installation, secure direct line of sight (LOS) communication, low consumption of power (roughly. half of radio frequency), small dimensions (about. one out of ten of radio frequency antenna size), and several more. The operating idea behind fiber-based optical communication and FSO is the same. rather than using a fiber-optic cable, the data conveyed in FSO communications is transmitted over an illogical channel. The conventional fibre-optic communication network, excluding the fiber, is represented by the FSO communication system diagram in Figure 1.

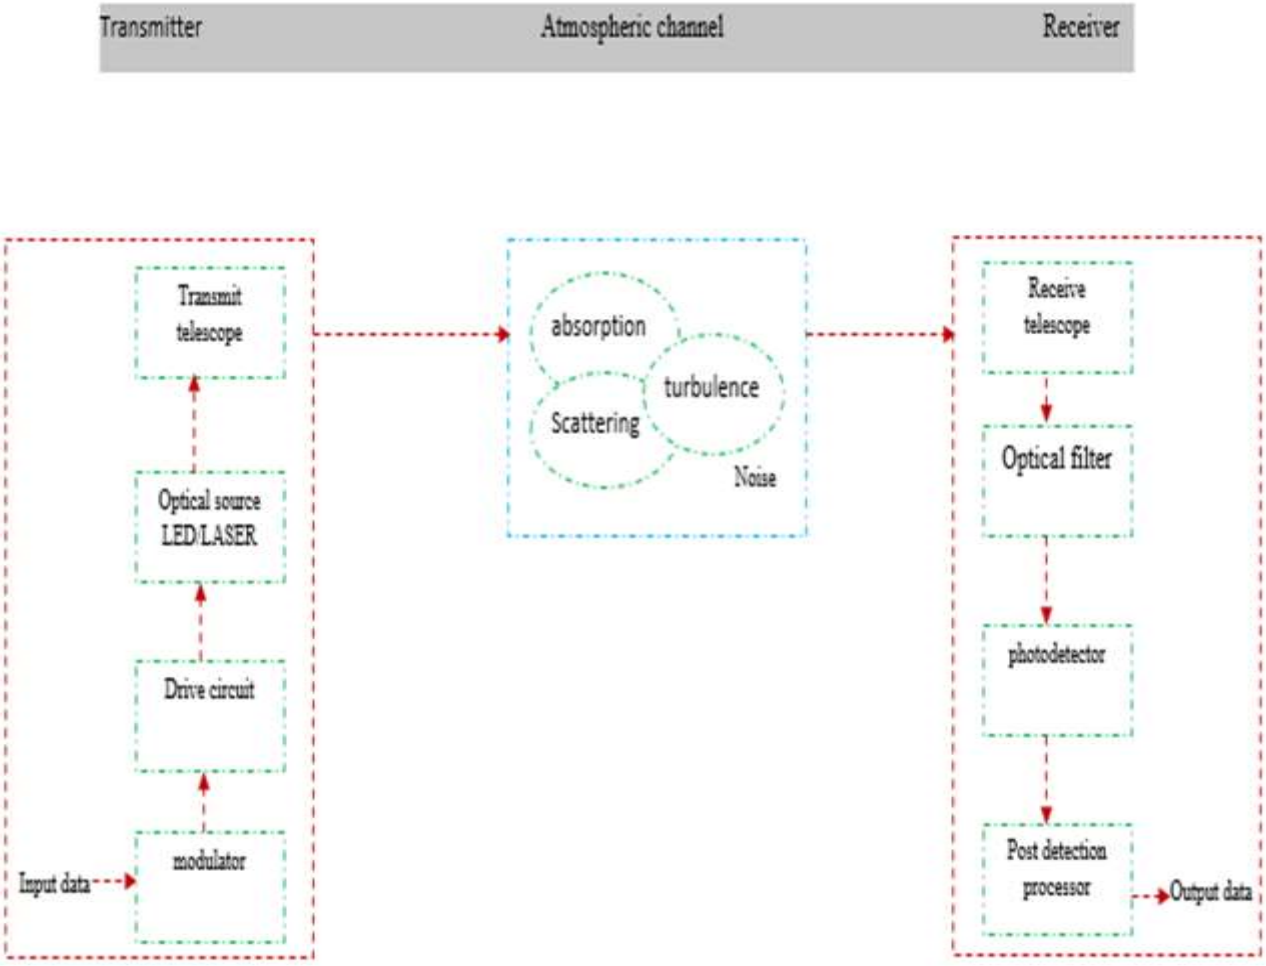

Fig 1. FSO communication system block diagram.

The block diagram of FSOC system contains three main parts: transmitter, channel, and receiver. The primary function of transmitter is modulating incoming signal into optical signals, which propagates Through atmosphere to receiver. Essential components are modulator, drive circuit and telescope, it is moveable part beam tracking, where channel is unpredictable conditions such fog, air etc, the receiver also recover transmitting signal, it filters the noise background to limited signal bandwidth and demodulator.

The potential challenger to substitute existing Radio Frequency (RF) networks of communication involves Free Space Optical Communication (FSOC). Because to the restricted dispersion of laser light, FSOC offers special benefits like high transfer rates, lower latency, and greater safety, that fall in line to the growing demand for fast-speed, safe, and trustworthy communication. Because FSOC does not require licensed spectrum, unlike RF networks, it could be implemented more readily and at a cheaper rate. This method is particularly efficient when needed when microwave communication is challenging, such as in faraway places & for defense purposes. An investigation of FSOC technology, its application, challenges, and fresh advances are the goals of the present research.

II. LITRATURE REVIEW FROM HISTORY TO TODAY

FSO is a frequently technique using a wireless medium for transmitting data in the shape of an optical pulse. The British inventor Alexander Graham Bell worked with the photophone, the first FSO communication, in 1880 [1]. He played the rays of the sun and sent them out a distance of approximately 213 meters in the course of his study. The justification for the study was the sound of speech at the transmitter was generating movements on a piece of glass. The frequencies are absorbed, displayed, and finally transformed into a voice signal by sunlight. While it was close to the phone as his greatest invention in history, it never became commercially viable. In 1935, the German army developed a photophone which utilized one infrared transmission bulb and a filament made of tungsten lamp. Within a few years, the creation of optical transmitting devices including lasers and LEDs has changed the future of FSO. In 1962, however, a TV signal was successfully transmitted over a distance of approximately forty-eight kilometres utilizing GaAs LED lighting. In the following year, 1963, US scientists sent a voice-modulated He-Ne laser as far as 190 kilometres. Yet, Nippon Electric Corporation (NEC) of Japan created the first industrial FSO link around 1970. The complete duplex 0.63 μm laser connection, lasting 14 km, joined Tamagawa and Yokohama [2]. After then, FSO has experienced gradual but steady improvement across defence and commercial fields. The rapid growth of optical electronics has contributed to a resurrection of the FSO, that has experienced rapid data traffic. A concise account of the The field of FSO demonstration using several variations and laser can be discovered in [3]. Yet, because of the many air disruptions and the broad dispersion point of the beam of light, the FSO's evaluation of performance was poor. The discovered of low- loss optical fibre around the year 1970 led a sudden shift in globe attention away from the FSO. Since that time, the only areas where FSO continues to be utilized are the defences [4],[5] and applications in space, including intersatellite and deep-space communications. The commercial use of the FSO had an enormous rise as more businesses showed excitement about small range of FSO and the creation of VLC (visible light communication) technologies [6]– [14]. Then The coming of Photonic Integrated Circuits (PICs) in 1980s brought great revolutionary changing to optical communication. PICs unable different optical components, like a lasers, modulators, and detectors, to be integrated a single chip, as decreasing size, weight, and control consumption. The starting arranges of PICs centred on joining basic optical components to discover out the feasibility of on-chip optical systems [15]. A new microchip has been developed that uses light to communicate. This could lead to faster and more efficient computer systems. Advances in using silicon in photonics technology is being used in data centres, space, and communication with satellites. Later, Lithium Niobate ($LiNbO_3$) became important in optical communication because of

its good electro-optic properties. It allowed for high-speed modulation techniques and data transmission. Using ($LiNbO_3$) in modulators improved the performance of optical communication systems, allowing for higher data rates and more reliable transmission.[16],[17],[18]. As time change advancements in thin-film $LiNbO_3$ electro-optic modulators on silicon, the best way for more compact and efficient FSOC systems. The integration of lithium niobate photonics, combining the modulation capabilities of $LiNbO_3$ with the compactness and integration opportunity of PICs. Combining PICs and $LiNbO_3$ has the potential to create highly efficient and compact FSOC systems, leveraging the strengths of both technologies [19]. After that integration of $LiNbO_3$ modulators on silicon photonics platforms, showcasing the potential for more compact and efficient FSOC systems. Research has shown that hybrid integrated devices can leverage the high-speed modulation capabilities of $LiNbO_3$ with the integration benefits of PICs, resulting in enhanced FSOC systems [21]. Finally, the integration of PICs and $LiNbO_3$ in FSOC systems holds promise for next-generation communication networks, including 5G and 6G. These technologies can support high data rates, low latency, and fabrications making them suitable for future wireless communication systems [22].

III. ADVANTAGES OF FSO IN AI

Free Space Optical Communication (FSO) represents a perfect approach to combining with artificial intelligence (AI) technologies due to it offers multiple significant benefits. First of all, FSO fulfils the need for rapid information processing and transfer in AI systems through its incredibly rapid information speeds. This ability is crucial to handling the enormous quantities of statistical information produced by algorithms that use AI, which enables efficient decision- making and analysis. security is a further significant advantage of FSO technological advances. compared to RF (radio frequency) communication, the FSO does not emit electromagnetic signals, therefore being naturally safe against capture. Secondly, FSO systems provide extremely fast interaction, which is essential to actual time artificial intelligence (AI) applications like autonomous cars and automation. By reducing delay in communicating information, FSO supports instantaneous response mechanisms, enhancing the reliability along with the security of AI-driven tasks in changing conditions. In critical AI applications where data security and confidentiality are essential, this feature is particularly useful. Since its ability to function in a less congested optically band as opposed in the RF region, FSO enables communication to occur with no interruption. The reliability and secure transmission of data is guaranteed by this trait, which is vital to preserving the confidentiality of AI systems that rely on ongoing information flow. In closing least, FSO systems are highly scalable, able to adapt to meet rising bandwidth requirements as AI algorithms develop and produce more datasets. This capacity is in pace with the increasing information technology and logical needs of AI applications across a range various industry, include factories, cities with smarts, healthcare, and other.

Table 1. Applications that are currently under development:

Application	Definition	Limitations	Challenge	Solution
Intra-Chip Communication	Chips for computers including optical links can boost processor performance and information speed of transfer.	Integration of electrical systems and reduction	avoiding a dispersion caused by heat and maintaining dependable transfer of signal at tiny sizes.	Enhance reliability as well as performance with advanced cooling techniques and photonic integrated circuits.
Underwater Autonomous Vehicles (UAVs)	UAVs are communicating with each other to plan cooperative oceanography research and data collection.	Extreme radiation absorption and scattering in the water.	Keeping reliable interaction in adaptable undersea conditions.	adaptive protocols for communication plus green or blue laser may be employed to enhance signal reliability.
6G Networks	FSO has been utilized by future wireless networks to offer extremely rapid transfer speeds and low delay.	Integration using the present network while preserving reliability.	handling an extensive variety of apps and an elevated user density.	Provides advanced modulation, and correction of errors, and mixed RF and FSO technologies.
Inter-Planetary Communication	Space exploration use optical communication lines among Earth along with other planets.	huge distances and different universes' atmospheres.	Allowing trustworthy, latency-free communications throughout long distances.	To maintain constant interaction, making use of adapting optics, high-power lasers, and precise alignment.
AI-driven Smart Cities	integrating AI to managing and improving of metropolitan infrastructure and services, particularly protection and transport.	limited band along with potential photonic source interaction.	issues about interference with signals or intercepted information in open spaces form a safety viewpoint.	For better performance and privacy, use multi-beam optical networks and encryption methods.

IV. EMERGING TRENDS

Major advancements in the field is currently inspired by recent advances in free-space Optical Communication (FSOC) together with photonics integrated circuits, particularly using lithium niobate. Listed below are some significant developments:

A. PHOTONICS INTEGRATED CIRCUITS

PICs reduce the dimension and price for optical communication systems and boosting efficiency through the integration of several photonic features onto just one chip. PICs are particularly helpful for FSOC due to their ability for efficiently handling data at a rapid pace.

B. LITHIUM NIOBATE

Due to its excellent electro-optic characteristics, lithium niobate has been a widely utilized materials for electro-optic modulation devices. Greater compatibility with PICs, or has been rendered feasible by the development of lithium niobate on insulator ($LiNbO_3$) the internet, resulting in: Greater Tuning Effectiveness: Internet Achievement: Small and Flexible Solutions.

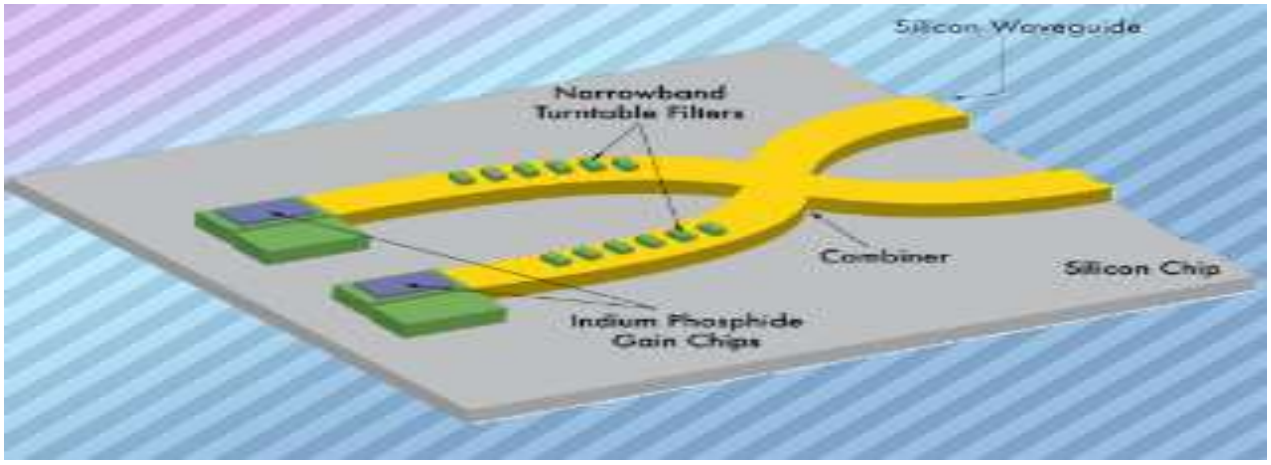

Fig 2. Photonics integrated circuit (PICS)

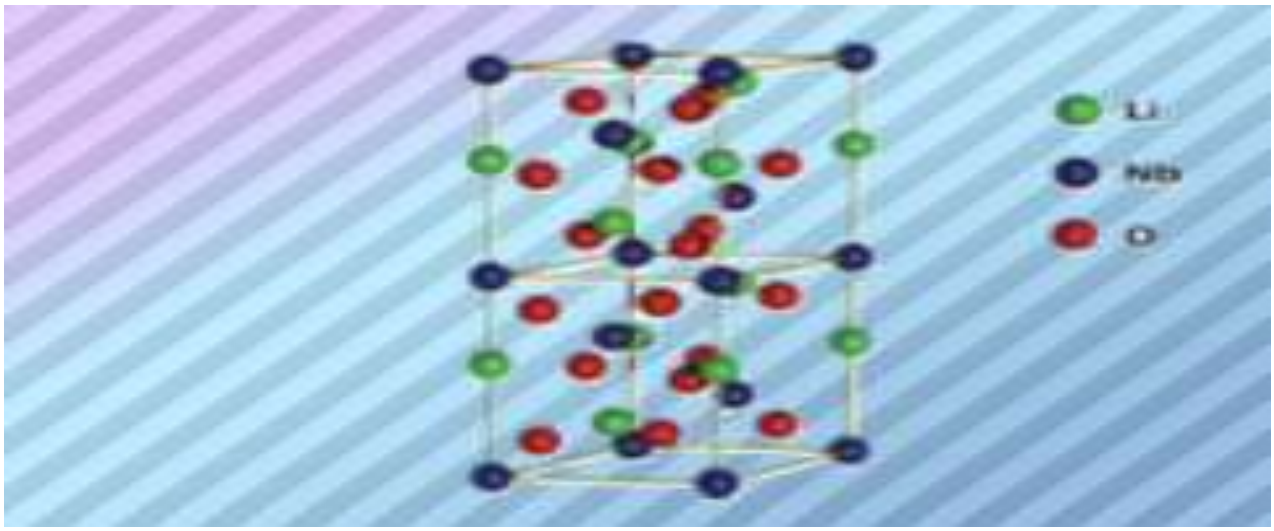

Fig 3. Crystal structure of lithium niobate ($LiNbO_3$)

V. COMPARATIVE ANALYSIS OF PHOTONICS INTEGRATED CIRCUITS (PICS) AND LITHIUM NIOBATE ($LiNbO_3$) FOR OPTICAL COMMUNICATION SYSTEMS

The following table examines lithium niobate ($LiNbO_3$) alongside photonics integrated circuits (PICs) based on the following parameters: throughput, data rate, energy consumption, error bit rate, and delay.

Table 2. PIC vs. $LiNbO_3$ Performance Comparison.

Parameter	Photonics integrated circuit (PIC)	Lithium niobite ($LiNbO_{3)}$
Latency	Low (sub-nanosecond)	Low (nanosecond)
Error Bit Rate	Low	Low
Energy Consumption	Low to moderate	Moderate to high
Data Rate	High (up to Tbps)	High (up to Gbps)
Throughput	High	High

VI. DISCUSSION

C. LATENCY

Usually, photonics integrated circuits (PICs) provide sub-nanosecond latency as well as which makes them extremely low. Low processing of signals delay and the inherent features of light propagation within photonic devices are the primary causes for this. PICs' efficient structure minimizes additional delays and their incredibly fast speed that light travels (about 300,000 km/s in vacuum) ensures quick data transfer, which makes them perfect for applications needing real-time data processing and communications. By comparison, Lithium Niobate ($LiNbO_3$) devices can also achieve a low latency, though a specific design and device architecture will influence how well they function. Latency numbers often fall around the milliseconds range. $LiNbO_3$s low latency performance is owed to its electro-optic features, which allow fast modulation and switching. But in comparison with other methods, the physical dimensions of production processes can lead to minor delays.

D. ERROR BIT RATE

According on the specific modulation techniques (such OAM, CAP) and correction of errors methods used, PIC error bit rates can be very low. Sophisticated modulation and coding techniques improve data transmission dependability by significantly reducing bit error rates. Sophisticated on-chip signal manipulation abilities help PICs reduce mistakes even more. $LiNbO_3$ devices also exhibit low error bit rates, which can be related to the specific modulation and error correction techniques utilized. Low rates of error remain achieved in part because the superior optical qualities of the material and the high-performance factor of $LiNbO_3$ modulators. Error effectiveness, however, could possibly be impacted by differences in the device's construction and operational conditions.

E. ENERGY CONSUMPTION

PICs typically have less energy consumption because photonic components are more effective. Unlike electrons, photons dissipate less energy when they pass through the waveguides since they do not produce a lot of heat. In addition to this characteristic and the capacity to combine multiple

functions onto a single chip, PICs have a lower total power consumption, which renders them suitable for energy-effective applications. But even though lithium niobate devices are powerful and can manage high power operation, they usually require more energy, particularly when high power modulation devices are used. The total amount of energy consumed rises due to the demand for external driving electronics and greater voltage demands on modulation. $LiNbO_3$ is still a reliable option in spite of this for application where high performance is of greater importance than energy efficiency.

F. DATA RATE

PICs are able to handle data at extremely rapid rates, often in excess of several terabits per second (Tbps). The ability to multiplex multiple light wavelengths (known as wavelength division multiplexing, or WDM) within only one waveguide is largely to blame for this ability. PICs have been established for an emerging technology in high-bandwidth communication networks, which greatly boost bandwidth via merging fast speeds modulators and detector. On the other hand, lithium niobate possesses a capacity to keep up huge information rates, usually reaching a few hundred Gigabits per second (Gbps). Rapid modulating allows rapid transfer of data through their excellent electro-optic characteristics. Yet, the data frequency generally lower than the maximum available without PICs since there are drawbacks in multiplexed possibilities or the challenging task of combining multiple fast-speed devices.

G. THROUGHPUT

PICs can provide excellent throughput given its high data transfer and the capacity to effectively combine a lot of photonic functions on a single chip. PICs were excellent in data-intensive applications because of their rapid speed modulation, and within the chip the process, with thick wavelength multiplexing, each of them ensures excellent data throughput. On the opposite hand, lithium niobate devices additionally generate high throughput, though figures that rely upon how the structure is built and operated. The product's exceptional throughput effectiveness may be ascribed to its exceptional clarity and high-power signal processing characteristics. However, for them to accomplish the similar throughput as PICs, more complex and power-intensive plans might be needed.

VII. CONCLUSION & FUTURE WORKS

As PICs as well as Lithium Niobate ($LiNbO_3$) devices are put together, it quickly becomes obvious that every innovation having its own benefits and drawbacks with regard to a variety of various considerations. PICs may achieve outstanding information rates, reduced energy consumption, along with extremely low latency as well as thereby rendering such an ideal match with modern, higher-performance optical communication platforms. Lithium Niobate devices, on the reverse hand, suffer from somewhat greater latency and greater use of energy yet provide excellent results, particularly in the areas of modulation rate and throughput. Upcoming investigations into this field will be mostly investigational because to the not enough established research in bromine photonics. It requires the risk of unanticipated outcomes while might additionally contribute to exciting discoveries and advancements. However, it could make an appropriate field of research for those who are motivated on investigating new materials and their use in photonics as well as optical communication.

Enerji sektöründe Kadınlar; cinsiyet eşitliği ve temel sorunlar üzerine kısa bir değerlendirme

Nazan Yalçın Erik[1*]

[1]*Jeoloji Mühendisliği /Sivas Cumhuriyet Üniv., Türkiye*

[*]*(nyalcin@gmail.com)*

Özet – Enerji sektörü tarihsel olarak her zaman erkek egemen bir alan olmuştur ve işgücü, nüfusu genellikle temsil etmez. Kadınlar küresel işgücünün yaklaşık %40'ını oluşturmalarına rağmen geleneksel enerji sektörünün yalnızca %16'sında bulunur. 29 ülkeden (22 IEA üyesi) 2018 yılında elde edilen verilere göre, enerji sektöründe ortalama olarak %76 daha az kadın çalışmaktadır. Bu ülkeler arasında enerji sektöründe becerilere bağlı olarak ortalama cinsiyetler arası ücret farkı yaklaşık -%15'tir. Enerji dışı sektörde ise -%13'lük daha küçük bir ücret farkı bulunur. Sektörün sürdürülebilir temiz enerji kaynaklarına doğru dönüşümü, daha fazla cinsiyet çeşitliliği için altın bir fırsat olarak görülmektedir. Kadınlara göre nispeten daha ayrıcalıklı olan erkeklerin, enerji alanındaki cinsiyet eşitsizliği konusunda daha az endişe duyması CEO'ların cinsiyet çeşitliliğinden yana örnek bir tavır sergilemesiyle bu durum tersine çevrilebilir ve erkeklerin de bu gündemi kadınlar kadar benimsemesine yardımcı olabilir. Bu çalışma, istihdamdaki cinsiyet eşitsizlikleri, kariyer gelişimi ve ücretler hakkındaki çalışan ve firma özelliklerine ve pazar yapısına ilişkin nicel verilerin kısa bir değerlendirmesini sunmaktadır. Ayrımcı uygulamaların sonuçlarının ortaya konulması sayesinde bunlara yönelik politikaların geliştirilmesi, tamamlayıcı çalışmaların oluşturulması ve doğrudan etkilenen sektör işveren ve çalışan barışının sağlanması öncelikli hedefler arasında olmalıdır.

Anahtar Kelimeler – Enerji, Cinsiyet Eşitliği, Kadın işgücü, Toplumsal Cinsiyet Eşitliği, Enerji Sektörü

I. GİRİŞ

Toplumsal cinsiyet eşitliği, erkek ve kadın bireylerin toplum ve yasalar karşısında eşit haklara sahip olması ve yararlanmasıdır. Ancak, toplumsal cinsiyet hiyerarşik bir yapıya sahiptir ve diğer eşitsizlik yaratan durumlar gibi (ekonomik ve sosyal) eşitsizlikler de geliştirebilir. Küresel işgücü de bunlardan en önemlisidir ve kadınlar yaklaşık işgücünün %40'ında varlık gösterirken, geleneksel enerji sektöründeki payları yalnızca %16'dır. Yönetim seviyeleri için rakamlar daha da düşüktür. Kadınların enerjiyle ilgili yeni istihdam seçeneklerinden yararlanma becerisi, belirli eğitim, öğretim ve istihdam türlerine erişimlerini sınırlayan sosyal engellerle kısıtlandığından, sosyal eşitlik politikalarının, ekonomik optimizasyonun enerji sektörü planlamasının ötesine geçmesi çok önemlidir.

Enerji sektöründe istihdam dünyanın her yerinde son derece erkek egemendir. 2012 yılında BM Kadın Birimi, fosil yakıta dayalı sektörde teknik personelin %6'sını, karar alıcıların %4'ünü ve üst yönetimin yalnızca %1'ini kadınların oluşturduğunu belirtmiştir [1]. Aradan geçen yıllarda çeşitli ulusal ve ulusal düzeydeki girişimler, kadınların enerji sektörüne katılımını geliştirmek için gösterilen çabalara rağmen, kadınlar hem geleneksel (fosil yakıta dayalı) hem de temiz ve yenilenebilir enerji sektörlerinde yeterince temsil edilmemektedir [2]. Küresel olarak kadınlar şu anda yenilenebilir enerji işgücünün yalnızca %32'sini ve fosil yakıta dayalı sektörün %22'sini temsil etmektedir [3]. Kadınlar, bilim, teknoloji, mühendislik ve matematik (STEM) eğitimi gerektiren işlerde (%28), STEM dışı teknik işlere (%35) ve idari pozisyonlara (%45) kıyasla Yenilenebilir Enerjide özellikle daha az temsil edilmektedir [3]. Kanada, ABD, İspanya,

Almanya ve İtalya gibi Ekonomik İşbirliği ve Kalkınma Örgütü (OECD) ülkelerinden elde edilen veriler, bu sektördeki işlerin yalnızca %20-25'inin kadınlara ait olduğunu ve bunların çoğunlukla daha düşük olduğunu belirtmiştir [4]. Bu durum, kadınların bahsedilen ülkelerdeki üniversite öğrencilerinin %50'sinden fazlasını ve işgücünün neredeyse yarısını temsil etmesi gerçeğiyle keskin bir tezat oluşturur [3]. Avrupa'da enerji sektörü işgücünün çoğunluğu erkeklerden (%77,9) oluşmakta olup, kadınlar yalnızca %22,1'i temsil etmektedir. Aynı eğilim, kadınların da yeterince temsil edilmediği yenilenebilir enerji sektörü için de geçerlidir. Yenilenebilir enerji sektöründe kadınlar imalat (araçlar için yakıt, kirlilik kontrol ekipmanı), inşaat (binaların güçlendirilmesi gibi) ve enerji üretimindeki pozisyonların %30'dan azını temsil etmektedir. Bu alanlardaki daha vasıflı işler (metal işçileri, yalıtım uzmanları, tesisatçılar ve boru tesisatçıları, elektrikçiler, ısıtma ve soğutma uzmanları) çoğunlukla erkek egemendir. Mühendislik, finans ve işletme hizmetleri (daha iyi ücretli işlerin yoğunlaştığı yerler) gibi diğer sektörler de erkeklerin hakimiyetindedir. Yenilenebilir enerji sektöründe çalışırken kadınlar genellikle yönetim ve iletişim başta olmak üzere daha düşük vasıflı işlerde çalıştırılmaktadır.

Kadınların enerji sektöründe karşılaştıkları engeller, çalışma hayatının diğer alanlarında karşılaştıklarıyla genellikle benzerdir. 2021 yılında dünya çapında nükleer enerji sektöründe çalışan 8.000'den fazla kadına anket uygulayan Nükleer Enerji Ajansı tarafından yapılan çalışmaya göre, sektörde kadınların karşılaştığı belirtilen temel engeller arasında ücret şeffaflığı ve adalet eksikliği, işyerinde cinsel taciz, kadın rol modellerinin eksikliği ve özellikle hamilelik ve aileyle ilgili görevlerle ilgili olarak iş-yaşam dengesine yardımcı olacak tedbirlerin bulunmaması olarak sıralanmıştır. Tüm engellerin cinsiyetler arası ücret farkları ve kariyer gidişatları üzerinde olumsuz etkisi olduğu belirlenmiştir. Bu bulgular, tarihsel olarak çoğunlukla erkekleri istihdam eden ve aynı zamanda kadınları işte tutma konusunda zorluklarla karşı karşıya kalan diğer sektörlerin bulgularıyla tutarlıdır.

Ancak enerji sektörünün son 20 yılında yavaş ancak istikrarlı dönüşüm süreci nedeniyle yeni fırsatlar ve zorluklar da gelişmektedir. Özellikle yenilenebilir enerji ve geleneksel olmayan enerji kaynakları gibi alanlarda gelişen yeni iş tanımları, işgücü dağılımında cinsiyet eşitliği konusunun tekrar gözden geçirilmesini gerektirmektedir. Özellikle, yenilenebilir enerji sektöründeki gelişmeler, yenilikçi çözümlerin ve yeni iş modellerinin benimsenmesini ve çeşitli kademelerde yetenek havuzundan daha fazla kadının katılımını gerektirecektir.

İş stratejisi, insan kaynakları ve yetenek yönetimi meselesi olarak ortaya çıkan cinsiyet farkının, kadınların bu rollerden uzak durmalarından mı, yoksa "erkekler kulübü"nde kendilerine yer bulamamalarından mı kaynaklandığını söylemek çok kolay değildir. Yüzlerce bağımlı ve bağımsız değişkenin yeraldığı bu durumda, sektör, firma, çalışan ve yerel ve bölgesel ekonomik şartların gözönüne alınması ve buna göre değerlendirmelerin yapılması elzem görünmektedir. Tek bir modellemenin yapılması mümkün olmadığı gibi özellikle enerji sektöründe cinsiyet eşitliğinin kabullenilmesi ve pratik olarak uygulanması da kolay olmayacaktır.

Enerji sektöründe kadınların karşılaştığı sorunlar birkaç nedenden dolayı diğer sektörlerdekinden farklılık gösterir. Genellikle ülkeler herhangi bir iyileştirici sonucu olmasa da sektörel boyutta bu konuyu araştırmaktadır. EIA gibi daha büyük organizasyonlar da geniş örneklem alanı ile bu tip raporlama çalışmalarını gerçekleştirmektedir. 2023 yılında EIA tarafından OECD LinkEED projesi kapsamında Avusturya, Fransa, Almanya, Portekiz ve İspanya'dan toplanan bilgilerden yararlanılarak yapılan raporlama çalışmasında enerji sektöründe istihdam ve ücretler, üst düzey yönetim, girişimcilik ve inovasyon alanlarındaki cinsiyet farklılıklarına ilişkin ayrıntılı veriler değerlendirilmiştir [5].

Değerlendirilen veriler ülkeler için farklı yıl aralıklarındadır; Avusturya (2000-2018), Fransa (2002-2018), Almanya (2002-2018), Portekiz (2002-2017) ve İspanya (2006-2018). Enerji sektöründeki firmalar, enerji dışı sektör olarak adlandırılan diğer firmalarla sistematik olarak karşılaştırılmıştır. Enerji dışı sektördeki firmalar tüm örneklemdeki firmaların %98'ini temsil etmektedir. Enerji firmaları istihdam açısından enerji dışı firmalara göre ortalama %50 daha büyüktür ve ücretler %9 daha yüksektir.

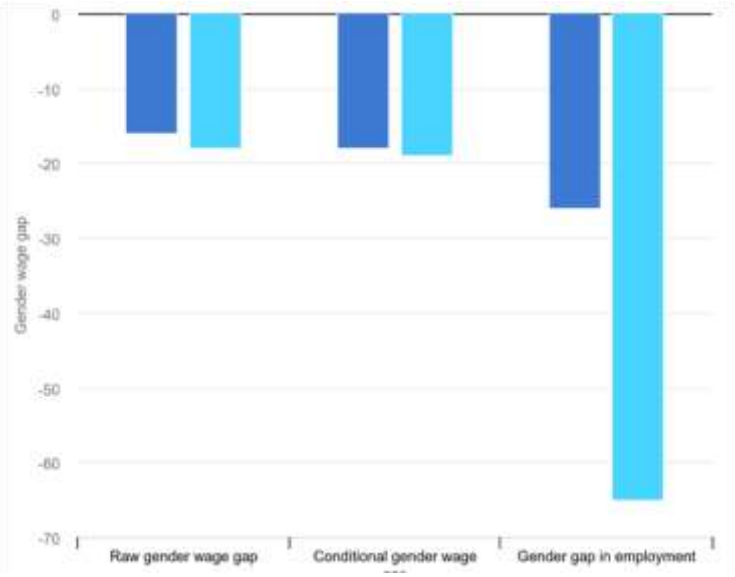
Bu çalışmada OECD ve IEA tarafından enerji sektöründe varolan cinsiyet eşitsizliğine dair raporlama sonuçları ile ülkemizdeki durum kısaca değerlendirilecek, yakın ve uzak vadede mümkün olabilecek geliştirmeye yönelik öneriler sunulacaktır.

II. ENERJI SEKTÖRÜNDE CINSIYET EŞITLILIĞI SORUNU VE KARIYER BOŞLUKLARI

Enerji sektöründe erkeklere kıyasla önemli ölçüde daha az kadının çalıştığı bilinen bir gerçektir. Kadınlar 95 ülkede işgücünün yarısını temsil etmelerine rağmen gayri safi yurt içi hasılanın (GSYİH) yalnızca %37'sine katkıda bulunmaktadır. Bu oran EIA 2023 raporunda %40 olarak belirlenmiştir (Şekil 1). Dünya Ekonomik Forumu'nun (WEF) Küresel Cinsiyet Eşitsizliği Raporu'na göre, Cinsiyet eşitliği, kişi başına düşen GSYİH, rekabet gücü ve insani kalkınma arasında yüksek korelasyon göreceli olarak, fark enerji dışı sektördekinden iki kat daha büyüktür [6]. ABD'de kadınlar enerji sektöründeki işlerin yalnızca %27'sini elinde tutarken, genel ekonomideki işlerin neredeyse yarısına sahip oluyor. Kadınların nispeten düşük katılım oranları, tüm enerji sektörlerinde tutarlı olup, elektrik üretiminde %33 gibi yüksek bir seviyeye kadar değişmektedir [7].

EIA tarafından hazırlanan raporda da görüldüğü gibi, enerji sektöründeki bulgular, diğer sektörlere kıyasla kadınların kariyer hareketliliği ve ilerlemesinde boşluklar olduğunu ve bunun da işgücünün hem ilgisini hem de elde tutulmasını etkileyeceğini ortaya koymaktadır. Bu durumun olağan sonuçları olarak, enerji sektöründe ilerleyemeyen kadın rol modelinin olmaması ve mentor sayısının azalmasını sağlayacaktır. Ayrıca enerji sektöründe çalışan ancak, kariyerlerinde ilerleme olmayan kadınlar sektör değiştirmeye mecbur kalacaktır.

Enerji sektörü, kadınların eğitim, sağlık, çocuk bakımı gibi otomatik olarak kendilerine atfedilen sosyal hizmetlerden uzaklaşarak daha "erkeksi işlere" doğru evriminde en iyiyi sergileyen prototiplerden biridir. ABD'deki şeyl gazları sayesinde petrol ve gaz sektöründe çalışan kadın sayısının 2004-2011'de 78.400 (%64) artması da bu görüşü doğrulamaktadır [8].



Şekil 1. Sektörlere göre ortalama cinsiyete dayalı ücret ve istihdam farkları

Dengesizlik doğrudan işe giriş seviyesinden başlamaktadır: Petrol ve doğalgaz sektörüne giren kadınların yalnızca %27'si mezuniyetten hemen sonra işe başlarken, %25'i çalışma hayatının ortalarında ve %17'si ise üst düzey ve idari seviyelerden başlamaktadır.

Aynı şekilde kadınlar da enerji sektörünün girilmesi mümkün olmayan ayrıcalıklı bir kulüp olduğunu ve kültürünün paylaşılmasına izin verilmediğini belirtmektedir. Kadın enerji profesyonellerinin %71'i erkek egemen bir şirket kültürünün varlığına inanmaktadır (9). Hatta ABD'nin eski İçişleri Bakanı Sally Jewell, 1981'de petrol ve doğalgaz sektörünü tamamen terk etmesinin nedeninin offshore'da çalışabilecek uygun işlerin olmaması şeklinde ifade etmiştir [9].

Enerji sektöründe iş pozisyonlarına hem yatay hem de dikey ölçekte bakıldığında zaten düşük olan kadın oranı daha da azalır: Petrol mühendislerinin sadece %13'ü,genel/operasyon/yatırım müdürlerinin %7'si ve geri kalan tüm yöneticilerin %20'si kadındır [10].

Enerji ve madenlerde giriş seviyesi çalışanların %40'ını kadınlar temsil ederken, üst düzey yönetim kademesinde bu oran %16'ya düşer [11]. Birleşik Krallık'ın en büyük 100 enerji şirketinin %61'inin yönetim kurulu üyeleri erkektir. En büyük 200 elektrik şirketinde yönetim kurulu üyelerinin yalnızca %5'i ve üst düzey yöneticilerin %14'ü kadındır [12]. Ancak elektrik ve yenilenebilir enerji sektöründe cinsiyet çeşitliliği daha iyi korunmaktadır: Kadınlar Petrol şirketlerinin %7 ve %8'ini elinde tutarken, yenilenebilir enerjide bu oran %17'dir [9].

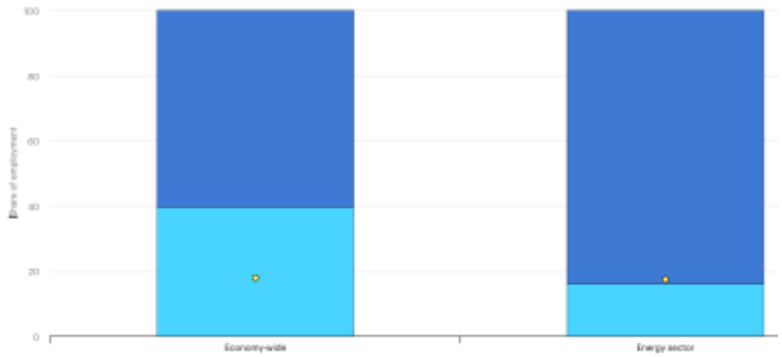
Kadın ve erkeklerin kazandığı ortalama saatlik ücret ile ikramiye arasındaki fark, İngiliz hükümeti tarafından "cinsiyete dayalı ücret farkı" olarak tanımlanır. 2017 yılında yayınlanan bir rapora göre, Birleşik Krallık'ta cinsiyetler arası ücret farkı 1997'den bu yana yarı yarıya azalmasına rağmen tam zamanlı çalışanlar arasında hala %9,1'dir [13].

Enerji firmalarında ücret priminin göreceli önemi, çalışanların üretkenliğe ilişkin ortalama performansı, sermaye yoğunluğu veya kâr, firmaların ücret belirleme gücü ve ücret belirleyen kurumların doğası gibi çeşitli faktörleri yansıtabilmektedir. Benzer vasıflara sahip çalışanlar için ücretleri rakiplerinden farklı belirleme yeteneği, firmaların cinsiyet gibi demografik özellikler de dahil olmak üzere farklı özelliklere sahip çalışanlar arasında ayrımcılık yapma potansiyelini önemli ölçüde artırır ve enerji sektöründeki potansiyel önyargıları değerlendirmek için oldukça önemlidir.

Petrol ve gaz sektörü, %7,4'lük cinsiyete dayalı ücret farkının, en büyük olduğu alandır [14]. Cinsiyete dayalı istihdam dengesizliği olan ilk on sektör arasında petrol ve gaz, kadın istihdam oranı %22 ile 9. sırada yer alır [15].

Bu bulgular, sadece petrol ve doğalgazın ötesinde enerji sektöründe de cinsiyet dengesizliğinin ve nedenlerinin sorgulanmasını da gerektirir. EIA tarafından hazırlanan ve beş ülkedeki sektörel verilere göre, kadın çalışanların ücretleri erkek çalışanlara göre neredeyse %20 daha düşüktür ve fark enerji dışı firmalara göre biraz daha büyüktür (Şekil 2). Bu fark, firmalar içindeki beceri seviyelerindeki cinsiyet farklılıklarının bir fonksiyonu olmadığını göstermektedir. Birleşik Krallık'ta ise Energy & Utility Skills'e göre Ulusal İstatistik Ofisi (ONS), enerji ve kamu hizmetleri sektöründeki mevcut cinsiyet farkının ciddi olduğunu, erkeklerin kadınlardan %15,4 daha fazla kazandığını belirtmiştir. Özellikle cinsiyetler arası en büyük ücret farkı enerji sektöründe (%19) ve gaz şebekelerinde (%17) görülmüştür [13].

En büyük petrol şirketlerinden birisi olan Shell, kadın-erkek ayrımı yapmadan aynı düzeyde ücret ödemesine rağmen, cinsiyetler arası ücret farkı hala %2,2'dir. Yüksek ücretli işlerde çalışan kadın çalışanların oranı, üst düzey yönetici olmak için gereken teknik ve ticari deneyimin, kadın yönetici adaylarında eksik olabileceği önyargısı nedeniyle, oldukça azdır. Teknik ve ticari işler daha fazla ücret getirdiği için erkekler kadınlardan daha fazla kazanmaktadır. Dolayısıyla bu sektörel yoğunlaşma, 2015 yılında ABD'de cinsiyetler arası ücret farkının en büyük açıklayıcı faktörlerinden biridir [16].



Şekil 2. Firmalar, enerji dışı ve enerji sektörleri içinde ve arasında ortalama cinsiyete dayalı ücret farkları (16).

Kadınlar tüm dünyada olduğu gibi Türkiye enerji sektöründe de yetersiz temsil edilmektedir (Şekil 3). PETFORM, ELDER, EÜD tarafından yapılan ve enerji sektöründen 565 beyaz yakalı kadının katılım gösterdiği araştırmaya göre kadınların %73'ü enerji sektöründe bulundukları için mutlu olduklarını belirtmiştir ancak çalışan sayısı diğer sektörlerden bile daha düşüktür (Şekil 3) [17].

Kaynak: Türkiye'de enerji sektöründe faaliyet gösteren 31 firmadan alınan verilerle oluşturulmuştur.

Şekil 3. Türkiye enerji sektöründe istihdam rakamları

III. CINSIYET EŞITSIZLIĞININ BAŞLICA NEDENLERI VE BAZI ÇÖZÜM ÖNERILERI

Kadınların enerji işgücü piyasasına düşük katılımını açıklayan nedenlerden bazıları şunlardır:

- Enerjiyle ilgili eğitimde ilk öğretimden başlayarak önyargı ve taraflı yönlendirmeler nedeniyle gelişen cinsiyet eşitsizliği nedeniyle uygun becerilerin eksikliği.
- Bazı çalışma konularının ve çalışma alanlarının ya 'dişil' ya da 'eril' olarak kurgulanması, örneğin enerji alanı erkek alanı olarak görülmesi.
- Kadın bilim insanı/mühendis rol modellerinin eksikliği ve üst orta eğitim sırasında bilim odaklı rehberlik ve mentorluk programlarının eksikliği.
- Okullardaki fen öğretimi yaklaşımının modası geçmiş özelliği ve bunun öğrencilere çekici gelmemesi.
- enerji sektörünün erkek alanı olarak algılanması ve devam eden toplumsal cinsiyet stereotipleri.
- kadınları öngörülemeyen çalışma programı veya acil seyahat içeren işleri üstlenmekten caydıran iş-aile yaşam dengesini sağlamanın zorluğu.
- Kadınlara yönelik kariyer geliştirme fırsatlarının ve mentorluk programlarının yetersiz olması olarak sıralanabilir (https://eige.europa.eu/gender-mainstreaming/policy-areas/energy).

Enerjide cinsiyet eşitsizliğinin çözümü sektörel ölçekte çözülebilecek bir sorun gibi görünse de temelinde toplumsal önyargı ve alışkanlıklar yatmaktadır. Bu durum aslında hem kadın hem de erkek bireylerde gelişim aşamasından itibaren yerleşik bir düşünce ve sonrasında davranış kalıbı haline gelir. Bu nedenle sektörde iş arama ve istihdam aşamasından önce çözülmesi gereken bir sorundur. Toplumsal cinsiyet eşitliği için kişilik oluşumu ve mesleki tercih aşamasına kadar bu bilincin çocuklara verilmesi ancak eğitim süreci ile gerçekleştirilebilir.

Kadınlara yönelik bir diğer önyargı ise “hırssızlık” söylemidir. Cinsiyet eşitliğinin desteklenmediği bir çalışma ortamında kadınların hırsları, kariyerlerinin en kritik dönemlerinde, yani 30-40 yaşları arasında erkeklere göre daha hızlı düşer. Bu nedenle umutsuzluğu ve körelmeyi yayan şey şirketin tutumu, ailenin desteği ve toplumsal beklentilerin karşılanma arzusudur [18].

Aynı şekilde her üç erkekten birisi kadınların bazı rollerin gerektirdiği esnekliğe sahip olamadığını düşünmektedir. Bunda erkeklerin ev ve çocuk bakımına kadınların başlıca sorumluluğu olduğunu düşünmesi ve bu nedenle daha az katkıda bulunmasının önemli bir rolü bulunur. Benzer şekilde kadınlar

da erkeklerin ev ve çocuk bakımında yeterli beceriye sahip olmadığını düşünmekte ve tüm sorumluluğu üstlenmeye çalışmaktadır.

Sonuç olarak, kadınların %75'i liderlik rollerini üstlenme isteği ve güvenini dile getirirken, %43'üne göre hem lider olmak hem de çocuk yetiştirmek mümkün değildir [19].

Bu ailesel ve toplumsal kısıtlamalar stereotiplerle daha da kötüleşmektedir. Uluslararası Öğrenci Değerlendirme Programı'nda (PISA) kızların erkekleri açık ara geçtiği ülkelerde bile, kendilerini bir bilim veya mühendislik kariyerinde hayal etmemiştir (19). Kızlar bu kararı isteyerek ya da bilmeyerek toplumsal cinsiyet ve toplumdaki çalışan kalıplarının etkisi altında almaktadırlar. Körfez ülkelerindeki durum, üniversite diplomasına sahip olmalarına rağmen sosyal/kültürel baskılar ve şirketlerin işe alımlarda erkekleri kadınlara tercih etme eğilimleri nedeniyle kendilerine enerji sektöründe yer bulamadıklarını göstermektedir [11].

Son 10 yılda ivmelenerek gelişen yeni enerji çağı kavramının baş aktörü olan yenilenebilir enerji kadınların enerji sektöründeki istihdamın artması konusunda önemli bir açılım alanı olarak görülmektedir. Uluslararası Yenilenebilir Enerji Ajansı (IRENA), 2019'da kadınların yenilenebilir enerji iş gücünün yalnızca %32'sini oluşturduğunu ve rollerinin büyük bir kısmının idari pozisyonlarda olduğunu belirtmiştir. Bu, toplam enerji sektöründeki (kadınların işgücünün yalnızca %25'ini oluşturduğu) cinsiyet ayrımından daha olumlu olsa da, önemli dengesizlikler devam etmektedir. Yine IRENA tarafından 2050 yılına kadar yenilenebilir enerji sektöründe yaklaşık 29 milyon iş olacağını tahmin etmektedir. Rüzgar ve güneş gibi yenilenebilir enerjiler daha yaygın bir güç kaynağı haline geldikçe ve iş piyasası büyüdükçe yenilenebilir enerji sektöründe kadınların iş potansiyelinin artması beklentisi de bir gerçektir.

STEM kaynaklarına ve eğitime artan erişim, kadınların enerji sektöründe hızla büyüyen, yüksek maaşlı kariyer fırsatlarına girmesine yardımcı olacaktır. IRENA, enerji iş gücündeki cinsiyet farkının kapatılmasına yardımcı olacak politika değişiklikleri önermektedir. Eşit eğitim fırsatları, iyileştirilmiş ebeveyn izni ve esnek çalışma saatleri, iyi bir başlangıç noktasıdır. Maaş şeffaflığı ve kariyer geliştirme fırsatları, bu alanda kadınlar için ağ oluşturma ve mentorluğu desteklemeye yardımcı olur.

Enerji sektöründe çalışan kadınların mobbing konusundaki cevapları/düşünceleri oldukça dikkat çekicidir. Kadınların yüzde 74,2'si en az bir kez mobbinge maruz kaldığını ifade etmiştir. Yüzde 19,2'si mobinge maruz kalmadıklarını belirtirken, yüzde 6,6'sı kararsız olduğunu belirtmiştir. Bu duruma karşı güçlü bir duruş sergilemek, kadınların daha fazla saha veya teknik iş üstlenebilmeleri için barınabilecekleri bir ortam yaratmak için zorunludur. Şirketlerin iş ve ev dengesini kurmak için daha fazla esneklik sağlaması gerekir. Cinsiyet açısından en eşit olan şirketler ebeveyn izni ve evde çocuk bakımı sağlarken, yarı zamanlı, esnek ve uzaktan çalışma, babalık izni veya uzatılmış doğum izni ve çocuk bakım desteği, araştırılması gereken diğer seçeneklerden yalnızca birkaçıdır.

Enerji sektöründe cinsiyetler arası ücret farkları enerji dışı sektöre göre daha fazladır. Enerji sektöründeki kadınların ücretleri, aynı beceriye sahip erkeklere göre yaklaşık %15 oranında düşüktür. Cinsiyetler arası ücret farkının büyük bir kısmı, firmalar içinde benzer becerilere sahip kadın ve erkekler arasındaki ücret farklılıklarıyla açıklanmaktadır, ancak ilginçtir ki, kadınların yoğunlaşması nedeniyle firmalar arası bileşenin enerji dışı sektöre göre belirgin şekilde daha fazladır.

Üstelik, cinsiyetler arası ücret farkının firmalar arası unsuru, enerji sektöründeki düşük vasıflı işçiler için özellikle önemliyken, beceri seviyesi ne olursa olsun, enerji dışı sektördeki işçiler için nispeten daha az önem taşır. Karşı olgusal bir araştırma, firmalar arasındaki ücret dağılımının, firmalar arasındaki cinsiyete dayalı ücret farkının açıklanmasında cinsiyet paylarındaki farklılıklardan daha büyük bir rol oynadığını ortaya koymaktadır.

Görev ve sorumluluklardaki farklılıkların tüm firmalarda cinsiyetler arası ücret farkı üzerinde önemli bir etkiye sahip olduğu tespit edilirken, enerji sektöründe pazarlık ve ayrımcılığın (ve dolayısıyla firma düzeyinde ücret belirleme uygulamalarının) rolü, enerji dışı sektör.

Enerji sektöründe kadınların her yaşta işgücü piyasasından ayrılma olasılığı erkeklere göre daha fazladır. Ayrıca enerji sektöründe çalışan kadınların sektördeki başka bir firmaya geçme olasılıkları erkeklere göre çok daha az, enerji sektöründen ayrılıp başka bir sektöre geçme olasılıkları daha yüksektir.

Harvard Business School'un 35 ülke ve 24 sektördeki 1.069 önde gelen firmayı analiz eden araştırması, cinsiyet çeşitliliğinin daha yüksek piyasa değeri ve gelirle ilişkili olduğunu göstermiştir. Ancak bu, yalnızca cinsiyet çeşitliliğinin yaygın olarak kabul edildiği ve büyük önem taşıdığına inanılan işletmelerde geçerlidir. Benzer şekilde, Morgan Stanley'in Dünya Endeksi'ndeki toplam 1.875 firmayı araştırması, daha fazla cinsiyet çeşitliliğine ve daha yüksek Bütünsel Eşit Temsil Puanına (HERS) sahip şirketlerin, daha az cinsiyet çeşitliliğine sahip şirketlerden %1,6 daha iyi performans gösterdiğini işaret etmiştir. Aynı çalışmada, Avrupa'daki cinsiyet çeşitliliğine sahip enerji şirketlerinin hisse fiyatlarının %23,7 oranında daha iyi performans gösterdiği de belirlenmiştir.

IV. SONUÇ VE ÖNERİLER

Bu kapsamda ilk sorun, enerji firmalarında kadın istihdam oranlarının nispeten düşük olması ve kadınların düşük ücretli firmalarda (sınıflandırma) ve mesleklerde (ayrışma) yoğunlaşması, sektördeki işe alım ve terfi uygulamalarının tarafsız olmadığını göstermektedir. Öncelikli olarak işe alım sürecinde makul ölçülerde (fiziksel performans gereklilikleri ve özel durumlar dışında) bilgi ve beceri düzeyine göre eşitlikçi davranışın önemi vurgulanmalıdır.

Enerji sektöründeki kadınların düşük istihdam oranının nedenlerinden birisi de STEM derecesine sahip kadın sayısının hala oldukça düşük olması, bu nedenle firmalar ve meslekler için potansiyel kadın başvuru havuzunun dolmamasıdır. Erkekler ve kadınlar arasındaki uzmanlaşma farklılıkları, en çok, kadın rol modellerinin eksikliğiyle daha da güçlendirilen cinsiyet normları ve beklentileriyle açıklanabilir. Böylece işe alım ve performans değerlendirmesinde şeffaflık ve adaletin sağlanmasına yönelik alınacak önlemler, enerji sektörüne hem daha fazla kadının çekilmesine hem de sektörde tutulmasına katkı sağlayacaktır. Özellikle yöneticiler arasında bilinçsiz cinsiyet önyargısı konusunda kurumsal eğitim, adil işe alım uygulamaları ve performans değerlendirmelerinin oluşturulmasında da önemli bir rol oynayabilir.

İkinci olarak, çalışma ortamının kalitesiyle ilgili unsurların sektördeki kadın çalışanların kariyer gidişatları üzerinde de önemli olumsuz etkileridir. Kadınların kariyer ve kişisel hedeflerini yakalamalarına ve dengelemelerine yardımcı olmak için ücret teşviklerinin ötesinde alınan önlemler hayati önem taşır. Bu tür önlemler arasında yeterli ebeveyn izni, uygun fiyatlı ve kaliteli çocuk bakımı, esnek çalışma düzenlemeleri sağlayarak iş-yaşam dengesinin iyileştirilmesine odaklanmanın yanı sıra mentorluk programları, kariyer rehberliği ve eğitim yoluyla daha destekleyici bir ortam oluşturulması da yer almaktadır.

Bilinçsiz cinsiyet önyargısı ve uygun işyeri davranışına ilişkin farkındalık oluşturmak, kadınlar ve erkekler için güvenli ve çekici bir işyeri sağlamanın da anahtarı olabilir. Ayrıca etkili cinsel taciz politikaları da hayati önem taşımaktadır.

Ve son olarak, enerji sektöründe benzer becerilere sahip kadın ve erkekler arasında ayrımcılık ve önyargılar nedeniyle oluşan nispeten yüksek ücret farkı, çalışanların (ve diğerlerinin) ayrımcı uygulamalara karşı korunmasının önemini göstermektedir.

Bazı ülkelerde hükümetler kotalar ve hedefler koyarak bu gelişim sürecine öncülük etmektedir. Norveç, borsada işlem gören şirketlerin yönetim kurullarında kadın kotası getirme kararının bir sonucu olarak, 2015 yılında borsada işlem gören şirketlerin yönetim kurullarında en çok kadının bulunduğu (%32) ilk ülke olmuştur. Fransa ve İtalya da 2011 yılında benzer kota kararlarını onaylamıştır. Ancak toplumdaki temel zihniyet değişmediği sürece doldurulamayacak kotalar koymak veya bu kotaları iş için yeterli vasıflara sahip olmayan kadınlar tarafından doldurmak yarardan çok zarar getirebilir. Norveç'teki kota uygulaması ile başarısız satın almalar, borç seviyeleri ve piyasa değerindeki kayıplar arasında yüksek bir korelasyon ortaya çıkmıştır. Hedeflerin belirlenmesi gibi gönüllü önlemlerin daha etkili olduğu söylenebilir. Birleşik Krallık, "2015 yılına kadar yönetim kurullarında %25 kadın" hedefini %26,1 olarak gerçekleştirmiştir.

Cinsiyet çeşitliliğinin diğer sektörlerde olduğu gibi enerji sektöründe de sağlanması, farklı bakış açılarının, deneyimlerin ve düşünce süreçlerinin karar alma sürecine dahil edilmesini teşvik eder. Bu bakış açısı çeşitliliği, karmaşık sorunların daha kapsamlı analizine ve yenilikçi çözümlerin geliştirilmesine yol açabilir. Cinsiyetle sınırlı olmayan, çeşitli üyelerden oluşan takımlar, geleneksel bilgeliğe meydan okuma ve kalıpların dışında düşünme eğilimindedir; bu, her takım için çok değerlidir! Bunun en önemli nedeni önyargıdır.

Yenilenebilir Enerji ve Küresel İklim Değişikliği Etkisindeki Küresel petrol piyasalarında Güncel Durum ve Geleceğe Yönelik Öngörüler

Nazan Yalçın Erik[1*]

Jeoloji Mühendisliği /Fen Bilimleri Enst, Üniversite, Türkiye

*(nyalcin@gmail.com)

Özet – Uluslararası petrol ticareti, yenilenebilir enerji sektöründeki gelişmeler, küresel iklim krizi etkileri, net sıfır hedefleri ile yeni bir enerji dönemine girmeye hazırlanırken, Rusya'ya yönelik geniş kapsamlı yaptırımlar ve kritik Kızıldeniz nakliye koridorundan geçen tankerlere yönelik saldırılar nedeniyle altüst olmuştur. Bu nedenle yeni bir bölgesel savaş veya Covid gibi küresel ölçekteki olayların bu sektörü nasıl etkileyeceğine dair görüşler ve öngörüler de yeniden gözden geçirilmiştir. Bilinen ve yadsınamayan bir gerçek, enerji arz güvenliğinin küresel politika gündeminin temel direği olduğudur. Küresel arz ve talep dengeleri doğrultusunda Asya'nın ham ve petrol ürünlerinde artan yapısal açıkları ve Atlantik Havzası'nda sürekli genişleyen arz fazlası, küresel petrol piyasasında yeni ticaret yollarının oluşmasını da sağlamıştır. Doğuya doğru, OECD üyesi olmayan Asya'ya, özellikle de Çin ve Hindistan'a doğru yönelim, enerji geçişi hız kazandıkça petrol piyasası faaliyetlerini yönlendiren çok sayıda yeni zorlukla aynı zamana denk gelmiştir. Artan elektrikli araç kullanımı, ortaya çıkan temiz enerji teknolojileri ve daha kapsamlı verimlilik politikaları bir araya gelerek petrol talebi için çok daha yavaş bir büyüme yörüngesi çizmekte olup, özellikle IEA tarafından 2023-2030 tahmin döneminin sonuna doğru petrol arz ve talebinin yatay bir seyir izleyeceği şeklinde öngörüler yapılmaktadır. Bu çalışmada küresel iklim değişikliği ve yenilenebilir enerji sektöründeki gelişmeler etkisinde petrol piyasasında güncel durum, IEA ve EIA gibi kuruluşların geleceğe dair prospeksiyonları kısaca sunulmuştur.

Anahtar Kelimeler – Petrol Sektörü, Petrol, Yenilenebilir Enerji, Küresel İklim Değişikliği, Enerji

I. GİRİŞ

Bir sektörün, özellikle de petrol gibi küresel siyaset, politika ve ekonomi gibi birçok etkenin rol oynadığı, kritik bileşenlerin çok fazla olduğu bir alanın geleceğine dair öngörüler yapmak her zaman çok zordur. Tek yönlü bir bakış açısı veya yerel bir ticaret noktasındaki ya da petrol fiyatlarına yönelik tahminler de sınırlı doğruluk payına sahip olur. Ancak, petrol sektörünün 1850'lerde resmen başlamasından sonra bu öngörüler her zaman yapılmıştır ve yapılmaya da devam edecektir. Petrol sektörünün her alanında bu çalışmalar güncel durumu değerlendirmesi ve geleceğe yönelik planlamaların yapılması için elzemdir. Sadece ulusal petrol şirketleri değil BP, Shell gibi büyük petrol şirketleri, OPEC veya IEA, EIA gibi kuruluşlarca da öngörüler yapılmaya devam etmektedir.

Yapılan tahminler zaman içinde çoğunlukla yenilense de sektörde bu konuyla ilgilenenler genel olarak ikiye bölünmüştür. İlk grup "geçiş dönemi" diyenlerdir…Onlara göre, ulaşımın elektrikleşmesi, fosil yakıta olan

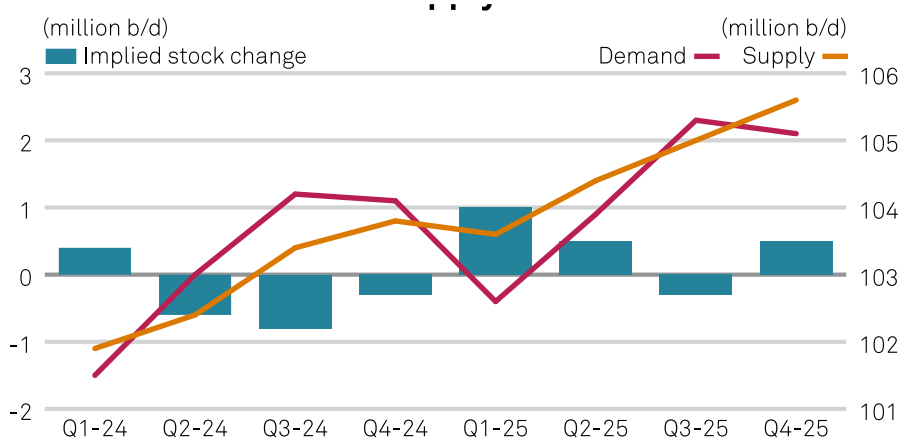
talebin katili olacaktır ve “Elektrikli araçlar yüzünden petrol ve doğalgaz yok olacaktır”. İkinci grup ise “sonsuz dek fosil yakıtçılar”dır. Onlara göre de ulaşımın elektrikleşmesi asla hedeflendiği gibi işlemeyecek ve onlarca yıl daha petrol ve doğalgaza talep olacaktır. Bu kapsamda birçok farklı rapor yayımlanmaktadır. Örneğin, BP raporu “Birincil enerji kaynağı olarak 2019’da %80 olan fosil yakıtların payı 2050 yılında %20 ile 55 arasına kadar kademeli olarak düşecek” demiştir. BP’ye göre, yenilenebilir enerjinin payı da aynı süreç içinde %10’dan, %35-65 arasına yükselecektir. Uluslararası Enerji Ajansı (IEA) ise küresel petrol talebinin günlük 102 milyon varille bu yıl rekor seviyelere yükseleceğini açıklamıştır. EIA (2022) “Bu, tüm elektrikli araç satışlarına ve fosil yakıtsız elektrik üretim kapasitesindeki büyük artışa rağmen olacak” diye de not düşmüştür. Oilprice analistleri, IEA’nın “genelde gelecek tahmini yapmaz ancak yaptığında da BP ile uyumlu yorumlar yapar” hatırlatmasını yapmıştır. Bloomberg ise elektrikli araçların parlak bir geleceği olduğuna inanan gruplardandır ve bu konudaki görüşünü “Fosil yakıtlardan uzaklaşmak, insanlığın tek geleceği” olarak açıklamıştır [1].

Başta OPEC olmak üzere petrol ve gaz sektörünün önemli temsilcileri, “temiz enerji”den daha çok “enerji”nin kendisine odaklanmış durumdadır. Oilprice’a göre, sektörün argümanları basitçe şu şekilde özetlenebilir: “İnsanların enerjiye ihtiyaçları var.”. Nasıl ve ne şekilde elde edileceği aslında önemli değil. Bu konuda küresel iklim değişikliği ile ilgili Paris Anlaşması gibi uluslararası organizasyonlar yapılmaya devam etse de en dramatik açık Rusya’nın Ukrayna’ya saldırması, Rusya’nın AB ‘ye gerçekleştirdiği yaptırımlar sonrasında yeniden kömüre dönüşle de kendini göstermiştir. Bunun tek anlamı, küresel iklim değişikliği konusunda devletlerin hassasiyetleri ve geleceğe yönelik planlamaları elbette var ancak tek öncelik enerji güvenliğidir.

Birçok etken altında, farklı otoriteler tarafından açıklanan geleceğe yönelik buluştuğu nokta, küresel petrol piyasalarının, yapısal değişimlerin petrol talebini ve ticaret akışlarını yeniden şekillendirmesi ve artan petrol arzının fiyatlar üzerinde baskı yaratması nedeniyle orta vadede çok sayıda zorlukla karşılaşacağıdır. Bölgesel ekonomik, siyasi dinamiklerin etkisi ve temiz ve enerji tasarrufu sağlayan teknolojilerin hızla yaygınlaşması, petrol talebi büyüme hızını kademeli olarak yavaşlatmak için önemli etkenlerdir ve IEA 2024 raporuna göre 2030'a yaklaşırken bir plato gelişmesi muhtemel görünmektedir. Gelişmiş ekonomilerdeki petrol talebi keskin bir şekilde düşerken, Çin ve Hindistan gibi Asya'daki gelişmekte olan ekonomiler küresel talep büyümesinin tamamını oluşturmaktadır [2].

IEA 2024 raporuna göre, OPEC+ dışındaki üreticilerin önderlik ettiği yükselen dünya petrol arzının, 2025'ten itibaren öngörülen talebi aşması beklenirken, doğal gaz sıvıları (NGL) ve kondensatlardaki artışın, 2024-2030 yılları arasındaki döneminde yeni kapasite artışlarının %45'ini oluşturacağı belirtilmektedir [2] (Şekil 1). Özellikle Suudi Arabistan, stratejisinde büyük bir değişiklik yaparak planlanan ham petrol

kapasite artışını askıya almıştır ve artık doğal gaz sıvılarını ve kondensatlarını genişletmeye odaklanacağını ifade etmiştir. Bu durum, küresel ham petrol üretim kapasitesindeki arz fazlasının kabul edildiği şekilde de yorumlanabilir. Küresel petrol sektörünün talep tarafındaki en büyük bileşeni olan petrokimyasalların artışı, büyük ölçüde üretimlerinde etkili olan NGL'lerin küresel arzındaki artışı olup, bunu takip etmektedir.



Note: Assumes extension of OPEC+ voluntary production cuts from June
Source: IEA monthly oil market report

Şekil 1. Uluslararası Enerji Ajansı (IEA) 2024 yılı petrol piyasasında arz/talep grafiği

Bu gelişme rafine ürünlere olan talep artışı nedeniyle rafineriler için yeni zorluklar da yaratacaktır. Dahası, enerji geçişi hızlanırken rafinerilerin azalan tüketim nedeniyle orta damıtıklar için farklı tüketici eğilimlerini karşılamak üzere ürün listelerini yeniden yapılandırmaları da gerekecektir. Bu durum özellikle elektrikli araçların (EV) pazar paylarını hızla artırdığı karayolu taşımacılığı yakıtları için geçerlidir [2].

Arz ve talep modellerindeki tüm bu yapısal değişimlerin ortasında, küresel petrol piyasası görünümü, zayıflayan makroekonomik beklentiler, enerji dönüşümünü hızlandırmaya yönelik yeni hükümet politikaları ve düzenlemeleri ve daha verimli teknolojileri ölçeklendirmek için benzeri görülmemiş düzeyde yatırım yapılması nedeniyle daha fazla belirsizlikle karşı karşıyadır. Bahsedilen bu zorluklara rağmen sektör, Rusya'nın Ukrayna'yı işgaliyle gelen enerji krizi ve öncesinde yaşanan Covid-19 salgını da dahil olmak üzere, büyük arz ve talep değişikliklerine uyum sağlayabildiğini de kanıtlamıştır.

II. KÜRESEL ARZ KAPASİTESİ GÜNCEL DURUMU VE DEĞİŞİMİ

Amerika Birleşik Devletleri ve Amerika kıtasındaki diğer üreticilerin öncülüğünde dünya petrol üretim kapasitesinin artırılmasının, 2023-2030 tahmin döneminde talep büyümesini geride bırakması ve Covid-19 dönemi hariç olmak üzere dünyanın yedek kapasitesini benzeri görülmemiş seviyelere çıkarması beklenmektedir [2]. Küresel ham petrol üretimi 2023'te %1 artarken, ABD, Brezilya ve İran'daki daha yüksek üretim OPEC+ üretim kesintilerini telafi etmiştir. 2022'de kaydedilen %5'lik büyümenin ardından,

küresel ham petrol üretimi 2023'te 2010-2019 ortalamasına uygun olarak +%1'e gerilemiş ve OPEC+ ülkelerinde önemli bir düşüş ve diğer ülkelerde güçlü bir büyüme yaşanmıştır. Kasım 2022'den 2023 sonuna kadar 2 mb/g üretim kesintisi duyuran OPEC+, yavaşlayan petrol talebi ve düşen petrol fiyatları bağlamında küresel petrol piyasasının istikrarını desteklemek için Mayıs 2023'ten 2023 sonuna kadar 1,65 mb/g'lik yeni gönüllü petrol üretim kesintileri getirmiştir. Bu kesintiler Haziran 2023'te 2024 sonuna kadar uzatılmış, sonuç olarak, ham petrol üretimi Suudi Arabistan'da %9,3 ve Rusya'da %1,5 azalmıştır ve her ikisi de küresel üretimin %12'sini oluşturmuştur. Bu arada, petrol üretimi OPEC+ olmayan ülkelerde, örneğin ABD'de (+2023'te %8,5), Brezilya'da (+%12), Çin'de (+%2,1), Norveç'te (+%6,4) ve hatta İran'da (OPEC+ kotalarından muaf, +%10) veya Nijerya'da (+%6) artmaya devam etmiştir [3].

Toplam arz kapasitesinin 2030 yılına kadar 6 mb/g artarak yaklaşık 113,8 mb/g'ye ulaşması önemli bir artış sürecini ifade etmektedir. Bu durum, fiyatları desteklemeyi hedefleyen mevcut OPEC+ piyasa yönetim stratejisinin de değişmesine neden olabilecektir.

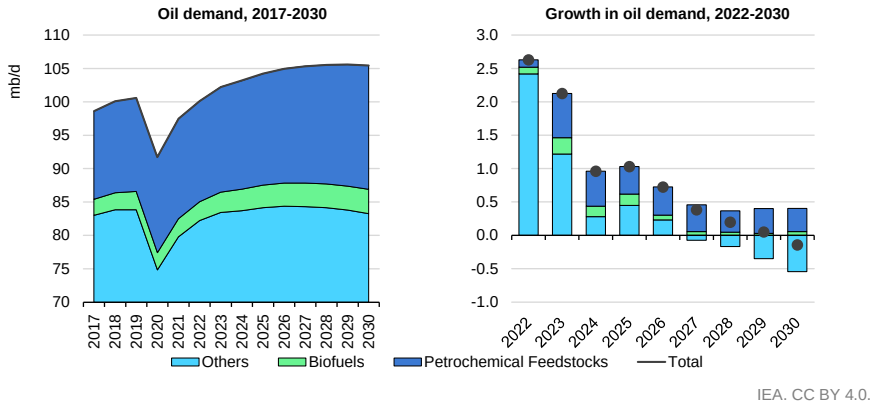
Bazı araştırmalarda ise petrol üretiminin 2030 civarında zirveye ulaşacağı belirtilir. Petrol üretimi, petrol zirvesinden çok sonra bile potansiyel olarak yüksek seviyelerde kalabilir ve böylece küresel CO_2 emisyonlarına ve iklim değişikliğine katkıda bulunmaya devam edebilir [4].

Daha düşük fiyat politikası ortamında, geleneksel olarak değişen piyasa koşullarına en hızlı yanıt veren ABD şeyl gaz sektörü de değişime zorlayacaktır. Endüstrinin yeni tedarik ortamına nasıl uyum sağlayacağı veya değişim geçireceği 2030 yılına kadar daha net bir görünüm kazanacak ve sonrasında küresel üreticiler ve tüketiciler için geniş kapsamlı sonuçlara neden olacaktır.
Suudi Arabistan planlanan ham petrol kapasite artışını 12 mb/g'den 13 mb/g'ye ertelemiş olsa da, devasa Jafurah gaz sahasının geliştirilmesi devam etmektedir ve 2030 yılına kadar OPEC+ kotalarına tabi olmayan hacimlerde, gaz sıvıları üretiminde neredeyse 1 mb/g'lik bir artışa neden olacaktır. ABD, Brezilya, Guyana, Kanada ve Arjantin gibi OPEC+ dışındaki üreticiler kapasite gelişimine öncülük etmeye devam ederken, net artışın %76'sı olan 4,6 mb/g'lik bir paya sahip olacaklardır [2]. Bununla birlikte, Suudi Arabistan, Birleşik Arap Emirlikleri (BAE), Irak, Afrika ve Asya üyelerinde düşüşler beklenmektedir. BAE ve Irak ham petrol kapasitesini artırırken, Suudi Arabistan NGL ve kondensat arzında önemli bir artışa hazırlanmaktadır. Rusya'daki kapasitenin, dev Vostok projesinin hızlanması ve olgun petrol sahalarındaki kayıpları telafi etmeye yardımcı olması nedeniyle uluslararası yaptırımlara rağmen yalnızca marjinal bir düşüş göstermesi tahmin edilmektedir [2].

Arzdaki bu artış, yukarı akış yatırımlarında istikrarlı bir büyümenin sonucudur. Küresel yukarı akış sermaye harcamaları, 2023'te %13 artarak sekiz yıllık zirve olan 538 milyar ABD dolarına ulaşmıştır ve 2024 yılında %7 daha artma trendindedir [1].

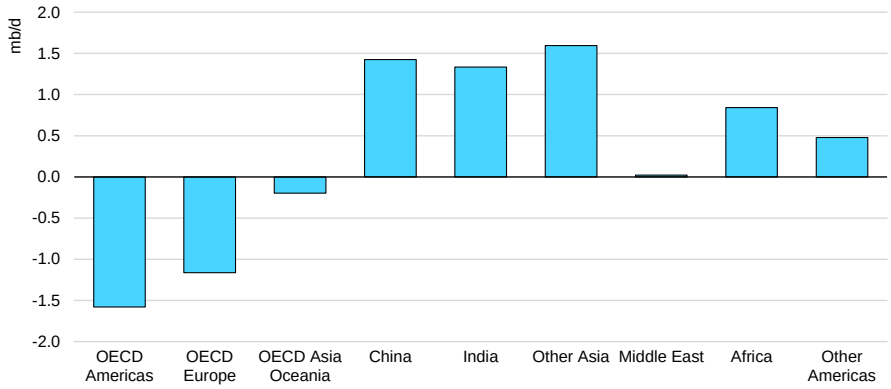
III. KÜRESEL PETROL TALEBİ VE YENİLENEBİLİR ENERJİ

Günümüzün piyasa koşullarına ve politikalarına göre, küresel petrol talebinin, yenilenebilir (temiz) enerji teknolojilerine geçişin hızlanmasıyla birlikte 2030 yılına kadar yaklaşık 106 mb/d'de sabitlenmesi ve yavaşlaması beklenmektedir [2]. Artan EV satışları ve araçların sürekli verimlilik iyileştirmeleri ile enerji sektöründe petrolün yenilenebilir enerji veya gazla değiştirilmesi, karayolu taşımacılığında ve elektrik üretiminde petrol kullanımının azalmasına neden olacaktır. Bununla birlikte, petrokimya sektöründen jet yakıtı ve hammadde kullanımının artması nedeniyle toplam petrol talebinin 2023 ile 2030 arasında 3,2 mb/d artacağı da tahmin edilmektedir (Şekil 2). Bu talep, özellikle Hindistan ve Çin olmak üzere Asya ekonomileri tarafından domine edilecektir. Petrol talebi, sanayi devriminden bu yana az ya da çok durmadan artmıştır ve en az 2030 yılına kadar da artmaya devam edecektir. 2019 yılının son çeyreğinde, küresel petrol talebi, başlıca Çin'de tüketim artışına bağlı olarak günde 1,9 milyon varil artmıştır, Covid 19 nedeniyle ani bir düşüş gerçekleşmiştir (https://www.theworldcounts.com/challenges/climate-change/energy/the-end-of-oil).



Şekil 2. Petrokimya sektörü etkisiyle artan küresel petrol talebi ve 2030 yılına kadar gelişim öngörüsü [2].

Talep tarafındaki iki önemli ülke olan Çin ve Hindistan'da durum muhtemelen aynı şekilde gelişmeyecektir, örneğin Çin'de, temiz enerji teknolojilerinin hızla yaygınlaştırılması ve yüksek hızlı demiryollarına yapılan büyük altyapı yatırımları ulaşım yakıtlarına olan talebi azalttıkça, talep tarafındaki büyüme petrokimya sektörü tarafından yönlendirilecektir. Hindistan'da ise, ulaşım yakıtları küresel yönelime tezat olarak keskin bir şekilde yükselecektir. Çin ve Hindistan dışındaki tüm OECD dışı Asya ekonomilerindeki birleşik kazanımların 1,6 mb/g ile daha da büyük olacağı tahmin edilmektedir. Asya ülkeleri birlikte düşünüldüğünde, gelişmekte olan Asya ekonomileri bu on yılda petrol talebi büyümesinin en önemli kaynağıdır (Şekil 3).



Şekil 3. 2023-2030 yılları arasında bölgelere göre petrol ihtiyacı tahmini [2]

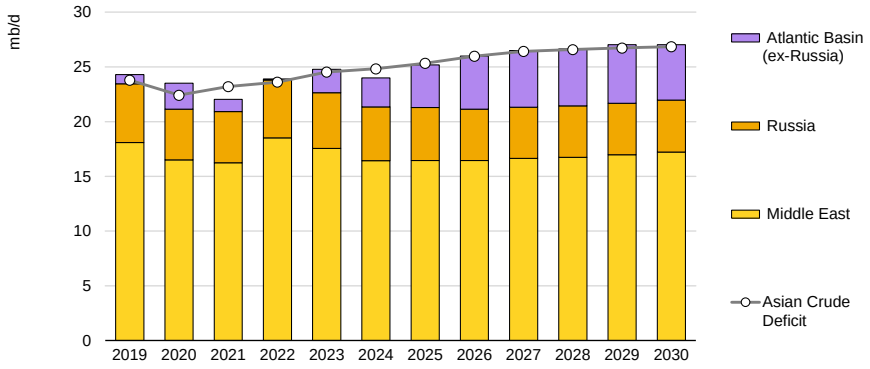
EV satışlarındaki gelişimi devam ederse önemli miktarda yakıt tasarrufu sağlayacaktır. Bu, 2030 yılına kadar günde 6 mb/gün benzin ve dizel talebinin azalması anlamına gelir (Şekil 3). Tüketici mobilite davranışındaki pandemi sırası ve sonrasındaki değişiklikler, uzaktan ve hibrit çalışmanın artık iyice yerleşmiş olması nedeniyle ulaşımda yakıt tasarrufuna günde 1 mb/mb daha katkıda bulunmaktadır [2]. Elektrik üretiminde kullanılan petrolün yerli gaz ve yenilenebilir kaynaklarla değiştirilmesi de gündemdedir ve küresel talebin sabit bir noktaya gelmesinde önemli bir rol oynama potansiyeli bulunur. Özellikle Suudi Arabistan'ın, enerji santrallerinde doğrudan ham petrol, akaryakıt ve gazyağı kullanımında 2030 yılına kadar günde yaklaşık 1 mb/d kesinti yapmayı öngören planları yanısıra Irak'ın elektrik santrallerindeki petrol yakımını daha küçük ölçekte de olsa azaltması bu değişim sürecini ortaya koyar [1].

IV. RAFİNERİLER VE ÜRETİM KAPASİTE DEĞİŞİMLERİ

Tarihsel gelişim sürecinin oldukça altında olmasına rağmen, küresel rafineri kapasitesinin 2023'ten 2030'a kadar 3,3 mb/g artacağı tahmin edilmektedir. Rafinerilerin kapasite artışları ise rafinerine olan talep gerisindedir. Yenilenebilir enerji ve elektrikli araçların artan pazar payları nedeniyle rafinerilerin farklı eğilimleri karşılamak için ürün çıktılarını kademeli olarak değiştirmeleri gerekecektir. Ayrıca, NGL'ler ve biyoyakıtlar gibi rafine edilmemiş yakıtlar, rafine ürün tedariklerine olan talebi ve ek rafineri kapasitesi ihtiyacını daha da zayıflatmaktadır. Rafine edilmemiş yakıt ürünlerinin, 2023-2030 döneminde öngörülen talep büyümesinin %75'inden fazlasını oluşturacağı ve bunun da Çin ve Hindistan'da olacağı tahmin edilmektedir [2]. Küresel polimer ve sentetik elyaf tüketimi istikrarlı bir şekilde artmaktadır ve petrokimya hammaddelerinin genel büyümenin temel taşları olacağı da söylenebilir. Özellikle LPG/etan kullanımındaki güçlü büyüme - 2023 ile 2030 arasında 2,5 mb/g artış - özellikle Amerika Birleşik Devletleri ve büyük Orta Doğu üreticilerinden gelen yeni NGL arzındaki önemli artışları yansıtmaktadır. Çin, petrokimyasallardaki büyümeye hakim olmaya devam ederken, hammadde ürünlerindeki 1,4 mb/g'lik kazanımlar ülkenin 2030'a kadarki genel artışına yakın olacaktır. Öte yandan, temiz enerji teknolojilerinin hızlı gelişimi, güçlü temel mobilite artışını da dengeleyecektir.

V. KÜRESEL PETROL TİCARETİNİN YENİ ROTASI,

Küresel petrol ticareti, Hindistan ve Çin önderliğinde Asya'nın ham petrol ve ürün arzındaki büyüyen yapısı ve Atlantik Havzası'ndaki ham petrol, NGL ve ürünlerin artan miktarı tarafından kontrol edilmeye devam edecektir. OPEC+ dışı ham petrol arzının artması, Rus ham petrol ihracatına yönelik yaptırımlar ve OPEC+ gönüllü kesintileriyle birlikte, 2024-2030 döneminde Atlantik Havzası'ndan Süveyş'in doğusuna daha yüksek hacimler geliştirebileceği öngörülmektedir [2] (Şekil 4).



Şekil 4. Asya kıtasının petrol ithalatı ve net ihracatı arasındaki ilişki grafiği

OPEC+ kesintileri sırasında Orta Doğu'dan gelen orta ekşi ham petrol kaybı, Brezilya, Guyana ve Kanada'dan gelen artan arzlarla kısmen telafi edilmiştir. Asya pazarları, Pasifik Kıyısı'na doğru genişletilen Trans-Mountain boru hattı aracılığıyla Kanada ham petrolüne de açılmıştır. Bununla birlikte, hafif tatlı ABD ham petrolünün zamanla artan bir şekilde Avrupa ve Afrika'ya ve Hindistan ile diğer Asya rafinerilerine doğru hareket etmesi de mümkündür. Petrol ürünleri için en büyük pazar olarak Asya, daha geniş bölgeden, özellikle Orta Doğu'dan daha fazla ürün tedariki için çaba göstermek zorunda kalacaktır. Atlantik Havzası'nın çoğunda yaptırımlara tabi olan Rusya'dan gelen tedarikler doğuya doğru ilerlemeye devam ederken, Afrika ve Latin Amerika da zamanla ithalat oranları artabilecektir. Avrupa'nın dizel ve jet yakıtı tedarikindeki açığı ve Kuzey Amerika'nın jet yakıtı ithalatına olan ihtiyacı, küresel rekabeti en çok orta damıtık pazarlara odaklanmasına neden olacaktır [2]. Talebin doğrudan ikameye daha az uygun olduğu havacılık ve deniz taşımacılığı gibi uzun mesafe taşımacılığı ile büyümeye devam edeceği de açıktır. Ancak burada yakıt verimliliği talep artışlarını giderek yavaşlatmaktadır.

VI. ELEKTRİKLİ ARAÇLAR VE PETROL TÜKETİM ORANLARINA ETKİSİ

Küresel elektrikli otomobil satışları muhteşem bir büyüme sergilemeye devam etmektedir. IEA'nın Küresel Elektrikli Araç Görünümü 2024'e göre, satışlar 2023'teki 14 milyondan 2024'te yaklaşık 17 milyona ve toplam satışların 2030'da 40 milyona ulaşacağı ve neredeyse her iki yeni otomobilden birinin elektrikli olacağı tahmin edilmektedir [2]. 2023'te EV satışlarının çoğunluğu Çin'de (%60) gerçekleşirken; Avrupa (%25) ve Amerika Birleşik Devletleri (%10) de bu pazarı geliştirmeye devam etmektedir. Bu hakimiyetin

devam etmesi ve 2030 yılına kadar Çin'de yollardaki neredeyse üç arabadan birinin elektrikli olması beklenmektedir. Aynı kapsamda, küresel olarak satılan tüm EV'lerin yarısından fazlası Çinli otomobil üreticileri tarafından üretilirken, bu rakam içten yanmalı motorlu (ICE) otomobiller için yalnızca %10'dur. Ancak, Çin'den gelen ucuz EV'lerin hızla pazar payı kazanması ve yüksek maliyetli Batılı otomobil üreticilerinin dışarıda kalması nedeniyle Çin ile Batı arasındaki ticari sürtüşmeler artmaktadır. Bu durum, Çin'in orantısız hükümet yardımlarıyla desteklenen yapısal kapasite fazlasını ihraç ettiği yönündeki suçlamalara yol açmıştır. Biden Yönetiminin Mayıs 2024'te Çin elektrikli araçlarına yönelik tarifeleri dört katına çıkarma kararı bunun bir örneğidir. Avrupa Birliği de Çin elektrikli araçlarına yönelik bir anti-damping soruşturması yürütülmektedir.

Bu olumsuz rüzgarlara rağmen, filoya daha fazla araç girdikçe petrol talebindeki tasarrufların artmasıyla elektrikli araç pazarındaki büyümenin hızlanmaya devam etmesini mümkündür [6]. Bu artış, iddialı sıfır emisyon hedefleri, devam eden sanayi politikası desteği ve istikrarlı bir şekilde düşen fiyatlar ile desteklenecektir. Çin büyümenin temel itici gücü olmayı sürdürürken, satışlar hem coğrafi olarak hem de yakıtlar açısından daha az yoğunlaşırken, dizel göreceli olarak önem kazanacaktır [2], [7], [8].

7. SONUÇLAR

Uluslararası Enerji Ajansı 12 Haziran 2024 de yaptığı açıklamada, dünyanın son on yılda büyük bir petrol kapasitesi fazlalığıyla karşı karşıya olduğunu ve bu durumun daha düşük fiyatları tetikleyebileceğini ve küresel petrol talebi zirveye ulaşırken OPEC'in pazar kontrolünü test edebileceğini belirtmiştir. Biyoyakıtlar da dahil olmak üzere küresel petrol talebinin, elektrikli araçlar, yenilenebilir enerji ve yakıt verimliliğindeki artış nedeniyle 2023'teki günlük 102 milyon varilden 2030 yılına doğru muhtemelen 106 milyon varil/güne yaklaşacağı tahmin edilmektedir [2].

Dünyada fosil yakıtlar yoğun bir şekilde kullanılmaya devam ederken, yenilenebilir enerji kaynakları birincil enerji tüketiminde nispeten küçük bir rol oynamaktadır. Biyokütle, küresel birincil enerji talebi paylarının yaklaşık %10'unu oluşturan en çok kullanılan yenilenebilir enerji kaynağıdır. Birçok hükümet 2050 için net sıfır emisyon hedeflerine bağlı kalsa da, OPEC yenilenebilir enerji kaynaklarının 2045'te toplam yakıt talebinin dörtte birinden daha azını oluşturmasını beklemektedir.

Toplam petrol talebinin, artan jet yakıtı ve petrokimya sektöründen gelen hammadde kullanımının desteğiyle 2023 ile 2030 arasında günde 3,2 milyon varil artacağı öngörülür, IEA, son yıllarda olduğu gibi petrol talebindeki büyümenin Asya'nın en büyük ekonomileri tarafından yönlendirileceğini, Çin'deki büyümenin petrokimya sektörü tarafından destekleneceğini, Hindistan'da ise ulaşım yakıtlarında önemli kazanımlar elde edileceğini belirtmiştir. Buna karşılık, gelişmiş ekonomilerdeki petrol talebinin yapısal

düşüşünü sürdürerek 2023'teki günlük 46 milyon varilden 2030'da 1991'den bu yana en düşük seviye olan 43 milyon varilin altına düşmesi de beklenmektedir.

Bir yıl önce IEA, küresel petrol talebinin 2022-2028 döneminde %6 artışla günde 105,7 milyon varile çıktıktan sonra 2030'da zirveye ulaşacağını öngörmüştü. S&P Global Commodity Insights, biyoyakıtlar da dahil olmak üzere küresel petrol talebinin 2034'te günde yaklaşık 109 milyon varil ile zirveye ulaşacağını, sonraki yıllarda kademeli bir düşüşle 2050'de ise yalnızca günde 100 milyon varilin altına düşeceğini tahmin etmektedir. Ayrı bir gelişmede IEA, 2024 küresel petrol talebi büyüme tahminini art arda üçüncü ayda da düşürerek günlük 100.000 varil/gün olarak açıklamıştır. IEA, 2023 talep tahminlerinin yukarı yönlü revizyonunun da yardımıyla dünya petrol talebinin bu yıl sadece 960.000 varil artarak günde ortalama 103,2 milyon varil olacağını öngörmektedir. COP28 tarafından belirlenen 2030 iklim hedefleri, EnerGreen'in de gösterdiği gibi, küresel sıcaklık artışını 2°C'nin oldukça altında tutmayı amaçlayan Paris Anlaşması hedefi ile uyumludur. Ancak, Ulusal Olarak Belirlenen Önlemler (NDC'ler) 2030 iklim hedeflerine ulaşmak için yeterli değildir. Yenilenebilir enerji kaynakları ve enerji verimliliği, EnerGreen'de küresel iklim hedeflerine katkıda bulunan tek kaldıraçlar değildir ve elektriklendirme ve verimliliğin rolü hafife alınmamalıdır.

Sonuçta, enerji ülkelerin vazgeçemeyeceği bir konudur ve küresel ısınma da dahil olmak üzere bunun gerisinde kalmaya mahkumdur.

Selecting the Optimal Features of the Mushroom Data using Genetic Algorithms

Ahmet Yilmaz*

[1] *Department of Computer Engineering, Karamanoglu Mehmetbey University, Turkey*

yilmazahmet@kmu.edu.tr

Abstract – Data pre-processing has an essential role in increasing the performance of the algorithms. It involves converting raw data into a suitable format for machine learning models and algorithms. This approach aims to enhance the accuracy and reliability of results by improving data quality. This involves addressing issues such as missing data, noisy data, dimensionality reduction, and feature selection. Feature selection strategies try to minimize the dimensionality of the data by identifying and selecting the most representative features while excluding the less representative ones rather than generating new data. In this study, we employ a Genetic Algorithm (GA) to choose the features of the mushroom data. The raw data, which is a classification problem, consists of 22 distinct features. Since the values in one of the features are identical for all samples, we removed this feature and used the other features. The fitness is measured by taking into account an Artificial Neural Network (ANN) performance with the selected features and the number of selected features. The GA chose eight features. The network that utilizes the chosen features exhibits slower learning than the one that utilizes all features. However, the network utilizing selected features attains the same amount of learning with longer training.

Keywords – Optimal Features, Mushroom, Genetic Algorithms

I. INTRODUCTION

Machine learning algorithms are used in many fields for various tasks such as classification [1], regression [2], and clustering [3]. Many factors affect the performance of the algorithms, such as their suitability to the data and the hyperparameters. Data pre-processing is another crucial factor that may affect the performance of the algorithm.

Data pre-processing transforms unprocessed data into a format appropriate for machine learning models and algorithms [4]. This method seeks to produce more accurate and trustworthy outcomes through data quality improvement such as removing the lack of data, removing the noisy data, normalizing the data and reducing the dimensionality of the data.

Reducing the data dimensions removes the noise in the data and speeds up the learning since it decreases the computational cost. Dimensionality reduction techniques such as principal component analysis [5], linear discriminant analysis [6], and autoencoders [7] aim to reduce the dimension of the data by creating new subfeatures. Feature selection techniques also reduce the dimension of the data; however, these techniques aim to determine and select the high-representative features and exclude the low-representative features instead of creating new data.

The literature introduces various feature selection methods [8], [9]. Genetic Algorithm (GA) [10], [11] is one of the good methods among them. GA is a population-based search method inspired by biological evolution principles. It usually performs well thanks to its capability of comprehensively searching the space, thereby finding the global optimum.

In this study, we use GA intending to decrease the number of features of mushroom data with a relatively high amount of features. The data has 20 categorical, 2 binary input features, and 1 binary target. The GA implementation decreased the number of input features to 8 by keeping the high prediction accuracy of all features.

This paper is organized as follows. The data are described in the next section. The material and methods are introduced in section 3. Then, the results and discussion are provided in section 4. Finally, some conclusions are presented in section 5.

II. DATA

The data are taken from the UC Irvine Machine Learning Repository [12]. It has 8124 samples and 22 features, including 20 categorical features and 2 binary features. It has one target with three categories: eatable, poisoned, and unknown. As the unknown is also regarded as poisoned, the data has two classes, including eatable and poisoned, thereby having a binary target.

We removed the 16th feature —weil-type— from the data as all samples have the same value in that feature. Therefore, we conducted our study with 21 features. The data is split into two parts: 70% training and 30% testing samples.

III. MATERIAL AND METHODS

As stated in the introduction, GA is a global search method used to select the optimal input features in this study. It uses mathematical strategies analogized from biological evolution operators such as crossover and mutation. Different encoding types have been introduced so far, e.g., binary encoding, real value encoding, and permutation encoding.

In this study, we used the GA with the permutation encoding since it is the most suitable for feature selection problems. As we have 21 features, the chromosome size is set to 21. The gene in an order represents the feature corresponding to that order. Each gene in the chromosomes can only be zero and one. If a gene is zero, the corresponding feature is not used; otherwise, if the gene is one, the corresponding feature is selected to use.

The population size of the GA is set to 50. The tournament selection is used with the tournament size of 2. A one-point crossover is used with a 90% crossover rate. The mutation rate is set to 10%. We measure the fitness of the chromosomes using the classification performance of an Artificial Neural Network (ANN) [13], [14] at the end of the training epochs and the number of selected features. In order to decrease the chance factor, the networks are run ten times for each fitness measurement, and their mean accuracy represents the accuracy for the corresponding chromosome.

Equation 1 provides the mathematical expression of the fitness, and the GA aims to minimize the fitness. Let the acc_af be the accuracy at the end of the training epochs of the ANN that is measured using all features in the data, and the af be the number of all features in the data. Let the acc_sf be the accuracy at the end of training epochs of the ANN that is measured using the features selected by the GA chromosome, and the sf be the number of selected features for the corresponding chromosome.

$$fitness = \frac{acc_af}{acc_sf} + \frac{sf}{af} \tag{1}$$

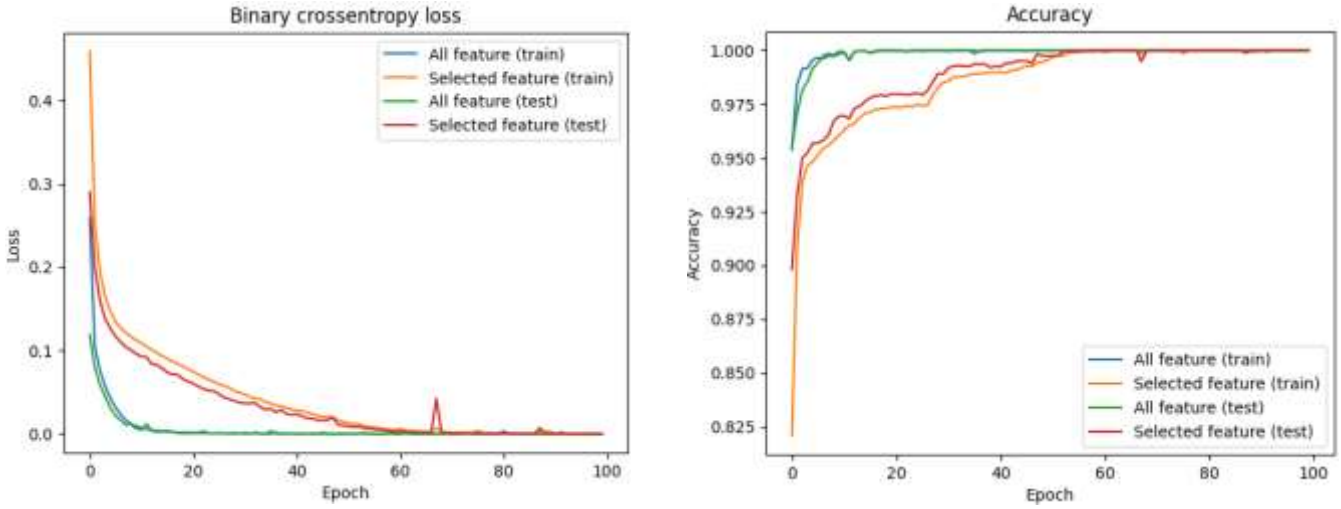
ANN is one of the most widely used machine learning methods. It has a layer-wise structure, including an input layer, one or more hidden layers, and an output layer. The layers have neurons. The number of hidden neurons is the same as the number of features. There is no rule to determine the hidden structure; therefore, it is usually determined by the user. The number of output neurons depends on the data.

In this study, the ANN has a variable input size that varies according to the chromosomes in the GA population, a single hidden layer with 16 neurons, and a single output neuron. The activation functions in the hidden and output layers are the Rectified Linear Unit and logistic sigmoid, respectively. The networks are trained using the Adam optimizer with 100 epochs and a mini batch size of 10. The hyperparameters of the networks were determined by the trial and error method.

IV. RESULTS

The GA system is run several times using the configuration defined in the previous section. As natural, the results differ from each other; however, some of the features selected are common for the runs. The best performance is the one provided by chromosome with a 1.3809 fitness value. Both networks with all features and selected features reach 100% training accuracy. However, the network using the features selected by the best chromosome achieves this learning with 8 features instead of 21. The selected features are odor, stalk-color-above-ring, stalk-color-below-ring, veil-color, ring-number, spore-print-color, population and habitat.

Figure 1 provides performance comparisons of the networks that use all features and selected features. The plots in Figure 1-a show the binary cross entropy loss for the networks, while those in Figure 1-b show their accuracy.



a. Binary crossentropy loss for training and testing data

b. Training and testing accuracy

Fig. 1 Learning performance of the networks that use all features and selected features

As seen in Figure 1, the network that uses all features learns the data faster than that uses selected features. However, in the end, both networks reach the same level of learning. The network that uses all features uses 13 features more than that uses the selected features. The difficulty of extracting these features should also be considered when comparing the networks. If this process is difficult, extracting only the selected features and training the network longer is enough for the network to perform well.

V. CONCLUSION

In this study, we use GA to select the mushroom data features. The original data is a classification problem with 22 features. We consider the data as if it has 21 features because one of the features is the same for all samples; thereby, we remove that feature from the data. Then, an ANN is fed with the selected features by the GA chromosomes. The ANN performance and the number of selected features measure the fitness of the chromosomes. The best chromosomes selected 8 features. The network that uses the selected features learns slower than that uses all features. However, it achieves the same level of learning with a lower number of features.

Applications of the Knapsack Problem: Part 1-Expensive Cargo Airline Dispatch

Okkes Tolga Altinoz[*1]

[1]*Department of Electrical and Electronics Engineering, Ankara University, Turkiye*

[*]*(taltinoz@ankara.edu.tr) Email of the corresponding author*

Abstract **–** Knapsack Problem (KP) is among the fundamental problems on the combinatorial optimization and industrial applications. The problem can be defined to select the items to fill the constant capacity with a maximum profit. It is the problem of packing the most profitable items into a knapsack. Many engineering problems can be modelled as KP. The cargo airline dispatch is an example of the application of the KP. As the number of items increases, the complexity of the problem also increases. Therefore, in this research the cargo airline dispatch problem is investigated with many items that are named as expensive cargo airline dispatch problem. The problem is solved with Genetic Algorithm and Binary Space Partition Tree Based Genetic Algorithm. The performance of these algorithms is compared and the impact of the number of items are also discussed in this research.

Keywords – Genetic Algorithm, Knapsack Problem, cargo airline dispatch, optimization, binary variable

I. INTRODUCTION

The Knapsack Problem (KP) is a problem of selecting items from a set N which has members $N = \{1, \dots, n\}$. Each item has two properties profit and weight [4]. As the items are added to the Knapsack its total weight increases until the maximum weight of c. In addition, as the items are added to the Knapsack total profit from the items increases. Therefore, the objective of the KP is to get maximum profit Knapsack. KP is mathematically defined as follows,

$$maximize \sum_{i=1}^{n} p_i x_i$$

$$subject\ to \sum_{i=1}^{n} w_i x_i < c$$

where the decision variable is $x_i \in \{0,1\}$, $i = 1, \dots, n$. The p and w are corresponding to profit and weight respectively; the c is the maximum capacity of the Knapsack. The aim is to get the highest profit from Knapsack. KP has many applications and is often used in models for real-world applications; some examples are cryptography [10], multimedia [11], timber industry [12], and satellite module layout design [13]. Different engineering problems lead to different modeling of KP. With some small modifications proposed on the KP, more and more problems are solved. By this way different variants of KP proposed. In [3] and [8], set-union knapsack problem is discussed as a variant of KP. In this problem, it is desired to achieve maximum profit among items assigned to certain clusters. In other words, it is aimed to obtain the highest profit among the items in each subset while preserving the diversity in Knapsack. In [6], knapsack problem with forfeits (KPF) is investigated and solved. In this problem, the selection of certain pairs is

undesirable, and a penalty is applied on the profit if these pairs are selected. In [7], two-dimensional (circular) knapsack packing problem is investigated. It is aimed to place objects of different sizes in a two-dimensional space. In this case, not only weight but also area is considered. An interesting example of KP is given in [9]. Here TSP and KP are used together and called the traveling thief problem. The problem is solved using multi-objective optimization algorithms.

The KP problem is the fundamental problem definition which can be altered to get variations of the KP to handle the real-world problem. As a real-world problem, the cargo airline dispatch problem is also considered in this research [5]. Unlike KP, the cost and profit of the cargo is directly related to the weight of the cargo. In other words, the cargo weight is directly related to the profit. Hence $p = kw$, where k is the rate of the profit. In this research for simplicity the parameters *k=1*. The mathematical definition of the airline cargo dispatch problem is given as;

$$maximize \sum_{i=1}^{n} w_i x_i$$

$$subject\ to \sum_{i=1}^{n} w_i x_i < c$$

where $p_i = w_i$ $x_i \in \{0,1\}$, $i = 1, \dots, n$. This research will examine both KP and airline cargo dispatch problems. In both problems, as the number of items increases, the complexity and difficulty of the problem increases. This is because the size of the decision space is equal to the number of items. As the number of items increases, the problem becomes more complex and difficult to solve. Therefore, each problem is named as expensive KP and expensive airline cargo dispatch problem (CDP) and is the basis of this research. The aim of the research is to investigate whether the solution can be obtained if the problem is made harder and how long it takes to obtain the solution. For this purpose, the search space size of both problems was increased from 250 to 100,000. In this respect, a different and relatively more difficult problem is analyzed.

This research is organized as four basis sections. After the introduction of the first section, in section 2 optimization algorithms are explained. In section 3 the results of the implementations will be presented and discussed. Finally in the final section the conclusion of this research will be given.

II. Coding: Optimization Algorithms

KP and CDP are considered in this research, and they are solved with binary encoded single objective optimization algorithms by using the Platemo platform [14]. The reader can find the codes for CDP to run on Platemo at 10.13140/RG.2.2.33962.84164.

A. Genetic Algorithm [2]

Genetic Algorithm (GA) is an optimization algorithm that is designed from biological evolution [2]. It is a population-based algorithm which is based on evaluating a set of possible solution candidates and evaluating their performances to decide their new value. The idea is to drag the population to the hopefully global optimum value. These members of the population are called chromosomes, and the assize of these chromosomes are equal to the size of the decision variables, or decision space dimension. The values of the chromosome vectors are binary. Hence for this coding perspective it is a binary optimization algorithm. The binary coding methodology in general for the optimization algorithms are preferred to select from a given set like in KP-based problems. The value 0 means “do not select” and 1 is for “select” the corresponding item. Preferring a different set of 1 and 0s are selecting for each member of the population. Hence the maximum number of members in the population is equal to 2^n, where n is the dimension of the decision space. Initially the randomly generated members are evaluated by using the objective function. In this research the objective function is to get the highest profit from the selecting

items under the constraint that total wight could not exceed the maximum weight which is defined as the half of the total weight of all the items. The maximization problem can easily convert to minimization problem by subtracting from the maximum capacity. Three operators are applied to these chromosomes. These are crossover, mutation and selection operators. The crossover operator is the mixing the chromosomes to form a new set of members or a new population. The chromosomes are divided into two parts and the distributed parts are merged to form a new chromosome. This process is called crossover. The parents are selected randomly (generally roulette method) and offspring is generated. Then mutation operator is applied. The idea of the mutation is to change a single value of a vector from 0 to 1 or 1 to 0. Finally, from these two populations the best members survived to the next generation. These operators are repeated until the termination constraints meets like maximum generation or tolerance value of the objective values.

B. Binary Space Partition Tree Based Genetic Algorithm [1]

Binary Space Partition Tree Based Genetic Algorithm (BSPGA) is proposed by Su et al. in 2019 [1]. The motivation of BSPGA is to improve the convergency speed of the binary GA to record all the generated members and be sure the there are no duplicated solutions exist in this database. The novel method is named as binary space partition (BSP) tree. The algorithm is a variant of GA so that it also evaluates three genetic operators. However, after the mutation operator two additional operators are defined before the selection operator. These two additional operators are BSP Tree Learning and Tree Construction. In learning phase offsprings do not generate any additional fitness evaluation. In the construction operator, all solution candidates insert all the solutions to the BSP tree in sequence and based on the Hamming distance and similarity same members only selected from the tree. Then the filtered offsprings with the main population are applied to the selection operator.

III. SIMULATION AND RESULTS

In this research two problem set are considered which are KP and CDP. The decision space of these algorithms is considered as 250, 500, 1000, 2000, 5000, 10000, 25000, 50000, and 100000. The implementations are repeated 10 times and statistical information for the objective value and runtime is recorded into tables. Two algorithm GA and BSPGA are compared based on these tables. Table 1 gives the objective values of the LP. The results statistically and numerically showed that even the BSPGA gives more complex and relatively improved version of GA remains underrate for these problems. As the number of decision variabes are increase the objective values are also increases as expected. As the problem complexity increases the difference between GA and BSPGA decreases. That means the improvement of the GHA against BSPGA decreases based on the results and statistics at the Table 1.

Table 1. The objective functions of the expensive KP.

Problem	D	BSPGA	GA
KP	250	3.9947e+3 (8.90e+1) -	3.3748e+3 (2.35e+1)
KP500	500	9.0866e+3 (3.23e+2) -	7.3905e+3 (1.14e+2)
KP1k	1000	1.9983e+4 (5.88e+2) -	1.5419e+4 (1.97e+2)
KP2k	2000	4.4537e+4 (7.50e+2) -	3.6172e+4 (3.96e+2)
KP5k	5000	1.2106e+5 (1.78e+3) -	1.0494e+5 (9.16e+2)
KP10k	10000	2.5160e+5 (1.88e+3) -	2.2746e+5 (1.73e+3)
KP25k	25000	6.5157e+5 (3.32e+3) -	6.1044e+5 (1.34e+3)
KP50k	50000	1.3265e+6 (7.32e+3) -	1.2645e+6 (2.48e+3)
KP100k	100000	2.6782e+6 (8.07e+3) -	2.5904e+6 (3.57e+3)
+/-/=		0/9/0	

Table 2 presents the expensive CDP. In this problem, the weight and the profit of the cargo is linearly dependent with each other. The similar performance difference is obtained in this table so that GA is outperforms against BSPGA. As the dimension increases the objective values increases and the difference between these two algorithm decreases. As the dimension increase the complexity of the problems are also increases.

Table 2. The objective functions of the expensive CDP.

Problem	D	BSPGA	GA
cKP	250	4.0708e+3 (3.74e+2) -	3.3973e+3 (4.45e+1)
cKP500	500	9.1378e+3 (2.83e+2) -	7.2910e+3 (5.92e+1)
cKP1k	1000	2.0010e+4 (6.59e+2) -	1.5415e+4 (3.16e+2)
cKP2k	2000	4.5160e+4 (1.13e+3) -	3.6053e+4 (6.75e+2)
cKP5k	5000	1.2127e+5 (1.49e+3) -	1.0473e+5 (1.13e+3)
cKP10k	10000	2.5151e+5 (1.64e+3) -	2.2601e+5 (1.36e+3)
cKP25k	25000	6.5049e+5 (4.60e+3) -	6.0858e+5 (2.46e+3)
cKP50k	50000	1.3254e+6 (3.63e+3) -	1.2641e+6 (2.43e+3)
cKP100k	100000	2.6824e+6 (4.07e+3) -	2.5953e+6 (6.14e+3)
+/-/=		0/9/0	

At this state the question of “What is the cost” for the BSPGA will be investigated as given in Table 3 based on the runtime of these two algorithms. It is expected that since the tree training and construction is added to the GA operators the BSPGA algorithm needs more resources that GA. Table 3 gives the runtimes for the CDP problems. As it is expected GA runs faster that BSPGA. Also, as the dimension increase the difference between two algorithms also increases. Since the tree structure is needed to be learned and constructed. As the dimension increases the necessary for the computational resources is increases.

Table 3. The runtime of the expensive CDP.

Problem	D	BSPGA	GA
cKP	250	2.5991e+0 (5.94e-1) -	1.9901e-1 (4.48e-3)
cKP500	500	2.9847e+0 (3.54e-2) -	2.6218e-1 (7.25e-3)
cKP1k	1000	3.2793e+0 (1.95e-2) -	4.7313e-1 (9.47e-3)
cKP2k	2000	3.8460e+0 (3.02e-2) -	9.4302e-1 (8.43e-3)
cKP5k	5000	7.7457e+0 (6.59e-2) -	2.5723e+0 (1.89e-2)
cKP10k	10000	1.3877e+1 (9.04e-2) -	4.7538e+0 (5.76e-2)
cKP25k	25000	2.4892e+1 (1.16e-1) -	1.1213e+1 (1.66e-1)
cKP50k	50000	4.0525e+1 (1.48e+0) -	2.3066e+1 (1.16e+0)
cKP100k	100000	7.3485e+1 (1.30e+0) -	4.6279e+1 (1.74e+0)
+/-/=		0/9/0	

IV. CONCLUSION

Knapsack Problem (KP) and its variant Cargo Dispatch Problem (CDP) are the problems of this research. Unlike other research the expensive KP and CDP are considered with up to 100.000 decision space dimension. That makes the problems expensive. Two optimization algorithms GA and BSPGA are applied to these problems. The solution indicates that GA gives superior performance against BSPGA under objective space statistical results and runtime. Even the BSPGA designed to be improved version of the GA; however, for these problem GA gives better performance. In addition, as the dimension of the decision space increases, the difference between GA and BSPGA decreases however, the runtime of

BSPGA against GA increased dramatically. The results suggested that GA still one of the fundamental algorithms for binary problems and other algorithms should be compared with GA.

Abstract **–** Chemical warfare agents include chemicals with high poisoning potential, such as nerve agents, choking agents, blister agents, and blood-poisoning gases. Chemical warfare agents can be taken into the body through respiration, digestion, or skin. Respiratory protection is required to prevent inhalation of these hazards, which can be achieved through superior filtration technologies. Nanofibrous filters are designed as ultra-low particulate air filters and capture small particulate matter with a filtration efficiency of 98.99%. For this purpose, cellulose acetate (CA) and cellulose acetate + polyvinylpyrrolidone (CA + PVP) CBRN filters were developed by electro-spinning method. The air permeability and filtration efficiency of CBRN filters were investigated using a permeability tester (ProWhite AirTest II) and an automatic filter tester (8130A, TSI Inc.). The air permeability rate of CA nanofiber filters coated on melt-blown fabric was 29 m^3h^{-1}, and CA + PVP nanofiber filters were 25 m^3h^{-1}. While the filtration efficiency of CA nanofiber filters was 89.69%, the filtration efficiency of CA + PVP nanofibers increased to 93.19%. Considering that the filtration efficiency of a high-efficiency filter should be between 90%-100%, the melt-blown fabric + CA + PVP nanofiber filter can be considered in a standard filter category because it has a high filtration efficiency.

Keywords – CBRN, Chemical warfare agents, Nanofiber filters, Filtration efficiency, Air permeability.

I. INTRODUCTION

Chemical, biological, radiological, and nuclear (CBRN) hazards refer to events that can result in death in living things. CBRN hazards include chemical warfare agents with high poisoning potential, such as nerve agents, choking agents, blister agents, and blood-poisoning gases. Although chemical warfare agents are taken into the body through respiration, digestion, or skin, one of the highest exposures occurs through respiration [1]. Therefore, in such cases, civilians, military personnel, and healthcare workers need superior filtration technologies. The filtration process is used in many different areas and one of the most important of these areas is air filtration. For the filtration process to be successful, one of the most important factors affecting the structural properties of the filters is the properties of the fiber used. Fibers are the basic element of the filter, and as the diameter of the fibers decreases, the amount of fiber increases and the pore size decreases, so the particles are captured more successfully [2]. Nanofibrous materials are developed by the electro-spinning method [3]. The greatest advantages of nanofibrous materials produced by this method compared to other materials are that they can provide a high filtration efficiency thanks to their large surface area, tiny diameter fibers, and tiny pores [4]. For this purpose, cellulose acetate (CA) and cellulose acetate + polyvinylpyrrolidone (CA + PVP) CBRN filters have been developed by electro-spinning.

II. Materials and Method

A. Production of CBRN Filter

Nanofibrous filters were separately developed by electrospinning method [5]. The main factor in the collection of polymer on the collector in the form of fibers is the process conditions. Process conditions were controlled by the concentration of the polymer solution (5%-15%), the distance between the syringe and the collector (7-20 cm), and the applied voltage (5-25 kV) [6]. Cellulose acetate (50 kDa) was used for the production of the Cellulose Acetate nanofiber filter. The polymer solution was prepared by adding 10%, 15%, 17% and 20% cellulose acetate into the 2:1 Acetone / DMac solution [7]. The polymer mixture was taken into a 5 mL syringe and placed on the syringe pump in the electrospinning apparatus. The distance between the syringe tip and the collector was adjusted and the high voltage power supply was turned on. The experiment was continued for a certain period to ensure sufficient fiber formation. At the end of the experiment, the cellulose acetate nanofiber filter was taken from the collector and dried at room temperature to remove the solvent. To increase the filtration efficiency in the production of Cellulose Acetate + PVP nanofiber filter, the cellulose air filter is combined with PVP. The polymer solution was prepared by adding 5%, 7% and 10% PVP (40 kDa) to the optimum cellulose acetate concentration. The polymer mixture was taken into a syringe. The distance between the syringe tip and the collector was adjusted and the high voltage power supply was turned on. The experiment was continued for a certain period to ensure sufficient fiber formation.

B. Air Permeability

The determination of the air permeability properties of the developed CBRN filters was carried out in accordance with TS 391 EN ISO 9237 standards. In this context, the air permeability of CBRN filters was tested according to ASTM D737 with the ProWhite AirTest II permeability tester [8]. The test area was set at 38 cm^2, the test pressure drop was 125 Pa, and the ambient temperature was set at 22 ± 2°C.

C. Particulate Filtration Efficiency

The particle filtration capacity of CBRN filters was determined using an automatic filter tester (8130A, TSI Inc.) [9]. Solid sodium chloride (NaCl) particles are produced from a solution of NaCl with a mass concentration of 2%. Filter samples with an effective area of 100 cm^2 were tested against aerosols in the range of 0.26 ± 0.07 μm at a surface velocity of 15.83 cms^{-1}. The pressure drop and filtration efficiency of the filter samples, which are the two main parameters that determine the quality of the air filter, were measured.

III. Results

To produce cellulose acetate (CA) nanofiber filter, the polymer solution was prepared at 10%, 15%, 17% and 20%. The optimum concentration for a successful electrospinning process was determined to be 15%. Electrospinning parameters for 15% CA nanofiber; The distance between the syringe tip and the collector was found to be 10 cm, the applied voltage was 22 kV, the flow rate was 1 ml/h, and the rotation speed of the collector was 300 rpm. To produce the nanofiber filter, different polymer solutions were prepared by separately adding 5%, 7% and 10% PVP onto cellulose acetate (15%). The optimum concentration for the CA + PVP nanofiber filter was determined as 15% CA and 10% PVP. Electrospinning parameters for 15% CA + 10% PVP nanofiber are; The distance between the syringe tip and the collector was found to be 10 cm, the applied voltage was 20 kV, the flow rate was 2 ml/h and the rotation speed of the collector was 300 rpm. While the air permeability rate of CA nanofiber filters coated on melt-blown fabric was 29 m^3h^{-1}, the air permeability rate decreased to 25 m^3h^{-1} when melt-blown fabric was coated with CA + PVP nanofibers (**Figure 1**). While the particle filtration efficiency of CA nanofiber filters coated on melt-blown fabric was found to be 89.69%, the particle filtration efficiency increased to 93.19% when melt-blown fabric was coated with CA + PVP nanofibers (**Figure 2**). Considering that the filtration efficiency of a high-efficiency filter should be between 90%-100%, the melt-blown fabric + CA + PVP nanofiber filter can be considered in a standard filter category because it has a high filtration efficiency.

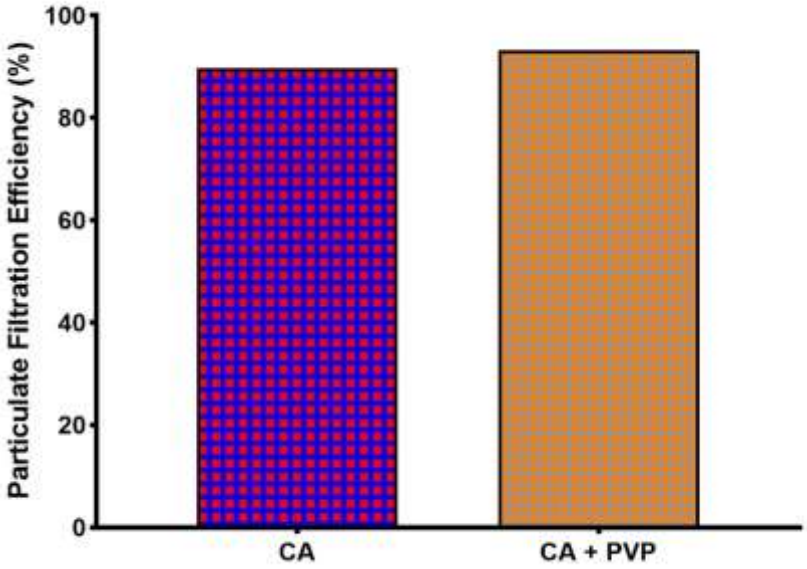

Figure 2 Particulate Filtration Efficiency of CA and CA + PVP nanofiber filters

IV. DISCUSSION

Filtration is generally the process of cleaning the air by keeping particles, microorganisms, and viruses in the environment using a porous structure. Environmental pollution and its effects on living things, which have been made worldwide in recent years, are a very important issue for filtration research. With the COVID-19 pandemic encountered in the recent past, the importance of air filtration has increased. High-performance air filters are important for healthcare professionals, patient relatives, and all living things at risk of disease. Nanofibrous materials developed for this purpose are promising for air filtration due to their specific surface area and porous structure [10]. In nanofibrous filters, ultra-low particulate air filters show a filtration efficiency of 98.99%, while high-efficiency particulate air filters capture small particulate matter with a filtration efficiency of 98.98% [11]. In this study, biodegradable nanofiber filters were manufactured using different raw materials, and cellulose nanofibers and PVP were combined. By choosing biodegradable polymers for filtration, it is aimed to reduce plastic waste and increase sustainability. It has been determined that the filters, which will be produced quite frequently and with a large amount of fiber, can hold some viruses and bacteria as well as chemical materials thanks to their

small size. The resulting nanofibrous CBRN air filters will be very valuable for next-generation force protection, as they can be used for both ambient filtration and masks.

V. CONCLUSION

To improve the filtration capabilities of CBRN filters, materials that will provide respiratory comfort and thermal comfort with antibacterial/antiviral properties should be selected. In this regard, new, cost-effective, effective, and convenient ways are being sought. With the production of nano-sized filters, filtration efficiency can be improved as a result of multiplying the layers of these filters and integrating them. In this study, cellulose nanofibers were used for biodegradable green nanofiber filter application. Cellulose acetate nanofibers are combined with polyvinylpyrrolidone (PVP). PVP has a high potential to be used for nanofiber filters due to its low cost and low toxicity. After this preliminary study, when the filtering feature of CBRN filters against toxic chemical gases or biological agents is investigated, it is expected to show a selective filtration feature. If the filtration is successful, national filters with commercialization potential can be developed in the field of CBRN.

Adli Ebelik

Feride Çevik[1*] ve Ebru Ertaş [1]

[1]*Ebelik Bölümü / Sağlık Bilimleri Fakültesi, Kütahya Sağlık Bilimleri Üniversitesi, Türkiye*

[*]*(feride.cevik@ksbu.edu.tr)*

Özet – Ebeler çeşitli alanlarda çalışmakta olup, doğumhane, , aile sağlığı merkezleri, kadın hastalıkları ve doğum servisleri, acil servisler, yenidoğan/yenidoğan yoğun bakım servisleri, çocuk servisleri, sağlık evleri, aile planlaması merkezleri ve toplum sağlığı merkezleri, gibi yerler bu alanlar arasında sayılabilir. Bu nedenle ebelik adli olaylarla çok sık karşılaşan meslek grubu olarak söylenebilir. Ebeler adli olaylarda bireyle ilk karşılaşan, eşyalarına veya kendisine ilk temas eden sağlık çalışanlarıdır. İlk adli delillere ulaşabilen sağlık çalışanlarından biri olan ebeler sadece durum bildirimi yükümlülüğü ile sınırlı kalmamalıdır. Ebelerin kadın, gebe ve çocukların içinde bulunduğu adli vakalarda; öykü alma, genel fizik muayene yapma, kanıtın tanımlanması, toplanması, saklanması ve korunması, kanıtın kaydedilmesi ve olayları anlık yönetebilme gibi oldukça hassas görevleri bulunmaktadır. Obstetrik aciller, kadına ve gebeye karşı şiddet, çocuk ihmal ve istismarı, tecavüz gebeliği, adölesan gebelik, rızasız genital muayene, gebelikte madde bağımlılığı, bebek karıştırma veya kaçırma örnek adli vakalardır. Ebeler bu adli vakalarla karşılaştıklarında çok dikkatli olmalı ve mutlaka bildirim yapmalıdırlar. Aksi durumda özensizlik veya mesleğin yükümlülüklerini yapmamaktan ortaya çıkabilecek olumsuz durumalar nedeni ile hukuki süreç ve cezai işleme tabi tutulabilmektedirler.

Anahtar Kelimeler – adli bilimler, adli ebelik, adli tıp, adli vaka, ebelik

I. GİRİŞ

Ebelik Dünya Sağlık Örgütü (DSÖ) tarafından, “Gebelik sırasında, doğumda ve doğumdan sonra gerekli bakım ve danışmanlığı sağlamak, normal sorumluluğunda doğumları yaptırmak, kendi yenidoğanın bakımını, aile planlaması danışmanlığını yapmak üzere eğitilmiş kişi” olarak tanımlanmaktadır [1]. Sağlık Bakanlığı’nın tanımında ise “ebe; ana-çocuk sağlığı hizmetlerini yürüten, doğum öncesi, doğum ve doğum sonrası hizmetleri veren, doğum yaptıran, 0-6 yaş grubu çocuk beslenme ve aşıları yapan, aile planlaması, kişisel temizlik kuralları, ilk yardım, bulaşıcı ve sosyal hastalıklardan korunma ve savaşla ilgili konularda bireye, aileye, topluma sağlık eğitimi veren, doğum ve ölüm istatistik verilerini toplayan, değerlendiren, kamu kuruluşları ile gerekli işbirliğini sağlayan insani ve ahlaki davranışları ile örnek, sağlık bakanlığınca tescil edilmiş bir okuldan mezun olan meslek mensubudur.” [2].

Ebeler çeşitli alanlarda çalışmakta olup, doğumhane, , aile sağlığı merkezleri, kadın hastalıkları ve doğum servisleri, acil servisler, yenidoğan/yenidoğan yoğun bakım servisleri, çocuk servisleri, sağlık evleri, aile planlaması merkezleri ve toplum sağlığı merkezleri, gibi yerler bu alanlar arasında sayılabilir. Bu nedenle ebelik adli olaylarla çok sık karşılaşan meslek grubu olarak söylenebilir. Ebeler adli olaylarda bireyle ilk karşılaşan, eşyalarına veya kendisine ilk temas eden sağlık çalışanlarıdır [3]. Adli vakaların çoğunluğunda kişiyi ilk gören ona ilk dokunan, ailesiyle ilk temasa geçen, muayene sırasında kişinin özel eşyalarını gören ve kişiden alınacak olan laboratuvar örnekleriyle herkesten önce temas eden meslek grubudur. İlk adli delillere ulaşabilen sağlık çalışanlarından biri olan ebeler sadece durum bildirimi yükümlülüğü ile sınırlı kalmamalıdır. Bu nedenle kadın ve çocuk savunuculuğu rolüde olan ebelerin adli vakaları tanıması, bildirmesi, tedavi yapabilmesi ve bakım sağlaması oldukça önemlidir [4]. Adli

olaylarda sorumluluk açısından doktor, ebe ve hemşirelerin cezai sorumlulukları birbirinden ayrılmamıştır. Doktorların mesleki yükümlülüklerini ve sınırlarını çizen her yönetmelik, diğer sağlık çalışanları için de belirleyici kapsamdadır. Bu yüzden ebelerinde TCK (2004)'ya göre bildirim yapması zorunludur [5].

A. Adli Ebelik Kavramı

Adli bilimler multidisipliner bir biçimde ilerleme sağlar. Adalet ve cezai işlemler için öncelikli yol gösterici bir disiplindir. Bu disiplin hukuksal çıkmazlarda bilimsel olarak çözüm üretmeyi hedeflemektedir. Adli vakanın tanımı "başka bir birey ya da kurumun tedbirsiz, dikkatsiz ihmalkar veya kasıtlı eylemi sonucu bireyin hastalanması ya da ölümüdür." Adli vakalarda sağlık çalışanlarının kanıtların değerlendirilmesindeki yeri oldukça önemlidir. Kanıtlara uygulanan (tanımlama, saklama vb.) prosedür ve tekniklere hakim olan sağlık çalışanlarının tedavi ve bakım esnasında adli incelemenin hızlanmasına ve vakaların daha kolay bir şekilde sonuçlanmasına yardımcı olacaklardır [6]. Sağlık hizmeti veren tüm kurum ve kuruluşlarda sağlık çalışanlarının tamamı adli vakalarla karşılaşmaktadırlar [7].

ICM Adli Ebelik'te dört tema belirlemiştir bu temalar aşağıdaki tabloda belirtilmiştir [8].

Tablo 1. Uygulama Alanlarına Yönelik Adli Ebelik Temaları

Uygulama Alanlarına Yönelik Adli Ebelik Temaları
❖ Gebelik sorunlarıyla ilgili uygulamalar
❖ Kadınlara ve çocuklara yönelik şiddet
❖ Ebelikte malpraktis
❖ Adli ebelikte profesyonelliğin geliştirilmesi

Adli ebelik; ebelik, tıp, hukuk ve kriminolojinin ebelik alanında eşit olarak harmanlanmasıdır. Öncelikli olarak sağlık hizmeti veren yerlerde çalışan ebeler; kadına, gebeye veya çocuğa yönelik şiddet, tecavüzü saptayarak ve madde kullanımının önlenmesi ile psikolojik ve fizyolojik çözümler sunarak gerekli bakım ve danışmanlığı yapmaktadırlar. Ebelerin; birinci basamakta aile sağlığı merkezleri, aile planlaması ve toplum sağlığı merkezleri, ana-çocuk sağlığı merkezleri; ikinci basamakta devlet hastaneleri, şehir hastaneleri, doğumevleri, doğumhaneler ve kadın sağlığı servislerinde; üçüncü basamakta tıp fakültesi hastaneleri, eğitim ve araştırma hastaneleri, yoğun bakımlar, acil servislerde çalışma alanı bulmaktalar. Ebeler kadın, gebe ve çocuklara yönelik şiddet, ihmal ve istismar şüphesi, cinsel saldırıya uğrayan kişilerle birebir karşılaşılan yerlerde istihdam edilmektedirler [9]. Yasal sorumlulukları göz önüne alındığında adli olaylarla karşılaşmaları oldukça sık olmaktadır.

Adli vakaların çoğunluğunda kişiyi ilk gören ona ilk dokunan, ailesiyle ilk temasa geçen, muayene sırasında kişinin özel eşyalarını gören ve kişiden alınacak olan laboratuvar örnekleriyle herkesten önce temas eden meslek grubudur. İlk adli delillere ulaşabilen sağlık çalışanlarından biri olan ebeler sadece durum bildirimi yükümlülüğü ile sınırlı kalmamalıdır. Bu nedenle kadın ve çocuk savunuculuğu rolüde olan ebelerin adli vakaları tanıması, bildirmesi, tedavi yapabilmesi ve bakım sağlaması oldukça önemlidir [4]. Ebeler; doğum, hastalık ve ölümleri raporlamak ve bu raporları gerekli üst mercilere bildirmek zorundadır [2]. Bu hizmetler kapsamında ebelerin vaka bildirimi, kanıtların toplanması, korunması ve

bakım verme gibi görevleri vardır [7]. Ebelerin kadın ve çocuk mağdurların olduğu adli olaylarda; öykü alma, fiziksel muayene, kanıtın tanımlanması, kanıtın toplanması, kanıtın saklanması, kanıtın koruma zincirinin sağlanması, kanıtın kayıt edilmesi ve krize müdahalede oldukça hassas rolleri bulunmaktadır [9]. Obstetrik aciller, kadına ve gebeye karşı şiddet, çocuk ihmal ve istismarı, tecavüz gebeliği, adölesan gebelik, rızasız genital muayene, gebelikte madde bağımlılığı, bebek karıştırma veya kaçırma örnek adli vakalardır. Ebeler bu adli vakalarla karşılaştıklarında çok dikkatli olmalı ve mutlaka bildirim yapmalıdırlar [10].

B. Adli Ebelerin Çalışma Alanları

Adli Ebelik eğitimi almış ebeler, hastanelerde ve aile sağlığı merkezlerinde rastladıkları herhangi bir adli olay karşısında eğitimli bilirkişi olarak adli vaka yöneticisi olabilmektedirler. Ayrıca Adli Ebeler; devlet hastaneleri, tıp fakültesi hastanesi, özel hastaneler, aile sağlığı merkezleri, toplum sağlığı merkezleri ve dispanserler gibi sağlık kurumları, adli tıp kurumları, hastanelerin adli tıp polikliniki leri, çocuk izlem merkezleri, cinsel saldırı mağdur izlem merkezleri gibi birçok kurum ve kuruluşta çalışabilecek uzman sağlık profesyonelleridir [11]. Mahkemede tanıklık, klinik adli ebeliği, cinsel saldırı muayene ebeliği, pediatride adli ebelik, geriatride adli ebelik, obstetri ve jinekolojide adli ebelik, cezaevlerinde adli ebelik, bilirkişilik, kişiler arası şiddette adli ebelik, adli psikiyatri ebeliği, adli araştırma ebesi, ebelik hukuku danışmanı, olay yeri inceleme gibi birçok çalışma alanına sahiptir [10]. Ebelerin sıklıkla karşılaştıkları adli olgular; dışarıdan bir etki sonucu oluşan, kişilerin psikolojik ve fizyolojik sağlığının bozulmasına ya da ölümüne neden olan her olay adli olgu olarak değerlendirilebilmektedir. Ebeler genellikle kadına, gebeye, çocuğa yaşlıya ve engelliye yönelik herhangi bir şiddet, ihmal veya istismar, mesleğe yönelik ise; malpraktis gibi adli vakalar ile karşı karşıya kalmaktadırlar. Bu vakalar klinik adli tıp alanında değerlendirilir ve bunlar klinikte en çok görülen adli vakalardır [12].

Tüm meslekler gibi ebelikte de mesleki yükümlülükler ve cezai yükümlülükler vardır. Ebelerin adli konulardaki yasal yükümlülükleri kanunlar ile belirtilmektedir. Ebeler, mesleğine ilişkin kanun ve mevzuatları temel alarak, adli olgulardaki hukuki sorumluluklarını 5237 Sayılı Türk Ceza Kanunu (TCK) (Madde 99,135,136,137,190, 204, 205, 209, 210, 279, 280, 281) ve 5271 Sayılı Ceza Muhakemesi Kanunu (CMK) (Madde 75, 76, 80)'nun ilgili maddeleri çerçevesinde yerine getirmek zorundadırlar. Aksi durumda özensizlik veya mesleğin yükümlülüklerini yapmamaktan ortaya çıkabilecek olumsuz durumalar nedeni ile hukuki süreç ve cezai işleme tabi tutulabilmektedirler. Bu nedenle mesleki hak, yükümlülük ve görevlerin iyi bilinmesi sağlık hizmetlerinin sunulması sürecinde ebeleri önemli düzeyde koruyacaktır [11,12].

II. SONUÇ VE ÖNERİLER

- Adli ebelik hakkında yasal mevzuatın düzenlenmesi ve adli ebeliğin görev tanımının, rollerinin ve yükümlülüklerinin ortaya koyulması,
- Adli ebeliğin görev tanımının en kısa sürede ve açıkça ortaya koyulması,
- Hizmet içi eğitimlerle adli ebelik ve adli vakalara nasıl yaklaşılacağıyla ilgili bilgilere yer verilmesi ve sürekli olarak bu eğitimlerin devam ettirilmesi,
- Sağlık hizmeti sunan kurumlarda en az bir adet adli ebelik alanında uzman bir ebenin istihdam edilmesi,
- Obstetri ve jinekoloji bilim dalı, adli vakalarla karşılaşılma ihtimalinin en yüksek olduğu sağlık alanlarından biri olduğu için ebelerin bu konuda yeterli bilgi, eğitim ve donanıma sahip olmaları gerekmektedir. Bu nedenle lisans ve lisansüstü müfredatlarına tıbbi hukuk ve adli tıp, adli ebelik vb. derslerin eklenmesi ve yaygınlaştırılması önerilmektedir.

Düşük Oranlarda Yumurta Kabuğu Tozunun Epoksi Kompozitlerin Mekanik Özelliklerine Etkisi

Gökhan Demircan[1*]

[1]*Makine Mühendisliği Bölümü / Mühendislik Fakültesi, Harran Üniversite, Şanlıurfa, Türkiye*

[*]*(gdemircan@harran.edu.tr)*

Özet **–** Bu çalışmada, yumurta kabuğu tozunun epoksi reçine matrisli kompozit malzemeler üzerindeki etkisi detaylı bir şekilde incelenmiştir. Yumurta kabuğu tozu, %1, %3 ve %5 oranlarında epoksi reçineye eklenmiş ve ASTM standartlarına göre eğilme ve çekme testlerine tabi tutulmuştur. Eğilme testleri sonuçlarına göre, %1 yumurta kabuğu tozu ilavesi eğilme dayanımını %0.89 artırırken, %3 ilavesinde bu artış %2.27'ye, %5 ilavesinde ise %4.25'e kadar yükselmiştir. Çekme testleri ise belirli konsantrasyonlardan sonra çekme mukavemetinde azalmalar göstermiştir; %1 yumurta kabuğu tozu ile %0.39 artış kaydedilirken, %3 ve %5 ilavelerinde sırasıyla %-0.88 ve %-2.1 azalmalar gözlenmiştir. Bu sonuçlar, yumurta kabuğu tozunun kompozit malzemelerdeki potansiyelini göstermektedir ancak konsantrasyonun dikkatlice seçilmesi gerektiğini ortaya koymaktadır. Ayrıca, malzeme üretim sürecinde oluşabilecek boşluklu yapıların mekanik özellikler üzerindeki etkisi de dikkate alınmalıdır. Bu çalışma, sürdürülebilir biyo-katkı maddelerinin kompozit malzemelerde kullanımının mekanik performans üzerindeki etkilerini anlamak için önemli bir adım sağlamaktadır. Ancak, konsantrasyon ve üretim süreci gibi faktörlerin optimize edilmesi gerektiği ve çalışmanın bazı kısıtlamaları olduğu unutulmamalıdır. Bu çalışma için boşluklu yapıların etkisi doğrudan değerlendirilmediği için mekanik test sonuçları hasar analizleri ile beraber yorumlanamamıştır.

Anahtar Kelimeler – Yumurta Kabuğu Tozu, Epoksi, Çekme Testi, Eğilme Testi, Biyo Kompozit

I. GİRİŞ

Atık malzemelerin geri dönüştürülmesi ve bunların kompozitlere biyo katkı maddeleri olarak dahil edilmesi, sürdürülebilir malzeme biliminin ilerlemesi açısından oldukça önemlidir [1]. Tarımsal atıklar, endüstriyel yan ürünler ve tüketim sonrası atıklar gibi malzemelerin kullanılması çevresel etkiyi azaltır ve geleneksel, yenilenemeyen kaynaklara sürdürülebilir bir alternatif sağlar [2]. Kompozit malzemelerde, bu geri dönüştürülmüş biyo katkı maddeleri genel maliyeti düşürürken dayanıklılık, mukavemet ve termal stabilite gibi özellikleri geliştirebilir. Örneğin, atık tekstillerden veya plastiklerden geri dönüştürülmüş elyafların kompozitlere dahil edilmesi, polimer kompozitlerin mekanik özelliklerini geliştirebilir [3, 4]. Pirinç kabuğu, hindistancevizi kabuğu ve jüt gibi tarımsal kalıntılar, kompozitin yapısal bütünlüğünü artıran ve yoğunluğunu azaltan, malzemeyi daha hafif ve daha verimli hale getiren dolgu maddeleri olarak kullanılabilir [5]. Bu biyo katkı maddelerinin kullanımı aynı zamanda atıkların çöplüklerden uzaklaştırılması ve işlenmemiş ham maddelere olan talebin azaltılması yoluyla döngüsel ekonomiye de katkıda bulunmaktadır. Ayrıca, bu tür uygulamalar, küresel sürdürülebilirlik hedeflerine uygun olarak, geleneksel malzemelerin üretimi ve imhasıyla ilişkili sera gazı emisyonlarını azaltabilir [6]. Bu nedenle, atık malzemelerin kompozitlerde kullanılarak geri dönüştürülmesi, yalnızca atık yönetimi zorluklarını gidermekle kalmaz, aynı zamanda gelişmiş performansa ve çevresel faydalara sahip gelişmiş malzemeler de ortaya çıkarır [7].

Gıda endüstrisinin yaygın bir yan ürünü olan yumurta kabukları (YK), benzersiz özelliklerinden dolayı kompozit malzemeler için sürdürülebilir bir biyo katkı maddesi olarak dikkat çekmektedir [8]. Esas olarak kalsiyum karbonattan ($CaCO_3$) oluşan yumurta kabukları, yüksek sertliğe ve dayanıklılığa sahiptir, bu da onları polimer matrisleri güçlendirmek için ideal kılar [9]. Teknik olarak yumurta kabuğu parçacıkları, polimer matris ile takviye fazı arasındaki arayüzey bağlanmasını geliştirebilen bir dolgu malzemesi görevi görür [10]. İnce öğütülmüş yumurta kabuğu parçacıklarının yüksek yüzey alanı/hacim oranı, kompozit içinde daha iyi gerilim aktarımı ve dağılımına olanak tanıyarak malzeme performansının artmasını sağlar. Ek olarak yumurta kabukları, kompozitin termal bozulmaya karşı direncini artırabilen ve değişen sıcaklık koşulları altında boyutsal stabilitesini geliştirebilen mükemmel termal stabiliteye sahiptir [11]. Yumurta kabuklarının kompozitlerde kullanılması, bunların ince parçacıklar halinde öğütülmesini içerir; bu parçacıklar daha sonra çekme mukavemeti, darbe direnci ve sertlik gibi mekanik özellikleri geliştirmek için bir polimer matris içinde eşit şekilde dağıtılabilir.

Deniz ve Güneş [12] çalışmalarında yumurta kabuğu tozu ile takviye edilmiş epoksi kompozitlerin mekanik özelliklerini incelenmişlerdir. Saf epoksi ve %5, %10, %20, %30, %40 gibi yüksek oranlarda yumurta kabuğu tozu içeren kompozit numuneler hazırlamış ve çekme ve üç nokta eğilme testlerine tabi tutmuşlardır. %5 yumurta kabuğu tozu ile en iyi çekme mukavemeti elde edilmiş, bu oran arttıkça mukavemet azalmıştır. Eğilme testlerinde ise en yüksek mukavemet %20 oranında yumurta kabuğu tozu ile elde edilmiş ve bu oranın üstünde mukavemet düşmüştür. Sonuçlar, takviye oranının kompozitlerin çekme ve eğilme mukavemetini önemli ölçüde etkilediğini göstermektedir. Sarmin ve ark. [13] ağırlıkça %40 hurma lifi ve ağırlıkça %5, 10, 15 ve 20 yumurta kabuğu kullanarak biyo-kompozitler üretmişlerdir. Ağırlıkça %15 yumurta kabuğu katkılı olan kompozitin optimum çekme ve eğilme özelliklerine sahip olduğunu, ağırlıkça %5'in ise darbe mukavemetini iyileştirdiğini gözlemlemişlerdir. SEM analizi, yumurta kabuğu dolgu maddelerinin biyo-epoksi yapısını değiştirdiğini ortaya çıkarmıştır. Ayrıca yapısal uygulamalara uygun, polimer kompozitlerin güçlendirilmesi için etkili yeşil malzemeler olduğu sonucuna varmışlardır. Hiremath ve ark. [14] yumurta kabuğu tozunun cam elyaf takviyeli reçine matrisli kompozitlerde dolgu maddesi olarak kullanımını inceleyerek çevresel ve ekonomik kaygıları ele almışlardır. Ağırlıkça %5 ve ağırlıkça %10 yumurta kabuğu tozu ile ağırlıkça %50 fiber kullanarak elle yatırma işlemiyle kompozit üretmişler ve bunları ASTM standartlarına göre test etmişlerdir. %5 katkı oranının rijitliği arttırdığı fakat %10'da düştüğünü tespit etmişlerdir.

Yapılan literatür çalışmalarında genellikle yumurta kabuğu tozu yüksek oranda kullanılmıştır. Düşük miktarların etkisi de ayrıca incelenmesi gereken önemli bir konudur. Bu çalışmada %1, %3, %5 oranında düşük miktarlarda yumurta kabuğu tozu epoksi reçinesine ilave edilmiş ve çekme ve eğilme deneyleri gerçekleştirilmiştir.

II. MATERYAL VE YÖNTEM

Yumurta kabuğu tozunu hazırlamak için yumurta kabukları (YK) 80 °C sıcaklıktaki fırında 24 saat boyunca kurutuldu. Kurutulduktan sonra laboratuvar öğütme makinesi kullanılarak ince toz haline getirildi. Ortaya çıkan toz, tekdüze parçacık boyutları elde etmek için sırasıyla 150 um ve 75 um'lik eleklerden elendi.

Daha sonra tozlar belirtilen boyutlardaki ahşap kalıp içerisine 330 gram MGS L 285 epoksi reçine ve 110 gram H287 sertleştirici ilave edilerek kompozit bir karışım hazırlandı. Yumurta kabuğu tozları reçine karışımına %1, %3 ve %5'lik kütle oranlarında dahil edildi. Yumurta kabuğu tozları başlangıçta manuel olarak epoksi reçine ile 5 dakika karıştırıldı, ardından homojenliği sağlamak için 250 rpm'de 30 dakika manyetik olarak karıştırıldı. Karışım daha sonra kalıplara döküldü ve 80°C'de 4 saat kürlendi. Sertleştirme sonrası kompozit numuneler bir CNC yönlendirici kullanılarak ASTM standartlarına göre kesildi. Üretim aşamaları Şekil 1.'de gösterilmiştir.

Numunelerin titizlikle hazırlanmasından sonra, malzeme mekanik özelliklerinin kapsamlı bir şekilde değerlendirilmesi için ASTM D790 standartlarına göre 3 nokta eğilme testlerine maruz bırakılmıştır [15]. Standart boyutlara göre hazırlanmış her numune, numunenin tam orta noktası boyunca stratejik olarak yerleştirilmiş iki destek noktasına yerleştirilmiştir. Her numunenin ortasına hassas bir şekilde kontrol edilen bir yük uygulanmıştır. Bu metodoloji, orta noktada belirgin bir kiriş yapısının oluşumunu etkili bir

şekilde kolaylaştırarak eğilme özelliklerinin hassas bir şekilde ölçülmesini sağlamıştır. Yüksek hassasiyetli 100 kN yük hücresi ile donatılmış bir Shimadzu Üniversal Çekme Makinesinin kullanılması, test prosedürü boyunca doğruluk ve güvenilirliği sağlamıştır. Eğilme testleri, tutarlı ve tekrarlanabilir sonuçlar elde etmek için 5 mm/dk kontrollü hızda gerçekleştirilmiştir. Eğilme gerilmeleri, Denklem 1 kullanılarak hesaplanmıştır.

$$\sigma_f = \frac{3PL}{2bd^2} \quad (1)$$

Çekme testleri, malzeme çekme özelliklerinin değerlendirilmesinde bir ölçüt olan ASTM D638-14 standartlarına uygun olarak yapılmıştır. Bu testler, aynı Shimadzu Üniversal Çekme Makinesi kullanılarak, gerinim hızı (1 mm/dk) ve numune boyutları gibi parametreler belirtilen standartlara uyarak kontrollü koşullar altında gerçekleştirilmiştir [16]. Hem eğilme hem de çekme testlerinden elde edilen veriler, malzemenin farklı yükleme senaryolarındaki mekanik tepkisinin kapsamlı bir şekilde değerlendirilmesine toplu olarak katkıda bulunmaktadır.

Şekil 1. Üretim aşamaları

III. BULGULAR

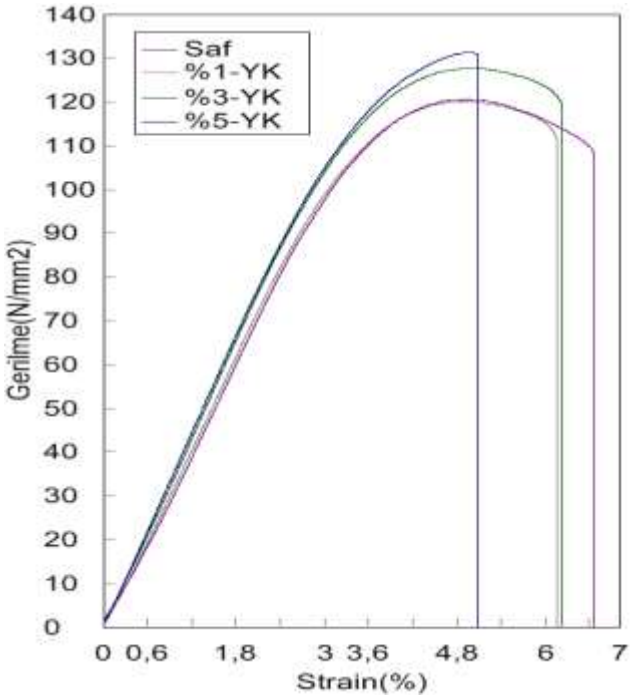
Eğilme ve çekme testleri her bir parametreden 5 er adet olacak şekilde gerçekleştirilmiş ve maksimum gerilme değerleri ortalamalar alınarak hesaplanmıştır. Şekil 2'de eğilme testi için gerilme-strain (birim şekil değiştirme) grafiği, Şekil 3'te çekme testi için gerilme-strain (birim şekil değiştirme) grafiği verilmiştir. Çekme ve eğilme testi sonucunda elde edilen maksimum gerilme değerleri Tablo 1'de verilmiştir.

Tablo 1. Çekme ve eğilme testi mekanik özellikler

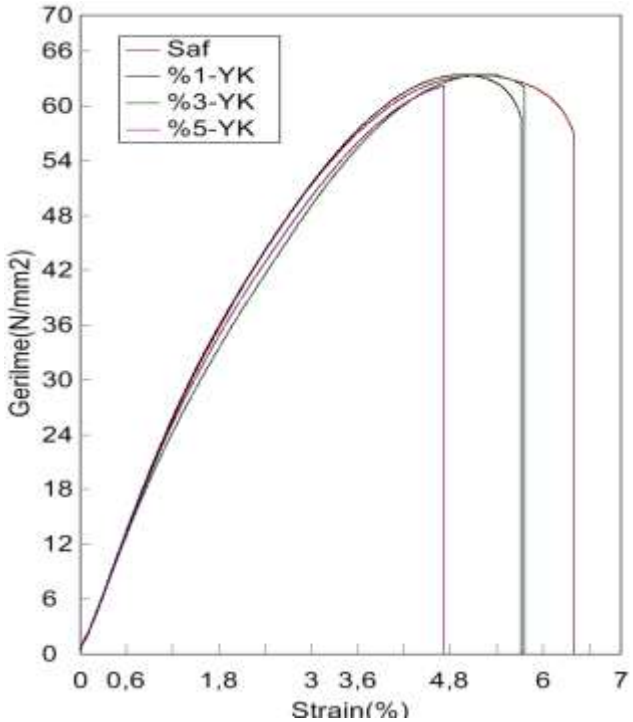
Test	Saf	%1YK	%3YK	%5YK
Eğilme Testi Maksimum Gerilme (MPa)	122.48	123.58	125.26	127.69
Çekme Testi Maksimum Gerilme (MPa)	63.19	63.44	62.63	61.86

Eğilme testi sonuçları incelendiğinde yumurta kabuğu tozu arttıkça eğilme dayanım değerlerinin arttığı görülmektedir. %1 YK tozu olan numunede bu artış %0.89, %3 YK tozu olan numunede bu artış %2.27 ve %5 YK tozu olan numunede bu artış %4.25 olarak gerçekleşmiştir.

Çekme testi sonuçları incelendiğinde yumurta kabuğu tozu arttıkça çekme dayanım değerlerinin %1 YK tozu olan numunede artarken %3 ve %5 YK tozu olan numunede azaldığı görülmektedir. %1 YK tozu olan numunede artış %0.39, %3 YK tozu olan numunede azalma %-0.88 ve %5 YK tozu olan numunede azalma %2.1 olarak gerçekleşmiştir.



Şekil 2. Eğilme testi gerilme-strain (birim şekil değiştirme) grafiği



Şekil 3. Çekme testi gerilme-strain (birim şekil değiştirme) grafiği

YK tozu yüzdesi arttıkça (% 1'den% 5'e), çekme mukavemetinin artmasına çeşitli faktörler katkıda bulunmaktadır. Partikül dolgu maddesi olan yumurta kabuğu tozu, epoksi matrisini etkili bir şekilde güçlendirerek gerilme mukavemetini artırabilir. Parçacıklar, uygulanan gerilme kuvvetlerinin kompozit boyunca daha düzgün bir şekilde dağılmasına yardımcı olur, böylece erken hasara uğramaya yol açabilecek lokalize gerilme konsantrasyonlarını azaltır. Bu takviye mekanizması tipik olarak, % 0.39'luk bir artışın kaydedildiği% 1 YK tozlu numunede gözlemlendiği gibi çekme mukavemetinde bir artışa yol açar.

Bununla birlikte, YK tozu konsantrasyonu daha da arttıkça (% 3 ve% 5 YK tozu), kompozitin yapısal bütünlüğü etkilenebilir. Daha yüksek partikül dolgu konsantrasyonları, potansiyel olarak reçine matrisi içindeki parçacıkların topaklanmasına veya kümelenmesine neden olabilir. Bu kümelenme, mikroyapısal kusurlar veya zayıf noktalar oluşturabilir. Sonuç olarak, çekme mukavemeti, sırasıyla %-0.88 ve%-2.1'lik düşüşlerin gözlendiği% 3 ve% 5YK tozlu numunelerde görüldüğü gibi azalmaya başlayabilir.

Malzemenin eğilme mukavemetinin değerlendirildiği 3 noktalı eğilme testlerinde ise sonuçları etkileyen baskın faktör, kompozitin eğilme gerilimi altında deformasyona ve kırılmaya direnme kabiliyetidir. Burada yumurta kabuğu tozu ilavesi, epoksi reçine ile parçacıklar arasındaki arayüzey bağını iyileştirme eğilimindedir. Bu geliştirilmiş yapıştırma, malzemenin eğilme kuvvetlerine karşı direncini artırarak yumurta kabuğu tozu konsantrasyonu arttıkça eğilme mukavemetinin artmasına neden olur. Değişen YK toz yüzdelerinde eğilme mukavemetinde gözlenen pozitif korelasyon (% 1 YK için% 0,89 artış, % 3 YK için% 2,27 artış ve% 5 YK için% 4,25 artış) bu güçlendirme etkisini yansıtmaktadır.

IV. TARTIŞMA

Deniz ve Güneş [12] yaptıkları çalışmada yumurta kabuğu tozunun %5 katkı oranında eposki kompozitin çekme ve eğilme dayanımlarını arttırdığını tespit etmişlerdir. Shin ve ark. [17] cam elyaf katkılı kompozitlere kütlece %10 oranında kattıkları yumurta kabuğu tozları ile çekme gerilmesinde artış gözlemlemişlerdir. Souza ve ark., [18] kütlece %10 oranında yumurta kabuğu tozu kattıkları epoksi kompozitlerin çekme gerilmesi değerlerinde artış gözlemlemişlerdir. Bu çalışmada literatür ile benzer şekilde eğilme gerilmelerinde artış gözlemlenirken çekme gerilmelerinde ise literatüre ters bir şekilde %1 katkı oranından sonra %5 katkı oranına kadar azalma gözlemlenmiştir. Bunun sebebi üretim sırasında oluşan boşluksu yapılar olabilir. Boşluksu yapılar eğilme dayanımın maksimum oluştuğu bölgede oluşmamış be böylece eğilme dayanım değerlerini olumsuz etkilememiş olabilir. Öte yandan çekme testinde boşluksu yapılar doğrudan bütün kesit alanını etkilediği için çekme gerilme değerlerini azaltmış olabilir. Sonuç olarak bu çalışmada boşluksu yapıya bakılmadığı için net bir şey söylemek mümkün değildir. Ancak bu tür toz katkılı kompozitlerde boşluksu yapıların da incelenmesi oldukça önemlidir.

V. SONUÇLAR

Bu çalışma, yumurta kabuğu tozunun epoksi reçine matrisli kompozit malzemeler üzerindeki etkilerini sistemli bir şekilde değerlendirmiştir. Yapılan eğilme testleri sonuçlarına göre, yumurta kabuğu tozunun %1, %3 ve %5 oranlarında eklenmesiyle eğilme dayanımında belirgin artışlar gözlemlenmiştir. %1 yumurta kabuğu tozu ile %0.89, %3 tozu ile %2.27, %5 tozu ile ise %4.25 artış sağlanmıştır. Bu artışlar, yumurta kabuğu tozunun kompozit malzemelerdeki takviye potansiyelini göstermektedir. Ancak, çekme testleri sonuçlarına göre, belirli konsantrasyonlardan sonra çekme mukavemetinde azalmalar gözlenmiştir. %1 yumurta kabuğu tozu ilavesi ile %0.39 artış kaydedilirken, %3 ve %5 ilavelerinde sırasıyla %-0.88 ve %-2.1 azalmalar gözlenmiştir. Bu azalmalar, yüksek konsantrasyonlardaki tozun reçine matrisi içindeki homojen dağılımını olumsuz etkileyebileceğini göstermektedir.

Çalışmanın bulguları, yumurta kabuğu tozunun kompozit malzemelerin mekanik özelliklerini önemli ölçüde etkileyebileceğini ve sürdürülebilir biyo-katkı maddelerinin kullanımının malzeme mukavemeti ve dayanıklılığı üzerinde potansiyelini ortaya koymaktadır. Ancak, malzeme üretim sürecinde oluşabilecek boşluklu yapıların mekanik performans üzerindeki etkisi dikkate alınmalıdır. Bu çalışma, sürdürülebilir malzeme biliminin ilerlemesi açısından önemli bir adım olmuştur. Gelecekteki araştırmalar, yumurta

kabuğu tozu konsantrasyonunun yanı sıra üretim sürecindeki diğer faktörlerin optimize edilmesini içermeli ve malzeme yapısal bütünlüğünün daha derinlemesine incelenmesi gerekmektedir.

Abstract **–** In this study, an equivalent circuit model of a microwave sensor design based on two symmetrical split ring resonators is presented. The design process involves leveraging the unique electromagnetic properties of split ring resonators to achieve high sensitivity and selectivity in material characterization. The equivalent circuit model is meticulously developed to represent the sensor's behavior accurately. Detailed 3D simulations are conducted to validate the model and analyze the sensor's performance. The integration of advanced modeling techniques and simulation tools provides a comprehensive understanding of the sensor's operational principles. The sensor operates by inducing resonant frequencies that are highly sensitive to the dielectric properties of the material. By monitoring shifts in these resonant frequencies, precise material characterization is achieved. This study also explores the potential applications of the proposed sensor in various fields, including material science, engineering, and industrial quality control. The versatility and effectiveness of the sensor are highlighted through its ability to detect subtle changes in material properties, making it a valuable tool for non-destructive testing and real-time monitoring. The robustness of the design ensures consistent performance across different operating conditions. Overall, the integration of split ring resonators in microwave sensor design opens new avenues for advanced material characterization techniques, offering significant improvements in accuracy and reliability over traditional methods. This work lays the groundwork for future advancements and practical implementations of split ring resonator based sensors in diverse applications.

Keywords – microwave sensor, dielectric characterization, equivalent circuit model, split ring resonators, frequency variation sensor

I. INTRODUCTION

Microwave sensors have emerged as a vital tool in the realm of material characterization, offering a unique blend of precision, versatility, and non-invasiveness. These sensors operate in the microwave frequency range, typically from 300 MHz to 300 GHz, utilizing electromagnetic waves to probe the intrinsic properties of various materials [1]. The interaction of microwaves with materials provides valuable insights into their dielectric properties, moisture content, density, and other critical parameters. The growing interest in microwave sensors is driven by their broad application potential across multiple industries [2], including aerospace [3], automotive [4], healthcare [5], and environmental monitoring [6]. Advancements in microwave technology, such as the integration of machine learning algorithms, have significantly enhanced the accuracy, sensitivity, and speed of material characterization processes. Machine learning, a subset of artificial intelligence, has revolutionized data analysis by enabling the extraction of complex patterns and relationships from large datasets. When applied to microwave sensing, machine learning algorithms can optimize sensor performance, improve measurement accuracy, and

enable real-time monitoring of material properties [7]. This synergy between microwave technology and machine learning not only elevates the capabilities of traditional sensors but also opens new avenues for innovative applications and research.

The RLC equivalent circuit model is a fundamental concept in the design and analysis of microwave sensors, playing a pivotal role in understanding their electrical behavior. The RLC circuit model provides a simplified yet effective representation of the complex impedance characteristics of microwave sensors. This model enables the translation of physical phenomena into electrical parameters, facilitating the analysis and optimization of sensor performance. By mapping the sensor's frequency response to the corresponding RLC components, engineers and researchers can gain valuable insights into the sensor's functionality and identify ways to enhance its accuracy, sensitivity, and stability. Understanding the RLC equivalent circuit model is particularly important for the development of advanced microwave sensors used in material characterization. The non-invasive nature of these sensors makes them ideal for applications in various industries, including healthcare, aerospace, and environmental monitoring. However, accurately modeling their behavior requires a deep comprehension of how the sensor's components interact with the target material at microwave frequencies. Recent advancements in computational techniques and simulation tools have furthered the development of more precise RLC models, incorporating factors such as parasitic effects and material heterogeneity. Moreover, the integration of machine learning algorithms with RLC modeling has opened new avenues for enhancing sensor performance through data-driven optimization and real-time analysis.

II. Materials and Method

Microwave sensor design for liquid material dielectric characterization is proposed. The proposed sensor is planar and designed and fabricated with double sided 1.6 mm thick Rogers RO4003C substrate. The total sensor dimensions are 20 mm x 35 mm with a sensing area of 4 mm x 4 mm. The proposed sensor design is presented in Fig. 1 with top and ground layers.

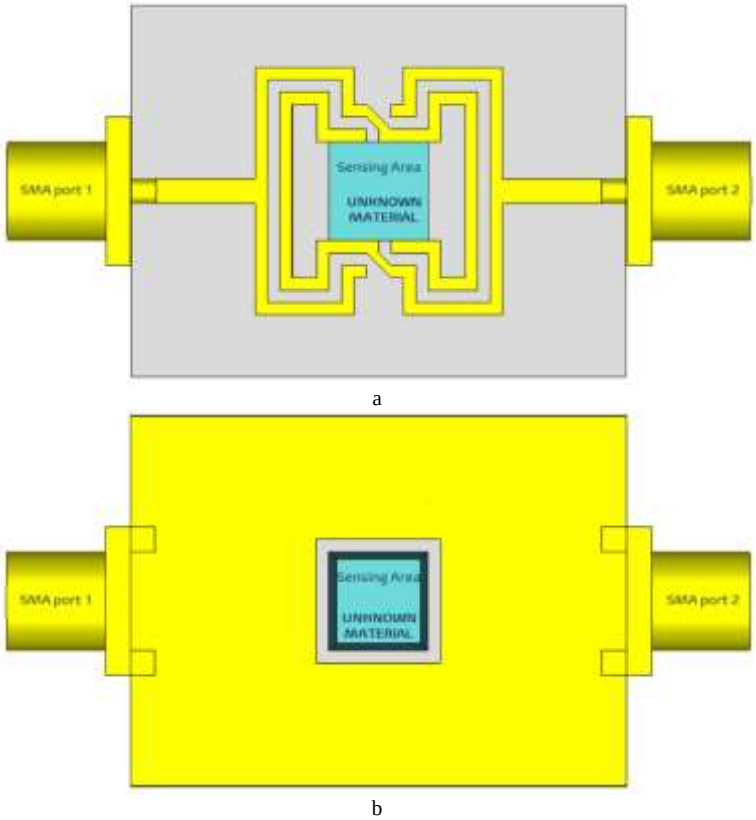

Fig. 1 Two symmetrical split ring resonators-based microwave sensor design.

The proposed sensor operates based on frequency variation, when liquid is added to the sensing area, a shift in the transmission parameter resonant frequency occurs. Thanks to this shift, the dielectric properties of the unknown material are obtained.

The transmission line, substrate, sensing area, and ground layer, which are the components of the proposed sensor design, are modelled as resistors, capacitors, and inductors in the equivalent circuit model. Parallel RLC elements are used in this model, the resonant frequencies of each RLC element are equivalent to the elements in the sensor model. The equivalent circuit model is shown in Fig. 2 and the values of the elements are presented in Tab. 1.

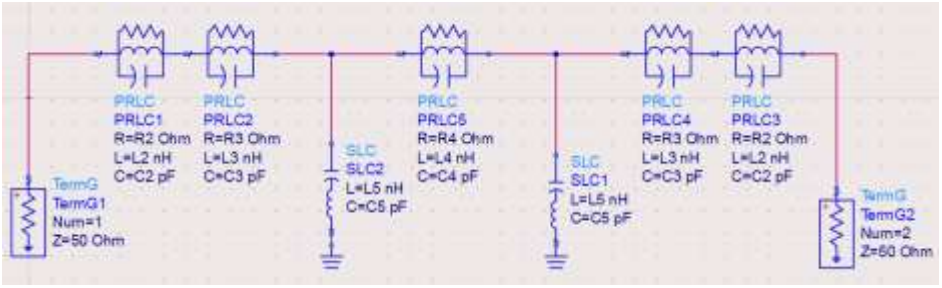

Fig. 2 Equivalent circuit model of the proposed microwave sensor.

III. Results and Discussion

The unique properties of SRRs are leveraged to achieve high sensitivity and selectivity in detecting material properties. The equivalent circuit model and 3D simulation results are discussed in detail to illustrate the sensor's performance and efficacy. Since the proposed sensor design is symmetrical between the two ports, the equivalent circuit model is also designed with symmetrical elements between the two ports. As a result, S_{11} and S_{22} values are equal and S_{12} and S_{21} values are equal. The magnitude and phase of the S-parameters from 3D physical model simulation, equivalent circuit simulation, and calculated using the equation are presented comparatively in the Fig. 3.

b

Figure **Hata! Belgede belirtilen stilde metne rastlanmadı.**.1: S-parameters of proposed MWS 3D model, equivalent circuit, and formulation results; (a) magnitude and (b) phase.

The graphs in the figure belong to the 3D model simulation, the equivalent circuit model, and the result calculated by integrating the elements in the equivalent circuit model into the formulation. All the results obtained are quite consistent with each other.

IV. CONCLUSION

The proposed microwave sensor design, based on two symmetrical split ring resonators, has demonstrated significant potential in material characterization applications. The equivalent circuit model developed for this sensor accurately represents its behaviour and performance, as validated by detailed 3D simulation results. The high sensitivity and selectivity achieved by leveraging the unique properties of SRRs underscore the efficacy of this design. The integration of advanced modelling and simulation techniques has been instrumental in providing a thorough understanding of the sensor's operational principles. This study highlights the potential of SRR-based microwave sensors in various fields, suggesting a wide range of applications in material science and engineering. Future work will focus on further refining the sensor design and exploring its capabilities in different material characterization scenarios.

Abstract – Colorectal cancer is a significant disease, ranking second among women and third among men worldwide. Due to the low sensitivity and toxicity of traditional treatment methods, new and alternative therapeutic approaches are being investigated. This study aims to develop natural therapeutic methods using protein-rich compounds from the venom of *Macrovipera lebetinus* (*M. lebetinus*), commonly known as the Levant viper, found in the Southeastern Anatolia region of Turkey. The characterization of the venom, rich in cytotoxic enzymes, non-enzymatic proteins, and peptides affecting various receptors on the DLD-1 colon cancer cell line, was performed. Venom samples obtained from the Levant viper were lyophilized and then characterized using HPLC, SDS-PAGE, and spectroscopic methods. Within the venom, 15 different protein fractions, including metalloproteinases, serine proteases, L-amino acid oxidase, C-type lectin, and dimeric 5' nucleotidase/phosphodiesterase, were identified based on their molecular weights. The cytotoxic properties of the venom were evaluated using the Alamar blue assay. The IC_{50} value for the DLD-1 colon cancer cell line was calculated to be 6.12 µg/mL, while the IC_{50} value for the healthy CCD-18Co cell line was 15 µg/mL. The higher cytotoxic effect of the Levant viper venom on colon cancer cells compared to healthy colon cells suggests its potential use in combating cancer cells. In conclusion, the high cytotoxic effect of *Macrovipera lebetinus* venom on colon cancer cells indicates that this natural compound could be considered a potential alternative in colorectal cancer treatment.

Keywords – Macrovipera lebetinus, DLD-1, Cytotoxicity, Colorectal Cancer, Characterization

I. INTRODUCTION

Colorectal cancer has been shown to cause the death of 935,000 people, according to International Agency for Research on Cancer (IARC) statistics announced in 2020. It is the third most common disease in men and the second most common in women worldwide, and it is an important disease that is difficult to treat [1]. Patients receiving cancer treatment often do not respond to traditional treatment methods. There are many reasons for this. One of the first reasons is that cancer cells behave like stem cells and transform into different cancer cells. These tumors initiate the process of angiogenesis to obtain oxygen and nutrients. After the disintegration of the basement membrane, migration and proliferation of the endodel cells, lumen formation, new blood vessels connect to the existing circulation and transform into different tumor cells by reshaping the extracellular matrix. Tumor cells that differentiate after such a process often do not respond to traditional treatments [2]. The second reason is that cancer patients being treated have a low immune system, causing damage to healthy cells during treatment, and the process showing non-specific cytotoxic properties is insufficient for treatment [3]. For this reason, the need for natural methods that can be used in cancer treatment and have fewer side effects is increasing. From past to present, many researchers have focused on natural poisons, especially snake venom and venom peptides [4]. These poisons are known for

their potent biological effects and can bind with high affinities to various molecular targets, making them pharmacologically important [5]. *M. lebetinus* snakes, first described by Linnaeus, live in a wide geography from Western and Central Asia to North Africa. They are found in Turkey, especially in the Southeastern and Eastern Anatolia regions [6, 7]. They are popularly known as "big vipers". The species has many subspecies accepted in its taxonomy. *M. l. lebetinus*, *M. l. obtusa*, *M. l. transmediterranea*, *M. l. turanica* and *M. l. chernovi* is among the known subspecies. These snakes usually exceed 2 meters in size and weigh around 3 kg. They are reptiles whose upper parts are generally gray or dusky brown, while their middle parts are reddish in color. Their tails are short and suddenly pointed [6, 8]. These protein/peptide poisons consist of toxic proteins such as neurotoxins and cardiotoxins, non-poisonous proteins, enzymes, enzyme inhibitors, biological amines and ions [9, 10]. When previous studies were examined, Viperidae family member snake venoms contained; phospholipase A2 (PLA2), LAAO enzymes, phosphodiesterases (PDE), C-type lectin, Kunitz-type protease inhibitor and dimeric degradants showed cytotoxic properties in different cancer cell lines [11-13]. However, in previous studies, the cytotoxic effects of all protein-containing compounds found in *M. lebetinus* venom, affecting the receptors on cancer cells without purification, were not investigated. In this study, the cytotoxic effects of snake venom, popularly known as big viper, obtained from Şanlıurfa Province in the Southeastern Anatolia Region of Turkey, on healthy human colon cells and colon cancer cells were examined. Through characterization studies, the protein contents that constitute these mechanisms of action have been identified.

II. MATERIALS AND METHOD

II.I. Collection of *Macrovipera lebetinus* Snake Species and Milking Its Venom

M. lebetinus species snakes were collected from Soğmatar Village of Şanlıurfa. The *M. lebetinus* species venom sample used in this study was obtained from Aydın Adnan Menderes University, Department of Biology. *M. lebetinus* venom was collected according to the method specified for vipers by Mirtschin et al. (2006). First, the snake was bitten into a sterile collection container covered with parafilm, and the venom glands were squeezed and the milking process was performed. Then, the expressed venom was taken with a micropipette and transferred to a sterile Eppendorf tube. This process was done twice a month to obtain a sufficient amount of poison. Expressed venom was stored at −80 °C.

II.II. Lyophilization Studies of *Macrovipera lebetinus* Snake Venom

In this study, lyophilization was carried out to ensure that snake venom did not lose its potency and stability and to obtain more accurate findings. First, the poison was filtered and transferred into vials. Then, the poison was lyophilized below -55°C and turned from liquid to solid. Lyophilized venom was stored at -80°C.

II. III. Characterization Studies of *Macrovipera lebetinus* Snake Venom

II. III. I. HPLC Analysis Studies

Protein fractions in *M. lebetinus* venom were determined by HPLC method. Analyzes were performed on a C18 reverse phase column (Inert Sustain AQ-C18 Analytical Columns, 5 µm, 4.6 mm I.D. x 250 mm) with the Shimadzu Prominence-i LC2030 3D Plus system. The venom sample was analyzed with Solvent A (0.12% trifluoroacetic acid - TFA in water) and Solvent B (TFA in 0.10% acetonitrile) on a 0-60% low gradient program at a concentration of 1ppm at a flow rate of 1 mg/mL. The PDA detector scanned the samples at a wavelength of 280 nm.

II. III. II. Spectrum Analysis Studies

For spectrum analysis of snake venom, a Shimadzu UV-1900i model spectrophotometer was used and wavelengths between 190 nm and 400 nm were scanned. Additionally, a Bruker brand spectrometer with Fourier transform infrared (FT-IR) vibration spectroscopy was used to identify various chemical groups and the analysis was carried out in the range of 3500-500 cm-1.

II. III. III. SDS-PAGE Analysis Studies

Proteins in *M. lebetinus* venom were separated according to their molecular weight using sodium dodecyl sulfate polyacrylamide gel electrophoresis (SDS-PAGE) [14, 15]. The proteins in the venom were separated with the help of ERB solution in 4% stacking and 12% separating gels. Then, after staining with Coomassie Brilliant Blue dye, protein images were visualized using the Syngene Imaging System.

II. IV. Cell Culture Studies

Colon cancer cell line DLD-1 and human healthy colon cell line CCD-18Co (American Type Culture Collection, Rockville, MD) were obtained from the company for cytotoxicity studies. The cells were incubated in an incubator containing 10% FBS, 2 mM L-glutamine and 1% penicillin streptomycin (Pen/Strep) added to RPMI-1640 and Eagle's Minimum Essential Medium (EMEM), which are nutrient media, respectively, at 37°C and 5% CO_2. has been enlarged. Cells that reached sufficient size were planted in a 96-well plate at 1 x 104 cells and treated with *M. lebetinus* snake venom in different concentration ranges of 1-20 µg/mL. It was determined using the Alamar blue method to calculate the poison concentration that inhibited cell viability by 50% (IC_{50} value) after 48 hours. Then, fluorescence measurements were taken with a BioTek Synergy HTX microplate reader at an excitation wavelength between 530-560 nm and an emission wavelength of 590 nm. Sigmoidal curves were drawn to determine cell death rates.

III. RESULTS

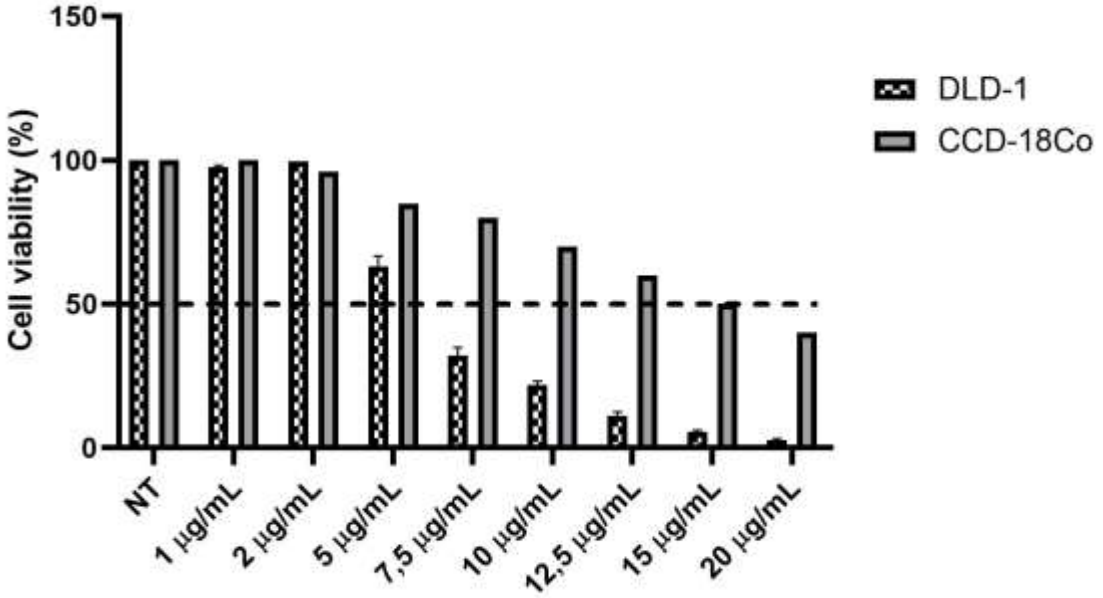

Fig.1. Cytotoxicity analysis studies of *M. lebetinus* venom. Bar graph of dose-dependent inhibition of DLD-1 and CCD-18Co cells measured by the Alamar Blue method after treatment with venom

Characterization studies were carried out on the snake venom of the *M. lebetinus* species, which is a member of the Viperidae family, and its bioactive content was determined. Protein fractions of the crude venom were made visible by SDS-PAGE method, 15 different protein fractions in the range of 11-245 kDa according to their molecular weight. In order to separate, identify and measure the active components in the venom in more detail, 29 protein fractions were used with High Performance Liquid Chromatography (HPLC). Different protein fractions were detected. The wavelength that became visible by UV-VIS Spectrum measurement gave maximum absorption at 280 nm. Fourier transform infrared (FT-IR) spectra identified 11 important peaks representing the chemical groups found as a result of the measurement between 3500-500 cm-1 wavelengths. The majority of the characteristic region lies between 1800 and 500 cm-1. Cell culture studies were performed to determine the cytotoxicity of snake venom on cells. The cytotoxic effects of *M. lebetinus* venom on colon cancer cell line DLD-1 cells and healthy human colon cell line CCD-18Co cells treated at different concentrations were determined by the Alamar Blue method. IC50 values of DLD-1 and CCD-18Co cells were found to be 6.12 µg/mL and 15 µg/mL. *M. lebetinus* venom treated in a dose-dependent manner caused a decrease in the viability of DLD-1 and CCD-18Co cells. A significantly higher cytotoxic effect was observed in the DLD-1 colon cancer cell line than in healthy human colon cells.

IV. DISCUSSION

In this study, the cytotoxic properties of DLD-1, a colon cancer cell line, and CCD-18Co, a healthy colon cancer cell line, treated with *M. lebetinus* snake venom, were investigated. Venom-treated DLD-1 and CCD-18Co cells reduced the number of viable cells in a dose-dependent manner. IC50 values (Fig.1) were calculated as 6.12 µg/mL in DLD-1 and 15 µg/mL in CCD-18Co. In line with the results obtained from the research, it was found that healthy human colon cells had a very low cytotoxic effect compared to the colon cancer cell line. Characterization studies of the poison were carried out to further investigate the bioactive protein-containing substances that are effective in its cytotoxic effect on colon cancer cells. Protein-containing substances in the venom were separated by SDS-PAGE analysis according to their molecular weight. In the acrylamide gel, 15 different protein fractions were determined to be in the range of 11-245 kDa. When our band images are compared with the literature; Metalloproteases and serine proteases

weighing 60 kDa and 50 kDa, serine proteases 30 kDa, metalloprotease types and vascular endothelial growth factor weighing 25 kDa, C-type lectin weighing around 18 kDa, dimeric L-amino acid oxidase weighing about 125 kDa and Various peptide-containing protein substances have been found, such as dimeric 5' nucleotidase/phosphodiesterase [16, 17]. t is thought that these bioactive proteins have cytotoxic properties by affecting different specific receptors on cell surfaces. [18, 19]. In order to determine the protein compounds in the venom in more detail, 29 different peaks were detected with High Performance Liquid Chromatography (HPLC). UV-VIS Spectrum measurement of snake venom showed compatibility with literature studies and gave the maximum absorption wavelength at 280 nm [20, 21]. The analysis of the chemical groups in the poison was carried out by FT-IR spectroscopic characterization study. In our study, Amide A, N–H stretching of proteins and amines (mainly), with contribution from O–H stretching of carbohydrates, CH_3 asymmetric stretching, Asymmetric CH_2 stretching, Symmetric CH_3 stretching, Amide I; 80% C=O stretching, 10% N–H bending, 10% C–N stretching, N-O stretching, CH_3 asymmetric bending, CH_3 symmetric bending, PO_2^- antisymmetric stretching (non H-bonded), PO_2^- symmetric stretching (fully H -bonded) contents found [22-28]. Since the results of FT-IR analysis of *M. lebetinus* snake venom compared with the Viperidae species are compatible with the literature; It consists of peptide structures, amines, nucleosides, carbohydrates and inorganic substances [29]. C-O and C-C stretching bonds may originate from the carbohydrate parts of nucleosides, nucleotides and venom glycoproteins present in the venom [29-32]. PO_2^- stretching bonds confirm the presence of ribonucleic acid (RNA) and deoxyribonucleic acid (DNA) substances found in the venom gland of snake venom [33, 34].

V. CONCLUSION

In this study, we aimed to find substances that affect the receptors on cancer cells and lead them to death, since snake venom has a cytotoxic effect on the colon cancer cell line DLD-1 compared to the healthy colon cell. These protein-containing substances were identified by performing various characterization analyzes such as SDS-PAGE, HPLC, UV-VIS spectroscopy and FT-IR spectroscopy. It is thought that it will contribute to future research on the effects of *M. lebetinus* species snake venom in cancer treatment.

Özet – Gelişen teknolojinin kullanımı ile birlikte yüksek katma değerli ürün ve hizmetlere odaklanılmıştır. Artan nüfus, azalan kaynaklar ve rekabet, maliyet kontrolünü ve israfı azaltmayı önceliklendirmektedir. Bu noktada, Yalın üretim, maliyet, işçilik ve israfı minimize ederek kârı artırmayı hedefleyen bir çözüm olarak ortaya çıkmıştır. Yalın üretim müşteri için değer yaratmayan her şeyi ortadan kaldırmayı ve en uygun maliyet seviyesini yakalamayı amaçlamaktadır. Teknolojinin gücüyle birlikte, güçlü tasarımlar ortaya çıkmış olsa da günümüzde rekabet arttığı için, teknoloji, ergonomi ve estetiği bir araya getiren yeni ve yaratıcı tasarımlar yapmak artık tek başına yeterli değildir. Bu tasarımların en uygun maliyetle üretimi de sağlanmalıdır. Yapılan çalışma, tasarım faaliyetlerinin Yalın üretim teknikleri kullanılarak fazladan maliyet yaratmadan mevcut üretime nasıl adapte edileceğini ve katma değer yaratacağını ele almaktadır. Çalışmada, yalın üretimin tarihi, felsefesi ve teknikleri ayrıntılı olarak açıklanmış; kavramsal tasarım süreçleri işletilerek gerçek bir tasarım değişikliği, gerçek bir üretim hattına en düşük maliyetle uyarlanmıştır.

Anahtar Kelimeler – Yalın Üretim, Tasarım, Yalın Tasarım

I. GİRİŞ

Günümüzde artan rekabet ve azalan kaynaklar, üreticiler için maliyet kontrolünü hayati önem taşıyan bir faktör haline getirmiştir. Bir ürünün piyasa fiyatının üzerinde satılması, organizasyonun başarısını olumsuz etkileyebilir. Bu nedenle, ürünün tasarımından üretimine kadar geçen süreçte prototipleme, malzeme, işçilik, hata ve benzeri maliyetleri azaltmak için yalın üretim teknikleri kullanılmaktadır. Yalın üretim, tek bir unsura odaklanabileceği gibi birden fazla unsura da odaklanabilir. Bu unsurların en başta geleni ise tasarımdır. Ürünün tasarımında meydana gelebilecek değişimler, üretim maliyetini doğrudan etkilemektedir. Tedarik edilen hammadde, insan kaynağı, üretim yöntemi ve üretim hatları doğrudan etkilenmekte, bu da maliyet performansını olumsuz etkilemektedir. Üretici firmalar, tasarımda değişiklik gerektiğini fark etseler bile, zaman ve maliyet kaygılarından dolayı bu değişikliklerde tutucu davranabilirler. Özellikle ülkemizde yalın üretimin yaygın olmaması, bu problemleri üreticiler için daha da can sıkıcı hale getirebilmektedir. Bu çalışma, ürün tasarımında yaşanacak değişikliklerin yalın üretim tekniklerinden herhangi biri/birileri kullanılarak en az maliyetle üretim hattı durmadan nasıl bütünleşmiş edilebileceğinin cevabını aramaktadır. Çalışmada, yalın üretim tekniklerinden biri kullanılarak hali hazırda üretilen ve üretim hattındaki bir ürünün bir parçasında tasarım değişikliği yapılmıştır. Daha önce yalın üretim ve tasarım ilişkisi adına hiç çalışma yapılmamış bir ortamda oldukça faydalı sonuçlar elde edilmiştir.

II. MATERYAL VE YÖNTEM

A. Yalın Üretim

Yalın üretim, israfı minimize ederek değer yaratmayı amaçlayan bir üretim felsefesidir. İlk olarak Toyota tarafından geliştirilen bu sistem, üretim süreçlerinde verimliliği artırmayı, maliyetleri düşürmeyi ve müşteri memnuniyetini artırmayı hedefler. Yalın üretim, gereksiz adımları ortadan kaldırarak sadece değer katan faaliyetlere odaklanır [1] [2]. Maliyet azaltma, verimlilik artışı, kalite iyileştirme, stok azaltma, çalışan memnuniyeti, müşteri memnuniyeti arttırma gibi faydaları vardır [3] [4]. Yalın üretim, birçok sektörde ve alanda kullanılmaktadır. Özellikle kullanıldığı alanlar otomotiv, elektronik, sağlık, gıda ve içecek, hizmet sektöründe kullanılmaktadır [5] [6]. Yalın üretimde en çok Kaizen, 5S, Kanban, Değer Akış Haritalama (VSM), Tam Zamanında Üretim (JIT) gibi yöntemler kullanılmaktadır [7] [8]. Yalın üretimde en çok başlangıç maliyetleri, kültürel direnç, uygulama zorlukları ve risk yönetimi gibi riskler ile karşılaşılmaktadır [9] [10]. Gelecekte yalın üretim, yapay zekâ, dijitalleşme ve Endüstri 4.0 ile daha da bütünleşmiş hale gelecektir. Akıllı fabrikalar, IoT (Nesnelerin İnterneti) ve büyük veri analitiği gibi teknolojiler, yalın üretim süreçlerini daha verimli ve esnek hale getirecektir. Ayrıca, sürdürülebilirlik ve çevreye duyarlılık konuları da yalın üretimin gelecekteki uygulamalarında önemli bir rol oynayacaktır. Yalın üretim, sürekli iyileştirme ve verimlilik odaklı yapısı sayesinde, gelecekte de rekabet avantajı sağlamak isteyen organizasyonlar için vazgeçilmez bir strateji olmaya devam edecektir [11] [12].

B. Yalın Tasarım

Yalın üretim ve tasarım, modern endüstriyel faaliyetlerin temel taşlarından kabul edilir. Her ikisi de üretim süreçlerini iyileştirmeyi, verimliliği artırmayı ve son kullanıcıya daha iyi ürünler sunmayı hedefler. Örneğin, bir araba tasarımında, kullanıcıların gereksinimlerini karşılayacak şekilde iç mekân düzenlemesi yapılması, yalın üretim sürecinde parça ve malzeme israfını önler. Bununla birlikte, yalın üretimin tasarıma etkisi sadece ürünlerin fiziksel tasarımıyla sınırlı değildir. Yalın düşünce tarzı, süreçlerin optimize edilmesi ve verimliliğin artırılmasıyla ilgilidir. Bu nedenle, yalın prensipleri endüstriyel tasarım sürecinin her aşamasında uygulanabilir. Örneğin, ürün tasarımı aşamasında, yalın düşünce ürünün optimize edilmesine yardımcı olabilir ve üretim sürecindeki gereksiz adımların ve israfın azaltılmasını sağlayabilir. Aynı şekilde, üretim sürecinde, yalın prensipler, malzeme akışını iyileştirerek ve atıkları azaltarak endüstriyel tasarımı desteklemektedir. Endüstriyel tasarımın yalın üretim üzerindeki etkisi, ürünlerin pazara daha hızlı bir şekilde sunulmasını sağlar. İyi tasarlanmış ürünler, üretim sürecindeki gereksiz adımları ve gecikmeleri azaltarak üretim süresini kısaltabilir. Ayrıca, kullanıcıların ihtiyaçlarına daha iyi uyum sağlayan ürünler, rekabet avantajı sağlayarak pazar payını artırabilir. Yalın üretim ve endüstriyel tasarım arasındaki bu görevdeşlik, şirketlerin daha hızlı ve daha esnek bir şekilde piyasaya sürmelerine olanak tanımaktadır. Sonuç olarak, yalın üretim ve tasarım arasındaki bağlantı, etki ve ilişki oldukça derindir. Her ikisi de ürünlerin daha iyi tasarlanmasını, üretim süreçlerinin optimize edilmesini ve sürdürülebilirlik açısından daha iyi sonuçlar elde edilmesini sağlar [13] [14] [15] [16].

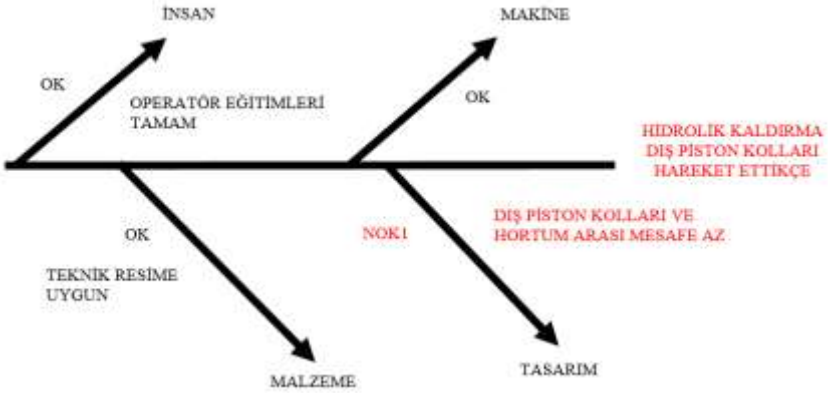
C. Kaizen Yalın Tasarım Bakış Açısıyla Üretim Hattı Adaptasyonu

Hidrolik kaldırma makineleri üzerine üretim yapan bir fabrikada uygulama gerçekleştirilmiştir. Hidrolik kaldırıcı hortumlarının sürtünmesi ile aşınması sonucunda tasarım olarak belirlenen bir hata önce kavramsal tasarım ve sonra sistematik tasarım yaklaşımı ile ele alınarak tasarımsal bir geliştirme uygulanmış olup üretim hattı durmadan minimum maliyet ile çözüme kavuşturulmuştur. Metot olarak yalın üretim tekniklerinden Kaizen seçilmiştir.

D. Bir Hidrolik Kaldırıcı Hortumunun Yeniden Tasarımı

Tablo 1 5N+1K Soruları

5N+1K	Mevcut Durum
Ne?	Hidrolik kaldırıcı hortumlarının sürtünmesi sonucu aşınması
Nerede?	Bimal Tezgâhı Hidrolik Kaldırıcı Testi
Ne Zaman?	FMEA sürecinde yapılan değerlendirme esnasında
Ne kadar?	PFMEA sürecinde tüm gövdelerde
Nasıl?	Hidrolik kaldırıcı kolları her kalktığında hortumlar dış pistona sürterek aşınmaktadır
Kim?	Burada uygulanabilir değildir.



Şekil 1 Hidrolik Kaldırma Kolları Tasarımı Kök Neden Analizi

E. Kavramsal Tasarım

Tablo 2 İhtiyaç Listesi - Tasarım Şartnamesi

Sıra No	**İstenilen özellikler / İhtiyaçlar (İstek/Arzu)**
1.	Sürtünme olmaması **(İ)**
2.	Aşınma olmaması **(İ)**
3.	Eğimli/engebeli ortama uyum göstermeli **(A)**
4.	Hortumların ideal uzunluğa sahip olması **(A)**
5.	Maliyeti düşük olmalı **(İ)**
6.	Tasarımı basit olması **(A)**
7.	Montajı kolay olmalı **(İ)**
8.	Ekstradan malzeme kullanılmaması **(A)**
9.	Üretim hattını aksatmamalı **(İ)**
10.	Güvenli olması **(İ)**

Hidrolik Kaldırma Kolları Hortum Tasarımı kavramsal tasarımı için hazırlanmış ihtiyaç listesi Tablo 2'de görülmektedir. Bu ihtiyaç listesinde tasarlanacak ürünün; maliyetinin düşük olması, aşınmaması tasarımın basit olması gibi özellikler yer almaktadır. Bu aşamada kavramsal tasarım için gerekli olan ve ihtiyaç durumunda esnetilebilecek özellikler belirtilmiştir. İhtiyaç listesinde yer alan özellikler, İstekler (İ) ve Arzular (A) şeklinde gösterilmiştir. İstekler tasarım için gerekli olan ve zorunlu özellikleri belirtirken, arzular ise şartlar el verdiği ölçüde karşılanmalıdır.

Tablo 3 Morfolojik Kart

Çözüm İlkeleri / Alt Fonksiyonlar		1	2	3
1	**Malzeme Türü**	Çelik Tel Destekli Kauçuk	Termoplastik	Çelik Tel Örgülü
2	**Malzeme Tipi**	Silindirik	Helezonik	Spiral
3	**Bağlantı Tipi**	Paslanmaz Çelik Rakor	Düz Rakor	
4	**Renk**	Siyah		

Tablo 4 Kavramsal Tasarım Seçenekleri ve İlişkili Alt Çözümler

Seçenek 1	1.1 – 2.1 – 3.1 – 4.1	Seçenek 6	1.2 – 2.2 – 3.1 – 4.1
Seçenek 2	1.1 – 2.1 – 3.2 – 4.1	Seçenek 7	1.2 – 2.2 – 3.2 – 4.1
Seçenek 3	1.1 – 2.2 – 3.1 – 4.1	Seçenek 8	1.3 – 2.1 – 3.1 – 4.1
Seçenek 4	1.1 – 2.2 – 3.2 – 4.1	Seçenek 9	1.3 – 2.2 – 3.1 – 4.1
Seçenek 5	1.2 – 2.1 – 3.1 – 4.1	Seçenek 10	1.3 – 2.2 – 3.2 – 4.1

F. Kavramsal Tasarım Ön Değerlendirilmesi (Seçim Kartı)

Tablo 3 ve 4'teki morfolojik kart ile oluşturulan on farklı seçenek arasından daha iyi olanları belirlemek amacıyla; tüm işlevlerle uyumlu olma, şartname isteklerini karşılama, üretile bilirlik, müsaade edilebilir maliyet, emniyet şartlarını doğrudan karşılama, kolay tasarım ve yeterli bilgi ölçütleri temel alınarak bir ön eleme işlemi yapılmıştır. Bu işlem için seçim kartı kullanılır (Tablo 6). Her bir tasarım seçeneği için belirlenen ölçütlere göre son sütunda bir karar verilmektedir. Bu işlem sonucu Tablo 5'de olumlu (+) işaretli olan Ç1, Ç3 ve Ç5 seçenekleri daha iyi tasarımlar olarak belirlenmiş ve diğer yedi seçenek ise elenmiştir. Ç1 tasarımı, çelik örgü destekli kauçuk yüksek basınca dayanıklı silindirik boru şeklinde ve suya, ısıya ve çamura dayanıklı paslanmaz çelik rakorlar ile bağlanmış bir tasarımdır. Ç3 tasarımı ise Ç1 tasarımının silindirik boru yerine helezonik bir boru ile bağlanmış hali olarak ortaya çıkmıştır. Ç5 tasarımı ise Ç1 tasarımının çelik örgü destekli kauçuk yerine termoplastik malzeme ile düşünülmüş hali olarak ortaya çıkmıştır.

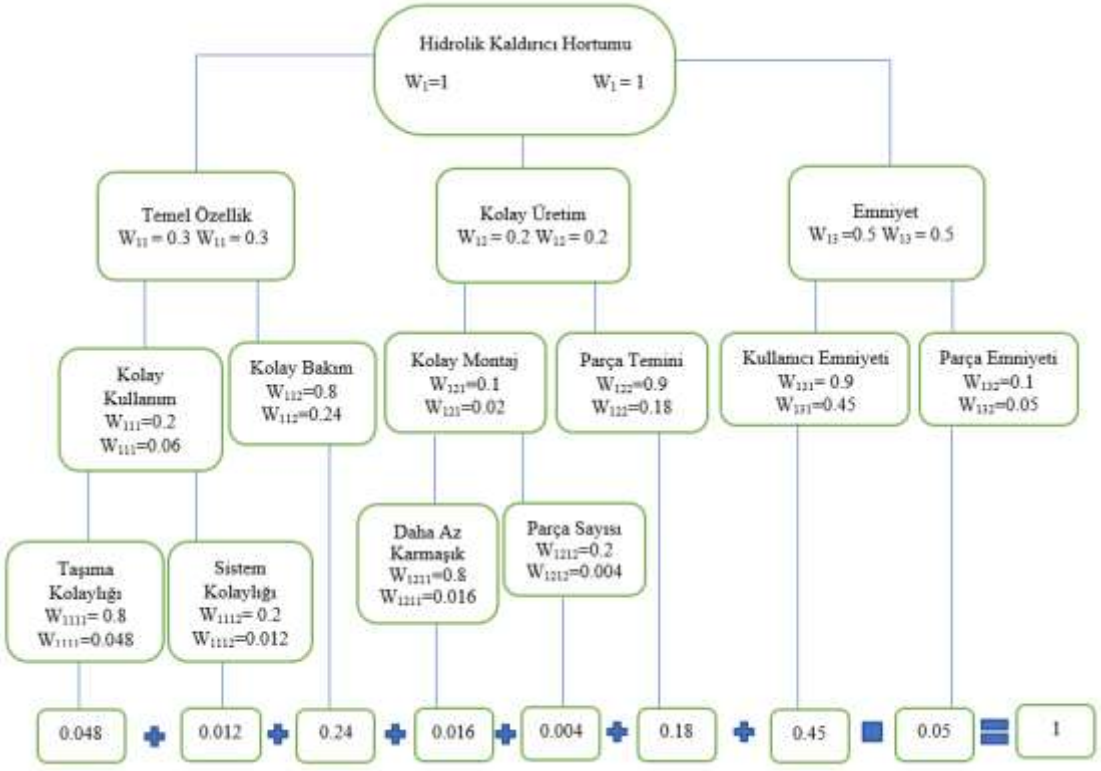
G. Amaçlar Ağacı ve Değerlendirme Tablosu

Bu aşamada üç tasarım seçeneği daha detaylı bir şekilde incelenerek ek seçim işlemleriyle önce ikiye düşürülecek ve sonra da en ideal çözüme ulaşılacaktır. Bu ek seçim işlemlerinde önce Şekil 7'de görünen amaçlar ağacı oluşturulmuştur. Önem durumuna göre kriterlere yüzde değeri verilip bir alt basamakta bu tüm değer kriterlere paylaştırılmaktadır. Bu işlem en alt basamağa kadar devam etmektedir. En alt düzeyde kriter değerlerinin toplamı 1'e (veya 100'e) eşit olmalıdır [18]. Ek seçim işlemlerinin ikinci aşamasında ise Tablo 6'da gösterilen değerlendirmede; ilk olarak kriterler parametrelere dönüştürülmektedir. Kalan son iki tasarım seçeneğine bu parametrelere uygunluk durumuna göre puanlar verilmektedir. Seçenek puanları toplandığında ise birinci ve ikinci seçeneğin beşinci seçenekten daha yüksek toplam puana sahip olduğu görülmektedir. Bu işlem sonucu seçenek sayısı ikiye inmektedir. Buradaki son işlem bu iki seçeneğe ait Şekil 8'deki değer profil diyagramı hazırlanmasıdır. Bu grafikte kriterlerin önem durumuna (yüzdelik orana) göre dikdörtgen kalınlıkları belirlenmektedir. Kalan son iki seçeneğin kriterlerden aldıkları puanlar,



Şekil 2 Ek Seçim İşlemi: (a) Amaçlar Ağacı

dikdörtgenler ile şematik gösterilmektedir. Grafikte taralı olarak gösterilen alanlar seçeneklerin zayıf noktalarını belirtmektedir. Taralı alanı daha fazla olan $Ç_3$ seçeneği elenerek en ideal tasarım $Ç_1$ olarak seçilmiştir [18].

III. BULGULAR

Hidrolik kaldırma makineleri üreten bir fabrikada gerçekleştirilen bu çalışmanın bulguları, Kaizen yaklaşımı ve yalın tasarım prensiplerinin üretim hattına adaptasyonunun etkinliğini göstermektedir. Hidrolik kaldırıcı hortumlarının sürtünme nedeniyle aşınması sorunu, yalın tasarım prensipleri kullanılarak tespit edilmiştir. Kavramsal tasarım ve sistematik tasarım yaklaşımlarıyla bu sorun ele alınmış ve tasarımsal bir geliştirme uygulanmıştır. Sorunun çözümünde Kaizen metodu kullanılmıştır. Bu metodun seçilmesi, sürekli iyileştirme ve küçük adımlarla büyük sonuçlar elde etme felsefesine dayanır. Kaizen uygulaması sayesinde, üretim hattı durdurulmadan, minimum maliyetle sorun çözülmüştür. Sorunun çözülmesiyle birlikte, üretim sürecindeki gereksiz duraklamalar ve aksaklıklar minimize edilmiştir. Bu durum, üretim hattının verimliliğinde belirgin bir artışa yol açmıştır. Üretim hattının durdurulmadan yapılan iyileştirme çalışmaları, işletmenin maliyetlerini önemli ölçüde düşürmüştür. Minimum maliyetle yapılan bu iyileştirme, işletme için ekonomik bir avantaj sağlamıştır. Hidrolik hortumların aşınma sorununun giderilmesi, nihai ürün kalitesinde bir iyileşme sağlamıştır. Daha dayanıklı ve güvenilir ürünler üretilerek müşteri memnuniyetinin artırılması hedeflenmiştir. Kaizen yaklaşımı, çalışanların sürece aktif katılımını teşvik etmiş ve onların önerileri doğrultusunda iyileştirmeler yapılmıştır. Bu katılım, çalışan memnuniyeti ve motivasyonunu artırmıştır. Üretim hattının durdurulmadan iyileştirme yapılması, üretim sürekliliğini sağlamış ve üretim kayıplarını önlemiştir. Bu süreklilik, siparişlerin zamanında teslim edilmesine ve müşteri memnuniyetinin korunmasına katkı sağlamıştır.

IV. TARTIŞMA

Yalın tasarım ve Kaizen metodolojilerinin birlikte kullanılması, üretim süreçlerinde verimlilik ve kaliteyi artırma konusundaki etkinliğini daha da pekiştirmektedir. Örneğin Otomotiv sektöründeki yalın üretim ve tasarım uygulamalarının tarihçesi ve gelişimi üzerine yapılan çalışmalar, bu metodolojilerin uzun vadeli sürdürülebilir rekabet avantajı sağladığını ortaya koymaktadır [19]. Bir başka örnek olarak elektronik sektöründe yalın tasarım ve Kaizen uygulamaları, ürün geliştirme süreçlerini hızlandırarak pazara sunma süresini kısaltmış ve üretim maliyetlerini düşürmüştür [20].

Bu çalışmanın bilime katkıları, yalın tasarım ve Kaizen metodolojilerinin entegre kullanımıyla çeşitli yönlerden derinlemesine incelenmesiyle ortaya çıkmaktadır. Çalışma, yalın tasarım ve Kaizen prensiplerinin farklı sektörlerde ve üretim süreçlerinde uygulanabilirliğini ve etkinliğini teyit eder. Bu, teorik bilgi birikimine pratik uygulama örnekleri ekleyerek literatürü zenginleştirir. Yalın tasarım ve Kaizen'in süreç iyileştirme ve verimlilik artırma konularındaki etkinliğini gösteren örnekler, diğer araştırmalara ve uygulamalara ilham verir. Bu, işletmelerin operasyonel süreçlerde yenilikçi çözümler geliştirmesine katkı sağlar. Yalın tasarımın ürün geliştirme süreçlerine entegrasyonu, pazara sunma süresini kısaltır ve ürün kalitesini artırır. Bu, işletmelerin pazar rekabetinde avantaj sağlamasına yardımcı olur ve literatürde ürün geliştirme süreçlerine yönelik yeni bakış açıları sunar. Yalın tasarım ve Kaizen uygulamalarının çevresel sürdürülebilirlik üzerindeki etkileri, çevre dostu üretim süreçleri ve sürdürülebilir endüstriyel çevre sunar.

V. SONUÇLAR

Bu çalışma ile üretim hatlarında tasarımdan meydana gelen değişikliklerde, üretim hattının durdurulmadan veya herhangi bir maliyet gerektirecek değişikliğe uğratmadan devamı sağlamanın çözümü

aranmıştır. Bir üretim hattındaki bir parça tasarımının değişikliği göz önüne alınarak yapılan çalışmada herhangi bir maliyet yaratmadan tasarım değişikliği sisteme monte edilebilmiş ve somut kazanç sağlanmıştır. Bu sonuç önemlidir çünkü günümüz ekonomik koşullarında maliyetlerin her kalemde her türlü arttığı (hammadde, enerji, iş gücü ve benzeri) ortamda her bir parçadan kazanç sağlamak toplam ürün yönetiminde çok avantaj sağlamaktadır. Bu araştırma hali hazırda mükemmele yakın bir tesiste yapıldığı için daha fazla kazanımların olup olmadığı hususu başka tesislerde de yapılarak bir başka çalışmanın konusu olabilir. Bu sonuç daha ileri düzeylerde ve farklı ortamlarda araştırma yapma açısından önemlidir. Bu araştırma sonuçları istenildiğinde veya talebe göre parasal değer olarak belirtilebileceği gibi zaman, hammadde, iş gücü, enerji gibi diğer faktörler açısından da ifade edilebilir. Bu çalışma, yalın üretim konusunda daha önce yapılan daha önceki çalışmalarla da paralellik gösterecek şekilde sonuçlanmıştır. Yalın üretim, son kullanıcının ilgilenmediği alanlardaki kazançları ile bu araştırmada da olumlu sonuçlar vermiştir. Bu araştırma, endüstriyel tasarım uygulamalarının gerçek hayatta maliyet kaynaklı karşılaşabileceği sorunların üstesinden gelme noktasında bilimsel bir yol açmıştır. Daha inovatif daha faydalı tasarımların maddi kaygılardan dolayı önünün kesilmesi veya tasarım değişikliklerinden kaçınılması gibi durumlarda yalın üretim tekniklerini bir çözüm olarak ortaya koymuştur. Gelişen teknoloji ve endüstri 4.0 yaklaşımları endüstriyel tasarımı her ne kadar daha da önemli hale getirse de günümüz ekonomik koşulları tasarımcıları maliyet konusunda gittikçe daha da zorlayacaktır. Bu noktada bu çalışma tasarımcılara bir fikir verecektir.

**(icetiner@mehmetakif.edu.tr)*

Abstract – Mobile and IoT devices have become very common and affordable with the development of technology in recent years. Naturally, many software programs have been developed and are being developed in this field. With the increase in devices with Android operating system, software that opens the application data of devices with this operating system to the public without permission and removes device permissions is also being developed. These data and permissions may contain information and data that are inconvenient for individuals and organizations to be known by others. In order to prevent these situations, there is an urgent need for software that detects and identifies malicious software. In this paper, we focus on the classification of malware targeting applications running on the Android operating system. In this context, the performance of different approaches of the Random Forest algorithm on the TUNADROMD (Android Malware) database, which is a recent dataset, is analyzed. In the classification process, different estimator numbers of the Random Forest classification algorithm, one of the machine learning algorithms, were taken into account. The results of the experimental study by changing the number of estimators of the Random Forest algorithm are given. As a result of the tests, Accuracy and Mean Squared Error values of Goodware and Malware values were analyzed according to Precision, Recall, F1 score and Estimator number. The F1 score and accuracy value exceeding 0.99 were achieved while presenting negligible false positive and false negative rates in the results. According to these values, the interpretability of the overall system is improved.

Keywords – Android, Random Forest, Classification, Algorithm, Mobile, IoT

I. INTRODUCTION

The Android operating system plays an important role not only for personal use, but also in many industrial controls such as smart homes, healthcare, automotive industry and many more. Due to different reasons such as price and ease of use, mobile applications with android operating system are expanding and their operability in IoT devices is increasing [1]. Android offers user-friendly applications that facilitate button control with a unified interface. These applications include software that can be used for different purposes such as IoT. There is a security and privacy attack on portable devices with the Android operating system, as the usage area is expanding day by day [2], [3], [4].

The security problem caused by malware has led to significant security risks in mobile devices used in different areas, especially IoT. These malware are at a level that can cause data breaches, unauthorized use and privacy issues on mobile devices. Devices with inadequate security levels are at great risk. Malware poses a great risk by making the application data of the mobile device public [5]. Damaged mobile devices are also highly likely to be used in DDoS attacks by non-user malicious actors [1]. The risk is even greater when the device under such attack is a portable device using an android operating system that manages a smart home system. Malware is impacting many areas, from excessive data consumption to data breaches, from unauthorized remote control to financial fraud [6], [7].

It is recommended that all portable devices with Android operating system install mobile applications from the google play store area [8], [9]. Installing apps from different sources on mobile devices increases the impact of malware [10]. Different mechanisms and methods, such as encryption, are applied to reduce the impact of malware [10], [11].

Many antivirus companies have entered into studies to detect and eliminate malware developed for the android operating system. However, they state that downloads outside the google play store increase the number of malicious software [12]. 13% of Android apps are downloaded from sources outside the google play store environment [1]. Cyber attackers who attack mobile devices often use software that appears to be legitimate. Android users should carefully review the permission requests before installing the application.

The following sections of the article consist of four parts. The second section summarizes the related work. The third section introduces the dataset samples and the algorithm used in the paper. Section four presents the results of the random forest algorithm at different estimator values. The fifth section concludes the paper.

II. Related Works

Çetiner classified the data damaging the Android operating system with different kernel types of SVM algorithm [13]. Aug et al. classified web pages with random forest algorithm [14]. They tried to categorize internet data into different categories by classifying web pages. Azar et al. tried to classify the most distinctive attributes in lymph diseases with random forest. They achieved a good performance with the integrated use of genetic algorithm and random forest algorithm by removing unnecessary elements. Song et al. performed classification using random forest algorithm on a fingerprint dataset consisting of nine different classes. Pal successfully classified data consisting of images of a field near Littleport in Cambridgeshire, England using random forest [15]. Garcia et al. conducted experimental studies on information obtained on 4616 patients being treated at the University Hospital of Salamanca [16]. Among different machine learning algorithms, the random forest algorithm is reported to give the best results.

Belgiu and Dragut investigate the existence of random forest algorithm in remote sensing systems [17]. They recommend that methods such as proximity analysis should be used to detect outliers in the training samples of the data they use during research. Galiano et al. used the random forest algorithm for effective classification of a complex landscape in terms of natural cover. [18]. In their research, they use 14 different terrain data, Landsa- 5 thematic mapping data from the south of Spain.

Wajahat et al. want to distinguish between malicious and benign android operating system software [1]. In their work, they are not only concerned with identifying benign and malignant software written for the Android operating system, but also investigating the spread of such software in the Interest of Things (IoT) space.

III. Materials and Method

A. Material

The dataset, known as the TUNADROMD dataset in the literature, contains 4665 pieces of sample information. Studies using the related dataset [13], [19], [20], [21], [22], [23], [24] . This article focuses on the classification of good and malicious software targeting software running on the Android operating system [19], [25]. In the classification process, different estimator numbers of the Random Forest classification algorithm, one of the machine learning algorithms, were taken into account. The classification results of the Random Forest algorithm with the default number of estimators were found to be effective.

B. Random Forest

Proposed in 2001 by Leo Breiman, the Random forest algorithm was developed at the University of California [26]. Many decision classifiers come together to form the Random Forest algorithm. In the Random Forest algorithm, after the training is completed, a data that is not used in the training in the dataset is given as input to the model, and it is an algorithm that decides according to the result voting from many independent decision makers.

Parmar et al. summarized the working principles of the Random Forest algorithm in their study [27]. First, it assigns a number of elements to each attribute subset. Second, it randomly selects one of the attribute subsets. Third, it performs training for different training groups using the attribute subsets of each training group. Finally, a test data, which is not used in training, is used to determine the class with the data outputs from each sub-decision tree.

IV. Experimental Results and Discussion

In this section of the paper, we analyze the performance of different approaches of the Random Forest algorithm on a recent Android Malware dataset. The results of the experimental study by changing the number of estimators of the Random Forest algorithm are presented in the tables between Table 1 and Table 8. At the same time, the graphs of the obtained results are presented in this section.

Looking at the results in Table 1, the performance values obtained in the Random Forest algorithm when the number of estimators is 0 are quite high.

Table 1. Performance values obtained with Random Forest when the number of estimators is 0

Class	Precision	Recall	F1 score	Estimator number
Goodware	0.99	0.99	0.99	0
Malware	1.00	1.00	1.00	0
Accuracy		0.9955		
Mean Squared Error		0.00448		

Looking at the results in Table 2, although the number of estimators increases, the results decrease slightly. Mean Square Error (MSE) value increases. The accuracy value is reduced from 0.9955 to 0.9928.

Table 2. Performance values obtained with Random Forest when the number of estimators is 10

Class	Precision	Recall	F1 score	Estimator number
Goodware	0.99	0.97	0.98	10
Malware	1.00	1.00	1.00	10
Accuracy		0.9928		
Mean Squared Error		0.00717		

When we look at the results in Table 3, the number of estimators increases and values close to the results of estimator 0 are obtained. The MSE value increases according to the results of estimator 0. The accuracy value is reduced from 0.9955 to 0.9946. It can be said that when the number of estimators is 0, it gives better results than 10 and 15 estimator values.

Table 3. Performance values obtained with Random Forest when the number of estimators is 15

Class	Precision	Recall	F1 score	Estimator number
Goodware	0.99	0.99	0.99	15
Malware	1.00	1.00	1.00	15
Accuracy		0.9946		
Mean Squared Error		0.00538		

When we look at the results in Table 4, the results at estimator 0 were obtained by increasing the number of estimators. It can be said that when the number of estimators is 0, it gives better results than 10 and 15 estimator values.

Table 4. Performance values obtained with Random Forest when the number of estimators is 20

Class	Precision	Recall	F1 score	Estimator number
Goodware	0.99	0.99	0.99	20
Malware	1.00	1.00	1.00	20
Accuracy		0.9946		
Mean Squared Error		0.00538		

When we look at the results in Table 5, the number of estimators increases and values close to the results of estimator 0 are obtained. The MSE value increases according to the results of estimator 0. The accuracy value is reduced from 0.9955 to 0.9937. It can be said that when the number of estimators is 0, it gives better results than 10, 15 and 20 estimator values.

Table 5. Performance values obtained with Random Forest when the number of estimators is 25

Class	Precision	Recall	F1 score	Estimator number
Goodware	0.98	0.99	0.98	25
Malware	1.00	1.00	1.00	25
Accuracy		0.9937		
Mean Squared Error		0.00627		

When we look at the results in Table 6, the results at estimator 0 were obtained by increasing the number of estimators. When the number of estimators is 30, it can be said that it gives better results than estimator values of 10, 15, 20 and 25.

Table 6. Performance values obtained with Random Forest when the number of estimators is 30

Class	Precision	Recall	F1 score	Estimator number
Goodware	0.98	0.99	0.98	30
Malware	1.00	1.00	1.00	30
Accuracy		0.9946		
Mean Squared Error		0.00538		

When we look at the results in Table 7, the number of estimators increases and values close to the results of estimator 0 are obtained. The MSE value increases according to the results of estimator 0. When the number of estimators is 100, it can be said that it gives better results than estimator values of 10, 15, 25 and 30.

Table 7. Performance values obtained with Random Forest when the number of estimators is 100

Class	Precision	Recall	F1 score	Estimator number
Goodware	0.99	0.99	0.99	100
Malware	1.00	1.00	1.00	100
Accuracy		0.9955		
Mean Squared Error		0.00448		

When we look at the results in Table 8, the number of estimators increases and values close to the results of estimator 0 are obtained. The MSE value increases according to the results of estimator 0. When the number of estimators is 200, it can be said that it gives better results than 10, 15, 25 and 30 estimator value.

Table 8. Performance values obtained with Random Forest when the number of estimators is 200

Class	Precision	Recall	F1 score	Estimator number
Goodware	0.99	0.99	0.99	200
Malware	1.00	1.00	1.00	200
Accuracy		0.9955		
Mean Squared Error		0.00448		

In general, when the values between Table 1 and Table 8 are examined, even if the number of estimators is the same in precision, recall, F1 score values, there may be a difference in MSE value.

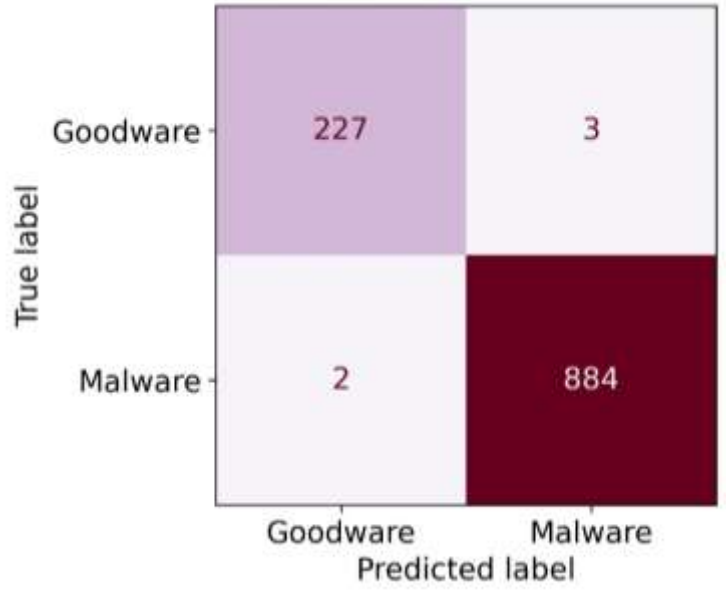

Fig. 8. Confusion matrix result of the Random Forest algorithm with 200 estimators

The reflection of the results in Table 8 in the confusion matrix table is given in Fig. 8. As a result, there are differences in the reflection of the number of estimators on the confusion matrix.

V. CONCLUSION

The use of IoT and mobile devices running on the Android operating system is increasing day by day around the world. In addition to this, malware known as cyber-attacks on these devices and malware that disrupts the current functioning and causes material and moral damages are increasing. In this article, we share the classification results obtained with different estimator values of the Random Forest method to be applied on the TUNADROMD database on the Kaggle platform. In general, when the values between Table 1 and Table 8 are analyzed, even if the precision, recall, F1 score values are the same, there may be a difference in the MSE value according to the number of estimators. Estimator values of 0, 100 and 200 give

the best results, while the others are close to these values. When the performance results in these parameters are examined in detail, even if all other performance results are the same, there are differences in MSE values. It can be stated that malware written for the Android operating system can be classified according to the results obtained.

Abstract – The aim of this study is to examine the effect of internal marketing on employee performance and the mediating roles of both corporate image and job satisfaction in this effect. A face-to-face survey was used to collect the research data. Data were collected from 278 employees of a national cargo company. Jamovi software was used to perform statistical analyses of the data collected. The results of the statistical analysis show that internal marketing has a direct positive effect on employee performance and also that internal marketing has an indirect effect on employee performance through the mediating roles of both corporate image and job satisfaction. In addition, internal marketing has a direct positive significant effect on corporate image and job satisfaction, while corporate image and job satisfaction have a direct positive effect on employee performance. The results obtained are discussed.

Keywords – Internal Marketing, Corporate Image, Job Satisfaction, Employee Performance

INTRODUCTION

Internal marketing is based on the view of ensuring the satisfaction of employees, who are also referred to as internal customers and interact one-to-one with external customers, and constitutes the intersection point of the marketing and human resources functions of the enterprise [1]. In this context, businesses' orientation towards the satisfaction of internal customers with various tools and techniques that will increase the motivation of employees will facilitate the formation of employees who adopt corporate values and internalise organisational goals [2].

The purpose of this study is to determine the effect of the mediating role of corporate image and job satisfaction on the effect of internal marketing practices on employee performance. Internal marketing and strategies applied to increase employee performance are important for businesses. Employees, who are the most important resource of enterprises, are considered to be the most important determinants of the success of enterprises. In order to reveal the situation of the subject in practice, an application was carried out for a cargo company. It is thought that this study will be a guide for business managers in terms of positively affecting the corporate image perception of their employees by applying internal marketing and increasing employee performance by positively affecting their job satisfaction.

LITERATURE REVIEW AND HYPOTHESES

Internal marketing strategy, which has its origins in marketing research in the service sector [3-4], emerged from the idea that businesses in the service sector should value, respect and see their employees as "internal customers" and that customer satisfaction depends on employee satisfaction [5].

Internal marketing is defined as working to attract, develop, motivate and maintain high quality staff by providing employees with the work products they need [6]. Accordingly, internal marketing consists of an

organisation's efforts to train and motivate its employees to provide better service [7-8]. Previous studies have shown that internal marketing activities have a positive relationship with employee performance [8-9-10-11]. Therefore, we propose the following hypothesis:

H_1: Internal marketing has a significant and positive effect on employee performance.

Corporate image refers to the sum of the images that customers, investors, employees, supporters and society in general have of a company [12]. Positive impressions of well-managed and participatory businesses that do things for the benefit of the society in which they are located, produce projects, are sensitive to culture, art and environmental issues, turn into a good corporate image for them over time [13]. Studies in the literature show that internal marketing represents an important component in creating corporate image and affects the perception and satisfaction of customers [14-15-16]. In the light of this information, the following hypothesis is formed:

H_2: Internal marketing has a significant and positive effect on corporate image.

Job satisfaction is defined as the satisfaction seen as a result of the compatibility between work life or workplace conditions and the positive attitude that people have towards their jobs [17]. In many studies in the literature, there are findings that internal marketing has a significant effect on job satisfaction [18-19-20-21-22-23]. Therefore, we consider that:

H_3: Internal marketing has a significant and positive effect on job satisfaction.

Employees' perception of a positive image of their organisation will lead to an increase in their effort and performance [24]. According to management scientists, a good corporate image perception can give employees a positive perspective, enable employees to develop positive attitudes towards the business and managers, and thus a meaningful bond between the person and the business can be formed through positive image [25-26]. Studies show that corporate image is perceived as a status indicator and as a result, it increases the performance of employees [2-27-28-29-30]. Therefore, we propose the hypothesis:

H_4: Corporate image has a significant and positive effect on employee performance.

In general terms, job satisfaction refers to "the general attitude that individuals have towards their jobs" [31]. Ensuring job satisfaction in businesses has a significant effect on the quality of the activities to be performed by employees [32]. Previous studies report that job satisfaction has positive effects on employee performance [33-34-35-36]. The following hypothesis was formed based on this information.

H_5: Job satisfaction has a significant and positive effect on employee performance.

As in the previous sections, it has been argued that internal marketing, corporate image and job satisfaction have an impact on employee performance and that corporate image and job satisfaction are important outcomes of internal marketing practices. Therefore, it is important to check whether there is a mediating role of corporate image and job satisfaction on employee performance. Therefore, the following hypotheses can be put forward:

H_6: Corporate image has a mediating role in the effect of internal marketing on employee performance.

H_7: Job satisfaction has a mediating role in the effect of internal marketing on employee performance.

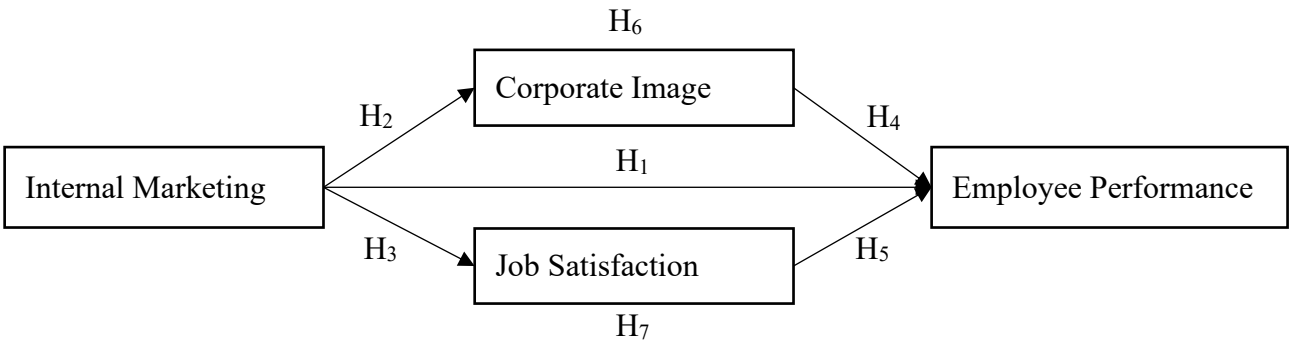

Figure 1. Research Model

MATERIALS AND METHOD

Items from the scales on internal marketing [37], corporate image [38], job satisfaction [39] and employee performance [40] have been adapted from previous studies for use in this study.

Data were collected through a face-to-face survey from 278 employees of a national cargo company. The sample size of 278 people is more than 10 times larger than the total of 23 scale items used in this study [41]. The sample size therefore meets the criteria for a minimum sample size.

The result of Harman's one-factor test is 48.42%, which is <50% [42]. In addition, Table 5 shows that the correlation coefficient between the two factors is <.90 [43]. According to these results, there is no problem of common method variance bias in the data set obtained.

Data analysis was performed using Jamovi software [44-45]. The results of the statistical analyses are reported on the following pages.

RESULTS

Table 1 shows that the number of employees who are male (Counts=240; 86.33 %), married (Counts=251; 90.29 %), aged 30-39 (Counts=133; 47.84 %), have a bachelor's degree (Counts=120; 43.17 %) and have 6-10 years' service (Counts=89; 32.01 %) is higher.

Table 1. Results of Frequency Analysis

Gender	**Counts**	**% of Total**	**Cumulative %**
Female	38	13.67 %	13.67 %
Male	240	86.33 %	100.00 %
Marital Status	**Counts**	**% of Total**	**Cumulative %**
Married	251	90.29 %	90.29 %
Single	26	9.35 %	99.64 %
Divorced	1	0.36 %	100.00 %
Age	**Counts**	**% of Total**	**Cumulative %**
18-29 years old	13	4.68 %	4.68 %
30-39 years old	133	47.84 %	52.52 %
40-49 years old	66	23.74 %	76.26 %
50-59 years old	57	20.50 %	96.76 %
≥60 years old	9	3.24 %	100.00 %
Education Level	**Counts**	**% of Total**	**Cumulative %**
High school graduate	83	29.86 %	29.86 %
Associate degree	66	23.74 %	53.60 %
Bachelor's degree	120	43.17 %	96.76 %
Postgraduate	9	3.24 %	100.00 %
Service Time	**Counts**	**% of Total**	**Cumulative %**
<1 year	7	2.52 %	2.52 %
1-5 years	17	6.12 %	8.63 %
6-10 years	89	32.01 %	40.65 %

EP4	0.696					

The reliability analysis results in Table 3 show that both Cronbach's α and McDonald's ω values of the internal marketing, corporate image, job satisfaction and employee performance scales are >0.70 [48].

Table 3. Results of Reliability Analysis

Scale	**Mean**	**Standard Deviation**	**Cronbach's α**	**McDonald's ω**
Internal Marketing	4.28	0.540	0.922	0.923
Corporate Image	4.21	0.655	0.891	0.894
Job Satisfaction	4.16	0.724	0.930	0.931
Employee Performance	4.29	0.625	0.889	0.894

The results of the normality test in Table 4 show that the skewness and kurtosis values of the four factor dimensions are between ±2 and therefore the data have a normal distribution [49].

Table 4. Results of Normality Test

Descriptives	**Internal Marketing**	**Corporate Image**	**Job Satisfaction**	**Employee Performance**
Mean	4.28	4.21	4.16	4.29
Standard error mean	0.0324	0.0393	0.0434	0.0375
Median	4.20	4.00	4.00	4.13
Standard deviation	0.540	0.655	0.724	0.625
Variance	0.291	0.429	0.525	0.391
Minimum	2.40	2.00	1.20	1.25
Maximum	5.00	5.00	5.00	5.00
Skewness	-0.503	-0.605	-1.01	-0.927
Standard error skewness	0.146	0.146	0.146	0.146

To test the research model, the results of the GLM mediation model are presented in Table 6. The results show that internal marketing-IM has a significant and positive effect on corporate image-CI (β=0.707; p<0.05), job satisfaction-JS (β=0.625; p<0.05) and employee performance-EP (β=0.212; p<0.05), while the positive effect of corporate image-CI (β=0.154; p<0.05) and job satisfaction-JS (β=0.379; p<0.05) on employee performance-EP is also significant. In addition, both corporate image-CI (β=0.109; p<0.05) and job satisfaction-JS (β=0.237; p<0.05) play a mediating role in the positive effect of internal marketing-IM on employee performance-EP. These results show that all hypotheses are supported.

DISCUSSION AND CONCLUSION

The positive effects of internal marketing practices on businesses have been revealed by various studies. According to the research results that are in parallel with our study, internal marketing has a positive effect on corporate image [50-51-52], employee performance [53-54-55] and job satisfaction [2-56-57-58], while corporate image has a positive effect on employee performance [59-60-61] and job satisfaction has a significant and positive effect on employee performance [62-63-64].

In this study conducted for a cargo company, as mentioned above, findings that are in parallel with the literature have been reached. Accordingly, it is seen that internal marketing has a direct positive effect on employee performance, corporate image and job satisfaction, while internal marketing has an indirect effect on employee performance through the mediating roles of both corporate image and job satisfaction. According to these results, it can be said that effective internal marketing activities can increase corporate image and job satisfaction in cargo companies.

These results show that businesses operating in a competitive environment should attach importance to internal marketing practices. In this context, marketers should develop and adopt various marketing practices within the company. In particular, increasing the number of satisfied customers through internal marketing practices will contribute positively to increasing the share of the business in the market and will contribute to increasing profit rates. Internal marketing requires investment in human resources and envisages that this investment will be returned as high performance and high customer satisfaction. As a matter of fact, Papasolomou (2003) argues that unless awareness and understanding of internal marketing practices increase, it will be impossible to cope with rival organisations that have adapted internal marketing to the entire management and marketing process [65].

In summary, the results of this research are considered to be important in terms of contributing to the marketing and management literature and filling a gap in the service sector. There are also some limitations that should be considered while evaluating the findings of the research. The findings obtained are for a cargo company in the service sector. Therefore, it cannot be said that these findings can be generalised for other cargo companies or other enterprises operating in the service sector.

Abstract **–** Language, according to Halliday (1978), is a social semiotic phenomenon, and is thus, inseparable from society. Rapid societal transformations are being observed in the contemporary world owing to globalization and technological advancements. Due to this evolution of societal norms and practices, notable changes are also occurring in language and its structures including the perception and usage of linguistic taboos. The current research examines the variation in the perception and usage of linguistic taboos across different generations and genders in Pakistani society. Additionally, it also explores how Pakistani bilinguals perceive and use linguistic taboos differently in their first versus their second language. The data for the present study was collected through a web-based questionnaire that was filled by one hundred Urdu-English bilinguals who were equally divided into four groups based on their age and gender. The data was analyzed using quantitative methods of research. The study revealed that gender did not significantly influence perspectives on linguistic taboos, whereas the age of participants showed a notable difference in perceptions. This indicates that the diminishing of linguistic taboos is not gender-dependent but is associated with age. Although there is an overall decline in linguistic taboos, certain taboos still maintain their offensive nature. The data analysis highlights the significant role of social media, parents, and peers in exposing children to abusive and taboo language. Additionally, how taboo words and swear words are expressed can influence the perception that bilingual learners develop regarding them.

Keywords – Linguistic taboos, bilingualism, emotional force, perception and usage of linguistic taboos, abusive language

I. INTRODUCTION

Language, according to Halliday (1978), is a social semiotic phenomenon, meaning that it cannot exist in isolation from society. In the present era, the forces of globalization and technological progress are driving rapid transformations in society. Consequently, language and its structures are also undergoing significant changes. As societal norms and practices evolve in response to these shifts, linguistic taboos are likewise subject to alteration.

Linguistic Taboos

Linguistic taboos are possessed by each language owing to the norms, values, and traditions of the culture and society to which that language belongs. They can denote various concepts and ideas such as bodily functions, concepts that are held sacred or prohibited to discuss openly in certain cultures, etc (De Klerk, 1992). These concepts may also include the metaphysical, religion, death, etc (Bușu, 2023). According to Jay (2009), taboo language is a phenomenon that is socially, culturally, psychologically, and emotionally rich and its usage is prohibited on individual and institutional levels to prevent the harm that

will occur in case it is spoken. Linguistic taboos usually attain their status due to societal norms and institutions (Jay, 2009). According to Pinker (2008), a form of this harm are the strongly negative emotions that we go through upon encountering a word that has been declared taboo owing to societal or cultural conventions. Pinker (2008) further asserts that this experience is the exact reason why people often tend to use taboo or swear words because they wish to hurt a certain person or to convey how deeply they have been disturbed or offended due to something.

Linguistic taboos' are made to keep their quality of being taboo and forbidden whilst being transmitted from one generation to the next as parents emphasize this quality in front of their children and make them realize their perceived offensiveness. No one is born with the knowledge of taboo words and their offensive nature. Children gradually learn about taboos and how their use is prohibited through caregivers and family members as well as through other social interactions (Jay, 2009).

There are several kinds of linguistic taboos based on their degree of offensiveness and being forbidden or the concepts that are denoted by them. They encompass a range of topics and serve different purposes, including religious, social, and emotional triggers. Finn (2017) categorizes taboo words into five groups based on the kind of negative emotion they elicit. These include disgust related to bodily secretions and organs, including fear related to religion (supernatural), dread associated with disease and death, revulsion related to sexuality, and hatred toward disfavored people or ethnicities,

A huge proportion of the linguistic taboos of many cultures is covered by linguistic taboos that stemmed due to religion, which is the main source of swearing for several languages including English (Pinker, 2008). Other than religion, bodily excretions, orifices, diseases, and plagues are also sources of linguistic taboos such as "*Bring out your dead*" (from Monty Python) and *'Bloody' etc* (Pinker, 2008).

Research Objectives

The objectives of this research study are as follows:

1. Investigate variation in the perception and usage of linguistic taboos across different age groups in Pakistani society.
2. Investigate variation in the perception and usage of linguistic taboos between genders in Pakistani society.
3. Find out if linguistic taboos are diminishing in Pakistani society.
4. Investigate the variation in the perception of taboo words in bilingual learners based on the language in which taboo words are uttered i.e. their first versus their second language.

Research Questions

The current study aims to answer the following research questions:

1. To what extent is there a variation in the perception and usage of linguistic taboos across different age groups in Pakistani society?
2. To what extent is there a variation in the perception and usage of linguistic taboos between genders in Pakistani society?
3. Whether or not linguistic taboos are diminishing in Pakistani society?
4. To what extent do bilingual individuals perceive taboo words differently depending on whether they are using their first language or second language?

Significance of the Study

The rapid transformations of our society that are mainly being caused due to globalization and technological advancements add to the significance and requirement of this study. Due to these changes, modifications are also occurring in cultural inclinations and values as well as compliance towards these values. These cultural and behavioral changes are also reflected in the linguistic habits of our habits. The current study sheds light on the variation in the perception and utilization of linguistic taboos by different genders and age groups in Pakistani society. It also adds to the current body of relevant research by

exploring the variation in perception and understanding of linguistic taboos based on the language in which bilingual individuals hear these taboos i.e. their first versus their second language.

Literature Review

Linguistic Taboos and Gender

The perception and usage of linguistic taboos have been observed to vary across genders. Males and females differ in their attitudes and utilization of linguistic taboos based on factors such as the category to which a particular linguistic taboo belongs and the concept denoted by it etc.

Women are usually considered to use linguistic words less in their day-to-day communication as compared to men. The main reason behind this is the widely accepted belief that to adopt behavior and mode of living that is typically more "ladylike," women have to avoid using vulgar and taboo language (De Klerk, 1992). Various studies prove this view as correct while others refute this view. Risch (1987) and De Klerk (1992) oppose this view and state that women are familiar with and use slang and abusive terms nearly as much as their male counterparts. From her study on the understanding and usage of offensive words by college-age females, Uhlman (2015) also concludes that women use offensive words as much as men irrespective of the nature of the gathering that they are present in i.e. mixed or all-female. Mohammadi et al. (2014) also opine that the language of both women and men is characterized by the usage of taboo words with the exception of certain situations. These views are opposed by the results of the study conducted by Ghounane (2014) who states that men and women avoid discussing certain taboos in mixed gatherings and prefer mentioning them in single-sex groups. Pervaiz et al. (2021) also oppose Risch (1987) and De Klerk (1992) by concluding that in Pakistani society, women tend to use less abusive and vulgar language as compared to men.

There are certain categories of linguistic taboos that individuals of each gender feel comfortable discussing with other members of their gender but they avoid mentioning them in front of the members of other genders. In many cultures, the concepts of pregnancy, virginity, menstruation, and menopause are viewed as sensitive topics. In these cultures, women frequently refrain from discussing these topics in the presence of men, even though they typically feel at ease discussing them when among individuals of the same gender.

While there are linguistic taboos that women can openly discuss or mention among themselves, regardless of age, variations in the interpretation and application of these taboos still exist among women from different age groups, influenced by their respective cultural backgrounds. Based on the difference in their age, women belonging to the same culture may differ in their perception and usage of the same linguistic taboos.

Diminishing Linguistic Taboos

Language is an ever-changing and dynamic phenomenon. It continues to undergo changes and modifications as the society to which it belongs constantly transforms itself Halliday (1978). Due to changes in societies, the structures and forms of their languages continue to change as well. These linguistic changes range from adopting new structures, modifying previous structures, and even discarding the usage of older and previous structures. Since linguistic taboos, swear words and abusive words are also among the structures of language, they are subject to change as well.

Due to technological and scientific advancements around the globe and due to globalization, linguistic taboos in languages belonging to various cultures have been observed as being gradually diminished. There used to be a time when religious oaths, cursing, or swearing were considered very offensive and disrespectful acts. This might still be the case in several cultures in the world, however, in the English-speaking community, such swearing is no longer considered offensive (Pinker, 2008).

Another variety of linguistic taboos that are no longer considered offensive generally includes linguistic taboos that denote plagues and diseases as well as the linguistic taboos related to death, which are also gradually diminishing in several cultures and societies (Pinker, 2008). However, in Pakistani

society or Muslim communities in general, the concept of death is brought into discussion by using euphemisms such as "*Wo fout hogaye"* (Urdu for 'He passed away).

Although in Pakistani society, euphemisms such as the ones mentioned above still hold the same importance in both the younger and older age groups, there are a few linguistic taboos that are diminishing in Pakistani society similar to how linguistic taboos are diminishing in other societies around the globe. Pervaiz et al. (2021) state that several linguistic taboos such as using '*yaar*' to refer to people, and talking to one's fiancé/fiancée before marriage, etc are gradually diminishing.

Influence of First vs. Second Language on the Perception of Linguistic Taboos

Bilingual speakers have reported that they experience greater emotional resonance whilst listening to their first language. This emotional resonance is decreased when their first language is replaced by their second language. The second language of an individual generates comparatively lesser emotional responses as compared to his native language (e.g., Dewaele, 2004; Caldwell-Harris & Ayçiçeği-Dinn, 2009; Pavlenko, 2006). Using one's second language induces more controlled processes and decreases emotional responses. Due to this, the degree of emotional force and resonance of words is decreased and the speakers and listeners feel more emotionally detached whilst using their second language. This very emotional resonance and force is increased while bilinguals are being exposed to their native language.

Languages learned earlier in life seem to have a stronger emotional hold on individuals than the languages that they learn later in life (Amati-Mehleret al., 1993; Javier, 1989; Santiago-Rivera & Altarriba, 2002). The reason behind this is the experiences that are attached to one's native language. Since it is learned during one's early years, hence speakers are less emotionally detached while perceiving or speaking words in their first language.

Bilinguals find it easier to utter emotionally charged words or expressions in a language that is not their native language due to a decrease in the degree of emotional resonance (Caldwell-Harris, 2014). Words that denote concepts that are considered taboo as well as swear words are perceived by bilinguals as being more emotionally stunted when uttered in their second language (Caldwell-Harris, 2014).

Due to the variation in emotional resonance on shifting between the first and the second language, bilinguals may switch from their first to their second language due to an increase in the emotional distance (Bond and Lai, 1986; Javier and Marcos, 1989). Bond and Lai (1986) state that due to the stunted emotional arousal linked to conversing in second and foreign languages, individuals find it easier to discuss topics in their second or foreign language that they would find hard to talk about in their first language. Dewaele (2004) conducted a study on 1039 multilinguals after which he reported that the emotional force associated with swear and taboo words decreased when they were heard in languages that individuals had learned later in their lives. Gonzalez-Reigosa (1976) and Javier (1989) also state that because it was learned in early childhood, an individual's first language elicits comparatively more emotional responses from him. Any factor belonging to the context in which an utterance takes place can influence the way that utterance is perceived. This includes the language in which the particular expression is uttered (Caldwell-Harris, 2014).

II. MATERIALS AND METHOD

Participants

A total of one hundred individuals participated in the study. They were equally divided into four groups based on their age and gender. In the first group, young females were placed, and young males were placed in the second group. In the third group, elder females and lastly, in the fourth group, elder males were placed. The participants in the first two groups were within the age range of fifteen to thirty. On the other hand, the participants of the last two groups were within the age range of forty-five to sixty.

Data Collection

The data for the current research was collected by making the participants fill out a web-based questionnaire comprising a total of twenty-four questions. The items in the questionnaire were based on the four research questions of this study and they address the ideas of the usage and perception of linguistic taboos held by different age groups and genders in Pakistani society. The items related to the first two research questions were designed to collect data regarding the general perceptions of individuals about abusive words, vulgar language, and using euphemisms to discuss uncomfortable topics. Through the items of the questionnaire, the perceptions of the members of the four groups about a total of six linguistic taboos of our society were also collected. These six linguistic taboos are as follows:

1. Referring to your spouse using his/her name.
2. Talking to fiancé/fiancée before marriage.
3. Referring to your elders using '*yaar*.'
4. Referring to the opposite gender using '*yaar*.'
5. A newly married couple to talk to each other, in the presence of elders.
6. Discussing matrimonial plans with one's father.

The items in the questionnaire also address the question that whether or not linguistic taboos are diminishing in our society and whether or not bilingual learners perceive taboos and swear words differently based on the language in which these words are uttered. Participants were asked if they felt any variation in the perceived offensiveness of taboo, swear, and abusive words when those words were heard and uttered in Urdu (their first language) compared to when those words were heard and uttered in English (their second language).

Data Analysis

To analyze the data, chi-square tests were conducted to assess whether or not an association exists between the categorical variables being studied. After conducting the chi-square tests, the data collected through the web-based questionnaire was analyzed by comparing the descriptive values of the responses of the groups with each other. This was done by assigning a point to each of the five answer options in the Likert scale used in the questionnaire as follows:

Strongly Agree=1 Agree=2 Neutral=3 Disagree=4 Strongly Disagree=5

The means of the responses were calculated and based on the above division of points, the results were given regarding the extent to which participants agreed or disagreed with an item in the questionnaire. If the mean value of the response of a group fell somewhere around two, then it was concluded that the majority of the participants agreed with the statement of the item in question.

RQ#1: Variation in Perception and Usage of Linguistic Taboos across different age groups in Pakistani Society

To assess whether or not there is a significant relationship between the perception and usage of linguistic taboos and the age of individuals in Pakistani society, a chi-square test was conducted. A null hypothesis was proposed that assumed that no such association existed between the two categorical variables in question. This null hypothesis is as follows:

H_0: No association exists between the perception and usage of linguistic taboos and the age of individuals in Pakistani society.

Table 1: Chi-Square Tests for RQ#1

	Value	df	Asymp. Sig. (2-sided)
Pearson Chi-Square	43.330[a]	21	.003
Likelihood Ratio	54.682	21	.000
N of Valid Cases	100		

The results of the chi-square show that $p<0.05$ which means that there is an association between the two categorical variables. In other words, the null hypothesis will be rejected. Since the null hypothesis was rejected, an alternative hypothesis was proposed as follows:

H_A: The two categorical variables perception and usage of linguistic taboos and the age of individuals in Pakistani society are not independent of each other and an association exists between them.

In other words, there is variation in the perception and usage of linguistic taboos based on the age of bilingual individuals in Pakistani society. After conducting the chi-square test and establishing that the two categorical variables in question were related, a comparison was drawn between the means of the responses given by the two groups belonging to the age range of 15-30 and the members of the two groups falling in the age range of 45-60.

Use of Swearwords and Abusive Language

Out of 25, 32% of the elder females answered 'Yes' when asked whether they use vulgar or abusive language. 68% of the elder females answered 'No' to the question regarding the usage of vulgar and abusive language. Only 2% of the younger females answered 'Yes' and 92% answered 'No' to this question. On the other hand, 40% of the younger males answered 'Yes' and 60% answered 'No' when asked about using vulgar and abusive language in their daily lives. Out of 25, 36% of elder males answered 'Yes' while 64% answered 'No' in response to this question. Thus, the elder age group uses vulgar and abusive language more as compared to the younger age group.

Table 2: Use of Swearwords and Abusive Language by EM and EF

Statement	N	Mean	Std. Deviation
I feel uncomfortable while using vulgar/slang words in front of the opposite gender.	50	1.82	.661
I feel uncomfortable while using vulgar/slang words in front of my peers.	50	1.90	.789
I feel uneasy while using vulgar/slang words in front of my siblings.	50	2.44	.993
I feel uneasy while using vulgar/slang words in front of my elders.	50	1.56	.733
It is okay for me to use vulgar/slang words in public.	50	3.32	1.347

People should not shy away from using vulgar/abusive language to express their true feelings and emotions.	50	3.40	1.125

Table 3: Use of Swearwords and Abusive Language by YM and YF

Statement	N	Mean	Std. Deviation
I feel uncomfortable while using vulgar/slang words in front of the opposite gender.	50	1.72	.991
I feel uncomfortable while using vulgar/slang words in front of my peers.	50	2.54	1.154
I feel uneasy while using vulgar/slang words in front of my siblings.	50	2.26	1.139
I feel uneasy while using vulgar/slang words in front of my elders.	50	1.50	.931
It is okay for me to use vulgar/slang words in public.	50	4.10	1.035
People should not shy away from using vulgar/abusive language to express their true feelings and emotions.	50	4.00	1.030

By comparing the means of the responses given by the two age groups, it was seen that the elder age group used swear words more as compared to the younger age group. However, the responses of the younger age groups also showed that they were comfortable using abusive language in front of their peers. The mean value of the responses of YF and YM to the question regarding 'using abusive language in front of one's peers' was 2.34, while the mean of the responses of the elder age groups was 1.90. In other words, the members of the younger age group did use abusive language but only in the presence of their peers i.e. other young individuals. This shows that the taboo of using vulgar and abusive language is diminishing slightly because the members of the younger age group usually consider it a taboo in the presence of the members of the elder age group.

Viewpoint on the Use of Euphemisms

By comparing the means of the responses given by the two age groups, it was seen that both the elder and younger age groups were aware and conscious of the importance of using euphemisms in everyday speech, especially for topics such as death and assault, etc.

Referring to one's spouse using his/her name

By comparing the means of the responses given by the two age groups, it was seen that the younger age agreed more as compared to the elder age group with the idea that it was acceptable to refer to one's

spouse by his/her name. The mean of the response of YM and YF to this item was 2.04 while that of EM and EF was 2.92. Thus, this linguistic taboo is gradually diminishing.

Talking to fiancé/fiancée before marriage

Engaging in conversation with one's fiancé/fiancée is a linguistic taboo that is seen to be gradually diminishing in our society and the findings based on the collected data further confirm it. The mean of the response of YM and YF to this item in the questionnaire was 2.74 while that of EM and EF was 4.02. This stark difference in the values of means shows that this linguistic taboo is gradually diminishing.

Referring to others using '*yaar*'

The word '*yaar'* was once considered extremely offensive in our society and had negative connotations attached to it. However, it is now an example of the many linguistic taboos that are gradually diminishing, and the findings from the collected data act as evidence of the diminishing of this taboo. The mean of the response of the younger age group to this item in the questionnaire was 3.14 while that of EM and EF was 4.36 and 3.94. Thus, this linguistic taboo is gradually diminishing.

A newly married couple to talk to each other, in the presence of elders

By comparing the means of the responses given by the two age groups, it was seen that this linguistic taboo is diminishing to some extent. The mean of responses of YM and YF was 2.34 which means that most of these participants agreed that it was acceptable for a newly married couple to converse in the presence of elders. The mean of responses of EM and EF was 2.98 which means that they agreed less with this particular idea as compared to the younger age group.

Discussing matrimonial plans with one's father

The means of responses to this linguistic taboo also showed that the younger age group agreed more as compared to the elder age group with the idea that it is acceptable to discuss matrimonial plans with one's father. The mean of the responses of the former group to this item in the questionnaire was 2.78 while that of the latter was 3.14.

Table 4: Comparison of the responses of YM and YF and EM and EF regarding use of Euphemisms and Linguistic taboos

Statement	**Mean of responses of YM and YF**	**Mean of responses of EM and EF**
People should be more straightforward and avoid using euphemisms.	3.12	3.72
It is necessary to use euphemisms while discussing sensitive topics like death, assault, etc.	2.14	1.56
It is acceptable to refer to your spouse using his/her name.	2.04	2.92
It is acceptable to talk to fiancé/fiancée before marriage.	2.74	4.02

It is acceptable to refer to your elders using '*yaar*.'	3.14	4.36
It is acceptable to refer to the opposite gender using '*yaar*.'	3.14	3.94
It is acceptable for a newly married couple to talk to each other spouse, in the presence of elders.	2.34	2.98
It is acceptable to discuss matrimonial plans with your father.	2.78	3.14

RQ#2: Variation in Perception and Usage of Linguistic Taboos between Genders in Pakistani Society

To assess whether or not there is a significant relationship between the perception and usage of linguistic taboos and the gender of individuals in Pakistani society, a chi-square test was conducted. A null hypothesis was proposed that assumed that no such association existed between the two categorical variables in question. This null hypothesis is as follows:

H_0 : No association exists between the perception and usage of linguistic taboos and the gender of individuals in Pakistani society.

Table 5: Chi-Square Test for RQ#2

	Value	df	Asymp. Sig. (2-sided)
Pearson Chi-Square	60.374[a]	63	.570
Likelihood Ratio	33.745	63	.999
N of Valid Cases	100		

The results of the chi-square show that $p>0.05$ which means that there is no significant association between the two categorical variables. In other words, the null hypothesis will be accepted. Both males and females are quite similar in their perceptions and usage of linguistic taboos. After conducting the chi-square test and establishing that the two categorical variables in question were not related, a comparison was drawn between the means of the responses given by the elder and younger females and the responses of the elder and younger males.

Use of Swearwords and Abusive Language

Out of 25, 32% of the elder females answered 'Yes' when asked whether use vulgar or abusive language. 68% of the elder females answered 'No' to the question regarding the usage of vulgar and abusive language. Only 2% of the younger females answered 'Yes' and 92% answered 'No' to this question. On the other hand, 40% of the younger males answered 'Yes' and 60% answered 'No' when asked about using vulgar and abusive language in their daily lives. Out of 25, 36% of elder males answered 'Yes' while 64% answered 'No' in response to this question. Thus, men use more vulgar and abusive language as compared to women. In both the female and male groups, the elder participants were seen to use

abusive language more as compared to their younger counterparts. Although the two genders differed in their responses about using abusive language, they did not differ to a large extent.

Table 6: Use of Swearwords and Abusive Language by YF and EF

Statement	N	Mean	Std. Deviation
I feel uncomfortable while using vulgar/slang words in front of the opposite gender.	50	1.90	.886
I feel uncomfortable while using vulgar/slang words in front of my peers.	50	2.04	.989
I feel uneasy while using vulgar/slang words in front of my siblings.	50	2.46	1.110
I feel uneasy while using vulgar/slang words in front of my elders.	50	1.50	.789
It is okay for me to use vulgar/slang words in public.	50	3.80	1.245
People should not shy away from using vulgar/abusive language to express their true feelings and emotions.	50	3.80	1.069

Table 7: Use of Swearwords and Abusive Language by YM and EM

Statement	N	Mean	Std. Deviation
I feel uncomfortable while using vulgar/slang words in front of the opposite gender.	50	1.64	.776
I feel uncomfortable while using vulgar/slang words in front of my peers.	50	2.20	1.030
I feel uneasy while using vulgar/slang words in front of my siblings.	50	2.24	1.021
I feel uneasy while using vulgar/slang words in front of my elders.	50	1.56	.884
It is okay for me to use vulgar/slang words in public.	50	3.62	1.276

People should not shy away from using vulgar/abusive language to express their true feelings and emotions.	50	3.60	1.161

Viewpoint on the Use of Euphemisms

Both genders were somewhat similar in their responses regarding using euphemisms, both of the genders were aware of the importance of using euphemisms to discuss topics that are taboo or hold the potential to offend or hurt someone.

Referring to your spouse using his/her name

The values of means of the responses of both the genders to the idea of 'referring to one's spouse by their name' were the same i.e. 2.48. Thus, both genders had similar viewpoints regarding this idea.

Talking to fiancé/fiancée before marriage

The null hypothesis proposing that no association existed between the perception and usage of linguistic taboos and the gender of individuals in Pakistani society was further supported by the means of responses to this question. The mean of responses of YF and EF was 3.48 while that of YM and EM was 3.28.

Referring to others using '*yaar*'

The means of the responses of the groups showed that both genders were similar in their viewpoints on the idea of 'referring to others using the word '*yaar.'*

A newly married couple to talk to each other, in the presence of elders

The means of the responses of the groups showed that both genders were similar in their viewpoints regarding 'a newly married couple conversing in the presence of elders.'

Discussing matrimonial plans with one's father

The means of the responses of the groups showed that both genders were similar in their viewpoints regarding 'discussing matrimonial plans with one's father.'

Table 8: Comparison of the responses of YF and EF and YM and EM regarding use of Euphemisms and Linguistic taboos

Statement	**Mean of responses of YF and EF**	**Mean of responses of YM and EM**
People should be more straightforward and avoid using euphemisms.	3.48	3.36
It is necessary to use euphemisms while discussing sensitive topics like death, assault, etc.	1.70	2.00
It is acceptable to refer to your spouse using his/her name.	2.48	2.48
It is acceptable to talk to fiancé/fiancée before marriage.	3.48	3.28

It is acceptable to refer to your elders using '*yaar*.'	3.70	3.80
It is acceptable to refer to the opposite gender using '*yaar*.'	3.64	3.88
It is acceptable for a newly married couple to talk to each other spouse, in the presence of elders.	2.62	2.62
It is acceptable to discuss matrimonial plans with your father.	2.90	3.04

RQ#3: Whether or not Linguistic Taboos are diminishing?

The results of the first and second research questions show that linguistic taboos are gradually diminishing in our society. By comparing the responses of the two genders, it was seen that both genders do not differ to a large extent in their perspectives about linguistic taboos. On the other hand, by comparing the responses of the participants by dividing them into two groups based on their age, a prominent difference was observed in the perceptions of the two age groups. Thus, the diminishing of linguistic taboos does not have an association with gender but it does have a relationship with the age of the individuals.

In the current study, compared to the elder age group, participants belonging to the younger age group were observed to have less adherence to cultural norms regarding taboos such as talking to others using '*yaar*,' conversing with one's fiancé/fiancée before marriage and discussing matrimonial plans with one's father. Thus, linguistic taboos are certainly diminishing but some of them, such as not using euphemisms, still hold their quality of perceived offensiveness.

In addition to exploring whether or not linguistic taboos are diminishing, the current study also investigated the perceptions of the participants regarding the factors responsible for the gradual diminishing of these taboos. The items of the questionnaire also gathered data regarding the participants' perception of the role of social media, parents, and peers in the ever-increasing awareness of children about taboo and abusive language.

The means of responses of the participants showed that they all agreed that social media played a huge role in the usage of abusive and vulgar language by children. According to them, if there were no social media, children would have comparatively lesser knowledge about such language. Moreover, they also agreed that parents and peers play a huge role in transferring the knowledge of such language to children.

The mean of the responses to the question regarding the huge role played by social media in transmitting knowledge of taboo words to people was 1.73. In other words, majority of the participants agreed to this statement. The mean of the responses to the question regarding how children get to know more about taboo language through social media was 1.63. A unanimous agreement was also observed related to the notion that if there were no social media, children would not get to know much about such language as the mean of the responses to this question was 2.28.

Moreover, the responses of the participants regarding the role of parents and peers in transmitting knowledge of such language to children also tipped towards 'agree.' The mean value of the responses to the former question was 2.16, while that of the latter was 1.84.

Table 9: Viewpoints of participants on factors responsible for diminishing linguistic taboos

Statement	N	Mean	Std. Deviation
Social Media has a huge role in the increase in usage of taboo words.	100	1.71	.574
Through social media, children get to know more about linguistic taboos and abusive language.	100	1.63	.677
If there were no social media, children would not get to know much about linguistic taboos and abusive language.	100	2.28	1.006
Parents may play a role in their children's development of knowledge of abusive language.	100	2.16	1.051
Peer influence plays a significant role in shaping and developing children's abusive language.	100	1.84	.662
Children use abusive and vulgar language to impress their peers.	100	2.62	1.179

RQ#4: Variation in the Perception of Taboos and Swearwords based on the language they are spoken or heard in

All of the hundred participants in the study were Urdu-English bilinguals whose first language was Urdu and the second language was English. The current study also investigated whether or not these participants perceived taboo words, swear words, and other insults differently based on the language in which those words were uttered or heard.

Through the analysis of the collected data, it was discovered that the language in which taboo words and swear words are used can influence the perception that bilingual learners develop regarding them. The participants' responses revealed that taboos, reprimands, insults, and other similar words heard and spoken in Urdu, were perceived as more severe as compared to when those words were heard or uttered in English.

Table 10: Variation in the Perception of Taboos and Swearwords based on the language they are spoken or heard in

	N	Mean	Std. Deviation
Insults and reprimands heard in Urdu feel less harsh to me as compared to insults in English.	100	3.42	1.296
Swear and taboo words in different languages have different emotional weight for me.	100	2.26	.872
Taboo words heard in Urdu feel less harsh to me as compared to those in English.	100	3.62	.951
Swear words and taboo words in English feel less harsh to me as compared to the ones in Urdu.	100	2.33	.943

III. RESULTS

The results of the first and second research questions show that several linguistic taboos such as referring to others using '*yaar'* and talking to one's fiancé/fiancée before marriage are gradually diminishing in our society. In the case of using abusive words, although the younger age group uses such language less as compared to their elders, they do feel comfortable using such language in the presence of their peers, which means that the linguistic taboos of using vulgar and abusive language also carry the chances of diminishing gradually.

The study findings indicate that there is not a significant difference between genders in terms of perspectives on linguistic taboos. However, when the participants were divided into two age groups, a notable distinction in perceptions emerged. This suggests that the diminishing of linguistic taboos is not related to gender but rather associated with the age of individuals.

The study revealed that the younger age group showed less adherence to cultural norms regarding taboos compared to the older age group. Examples of these taboos included using informal terms like 'yaar' when addressing others, engaging in pre-marital conversations with one's fiancé/fiancée, and discussing matrimonial plans with one's father.

To summarize, while gender did not play a significant role in attitudes toward linguistic taboos, the study demonstrated a clear association between age groups and the diminishing adherence to cultural norms surrounding taboos. The younger generation displayed a greater inclination to challenge or disregard these norms compared to the older generation.

However, they did not show such behavior towards all of the linguistic taboos explored in the study. The younger age group had similar views regarding the use of euphemisms to discuss topics such as death and assault etc. Although linguistic taboos are experiencing a decline, it is important to note that certain taboos still retain their characteristic quality and are perceived as offensive.

Based on the participants' responses, there was a unanimous agreement that social media significantly contributes to the use of abusive and vulgar language by children. They expressed the belief that without social media, children would have limited exposure to such language. Additionally, the participants acknowledged the substantial influence of parents and peers in transmitting knowledge of this language to children.

Based on the data collected and analyzed, it was found that the language in which taboo words, swear words and similar expressions are spoken can impact the perception that bilingual learners form regarding them. The responses from 100 Urdu-English bilinguals that participated in the current study showed that the taboos, reprimands, insults, etc. heard and uttered in their first language i.e. Urdu were perceived as more harsh as compared to the ones heard and uttered in their second language i.e. English.

IV. DISCUSSION

The results of this study highlight the dynamic nature of linguistic taboos, particularly within the context of Pakistani society. As globalization and technological advancements continue to transform cultural norms and values, linguistic practices are evolving as well. This study adds to our understanding of these shifts by shedding light on the variations in the perception and utilization of linguistic taboos across different genders and age groups, as well as the influence that has bilingualism on these perceptions.

A key finding of the current study is the gradual decrease and the diminishing of adherence to certain linguistic taboos among younger individuals compared to their elders. This trend aligns with Halliday's (1978) assertion that language changes in accordance with societal changes. The study reveals that younger participants feel more comfortable using informal terms like 'yaar' and engaging in pre-marital conversations with their fiancé/fiancée, thus indicating a shift away from traditional cultural norms. This observation is consistent with Pervaiz et al. (2021), who noted similar trends in the diminishing use of specific taboos in Pakistani society.

However, the study also shows that certain taboos, such as euphemisms for discussing sensitive topics like death and assault, remain unchanged. This suggests that while some aspects of linguistic taboos are diminishing, others remain unchanged, which highlights the complex interplay between evolution of cultural norms and linguistic practices. Pinker (2008) noted a similar phenomenon in the English-speaking world, where some taboo subjects have become less offensive over time, while other maintain the status of being taboo.

Gender differences in the perception and use of linguistic taboos were not significant, which contrasts with some previous studies that found women generally use less taboo language than men (De Klerk, 1992). However, this study's findings align more closely with those of Risch (1987) and Uhlman (2015), who stated that women are just as likely as men to use taboo language in certain contexts. This discrepancy may be due to cultural and contextual differences in how taboos are perceived and used.

The influence of bilingualism on the perception of linguistic taboos presents an interesting dimension. The study supports findings by Dewaele (2004) and Caldwell-Harris (2014), which argue that bilinguals experience stronger emotional resonance with their first language. Participants reported that taboos and swear words in Urdu, their first language, felt harsher than those in English, their second language. This aligns with the idea that the languages that are learned in one’s childhood carry deeper emotional connections (Amati-Mehler et al., 1993; Javier, 1989).

The role of social media and parental influence in exposing children to abusive and taboo language emerged as a significant finding as well. Majority of the participants agreed that social media is amongst the leading factors that give rise to the use of such language among children. This finding calls for further investigation into the mechanisms of language transmission in the digital age. This insight builds on existing research into the socialization processes through which children learn taboo language (Jay, 2009).

In conclusion, this study advances our understanding of the evolving nature of linguistic taboos in Pakistani society. It highlights the decrease in the adherence to certain taboos among younger individuals,

the resilience and maintenance of specific taboos, the role of gender, and the impact of bilingualism on emotional resonance with taboo language. These findings highlight the importance of considering cultural, generational, and linguistic contexts in studying the dynamics of linguistic taboos. Future research could further explore the mechanisms behind these changes, particularly the role of digital media and cross-cultural interactions in shaping linguistic norms.

V. CONCLUSION

The study found that there was not a significant difference between genders regarding perspectives on linguistic taboos. However, a notable difference in perceptions was observed upon dividing participants into two groups based on their age. This suggests that the decrease in linguistic taboos is not associated with gender but does correlate with the age of individuals.

While linguistic taboos are indeed decreasing overall, it is important to note that certain taboos still retain their quality of being taboo and are perceived as offensive. Although there is a general trend of reduced adherence to linguistic taboos in the younger age group, some specific taboo words, phrases, or topics continue to carry a strong social stigma and are widely considered inappropriate or offensive.

Based on the data that was collected and analyzed, it is concluded that a huge role is played by social media and parents and peers of children in providing them with exposure to abusive and taboo language. Thus, these are among the several factors that contribute to diminishing linguistic taboos. Furthermore, the language in which taboo words and swear words are uttered can shape the perception that bilingual learners form regarding them.

Abstract – Selenium was discovered as an essential element for mammals by Schwartz and Foltz in 1957. Selenium plays a significant role in the detoxification of reactive oxygen species (ROS). Research indicates that selenium deficiency can trigger the development of diseases such as depression, autoimmune disorders, chronic heart diseases, goiter, diabetes, and cancer. In this study, Selenium Nanoparticles (SeNPs) were synthesized using a green synthesis method to leverage selenium's ability to detoxify ROS. According to the principles of green chemistry, 5 mM sodium selenite was reacted with three different concentrations of acetic acid (AA) at 0.1 M, 0.05 M, and 0.025 M using a magnetic stirrer, resulting in brick-red solutions. The SeNPs were matured at room temperature for 24 hours, then washed and dried at 50°C. The size properties and distributions of the SeNPs were determined using scanning electron microscopy (SEM) and dynamic light scattering (DLS) methods. The results showed that the SeNPs are spherical, with size distributions ranging from 60 nm to 200 nm. The zeta potentials of the SeNPs were measured to be between -28 mV and -39 mV. The characteristic peak of the SeNPs was observed at 265 nm and confirmed using UV-VIS spectrophotometry. Considering the synthesis method, size distribution, and shape characteristics, SeNPs are believed to be easily taken up by cells and show efficacy. In conclusion, SeNPs can be used as a potential therapeutic agent for the targeted treatment of diseases arising from selenium deficiency. The findings of this study demonstrate that selenium nanoparticles (SeNPs) can be effective agents in the treatment of selenium deficiency-related diseases through ROS detoxification. The suitable bioavailability and targeting capabilities of SeNPs make them a promising therapeutic option for future clinical applications.This document presents the formatting instructions for the Proceedings of Conference on Scientific and Academic Research. This document can serve as the base template for a Microsoft Word based typesetting system. The abstract should state briefly the purpose of the research, the approach used, the principal results and major conclusions. The abstract of 200-250 words is required.

Keywords – Selenium, Nanoparticles, Green Synthesis, Chronic Diseases, Target Theraphy

INTRODUCTION

Selenium was first discovered in 1817 by Jöns Jakob Berzelius and Johan Gottlieb Gahn. This element was found to be an essential mineral required for mammals by Schwartz and Foltz in 1957. Selenium (Se) is an essential element that participates in the structure of biologically active selenoproteins. In the studies conducted by Chambers and Friends in 1986, while examining the synthesis of glutathione peroxidase and bacterial formate dehydrogenase, it was observed that it contained selenocysteine, which contains its own mRNA and tRNA code. In this way, selenocysteine was identified as the 21st amino acid. Glutathione peroxidase enzyme, which is the building block of selenocysteine, is a part of the enzyme system that protects the cell from oxidative damage of peroxidases accumulated inside the cell. Thanks to this enzyme, Se, which is necessary for the body's antioxidant defense mechanisms to function properly, is a mineral that

is essential for living life, although it is considered an essential mineral. This element is taken into our body with water as well as plant and animal foods in the forms of elemental selenium, selenite, selenide and selenate found in nature. Se deficiency may occur depending on the soil mineral characteristics of the geographical region you live in. Adults need to take an average of at least 60 µg of selenium daily. According to the World Health Organization, selenium intake of around 400 to 700µg per day has a toxic effect on human health. It has been determined that selenium plays an important role in preventing the formation of important degenerative diseases such as cardiovascular diseases, neurological problems, chronic diseases, immune diseases and cancer, with its antioxidant effect (1). It is also recommended as an alternative against the side effects associated with chemotherapy and radiotherapy (2-3). It is thought that selenium may be beneficial in breast cancer due to its effect on mechanisms such as activation of apoptosis, inhibition of cell proliferation, immune system stimulation and inhibition of angiogenesis (4). In addition, in an in vitro study conducted on breast cancer cells with selenium dioxide by combining selenium with paclitaxel (PTX), a chemotherapeutic agent, it was concluded that the application of selenium dioxide (SEL) and PTX stimulated apoptosis and reduced the expression of NF-κB in MDA-MB-231 breast cancer cells. determined. Therefore, it was concluded that there is an antagonistic effect between these two substances and SEL reduces the apoptotic effect of PTX. These studies on cancer with selenium have suggested that studies on more superior forms of selenium should be carried out to eliminate this antagonist effect (5).

The active surface area, chemical reactivity, and biological effects of nanoparticles are significantly different from the active surface area, chemical reactivity, and biological effects of micrometer-wide particles (6). Nanoparticles' surfaces can be functionalized with functional bindings, providing the opportunity for specific guidance in living tissue. Interestingly, functionalized SeNPs exhibit less cytotoxicity than their other forms, such as selenate, selenite, selenoproteins, and inorganic selenium (7-8). In addition, the synthesized SeNP can be used in many different fields in the Department of Medicine, such as cell imaging, examination of the mechanisms of action of therapeutic drugs and their therapeutic use. In addition, it is an advantage that nanoparticles can be adjusted in size and can easily penetrate the cell and nucleus. SeNP's ability to participate in reactions within the cell enables its use in targeted therapeutic systems, especially by enabling genetic stimulation through the activation and inactivation of enzymes and affecting protein expression. Therapeutics aim to increase the patient's comfort of life and reduce side effects by developing targeted therapies for effective treatment of diseases rather than systematic effects. For this purpose, selenium nanoparticle (SeNP), which is targeted to have high bioavailability in a biocompatible manner, was synthesized and characterized in accordance with the principles of green chemistry.

MATERIALS AND METHOD

Chemicals Used

Sodium selenite (Na2SeO3) and Ascorbic acid ($C_6H_8O_6$) were purchased from Sigma Aldrich.

Synthesis of Selenium Nanoparticles

Chemical reduction method was used for selenium nanoparticle synthesis. Sodium selenite was dissolved in sterile deionized distilled water to 5 mM. Ascorbic Acid (AA) was prepared in three different concentrations (0.1 M- 0.05 M- 0.025 M) as a reducing agent, and it was carried out in a mechanical mixer, using sterile pediatric dosiflor, in a device prepared to provide controlled slow flow. The reaction was carried out at room temperature, and then the nanoparticles were matured by incubating at room temperature for 24 hours. Although the solutions were colorless before the reaction, orange color formation was observed in the solution containing selenium nanoparticles after the reaction. The synthesized selenium nanoparticles were washed by centrifugation at 4000 x rpm for 15 minutes. The washing process was

repeated 3 times. The resulting supernatant was dried in the oven at 50°C. Dried selenium nanoparticles were stored at +4°C for characterization studies.

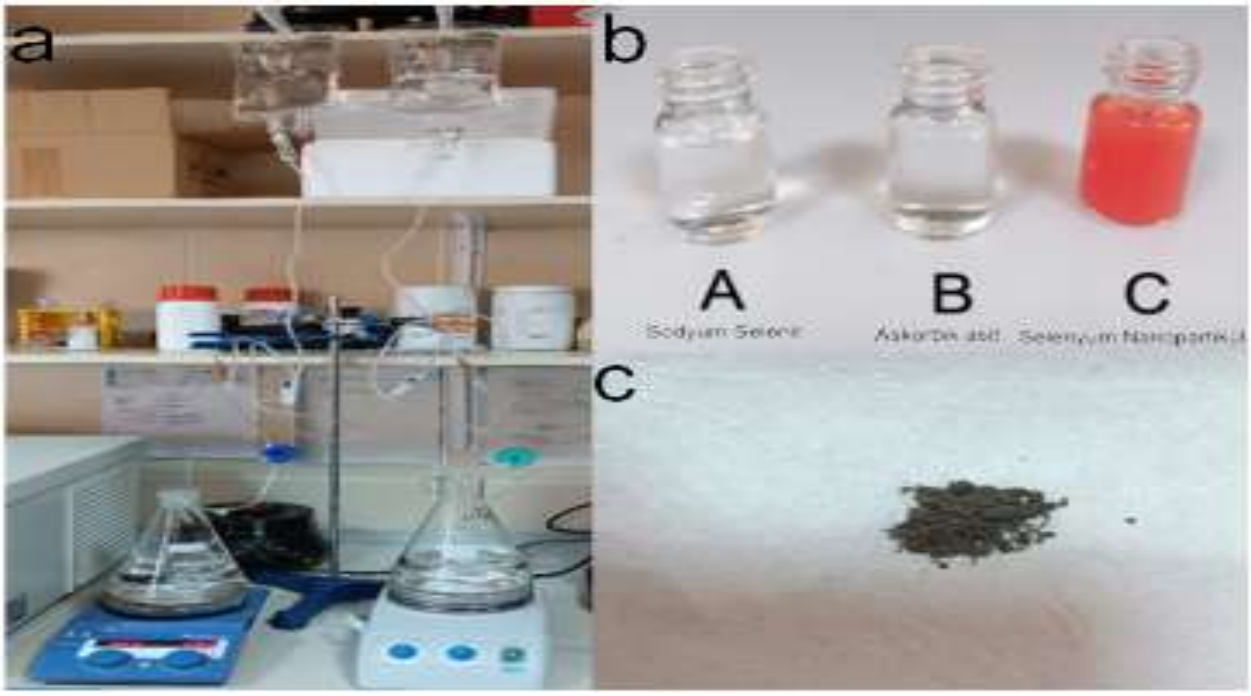

Figure 1 a-The setup set up for synthesis, b-Color change during synthesis, c-Dried state of the synthesized SeNP

Characterization of Selenium Nanoparticles

UV-vis absorbance measurement

The nanoparticles were dissolved in distilled water and measured between 200-800 nm on the UV-Vis device. The maximum peak was observed at 265 nm. Measurements were taken on a Shimadzu UV-1900i UV-VIS spectrophotometer.

DLS-Zeta Potential measurement

DLS-Zeta potential measurement of nanoparticles dissolved in distilled water was taken. Malvern Zetasizer DLS-Zeta potential measurement device was used. Particle sizes were measured between 100 and 300 nm. Surface charges were measured as negative. It is aimed to increase the effect and ensure easy entry into the cell by specifically targeting the cancer microenvironment.

SEM imaging

Size and shape data were obtained by taking SEM images of powdered nanoparticles. The synthesized nanoparticles were close to sphere-shaped, and their size was measured between 100-300nm. SEM images were taken on the ZEISS EVO LS10 SEM imaging device.

RESULTS

As a result of the measurement made in the measurement range between 200-600 nm, the solution prepared at a ratio of 1/10w/V with a UV-1900İ UV-VIS spectrophotometer (shimadzu), SeNPs gave a specific peak at 265 nm, confirming the formation of selenium nanoparticles (11).

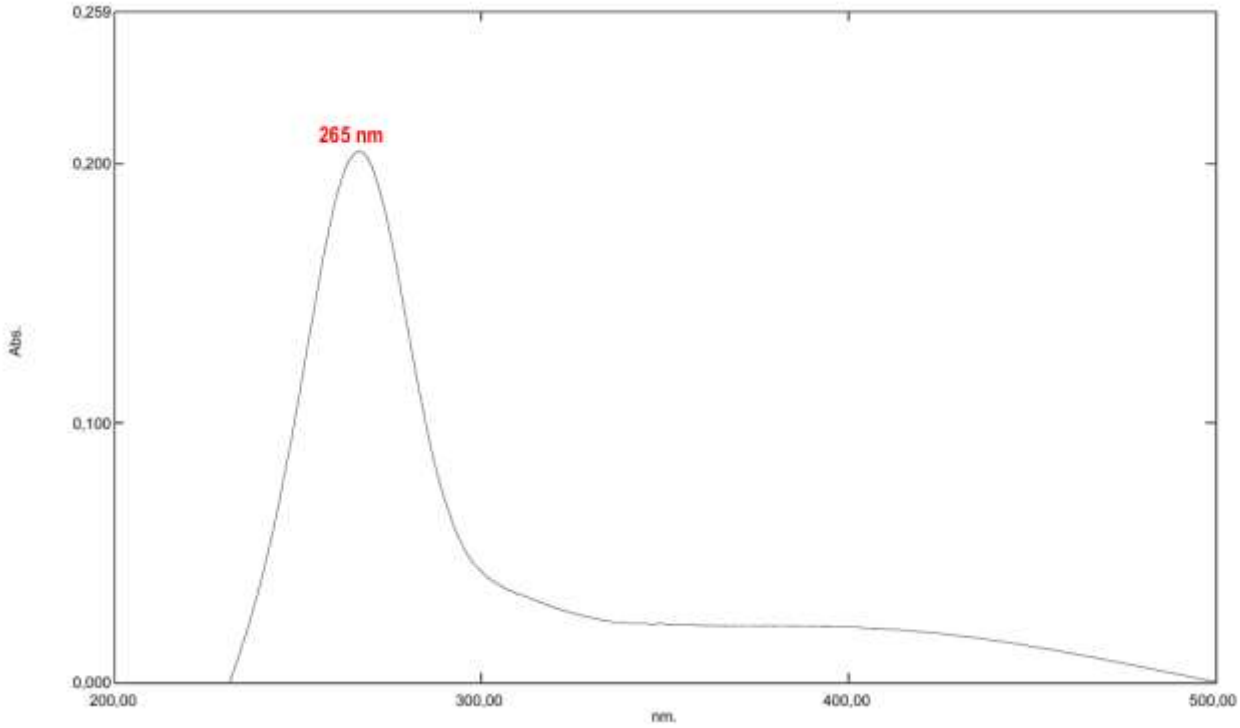

Figure 2 SeNP UV-VIS measurement

The selenium nanoparticles we synthesized were imaged without coating on the ZEISS EVO LS10 SEM imaging device. Since the selenium nanoparticle was highly aggregated in SEM imaging, it was seen to be in a sphere or near-sphere form in the images taken from the non-aggregated points.

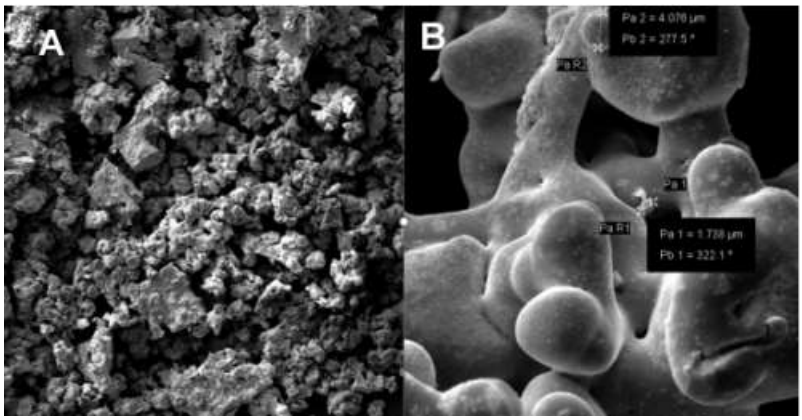

Figure 3 A- SeNP SEM image B- Measurement taken on the SeNP SEM Device

The nanoparticles we synthesized with different concentrations of AA (0.1 M – 0.05 M – 0.025 M) were dissolved in deionized sterile distilled water in a 1/10 w/V ultrasonic bath and measured on the Malvern Zetasizer DLS-Zeta potential measurement device.

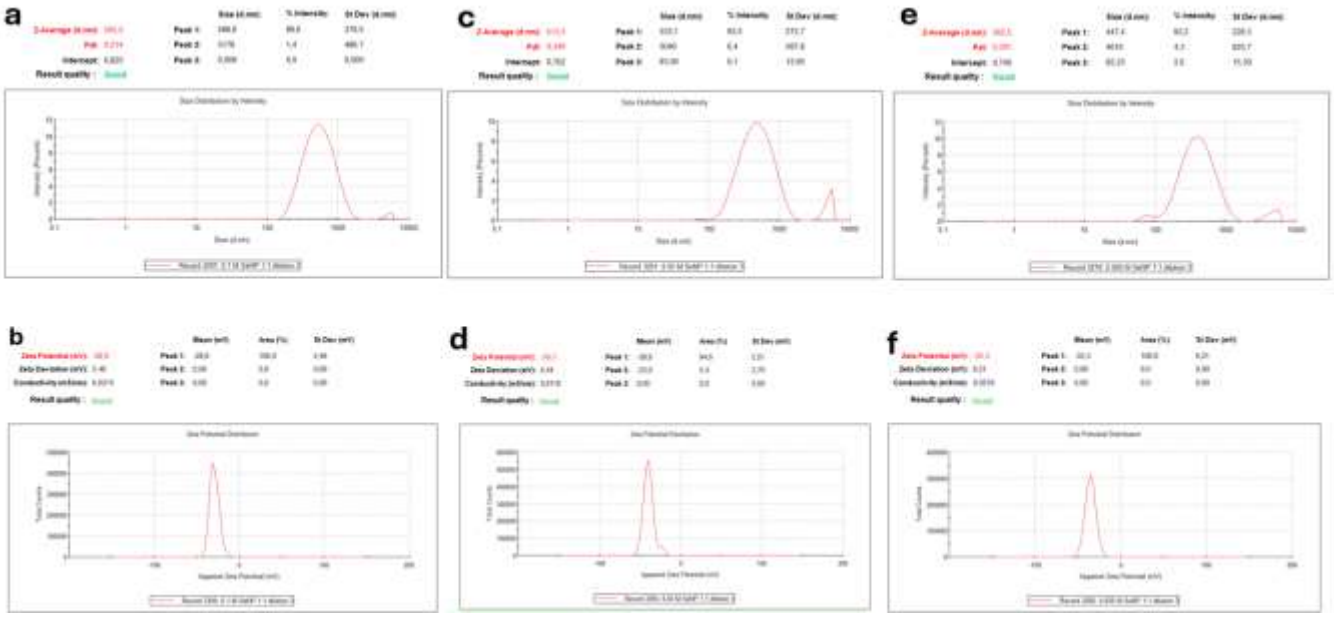

Figure 4 a- SeNP DLS measurement chart prepared with 0.1 M AA, b- SeNP Zeta Potential measurement chart prepared with 0.1 M AA, c- SeNP DLS measurement chart prepared with 0.05 M AA, d- SeNP Zeta Potential measurement chart prepared with 0.05 M AA, e- SeNP DLS measurement chart prepared with 0.025 M AA, f- SeNP Zeta Potential measurement chart prepared with 0.025 M AA

According to DLS measurements of selenium nanoparticles, the nanoparticle prepared with 0.1 M AA was measured as 276.5 nm, the nanoparticle prepared with 0.05 M AA was measured as 272.7 nm, and the nanoparticle prepared with 0.025 M AA was measured as 228.3 nm. Sufficient size was obtained for the nanoparticles to penetrate into the cell. Surface charges are intended to be negatively charged due to the acidic nature of the cancer microenvironment. The surface charges obtained in the measurement are (-) 28.8 mV for SENPs prepared with 0.1 M AA, (-) 39.3 mV for SeNPs prepared with 0.05 M AA, (-) 35 mV for SeNPs prepared with 0.025 M AA. Measured at 3mV.

DISCUSSION

Selenium is an essential micronutrient required for the proper functioning of biological and metabolic mechanisms in the human body. Selenium deficiency causes cancer and various disorders such as neurological, muscular and immune disorders (12). Reactive oxygen species (ROS) and reactive nitrogen species (RNS) free radicals are generally produced in the human body during various physicochemical and biochemical reactions. Intermediate complexes such as superoxide and hydrogen peroxide, produced in high amounts during these reactions, are structures responsible for cellular damage that leads to fatal diseases. SeNPs protect cells from damage and oxidative stress by playing important roles in clearing free radicals such as reactive oxygen and nitrogen species and regulating the contents produced during biochemical reactions (13). Thanks to their antioxidant properties, SeNPs can potentially be used in the treatment of neurodegenerative diseases such as Huntington's, Parkinson's and Alzheimer's diseases (14). Green synthesis applications to eliminate selenium deficiency and as a therapeutic agent provide more advantages than chemical reduction methods due to higher biocompatibility, bioactivity and lower cytotoxicity properties. Since the microenvironment of cancer cells is acidic, it is predicted that the SeNPs we synthesized will be more targeted and taken up by cancer cells due to their negatively charged surfaces. It is also known that selenium compounds are critical in genes related to cell proliferation and apoptosis by molecularly affecting the cDNA microarray (15). Additionally, it eliminates the use of expensive chemicals (12).

CONCLUSION

The synthesized SeNPs were synthesized as Green Chemistry and can be used effectively as candidate drugs because they are soluble in water, biocompatible and have high bioavailability. Since the size of SeNP is around 200 nm and its shape is close to a sphere, it can easily enter the cell and since it is in a water-soluble form within the cell, it can have an effect on the cytoplasm and nucleoplasm. The negative surface charge of SeNPs indicates that they can be used in targeted therapies and medical imaging by targeting the microenvironment of acidic cancer cells. Although selenium is an essential mineral in human metabolism, it can be used more effectively as SeNP, thanks to its physical and chemical properties, being more active in reactions and easily penetrating and invasive.

ACKNOWLEDGMENT

The study was supported by Akdeniz University Scientific Research Projects Coordination Unit [Project Number: FBA-2023-6159].

Kapsayıcı Liderlik Stratejilerinin Çalışan Adanmışlığına Etkisi

Nermin Kişi

Yönetim ve Organizasyon Bölümü / Çaycuma Meslek Yüksekokulu, Zonguldak Bülent Ecevit Üniversitesi, Türkiye

(ncelik@beun.edu.tr)

Özet – Liderlik tarzlarının çalışan adanmışlığı üzerindeki etkisi, kurumsal performans açısından önemli bir araştırma alanı olarak kabul edilmektedir. Bu bağlamda, bu çalışma, kapsayıcı liderlik stratejilerinin çalışan adanmışlığı üzerindeki etkisini incelemeyi amaçlamaktadır. Bu amaçla, konuyla ilgili literatürü analiz etmek üzere sistematik literatür taraması yöntemi kullanılmıştır. Web of Science (WoS) ve Scopus veri tabanları üzerinde yapılan sorgulama sonucunda, konuyla doğrudan ilişkili ve geçerli bulunan 14 yayın seçilmiştir. Araştırmanın bulguları, açık iletişim kurma ve erişilebilirlik, destekleyici davranışlar sergileme, psikolojik güvenlik ortamı oluşturma gibi kapsayıcı liderlik stratejilerinin çalışan adanmışlığını artırmada kritik bir rol oynadığını vurgulamaktadır. Bu stratejiler, çalışanların kendilerini değerli ve güvende hissetmelerini, iş süreçlerine aktif katılım göstermelerini ve iş ortamında daha fazla çaba harcamamalarını teşvik etmektedir. Dolayısıyla, bu stratejiler, çalışanların işlerine ve örgütlerine daha sağlam bir bağlılık geliştirmelerine olanak tanıyarak, adanmışlık düzeylerini anlamlı şekilde arttırmaktadır. Ayrıca, kapsayıcı liderlik stratejileri, örgüt içinde yaratıcı düşünceyi teşvik ederek yenilikçi iş modellerinin geliştirilmesine ve işletme performansının artırılmasına katkı sağlamakta, böylece sürdürülebilir rekabet avantajı elde etme sürecinde etkili olmaktadır. Çalışmanın bulgularına dayanarak bir kavramsal model geliştirilmiş ve bu model, kapsayıcı liderlik stratejilerinin işletmelerdeki çalışanların adanmışlık düzeylerine olan etkisini anlamak için önemli bir adım olarak değerlendirilmiştir. Sonuçlar, kapsayıcı liderlik stratejilerinin çalışan adanmışlığını artırmada etkili bir araç olduğunu ve işletmelerin sürdürülebilir başarısına önemli katkılar sunduğunu ortaya koymaktadır.

Anahtar Kelimeler – Liderlik tarzları, kapsayıcı liderlik, işe adanmışlık, örgüte adanmışlık, performans

I. GİRİŞ

Günümüzde çalışan adanmışlığı, organizasyonların sürdürülebilirliği için kritik bir unsurdur. Adanmış çalışanlar, iş gücü devrini azaltarak istikrarlı bir iş gücü oluştururlar. Bu durum, kaliteli ürün ve hizmetlerin sürekliliğini sağlar [1]. Literatürde çalışan adanmışlığı kavramı çeşitli şekillerde tanımlanmıştır. Kahn [2]'a göre çalışan adanmışlığı, işlerine derin bağlılık duyan ve işlerini yaparken fiziksel, zihinsel ve duygusal enerjilerini aktif bir şekilde kullanan çalışanların durumudur. Schaufeli vd. [3] çalışan adanmışlığını, zindelik, adanma ve yoğunlaşma gibi özelliklerle karakterize edilen pozitif, tatmin edici, işle ilişkili bir ruh hali olarak tanımlamaktadır. Bu tanımda yer alan zindelik boyutu, çalışırken yüksek enerji seviyeleri ve zihinsel dayanıklılıkla birlikte işe çaba harcamaya istekli olmayı ve zorluklarla karşılaşıldığında bile azim göstermeyi içermektedir. Adanma boyutu ise önem hissi, heves, ilham, gurur ve meydan okuma duygularıyla belirginleşir. Son olarak, yoğunlaşma boyutu, çalışanın işine tamamen odaklandığı durumu ifade eder. Bu durumda zaman hızla geçer ve işten kopmakta zorluk çekilir. Bu boyutların etkili yönetimi, iş performansını artırmada önemli bir rol oynar.

Öte yandan, çalışma ortamı, işin özellikleri, liderlik tarzı, ekip ve iş arkadaşları, örgüt kültürü, etkili iletişim, özerklik, adalet algılamaları, algılanan örgütsel destek ve psikolojik iklim gibi faktörler, çalışan adanmışlığının temel belirleyicileri arasında yer alır [4]. Özellikle liderlik tarzlarının çalışan adanmışlığı üzerindeki etkisi geniş çapta kabul görmektedir. Örneğin, dönüşümcü liderlik gibi pozitif liderlik

yaklaşımları, adanmış bir çalışma ortamının oluşturulmasında önemli rol oynamaktadır. Bununla birlikte, etik liderlik, otantik liderlik, kapsayıcı liderlik, hizmetkâr liderlik ve işlemci liderlik gibi farklı liderlik yaklaşımlarının çalışan adanmışlığı üzerindeki etkisini anlamak için daha fazla bilimsel araştırmaya ihtiyaç vardır [5]. Özellikle, çalışan adanmışlığı ve kapsayıcı liderlik konusunu ele alan literatürün azlığı dikkat çekmektedir [6].

Nembhard ve Edmondson [7] kapsayıcı liderliği, liderin söz ve davranışlarıyla takipçilerini katkıda bulunmaya teşvik ettiği ve bu katkıları takdir ettiği bir liderlik biçimi olarak tanımlanmıştır. Hollander [8] ise kapsayıcı liderliği, liderlerin takipçilerin ihtiyaçlarını dinlemesi ve onlara erişilebilir olduklarını hissettirmesi üzerine kurulu bir ilişkisel liderlik biçimi olarak görmüştür. Kapsayıcı liderler, bireylerin bir grup içinde hem ait olma hem de özgün kimliklerini koruma ihtiyacını dengeleyerek hareket ederler. Bu çerçevede kapsayıcı liderler, bireyleri grubun bir üyesi olarak görür, adalet ve eşitlik sağlar, karar alma süreçlerini paylaşır ve böylece grup içinde ait olma hissini güçlendirirler. Ayrıca, örgüte katkı sağlamalarını teşvik eder, tam katılımlarını sağlamaya yardımcı olur ve bireylerin özgünlüklerini öne çıkarırlar [9]. Bu tutum ve davranışlar sayesinde, kapsayıcı liderler, çalışanların işlerine daha fazla adanmışlık göstermelerini sağlarlar [10].

Bu çalışma, kapsayıcı liderlik stratejilerinin çalışan adanmışlığını nasıl etkilediğini araştırmayı amaçlamaktadır. Çalışmanın içeriği şu şekilde düzenlenmiştir: Çalışmada kullanılan materyal ve yöntemler tanıtıldıktan sonra, elde edilen bulgular sunulacak ve bu bulgular doğrultusunda kavramsal bir model geliştirilecektir. Ardından çalışmanın ana sonuçları özetlenecektir.

II. MATERYAL VE YÖNTEM

Bu çalışmada, kapsayıcı liderlik stratejilerinin çalışan adanmışlığına etkisi belirlemek amacıyla sistematik bir literatür taraması gerçekleştirilmiştir. 5 Temmuz 2024 tarihinde WoS ve Scopus veritabanlarında gerçekleştirilen arama sorguları şu şekildedir: WoS veri tabanında Topic: “employee engagement” and Topic: “inclusive leadership” şeklinde arama yapılırken, Scopus veritabanında Article title, Abstract, Keywords: “employee engagement” and Article title, Abstract, Keywords: “inclusive leadership” şeklinde arama gerçekleştirilmiştir. Her iki veri tabanında da arama sorguları, İngilizce makalelerle sınırlandırılmıştır. Böylece, WoS veri tabanından 11, Scopus veri tabanından 15 yayın elde edilmiştir. Ardından, tekrarlanan çalışmaları belirlemek amacıyla çapraz kontroller yapılmış ve 9 yayın kapsam dışı tutulmuştur. Ayrıca, 3 yayının tam metnine erişilemediğinden, araştırma kapsamına dâhil edilmemiştir. Nitekim kriterleri karşılayan toplam 14 yayın belirlenmiş ve analiz edilmiştir.

III. BULGULAR

A. *Tanımlayıcı İstatistikler*

Araştırma kapsamında incelenen kapsayıcı liderlik ve çalışan adanmışlığına dair 14 yayının tanımlayıcı istatistikleri şu şekildedir: Çalışmaların tümü uygulamalı olup, Pakistan ve Çin’de üçer, Zimbabve, Vietnam, Portekiz, Kamboçya, Namibya, Suudi Arabistan, Gana ve Irak’ta birer yayın gerçekleştirilmiştir. Sektörel dağılım incelendiğinde, turizm ve konaklama sektöründe altı, telekomünikasyon sektöründe üç, teknoloji sektöründe iki, kamu sektöründe iki ve çeşitli sektörlerde bir yayın yapılmıştır.

B. *Kapsayıcı Liderlik Stratejileri*

Bu çalışma kapsamında incelenen yayınlardan elde edilen temel bulgular, hangi kapsayıcı liderlik stratejilerinin çalışan adanmışlığını etkilediğini ortaya koymaktadır. Buna göre, çalışmalarda, özellikle açık iletişim kurma ve erişilebilirlik, destekleyici davranışlar sergileme ve psikolojik güvenlik ortamı oluşturma gibi stratejiler, kapsayıcı liderlik uygulamalarının temel taşları olarak öne çıkmaktadır.

Açık iletişim kurma ve erişilebilirlik: Kapsayıcı liderlerin çalışan adanmışlığını artırmasında iletişim anahtar rol oynamaktadır [11]. Abdou vd. [12]’nin belirttiği gibi iletişim stratejileri, çalışanların örgütsel değerlerle daha güçlü bir şekilde özdeşleşmelerine yardımcı olabilir. Özellikle açık iletişim, çalışan adanmışlığını artırmak için kritik bir araç olarak tanımlanmaktadır [13]. Örneğin, açık iletişim yoluyla çeşitlilik ve kapsayıcılık uygulamalarına yönelik olumlu algılar, çalışanların örgüte olan bağlılıklarını

artırabilir [14]. Bu nedenle, liderlerin kapsayıcı liderlik davranışlarını benimsemeleri ve çeşitliliği etkin bir şekilde yönetmeleri önemlidir [15].

İşbirliği kültürünü ve ekip çalışmasını teşvik eden kapsayıcı liderlik yaklaşımı [16, 17], açık kapı politikası ve etkili iletişim üzerine odaklanarak, çalışanların görüşlerini özgürce ifade etmelerini ve kurumsal kararlara katkıda bulunmalarını teşvik eder. Bu sayede, çalışanların adanmışlık seviyelerini olumlu yönde etkiler [6].

Çalışanların işlerine ve örgütlerine adanmışlıklarını artırmak için, liderlerin açık iletişim kurmanın yanı sıra erişilebilir olmaları da kritik öneme sahiptir [1]. Liderler, çalışanların ihtiyaç duyduklarında danışabilecekleri ve karşılaştıkları zorlukları paylaşabilecekleri bir ortam sağlamalıdır. Bu yaklaşım, çalışanların önemli ve değerli olduklarını hissetmelerine katkı sağlayarak adanmışlıklarını artırabilir. Bu nedenle, liderlerin açıklık, uygunluk ve erişilebilirlik özelliklerini benimsemeleri tavsiye edilir [16].

Bu özelliklere sahip kapsayıcı liderler, yüksek kaliteli ilişkiler geliştirerek çalışanların kendilerini güçlü hissetmelerine, enerjik bir şekilde çalışmalarına, işlerine adanmalarına ve derinden bağlanmalarına olanak tanırlar [6]. Dahası, çalışanların yeni bilgiler, pazarlar ve ürünler arayışına girmelerini desteklerler [15] ve onları yenilikçi iş davranışlarına katılmaya yönlendirirler [18].

Destekleyici davranışlar sergileme: Kapsayıcı liderler, çalışanlara destekleyici bir çalışma ortamı sağlayarak, karar alma süreçlerinde onların görüşlerine değer verir [6]. Bu doğrultuda, liderlere, çalışanlarının özgünlük ve aidiyet ihtiyaçlarına duyarlılık göstermeleri için eğitim programlarına katılmaları önerilmektedir [6, 16]. Kapsayıcı liderlik becerilerini geliştirmeye yönelik bu eğitim programları, çalışanların bağlılığını, iş tatminini, motivasyonunu ve genel performansını artırmayı hedeflemektedir [17, 18]. Ayrıca, koçluk, mentorluk ve rol oynama gibi liderlik geliştirme programları, yöneticilere iş ortamında kapsayıcı liderlik davranışlarını uygulama fırsatları sunar [6].

Hiyerarşik olmayan karar alma süreçlerini önceliklendiren kapsayıcı liderler, aidiyet duygusu yaratarak çalışanların adanmışlığını artırır [13]. Bunun yanı sıra, esnek çalışma düzenlemeleri de çalışan adanmışlığını artıran önemli kapsayıcı uygulamalardan biridir. Esnek çalışma saatleri, çalışanların iş-yaşam dengesini sağlamalarına yardımcı olarak, onların işlerine daha fazla bağlılık ve motivasyonla yaklaşmalarını sağlar. Kişisel ve mesleki ihtiyaçları daha iyi karşılanan çalışanlar, işlerine daha fazla katkıda bulunma eğiliminde olurlar [13].

Genel olarak, liderleri tarafından desteklenen çalışanlar, iş rollerine daha fazla bağlılık gösterirler. Üst yönetimin kendilerine önem verdiğini fark eden çalışanlar, örgütün beklentilerini karşılamak için kendilerini motive hissederler ve olumlu davranışlar sergilerler [1]. Kapsayıcı liderler, çalışanların enerjilerini, bağlılıklarını ve işlerine adanmışlıklarını maksimize eder [18]. Bu liderler, yenilikçi davranışlar üzerindeki önemli bir etkiye sahiptir ve bu etkiyi algılanan örgütsel destek aracılığıyla çalışan adanmışlığı üzerinden sağlarlar. Dolayısıyla, örgütsel destek, çalışanların yenilikçi davranışlarını artırmada kilit bir başarı faktörü olarak görülmektedir [19].

Psikolojik güvenlik ortamı oluşturma: Psikolojik güvenlik ortamı sağlandığında, çalışanlar bilgi ve düşüncelerini rahatça paylaşarak kendilerini güvende hissederler. Bu sayede, liderler, çalışanların güçlü ve zayıf yönlerini daha iyi anlayarak onların görüş ve deneyimlerinden nasıl faydalanacaklarını belirleyebilirler [1]. Bu nedenle, liderlerin psikolojik güvenlik ortamı oluşturmaları, çalışanların adanmışlıklarını ve üretkenliklerini artırmak açısından kritik öneme sahiptir [13].

Kapsayıcı liderlik ile çalışan adanmışlığı arasındaki ilişkide psikolojik güvenin belirleyici bir rol oynadığı bilinmektedir [1]. Kapsayıcı liderler, olumlu bir çalışma ortamı yaratarak çalışanların iyilik hallerini artırma, memnuniyeti sağlama ve adanmışlıklarını yükseltmede kritik bir öneme sahiptir. Bu liderler, çalışanların görüşlerini ifade etmelerini, karar alma süreçlerine katılmalarını ve çalışma ortamlarını aktif bir şekilde şekillendirmelerini teşvik ederler [13].

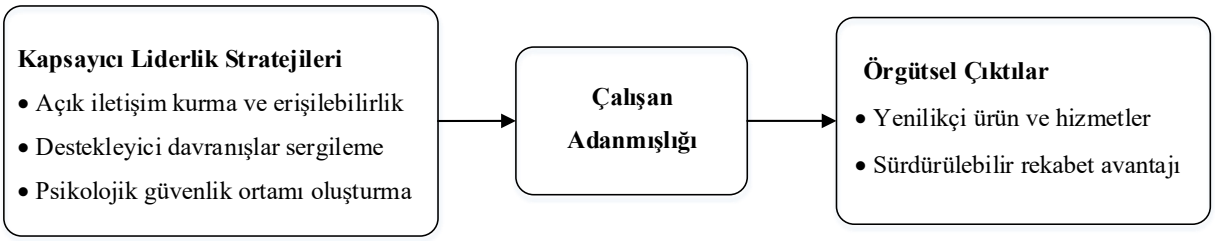
Dolayısıyla, kapsayıcı liderler, çalışanların kendilerini güvende hissetmelerini sağlayarak iş adanmışlıklarını artırmaktadır [20]. Şefkat, empati ve adalet gibi kapsayıcı liderlik uygulamaları, çalışanlarda gönüllü çaba ve dayanıklılığı güçlendirir. Bu uygulamalar, psikolojik olarak güvenli bir ortam yaratarak örgüt içi güveni artırır ve yenilikçi performansa katılımı güçlendirir [13].

C. *Kapsayıcı Liderlik Stratejileri ve Örgütsel Çıktılar*

Araştırmalar, kapsayıcı liderliğin çalışanların algılarını şekillendirerek adanmışlıklarını önemli ölçüde artırdığını ve kapsayıcı liderlik ile çalışanların işe adanmışlığı arasında pozitif bir ilişki olduğunu göstermektedir [6, 14, 17, 21]. Kapsayıcı liderler, çalışanların katılımını ve güçlenmesini sağlayarak, onların bağlılık göstermelerini ve işlerini canlılıkla, adanmışlıkla ve kendilerini işlerine kaptırarak yapmalarını desteklerler [6]. Kapsayıcı liderler, çalışanları karar alma süreçlerine dâhil eder ve onları örgütsel hedeflere ilişkin tam bilgi ile donatır. Bu sayede, çalışanlar olumsuz sonuçlardan korkmadan düşüncelerini rahatça ifade edebilirler. Kapsayıcı liderler, çalışanların özgüvenini artırır [16], yaratıcı düşünmelerini destekler [17, 21, 22] ve yenilikçi iş davranışlarında bulunmalarını teşvik ederler [15, 16, 18]. Dolayısıyla, kapsayıcı liderliğin çalışanların keşif ve yenilik yapma potansiyelleri üzerinde olumlu bir etkisi olduğunu [15] ve sürdürülebilir rekabet avantajına yol açma potansiyeline sahip olduğunu söylemek mümkündür [13].

D. *Kavramsal Bir Model Oluşturma*

Bu çalışmadan elde edilen bulgular çerçevesinde kavramsal bir model geliştirilmiştir. Bu model, kapsayıcı liderlik stratejilerinin örgütsel çıktılarla ilişkisini ve bu ilişkide çalışan adanmışlığının aracı rolünü göstermektedir. Modelin bileşenleri Şekil 1'de görüldüğü gibidir.



Şekil 1. Kapsayıcı liderlik, çalışan adanmışlığı ve örgütsel çıktılar

Kaynak: Yazar tarafından oluşturulmuştur.

Şekil 1'e göre, açık iletişim kurma ve erişilebilirlik, destekleyici davranışlar sergileme ve psikolojik güvenlik ortamı oluşturma gibi kapsayıcı liderlik stratejileri doğrudan çalışan adanmışlığını artırmaktadır. Kapsayıcı liderlerin çalışanlarla kurdukları açık iletişim kanalları ve erişilebilirlikleri, çalışanların kendilerini ifade etmelerine, geri bildirim almalarına ve liderlerine kolayca ulaşmalarına olanak tanır. Bu durum, çalışanların liderlerine duydukları güveni artırarak, işlerine daha fazla adanmışlık göstermelerine katkı sağlar. Destekleyici davranışların sergilenmesi, liderlerin çalışanlarına yönelik empati, anlayış ve yardımseverlik göstermesi anlamına gelir. Bu tür davranışlar, çalışanların kendilerini değerli hissetmelerini sağlar. Psikolojik güvenliğin sağlanması ise, çalışanların fikirlerini ve düşüncelerini özgürce ifade edebildikleri, hata yapmaktan korkmadıkları ve yenilikçi uygulamaları deneyebildikleri bir ortam oluşturur.

Kapsayıcı liderlik stratejileriyle artan adanmışlık düzeyi, çalışanların yaratıcı düşünme ve yenilikçi iş modelleri geliştirme yeteneklerini artırır. Bu süreç, örgütün yenilikçi ürün ve hizmetler geliştirmesini kolaylaştırır. Yenilikçi ürün ve hizmetlerin geliştirilmesi, örgütün piyasada farklılaşmasını, müşteri beklentilerini daha iyi karşılamasını, pazar payını artırmasını ve rekabet avantajı elde etmesini sağlayarak uzun vadeli başarıyı destekler.

Kısaca, kapsayıcı liderlik stratejilerinin uygulanması, çalışan adanmışlığını artırarak, yaratıcı düşünme ve yenilikçi iş davranışları geliştirmeyi teşvik eder. Bu durum, örgütün yenilikçi ürün ve hizmetler geliştirmesine ve sürdürülebilir rekabet avantajı kazanmasına önemli ölçüde katkıda bulunur.

IV. SONUÇLAR

Bu çalışma, kapsayıcı liderlik stratejilerinin çalışan adanmışlığı üzerindeki etkilerini sistematik bir literatür taramasıyla incelemektedir. Bulgular, kapsayıcı liderliğin çalışanların işlerine ve örgütlerine adanmışlıklarını artırdığını göstermektedir. Özellikle, açık iletişim ve erişilebilirlik, destekleyici

davranışlar sergileme ve psikolojik güvenlik ortamı oluşturma stratejilerinin, çalışanların adanmışlık düzeylerini artırmada etkili olduğu belirlenmiştir.

Bu bağlamda, liderlerin çalışanlarla sürekli iletişim halinde olmaları ve açık kapı politikası uygulamaları, çalışanların kendilerini değerli ve önemli hissetmelerini sağlayarak adanmışlıklarını artırmaktadır. Ayrıca, çalışanların başarılarını takdir etme, koçluk ve mentorluk desteği sunma, esnek çalışma programları düzenleme gibi destekleyici davranışların, çalışanların iş süreçlerine daha aktif katılım göstermelerini sağlamaktadır. Dahası, psikolojik güvenlik ortamı oluşturma stratejisi, çalışanların fikirlerini özgürce ifade etmelerini teşvik ederek adanmışlık düzeylerini artırmaktadır.

Çalışmanın önemli bulgularından biri, kapsayıcı liderlik stratejilerinin yaratıcı düşünme, yenilikçi iş davranışları ve örgütsel performans üzerinde olumlu etkiler sağladığı ve bu süreçte çalışan adanmışlığının aracı bir rol oynadığıdır. Bu çerçevede, kapsayıcı liderliğin çalışanlar arasında yaratıcılığı teşvik ettiği, yenilikçi çözümler geliştirme isteğini artırdığı ve sonuç olarak örgütsel performansı iyileştirdiği görülmüştür. Kapsayıcı liderlik uygulamalarının, örgütler için sürdürülebilir rekabet avantajı sağlama potansiyeline sahip olduğu da vurgulanmıştır.

Bu çalışma, kapsayıcı liderlik ve çalışan adanmışlığı arasındaki ilişkiyi anlamak için geliştirilen bir modelle yeni bir bakış açısı sunmaktadır. Elde edilen bulguların, yöneticiler ve araştırmacılar için kapsayıcı liderlik stratejilerinin çalışan adanmışlığını nasıl etkilediğini anlamalarına katkı sağlaması beklenmektedir. Gelecekte yapılacak araştırmaların, farklı endüstrilerde ve kültürel bağlamlarda bu ilişkiyi daha derinlemesine incelemesi önerilmektedir. Ayrıca, bu bilgilerin işletmeler tarafından stratejik olarak nasıl kullanılabileceği konusunda rehberlik sağlanması beklenmektedir. Böylece, kapsayıcı liderlik ve çalışan adanmışlığı arasındaki dinamiklerin daha iyi bir şekilde anlaşılması ve işletmelerin sürdürülebilir başarıları için bir temel oluşturulması mümkün olacaktır.

Abstract – The purpose of this study is to investigate certain numerical indicators related to the number of teachers, students, and public schools in Turkey between 2000 and 2023, based on the data and research reports provided by the Turkish Statistical Institute (TUIK) and the Ministry of National Education. In the study, data examination was conducted within the scope of the qualitative research method, and the obtained data were analyzed using statistical methods. Firstly, the graph showing the change in the number of students per teacher in Turkey between 2000 and 2023 was presented, and based on this, data on the changes in the number of students per teacher over the years were provided. The next analysis examined the change in the number of students in schools in Turkey between 2000 and 2023. In the mentioned years, an average of 360 students corresponds to each school. This number was lowest in 2001 with 243 students, and highest in 2014 with 546 students. Additionally, the gender distributions of students between 2000 and 2022 were examined, and some inferences were drawn from the obtained ratios. Lastly, the change rates in the number of schools, teachers, and students between 2000 and 2022 were investigated. In these calculations, the fixed base index method was used. Therefore, the year 2000 was taken as a constant, and the changes in the other years compared to this year were examined.

Keywords – Education indicators, school, teacher, constant basis index method

I. INTRODUCTION

Education is considered one of the most important cornerstones of social structure, and the key stakeholders in education are teachers, students, and educational institutions. In recent years, Turkey has experienced significant transformations in the field of education. These transformations have manifested as increases in the number of teachers, changes in student demographics, and differentiations in school structures. This study aims to examine the changes in the number of teachers, students, and schools in Turkey using statistical methods.

Each of these elements in our education system stands out as indicators of social change at both micro and macro levels. Teachers are at the center of knowledge and value transfer, while students, as the recipients of this knowledge and the representatives of the future, are at the heart of the education process. Schools, as the physical spaces where these interactions occur, are among the factors that directly affect the quality of education.

In recent years, especially technological advancements and demographic changes have had noticeable effects on the numbers of teachers, students, and schools. Optimally developing these three elements will enhance the effectiveness of education at every level. Consequently, social welfare and economic development will be positively affected. Therefore, the numbers of teachers, students, and schools hold

central importance in determining the fundamental dynamics of the education system and its impact on society. As a result, numerous studies have focused on these elements. For instance, in their study, [1] examined the preparations for future periods of Turkey's education policies based on the education sections of 10 development plans, investigating current and potential problems, and providing solutions and suggestions for the identified issues. As it is known, tangible returns on educational investments require long periods. Making short and medium-term preliminary assessments of educational investments is crucial for the reliability and continuity of the process. In this context, concrete data provided by some national or international examinations are important indicators in evaluating this process. For example, [2] examined the results of the countries successful in the Program for International Student Assessment (PISA) program and Turkey's results within the scope of the distribution of educational investments. Such examinations have been addressed in different methods and dimensions by many researchers ([2], [4], [5], [16]), as well as by educational policymakers. Based on the statistics and research reports of the Ministry of National Education, [6] studied the educational indicators related to public schools in Turkey between 2000 and 2021. In this study, document analysis was conducted within the scope of the qualitative research method, and thematic analysis technique was used for the obtained data. Changes in the numbers of teachers and students in schools in different regions of Turkey play an important role in shaping educational policies. Statistical analyses are crucial in uncovering the underlying trends and factors of these changes. Additionally, statistical analysis methods have been frequently used in recent periods to obtain qualitative data on various subjects ([7], [8], [9], [10]).

This research aims to conduct a comprehensive statistical evaluation to understand the current state of the Turkish education system and its changes over time. The study will analyze the changes in the numbers of teachers, students, and schools over the years, particularly focusing on these changes' yearly situations. These analyses will enable educational policies to be shaped more consciously and data-driven, shedding light on the future of the Turkish education system.

II. Materials and Method

A. *Data*

The data used in the study were provided from the Turkish Statistical Institute (TUIK) data portal [11]. The number of teachers in the data includes the number of permanent teachers working in the state. The number of graduating students was taken after the academic year was completed, as per the system. In other words, the numbers given in 2023 appear after the 2022-2023 academic year is completed.

B. *What is a Fixed Basis Index?*

A constant basis index is a method used to measure price or quantity changes in other years, based on the price or quantity levels of a particular base year. The base year is chosen as the reference year against which other years will be compared. These indices are used to monitor changes in inflation rates, production levels and other economic variables in the economy over time [12].

C. *Fixed Based Index Types*

Price Indices: These indices measure price changes in other years based on the price levels of a particular base year. For example, the Consumer Price Index (CPI) and the Producer Price Index (PPI) fall into this category [13].

Quantity Indices: These indices measure quantity changes in other years based on the quantity levels of a particular base year. For example, production amounts of agricultural products or industrial production indices fall into this category [14].

Calculation Methods

Fixed basis indices are often calculated using methods such as Laspeyres and Paasche indices:

Laspeyres Index: It measures price changes in other years, keeping the base year's quantities constant. This index may tend to exaggerate cost increases because it ignores the fact that consumers switch from higher-priced goods to lower-priced goods [15].

$$Laspeyres\ Price\ Index = \frac{\sum(P_t.Q_o)}{\sum(P_o.Q_o)}x100$$

Here,
Pt is the current year price,
P_o base year price
Q_o indicates the base year amount.

Paasche Index: It measures price changes in other years, keeping the current year's quantities constant. This index may more accurately reflect how consumers respond to price changes [12].

$$Paasche\ Price\ Index = \frac{\sum(P_t.Q_t)}{\sum(P_o.Q_t)}x100$$

Here,
Q_t displays the current year amount.

III. RESULTS

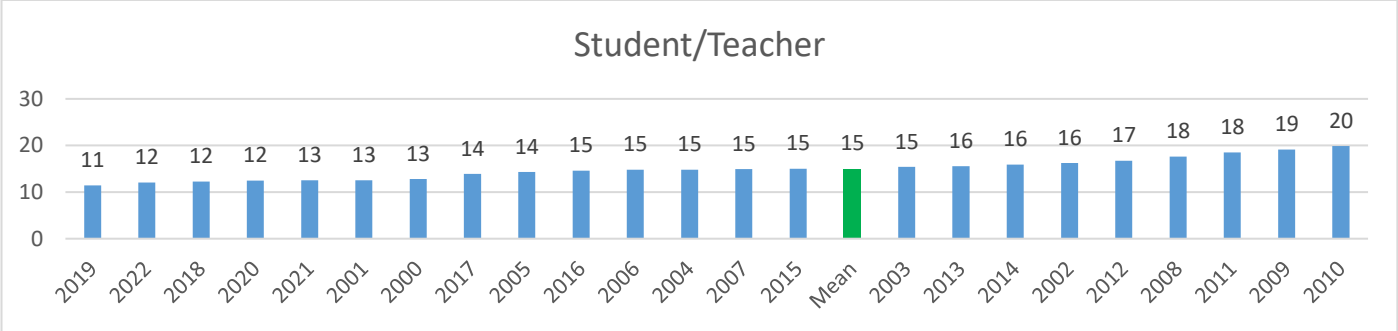

Fig 1. Number of Students per Learner Between 2000-2023

As a result of the analysis, the change graph of the number of students per teacher in Turkey between 2000 and 2023 is shown in the figure is located. According to the figure, the average of the years in question is calculated as 15. In other words, there are 15 students for each teacher in the relevant years. While 2002 and 2003 and 2009-2014 were above this general average, the remaining years remained below the average. The lowest number was calculated as 11 students in 2019. Contrary to 2019, it was determined that the highest number of students per teacher was found in 2010, with 20 students, almost twice the number in 2009.

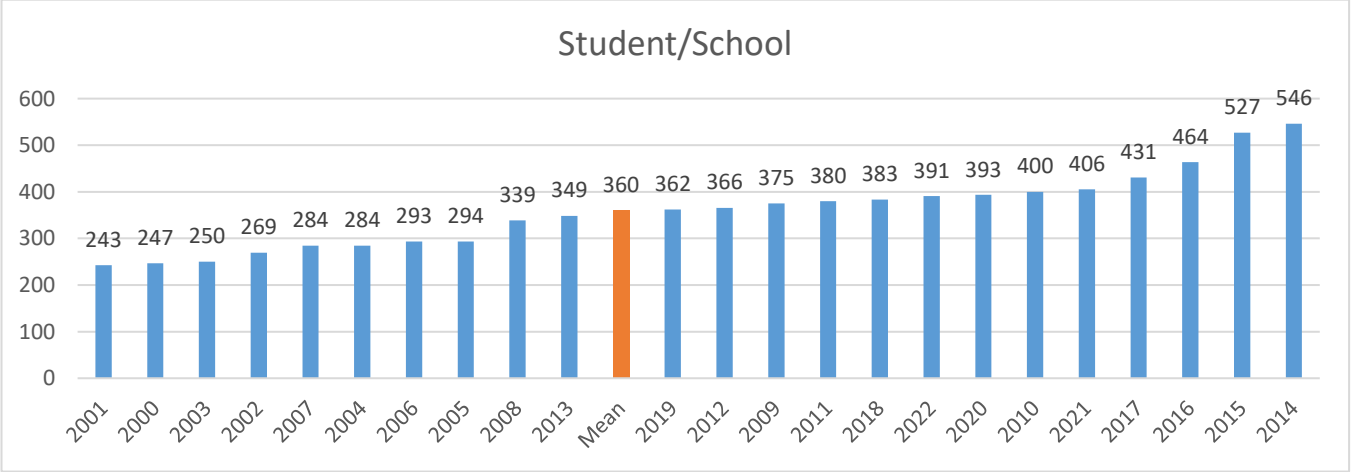

Fig 2. Number of Students per School Between 2000-2023

Figure 2 contains a graph showing the change in the number of students in schools in Turkey between 2000 and 2023. The relevant chart shows the average of the years in question, that is, an average of 360 students in each school. While this number was lowest with 243 people in 2001, it was found to be the highest in 2014 with 546 people. While the years 2000-2008 and 2013 remain below the average, the remaining years are above the general average.

	2000	2001	2002	2003	2004	2005	2006	2007	2008	2009	2010	2011	2012	2013	2014	2015	2016	2017	2018	2019	2020	2021	2022

Fig 3. Female-Male Ratios in Learning by Years

Figure 3 shows the percentage distribution of teachers in terms of gender in Turkey between 2000-2023. As a result of the analysis, it is seen that there was an imbalance in terms of gender in the 2000s. In 2000 and 2001, the proportion of male teachers was 62%, while the proportion of female teachers was 38%. In the following years, the rate of male teachers decreased and the rate of female teachers began to increase. When looking at both genders over time, it is seen that the rates are closer to each other. It has been determined that this gender distribution ratio is equally distributed between women and men, especially in the years 2019-2022. It can be said that between the years in question, the imbalance gradually decreased in the transition from the current year to the next year and the rates became closer to each other. However, it was determined that this situation was not valid from 2003 to 2004. In other words, while the rate of male teachers was 59% in 2003, this rate increased by 4 points and rose to 63% in 2004.

	2000	2001	2002	2003	2004	2005	2006	2007	2008	2009	2010	2011	2012	2013	2014	2015	2016	2017	2018	2019	2020	2021	2022

Fig 4. Female-Male Ratios among Students by Years

In Figure 4, the gender distribution of students between 2000-2022 is determined. As a result of the analysis, it is observed that the difference in gender distribution decreased from the 2000s to 2015. For example, in 2000, while the rate of male students was 63%, the rate of female students was 37%. These rates were calculated as 53% and 47% in 2015. In the following years, if we exclude only 2017, there is a decrease in the rate of female students. By 2022, the rate of male students is calculated as 59% and the rate of female students is 41%.

	2000	2001	2002	2003	2004	2005	2006	2007	2008	2009	2010	2011	2012	2013	2014	2015	2016	2017	2018	2019	2020	2021	2022
School	1	5	3	19	9	14	20	26	30	37	46	55	75	103	44	48	65	71	77	73	72	71	70

Student	1	4	13	20	26	35	42	45	79	108	137	139	159	187	219	215	210	199	174	153	174	180	169

Fig 5. Changes in Schools, Teachers and Students by Years

Figure 5 shows the change rates in the number of schools, teachers and students between 2000 and 2022. In the calculation made here, the fixed basis index method was used. Taking the year 2000 as constant, it was calculated how much change the other years showed compared to this year. Therefore, the year 2000, taken as a constant, was written as 1, that is, 100%. In the analyses, it is seen that there is a continuous increase in the number of schools until 2013, considering the year 2000 as the starting point. The same situation is seen in the number of students until 2015. When examined in terms of the number of schools, it can be said that 2013 was the peak year, and when examined in terms of the number of students, it can be said that 2014 was the peak year. However, this cannot be said to be the same for the number of teachers. For example, it is seen that there was a serious decline in the number of teachers in 2002, and this decline is explained by a decrease of 11% compared to 2000. It is seen that the number of teachers in 2003 was the same as in 2000. It is seen that there were serious increases in the following years. It can be said that there was no change in the years 2005-2007, there were increases in the remaining years, and recently it generally remained stable, especially in the years 2014-2022.

IV. DISCUSSION

In this study, the number of students per teacher, the number of students per school, gender distribution, and the change rates of schools, teachers, and students in Turkey between 2000 and 2023 were analyzed. The findings reveal significant changes and trends in the education system.

The findings on the number of students per teacher indicate significant fluctuations over the years. The number of students per teacher reached its highest level in 2010 and its lowest level in 2019. These fluctuations can be associated with changes in education policies, teacher appointments, and demographic shifts. The decreasing trend in the number of students over time suggests an improvement in the teacher-student ratio and a potential increase in education quality.

The number of students per school has generally increased over the years. The highest number of students was reached in 2014, which can be explained by the increase in school capacity and population growth. However, the number being below average between 2000-2008 and in 2013 indicates that the number of schools was insufficient or the student distribution was imbalanced during these periods.

When examining gender distribution, it is observed that gender imbalance among teachers has decreased over time. At the beginning of the 2000s, the number of male teachers was significantly higher than that of female teachers. However, in the following years, an increase in the number of female teachers was observed, and the gender distribution became equal between 2019 and 2022. Among students, gender distribution approached balance by 2015, but after 2015, a difference in favor of male students re-emerged. This situation indicates that there are still some challenges regarding girls' access to education.

When examining the change rates of schools, teachers, and students, a continuous upward trend is observed between 2000 and 2022. The peaks in 2013 and 2014 reflect investments in the education system and population growth. However, the drop in the number of teachers in 2002 is notable and suggests a need to revisit teacher policies from that period.

V. CONCLUSION

This study reveals significant changes and trends in the education system in Turkey between 2000 and 2023. The decrease in the number of students per teacher indicates a potential increase in education quality, while the increase in the number of students per school suggests an expansion in educational infrastructure and capacity. The reduction in gender imbalance among teachers can be considered a positive development, whereas the imbalance in gender distribution among students highlights that there is still work to be done to improve girls' access to education.

The findings emphasize the importance of education policies and investments, pointing out crucial aspects to be considered in future educational planning. It can be concluded that more efforts are needed, particularly in teacher appointments and improving girls' access to education. For the overall improvement of the education system and the creation of a more equitable structure, it is essential that policymakers take these findings into account.

Özet – İletişim sağlık bakım hizmetlerinde önemli bir araçtır. Sağlık profesyonellerinin bakım verdikleri bireylerle olan iletişimi bakım kalitesi ve memnuniyetini artıracaktır. İletişim Dünya Sağlık Örgütü'nün önerdiği çerçevede perinatal bakım kalitesinin sekiz alanından biridir. Kadın sağlığını koruma ve geliştirmede birincil sağlık profesyoneli olan ebelerin kadınlar ile olan ilişkisi büyük ölçüde iletişim yoluyla kurulur. Ebe fiziksel, sosyal ve psikolojik destek sağlarken tüm bunları etkili bir iletişim ile gerçekleştirmesi gerekir. Bu anlamda ebelik bakımı ebenin iyi bir iletişimci olmasını gerekli kılmaktadır. Bu derleme makalesinde ebelik bakım uygulamaları sırasında iletişimin öneminin literatür çerçevesinde incelenmesi amaçlanmıştır. Ebeler doğum öncesi, doğum ve doğum sonrası dönemde kaliteli ve etkili iletişim ile kadına sağladıkları bakımın kalitesini ve kadınların bakımdan duydukları memnuniyeti artırabilir. Gebelikte, optimum iletişimin bakımdan memnuniyeti artırdığı, kaygıyı azalttığı ve sağlık davranışı değişikliği için motivasyonu artırmaktadır. İletişim, doğum yapan kadının güvenlik ve öz yeterlilik duygusunu güçlendiren bir unsurdur Doğum eyleminde hormonal değişimler ve kontraksiyonlara bağlı olarak kadın sözel iletişime kapalı olsa da bu dönemde özellikle sözsüz iletişim önem kazanmaktadır. Doğum sonrası dönemde ise kadının bebeğine kavuşması ile tüm dikkati bebeğine yönlenir. Özellikle bu süreçte bebek bakımı konusunda etkili bir iletişime gereksinim duyulmaktadır. Bu bilgiler ışığında ebelik eğitimi ve meslek yaşamı boyunca ebelerin iletişimini geliştirecek teorik ve pratik uygulamalara daha fazla yer verilmesi önemlidir.

Anahtar Kelimeler – ebelik, iletişim, doğum öncesi, doğum, doğum sonrası

I. GİRİŞ

İletişim, sağlık hizmeti uygulayıcısı olmanın temel bir unsurudur. Bakım alan bireyler hakkında gerekli ve hayati bilgiler iletişim yoluyla toplanır. Etkili iletişim, bireylerin aldıkları bakımdan duydukları memnuniyeti etkilerken, aynı zamanda bireylerin zamanında ve uygun bakımı almalarını sağlamada da önemli bir araçtır. Örneğin, iletişimin ilaç uygulama hatalarını azaltmada önemli bir kriter olduğu ve acil durumlarda sağlıklı iletişimin önemli bir rol oynadığı bildirilmektedir [1], [2].

Dünya Sağlık Örgütü'nün önerdiği çerçevede perinatal bakım kalitesinin sekiz alanından biri de iletişimdir. Kadın ile ebe arasındaki ilişki büyük ölçüde iletişim yoluyla kurulur [3]. Ebeler, antenatal, intrapartum ve postpartum dönemde kadınlara doğum bakımı sağlama konusunda dünya çapında uzman sağlık profesyoneli olarak kabul edilmektedir. Hemşirelik ve Ebelik Konseyi (NMC) ebeleri; kadınlara, bebeklere ve ailelere yetenekli, bilgili, saygılı ve şefkatli bakım sağlayan özerk uygulayıcılar olarak tanımlamaktadır [4]. Ebelik uygulamasının temelini oluşturan temel felsefi değerlerden biri, kadını kendi bakımının merkezine yerleştirmek ve karar verme süreçlerine katılımını sağlamaktır [4],[5]. Tüm bu süreçler içinde ebe ve kadın birebir iletişim içinde olmaktadır. Ebe fiziksel, sosyal ve psikolojik destek sağlarken tüm bunları etkili bir iletişim ile gerçekleştirmesi gerekir. Bu anlamda ebelik bakımı ebenin iyi bir iletişimci olmasını gerekli kılmaktadır.

Bu derleme makalesinde ebelik bakım uygulamaları sırasında iletişimin öneminin literatür çerçevesinde incelenmesi amaçlanmıştır.

II. EBELİK MESLEĞİ İÇİNDE İLETİŞİMİN YERİ

Ebeler, kadınların tercihlerini, endişelerini ve ihtiyaçlarını anlamak için kadını bakım sürecine dahil eden ve bu süreçte kadını dinlemeyi gerektiren uygulamalar gerçekleştirir [6]. Ebeler ayrıca antenatal, intrapartum ve postpartum dönemde kadını bakım konusunda bilgilendirme ve bireyselleştirilmiş bakımı sağlamakla ilgili bilgi vermekten de sorumludur. Risk değerlendirmesi, sevk, savunuculuk ve halk sağlığı da ebelik uygulamasının merkezi rolleridir [4]. Tüm bu roller ve sorumluluklar ebenin etkili bir iletişimci olmasını gerektirir. Ancak ebelerin iletişim becerilerini daha çok klinikte geliştirdikleri ve iletişim konusundaki becerilerini kendilerinin değerlendirdikleri bildirilmektedir [7].

Ebelik bakımında iletişim birçok biçimde olabilir. Uluslararası Ebeler Konfederasyonu (ICM) yeterlilik standartları (2019), ebelerin kadınlarla paylaşması ve tartışması beklenen bilgilere kapsamlı bir genel bakış sunmaktadır. Bilgi verme, bilgilendirme, tartışma, danışmanlık yapma, öneride bulunma gibi terimler bu standartlarda defalarca vurgulanmaktadır. Bunlara örnek olarak 'taramayla tespit edilebilecek durumlar hakkında bilgi sağlamak', 'bulguları ve potansiyel sonuçları kadınla tartışmak ve bakım planını karşılıklı olarak belirlemek', 'kadına bakım veya tedavi seçenekleri hakkında danışmanlık yapmak', ‘gebeliği sonlandırmak’ ve ‘kadının kararına saygı duymak’ verilebilir [5]. Benzer şekilde NMC yeterlilik standartları (2019), ebelerin kadınlarla çalışırken sorulara dürüst bir şekilde yanıt vermesi, kanıta dayalı bilgiler sunması, karmaşık ve hassas konuları tartışması ve bireyselleştirilmiş bakımı sağlaması gerektiğini belgelemektedir [4]. Bu standartlar, tüm ebelerin iletişim konusunda iyi eğitimli olmaları ve iletişim becerilerini yeterince geliştirmiş olmaları beklentisiyle iletişim becerilerine merkezi bir odak noktası oluşturmaktadır.

Kadın için en özel dönemlerden biri olan doğum öncesi dönem sunulan ebelik bakımı ebe ve kadın arasında etkili bir iletişim gerektirmektedir. Doğum öncesi dönemde bakım memnuniyetinin sağlanmasında kaliteli iletişim ve kişi merkezli bakımın önemli olduğu vurgulanmaktadır [8]. Gebelikte, optimum iletişimin bakımdan memnuniyeti artırdığı, kaygıyı azalttığı ve sağlık davranışı değişikliği için motivasyonu artırdığı gösterilmiştir [9],[10]. Kaliteli iletişimi kolaylaştırmak için ise bakım sürekliliğinin ve sürekli bakımın sağlanmasında bakım sağlayan ebenin değişmemesinin önemli olduğu bildirilmektedir [10],[11],[12]. Bu durum sürekli ebelik bakımı modelinin önemini desteklemektedir. Ayrıca doğum öncesi bakımda ebenin saygılı annelik bakımı çerçevesinde saygılı, güven veren, etkileşimli ve destekleyici iletişim kurmasının kadınların korku ve endişelerini azaltacağı bildirilmektedir [8]. Doğum öncesi dönemde kaliteli iletişim ile sağlanan bakım, kadının doğuma hazırlanmasını olumlu yönde etkileyerek doğum sürecini kolaylaştırabilir.

İletişim, doğum yapan kadının güvenlik ve öz yeterlilik duygusunu güçlendiren bir unsurdur. Bu durum, doğum sırasında hayati önem taşır ve kadının perinatal bakımdan duyduğu memnuniyeti önemli ölçüde etkilemektedir. Doğum bakım personeli tarafından sağlanan etkili iletişim, bir kadının doğum eylemi ve doğum sırasında olumlu bir doğum deneyimi yaşamasına yardımcı olabilir. Bakımda kadınlar ve aileleriyle etkili ve kaliteli iletişim içinde, onların ihtiyaç ve tercihlerine yanıt verilmesi sağlanmalıdır [3]. Doğum öncesi dönemden farklı olarak doğum sürecinde kadının vücudu bilişsel süreçlerden kısmen çekilir. Hormon salgılanmasıyla ilgili olarak özellikle travay sırasında eylemler içgüdüsel hale gelmektedir. Özellikle kontraksiyonların şiddetlendiği aktif faz, geçiş fazı ve ikinci evrede kadın sözel iletişime kendini kapatabilmektedir. Doğum yapan kadından bir konuşma ve rasyonel tepkiler beklemek doğumun doğal akışını bozabilir. Bu durumda sözel olmayan iletişim ebe ve kadın arasındaki iletişime daha uygun olabilir [13]. Ebelerin iletişim becerileri üzerine yapılan bir araştırma, kadınların memnuniyeti ile ebelerin hem sözlü hem de sözlü olmayan iletişim becerileri arasında bir ilişki olduğunu göstermektedir [14].

Doğum kadının bebeğine kavuştuğu mucizevi bir olaydır. Doğumdan sonra kadının dikkati büyük ölçüde bebeğine ve ona bakmak için gerekli olan bilgi ve desteğe odaklanmaktadır. Bu süreçte kadın bebek bakımı ile ilgili bilgilendirmeye açık, merak ettiği konularda danışmanlık arayan, bebeğinin beslenmesi, hijyeni, bakımı ve sağlığını korumaya yönelik bilgiye meraklı bir tutum sergilemektedir.

Doğum sonrası ilk 24 saatlik süreç olarak nitelendirilen erken portpartum dönemde verilecek bilgi ve destek önemlidir. Erken portpartum dönemde kadının iletişime açık olması verilen bilgi ve desteği daha etkili kılacaktır [3]. Tüm bu fiziksel değerlendirmeler arasında daha az dikkat edilen bir durumsa kadının psikolojik sağlığıdır. Doğum öncesi dönemde doğuma dair hissedilen korku, stres ve kaygı, doğum sırasında yaşanan ağrı, travmatik doğum deneyimi, olumsuz iletişim postpartum dönemde kadını psikolojik yönden olumsuz etkilemektedir. Kadının anneliğe hazır hissedip hissetmediği, önceki deneyimleri, sosyal destek, sağlık desteği, bebek bakımı konusunda yaşadığı zorluklar çoğu zaman kendini yetersiz hissetmesine neden olabilmektedir. Tüm bu durumlar postpartum dönemde ebe-kadın iletişiminin ne derece önemli olduğunu göstermektedir [15]. Bu dönemde özellikle kaliteli iletişimin sağlanması, sürekli ebe desteği ve saygılı annelik bakımı psikolojik komplikasyonların gelişmesini önleyebilir. Zayıf hasta-sağlık hizmeti sağlayıcısı etkileşimi, olumsuz öznel doğum deneyimleri ve doğum sırasında destek eksikliği ile doğum sonrası posttravmatik stres bozukluğu gelişimi arasında güçlü ilişki bulunmuştur [16],[17]. Travmatik bir doğum yaşadığını belirten kadınların doğum deneyimlerine ilişkin geniş bir retrospektif araştırmada, ortaya çıkan temalardan biri ‘bakım verenlerle zayıf iletişim’ olarak bildirilmiştir [18].

Kadın yaşamının önemli dönüm noktalarını oluşturan gebelik, doğum ve doğum sonrası dönemde ebe-kadın arasında kaliteli iletişimin sağlanması bakım memnuniyetini artırırken gelişebilecek komplikasyonları da önleyecektir. Bu anlamda ebelerin sağlıklı ve etkili birer iletişimci olması önemlidir. Ebelerin iletişim becerilerini geliştirmek için ebelik eğitimin içinde iletişim alanında teorik ve pratik derslere yer verilmesinin yanı sıra meslek yaşamlarında da kişisel gelişimleri için hizmet içi eğitimler düzenlenebilir.

III. EBELİK EĞİTİMİ VE MESLEK YAŞAMINDA İLETİŞİM

İletişim becerilerinin klinik uygulamanın anahtarı olduğunu ve diğer klinik beceriler kadar sağlam bir şekilde öğretilmesi gerektiği ileri sürülmektedir [19]. Tıp fakültelerinde iletişim eğitiminin sağlanması artık yaygın olarak müfredatın temel bir unsuru olarak kabul edilmektedir [20], [21]. Bachmann ve ark. (2017) tarafından, iletişimi yapıcı bir şekilde uyumlu hale getiren müfredatların geliştirilmesine ihtiyaç olduğu bildirilmektedir [20].

Klinik iletişim becerilerinin öğretilmesi zordur. Bu durum, klinik iletişimin gerçekleştiği klinik bağlama girmeden önce akademik ortamda temel ve temel becerileri öğrenen lisans öğrencileriyle etkileşimde bulunulurken özellikle geçerlidir. Bu karmaşıklıklara, özellikle ebeliğin temelini oluşturan ve kadının tercihlerinin, ihtiyaçlarının ve isteklerinin bakımın sağlanmasında merkezi kalmasını sağlamayı amaçlayan kadın merkezli felsefe ışığında, güvenliği ve risk yönetimini ve bilgilendirilmiş onayı sağlamak için bir ebenin profesyonel zorunlulukları da eklenmektedir [22]. Bu durum, ebeler ve kadınlar arasındaki iletişimsel alışverişlerin genellikle duygusal, bireysel ve bir dereceye kadar ebeliğin tıbbi odaklı bir sistem içinde yer almasının tarihsel doğasından etkilenmesi ve zaman zaman kadın merkezli yaklaşımla çelişebilmesi nedeniyle daha da karmaşık hale gelmektedir [23]. Ebelik eğitim müfredatlarında iletişim ile ilgili teorik derslere yer verilirken klinik uygulamaların da iletişim pratiğine katkı sağladığı söylenebilir. Ancak ebelerin meslek yaşamında etkili ve kaliteli iletişim sağlamaları için daha fazla teorik ve pratik desteğe ihtiyaçları olduğu görülmektedir.

Sağlık hizmeti verenlerin bakım alan bireyler ile iyi iletişim kurma konusunda gerekli yeteneğe sahip olmadıkları bildirilmektedir [24]. Ebeler arasında sözlü iletişim düzeyinin artırılması gerektiği ve bunların yalnızca %38'inin optimal düzeyde olduğu belirtilmektedir [25]. Ebelerin iletişim becerilerinin zayıf olduğu ve iletişim eğitimi yoluyla geliştirilebileceği bildirilmiştir [24]. Ülkemizde birinci, ikinci, üçüncü basamak ve özel sektör olmak üzere kadın sağlığını koruma ve geliştirme, kadına sağlık hizmeti sunma noktasında birincil sağlık profesyoneli olarak yer almaktadır. Ebelerin meslek yaşamları boyunca iletişim becerilerini geliştirmeye yönelik hizmet içi eğitim ve kurslara katılmaları bakım verdikleri bireyler ile etkili ve kaliteli iletişim kurmalarına katkı sağlayacaktır.

IV. SONUÇLAR

Bakımı geliştirme ve bakım memnuniyetini artırmada önemli bir yeri olan iletişim özellikle sağlık profesyonelleri için temel bir unsur olduğu bilinmektedir. Ebeler, kadının yaşamı boyunca kadına bakım sunan ve danışmanlık sağlayan birincil sağlık profesyonelleridir. Bakım ve danışmanlık süreçlerinde ebe-kadın iletişimi gebelik, doğum ve doğum sonrası dönemin sağlıklı geçirilmesini olumlu yönde etkilemektedir. Ebelik eğitim süreçleri dışında ebelerin meslek yaşamları boyunca da bireyle birebir iletişim halinde olması etkili bir iletişimci olmalarını gerektirmektedir. Bu anlamda ebelik eğitimi ve mesleki gelişim hizmetleri içerisinde iletişim becerilerini geliştirmeye yönelik uygulamaların yaygınlaştırılması önerilmektedir.

Çimentolu Harçlarda Agrega İkamesi Olarak Atık Kahve Telvesinin Kullanımı

Ahmet Ferdi Şenol[1*]

[1]*İnşaat Mühendisliği Bölümü / Mühendislik Fakültesi, Bilecik Şeyh Edebali Üniversitesi, Türkiye*

[*]*(ahmetferdi.senol@bilecik.edu.tr)*

Özet **–**Harç üretiminde kullanılan agregalar, harç hacminin yaklaşık %60-80'ini oluşturmakta ve harçların işlenebilirliklerini, reolojik özelliklerini, mekanik davranışlarını ve dayanıklılığı dahil olmak üzere birçok özelliklerini etkilemektedir. Dünya'da, çaydan sonra tüketilen en büyük ikinci içecek olan kahve tüketimi sonrasında geriye kalan kullanılmış kahve telveleri, çoğunlukla çöp depolama alanlarına atılmaktadır. Bu çalışmada, Türkiye'deki yerel kafeteryalardan toplanan atık kahve telvelerinin, çimento esaslı harçlarda kum yerine ikame edilmesi sonrasındaki etkileri araştırılmıştır. Bu amaçla, çimento harcındaki kum, atık kahve telvesi ile hacimce; %0, %2.5, %5, %10, %20 ve %30 oranlarında yer değiştirecek şekilde altı serilik harç tasarımı yapılmıştır. Taze harç serilerine işlenebilirlik deneyi uygulandıktan sonra üretilen 50x50x50 mm'lik numuneler üzerinde; birim hacim ağırlık ve basınç dayanım deneyleri uygulanarak, atık kahve telvesinin çimento esaslı harçlarda meydana getirdiği etkiler değerlendirilmiştir. Çimento esaslı harçlarda kum hacmi yerine ikame edilen atık kahve telvesinin kullanım miktarının artması ile her kademede işlenebilirliklerin, birim hacim ağırlıklarının ve basınç dayanımlarının azaldığı, en fazla %5 oranına kadar kullanılabilecek atık kahve telvesinin, harçların basınç dayanımı üzerinde kabul edilebilir kayıplar oluşturabileceği değerlendirilmiştir.

Anahtar Kelimeler – Agrega, Atık kahve telvesi, Harç, Kahve, Basınç dayanımı

I. GİRİŞ

Dünya'da, çaydan sonra en fazla tüketilen ikinci içecek olan kahve, tüketimi sonrasında geriye kalan kullanılmış telveleriyle birlikte, çoğunlukla çöp depolama alanlarına atılmaktadır. Bununla birlikte atık kahve telvesi, genellikle tarım atıkları kategorisine göre değerlendirilmektedir [1]. Kahve telvesinin geri dönüştürülerek beton teknolojisinde kum veya çimento yerine kullanılması, organik atıkların depolama sahalarına atılmasıyla ilgili çevresel kaygıları azaltabilecektir. Ayrıca, bu yöntem beton üretiminde kullanılan doğal kaynakların tüketimini de azaltarak sürdürülebilirliğe katkı sağlayabilecektir [2].

Agregalar, betonun temel bileşenlerindendir ve fiziksel ile kimyasal özellikleri beton dayanımını etkilemektedir. Beton hacminin yaklaşık %60-80'i doğal agregalardan oluşur ve bunların tüketimi inşaat sektörünün büyümesiyle giderek artmaktadır. Günümüzde kullanılan doğal kumların kullanım miktarının artması ve kontrolsüz kum madenciliği; çevresel bozulmalara, erozyona, biyolojik çeşitliliğin zarar görmesine ve ekolojik dengenin bozulmasına neden olmaktadır [3]. Bu nedenle birçok araştırmacı tarafından, beton sektöründe kum yerine kullanılabilecek çeşitli agrega kaynakları üzerine çalışmalar yapılmaktadır.

Bu çalışmanın amacı, Türkiye'deki yerel restoran ve kafeteryalardan temin edilen atık kahve telvelerinin, çimento esaslı harç üretimlerinde kum ikamesi olarak kullanılabilirliğini araştırmaktır. Bu amaçla, karışımlarda kum hacmi yerine; %2.5, %5, %10, %20 ve %30 oranlarında atık kahve telvesi ikame edilerek harç serileri üretilmiştir. Bunlara ilave olarak; agrega olarak sadece standart kumun kullanıldığı kontrol (C)

serisi de üretilerek, tüm harç serilerinin işlenebilirlik, birim hacim ağırlık ve basınç dayanım özellikleri değerlendirilmiştir.

II. MATERYAL VE YÖNTEM

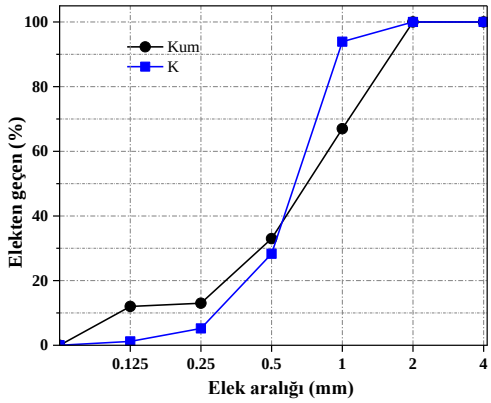
A. Materyal

Çalışmada kullanılan atık kahve telvesi (K), Türkiye'deki yerel kafeteryalardan toplanmış (Şekil 1) ve öncelikle malzemenin gözenek yapısından suyun tamamen uzaklaştırılması için 24 saat sürede 70 ℃ sıcaklıktaki etüvde tutulmuştur. Malzemelerin özgül ağırlığı, malzemenin bilinen hacmi ve kuru ağırlığı kullanılarak hesaplanmıştır. Toplanan atık kahve telvesinin parçacık boyutu 0-1 mm aralığında, özgül ağırlığı ise 0.47'dir. Harç serilerinin üretiminde; yerel kaynaklardan temin edilen ve TS EN 196-1 [4]'e uygun CEN standart kumu ve yerel kaynaklardan temin edilen CEM I 42.5R Portland çimentosu (özgül ağırlık; 3.09 gr/cm3) kullanılmıştır. CEN standart kumunun (özgül ağırlık: 2.56, su emme: %0.63) tanecik boyutu 0-2 mm aralığındadır. Karışımlarda kullanılan CEN standart kumunun ve atık kahve telvesinin (K) granülometrisi eğrisi Şekil 2'de, K ve çimento üzerinde yapılmış analiz (XRF) sonuçları Tablo 1'de sunulmuştur. Harç serilerinde kullanılan K'nin yüzey dokusu ve parçacık şekli, Zeiss LEO 1430VP marka taramalı elektron mikroskobu (SEM) kullanılarak gözlemlenmiştir (Şekil 3). SEM analizine göre; K'nin geometrik şeklinin küresele yakın ve yüzeylerinin pürüzlü taneciklerden oluştuğu gözlemlenmiştir.

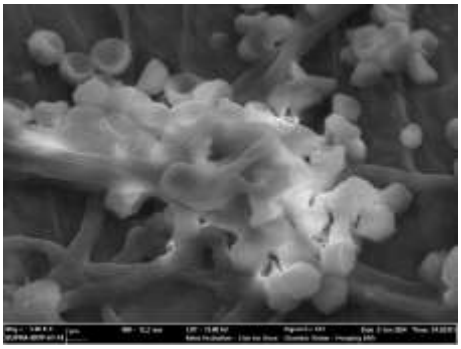
Şekil 1. Atık kahve telvesi (K)

Tablo 1. K ve çimentonun kimyasal özellikleri.

Oksit bileşenleri, %	**K**	**CEM I 42,5R**
SiO_2	0.57	18.7
Al_2O_3	0.1	4.6
Fe_2O_3	0.07	3.4
CaO	6.35	63.7
MgO	7.22	1.3
SO_3	1.65	2.7
K_2O	38.98	0.7
Kızdırma kaybı	34.47	3.9



Şekil 2. Agregalar için granülometri eğrisi.



Şekil 3. K'nin SEM mikrografi (x5000).

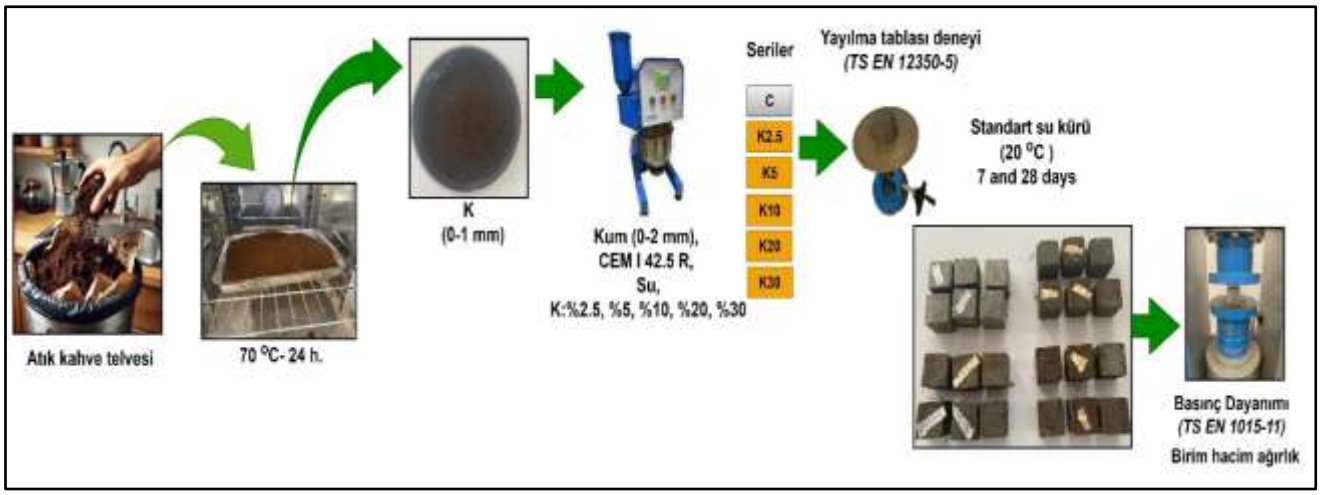
B. Yöntem

Üretilen harç serileri; TS EN 196-1 (2016) [4] standartlarında 6 farklı karışım serisi olarak tasarlanmıştır. K; standart kum ile hacimce; %0 (C), %2.5, %5, %10, %20 ve %30 oranlarında değiştirilmiştir. Tüm serilerde; agrega/bağlayıcı oranı: 3 ve su/bağlayıcı oranı: 0.5 olarak belirlenmiştir. Harç serileri; C, K2.5, K5, K10, K20 ve K30 olarak adlandırılmıştır. Seri kodlarındaki K indisi; atık kahve telvesi agregasını, sayılar ise kumun yerine hacimce ikame edilen agrega yüzdesini temsil etmektedir. Örnek olarak K10; Kum yerine hacmen %10 oranında K agregası içeren harç serisidir. Harç serilerindeki malzeme bileşimleri ve miktarları Tablo 2'de verilmiştir. Harçların üretilmesinde kullanılan harç mikserine ilk olarak bağlayıcı ile su konulup karıştırılmıştır. Su olarak şehir şebeke suyu kullanılmıştır. Ardından karışıma agregalar eklenip, karıştırma işlemine devam edilmiştir. Taze harç serilerinin yayılma tablası ile işlenebilirlik tespiti TS EN 1015-3/A2 (2007) [5] standardına göre ölçülmüştür (Şekil 4). Hazırlanan harç serileri, 50×50×50 mm boyutlarında olan küp şeklindeki kalıplara iki aşamada dökülmüş, her bir aşamada sarsma tablası kullanılarak, harçlar kalıplara yerleştirilmiş ve 24 saat boyunca kalıplarda bekletilmiştir. Kalıplardan çıkartılan harç numuneleri, laboratuvardaki kirece doygun suda (20 ± 2 ºC sıcaklıkta), 7 ve 28 günlük kür sürelerine kadar bekletildikten sonra TS EN 772-4 [6]'e göre birim hacim ağırlık ve TS EN 1015-1[7]'e göre basınç dayanımı deneyleri uygulanmıştır. Çalışmanın akış şeması da Şekil 5'te gösterilmiştir.

Şekil 4. İşlenebilirlik deneyi.

Tablo 2: Harç serilerinin karışım içerikleri.

Seriler	Çimento (gr)	K (gr)	Kum (gr)	Su (gr)
C	450	-	1350	225
K2.5	450	6.2	1344	225
K5	450	12.4	1338	225
K10	450	24.8	1325	225
K20	450	49.6	1300	225
K30	450	74.4	1275	225

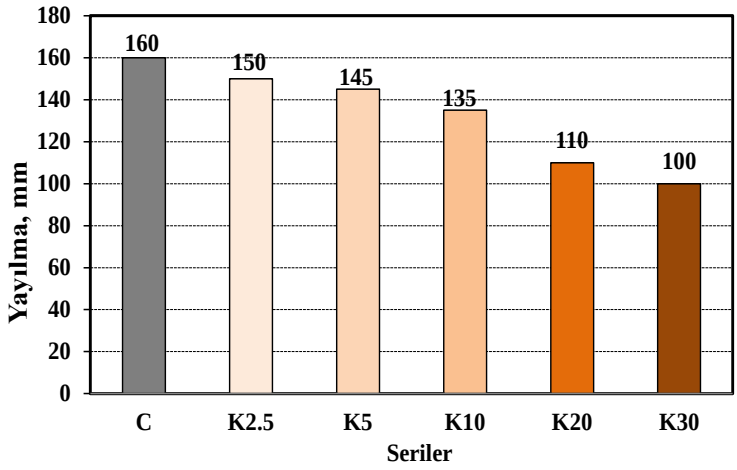


Şekil 5. Çalışmanın akış şeması.

III. BULGULAR VE TARTIŞMA

A. Taze Hal Deney Sonuçları

Üretilen harç serilerinin taze haldeki işlenebilirlik özellikleri, yayılma tablası deneyi ile belirlenmiştir. Belirlenen yayılma çaplarındaki değişimler Şekil 6'da sunulmuştur.



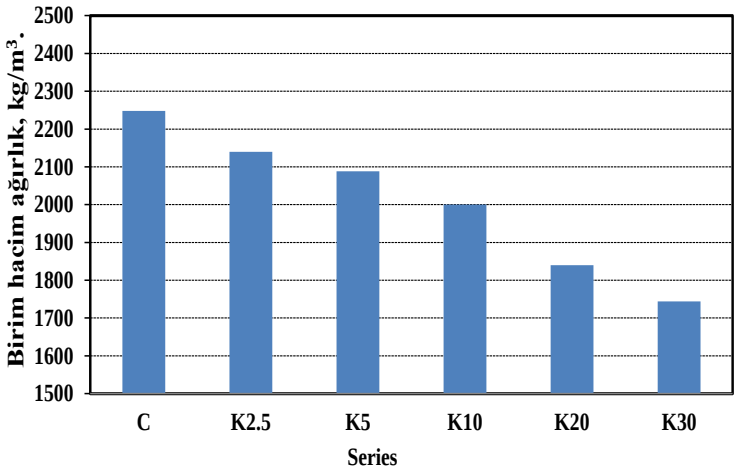
Şekil 6. Serilerin yayılma çaplarına göre değişimi.

Yayılma çapı sonuçlarına göre, karışımda K ikamesi arttıkça yayılma değerleri azalmıştır. C serisine göre K2.5, K5, K10, K20 ve K30 serilerindeki yayılma çapları sırasıyla; %6.3, %9.4, %15.6, %31.2 ve %37.5 oranlarında azalmıştır. Atık kahve telvesinin pürüzlü yüzeye ve yüksek su emme kapasitesine sahip olması harçların işlenebilirliğinin düşmesine katkıda bulunmuştur. Çimentolu harçlara ilave edilecek kahve telvesi külünün (K), %20'den daha fazla olması durumunda, üretilecek standart harcın yayılma değerlerinin de %31'ten daha fazla azalacağı ve karışımda akışkanlaştırıcı kullanımına veya ilave karışım suyuna ihtiyaç duyulacağı değerlendirilmektedir.

B. Birim Ağırlık Deney Sonuçları

Serilerin, 28 günlük kür sonundaki birim hacim ağırlık sonuçlarının değişimi Şekil 7'de verilmiştir. Buna göre, harçların birim hacim ağırlıkları 1744 ile 2248 kg/m^3 arasında değişmektedir. Serilerdeki K artışı ile birlikte birim hacim ağırlıklar azalarak hafif ağırlıkta harç üretimi sağlandığı tespit edilmiştir. Harç

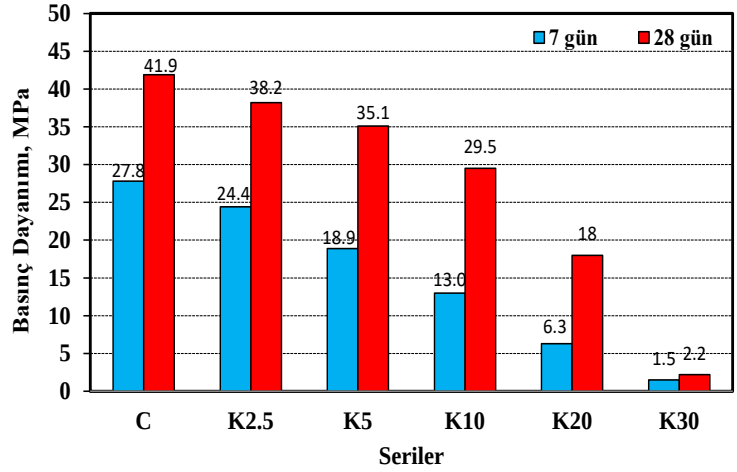
serilerinde K ikamesi arttıkça, 28 günlük kür süresi sonundaki K2.5, K5, K10, K20 ve K30 serilerinin birim hacim ağırlıkları sırasıyla; %4.8, %7.1, %11, %18.1 ve %22.4 oranlarında azalmıştır.



Şekil 7. Serilerin birim hacim ağırlıklarına göre değişimi.

C. Basınç Dayanımı Deney Sonuçları

Serilerin basınç dayanımı sonuçlarının kür sürelerine göre değişimi Şekil 8'de verilmiştir. Harçların 7 günlük basınç dayanımları Şekil 8'de görüldüğü gibi 1,5 MPa ile 27,8 MPa arasında, 28 günlük basınç dayanımları ise 2,2 MPa ile 41,9 MPa arasında elde edilmiştir. Serilerin basınç dayanımları, kürleme süresinin artması ile artarken, K ilavesi ile önemli ölçüde azalmıştır. Buna göre, harç serilerinde K ikamesi arttıkça, 7 günlük kür süresi sonunda; K2.5, K5, K10, K20 ve K30'da sırasıyla; %12.2, %32, %53.2, %77.3 ve %94,6 oranlarında dayanımlar azalmıştır. 28 günlük kür süresi sonundaki basınç dayanımları ise K2.5, K5, K10, K20 ve K30'da sırasıyla; %8.8, %16.2, %28, %57 ve %94,7 oranlarında azalmıştır.



Şekil 8. Serilerin 7 ve 28 günlük basınç dayanımlarına göre değişimi.

IV. SONUÇLAR

Yapılan deneysel çalışmalar sonrasında elde edilen sonuçlar, aşağıda sunulmuştur. Buna göre;

- İşlenebilirlik sonuçlarına göre; harç serilerindeki K miktarının artması, işlenebilirlikleri her seride düşürmüş ve en yüksek işlebilirlik kaybı %37,5 ile K30 serisinde tespit edilmiştir.
- K serisinin 28 günlük basınç dayanımlarına göre; K2.5 ve K5 serilerinin basınç dayanımları, kontrol serisinde göre; %8.8 ve %16.2'lik kayıp ile en yakın ve kabul edilebilir seviyede olurken,

karışımlarda %5'dan daha fazla K kullanılması basınç dayanım kayıplarını önemli ölçüde (K30'da %95 kayıpla) artırmıştır.

- Serilerin birim hacim ağırlıkları incelendiğinde, K miktarının artması ile harçların birim ağırlıklarının azaldığı ve böylece düşük ağırlıklı kompozitlerin üretilebileceği değerlendirilmiştir.
- Genel olarak çimentolu harçlarda kum yerine hacmen belirli oranlarda atık kahve telvesinin (K) kullanılması, 28 günlük süre sonundaki harçların fiziksel ve mekanik özelliklerini düşürürken, en fazla %5 oranına kadar kullanılabilecek atık kahve telvesinin harçların basınç dayanımı üzerinde kabul edilebilir kayıplar oluşturabileceği ve atık kahve telvelerinin geri dönüştürülerek sürdürülebilirliğe katkı sağlayacağı değerlendirilmektedir.

Çocuklarda Akıllı Telefon Kullanımı ve Dijital Göz Yorgunluğu

Fatih AYDOĞDU[1]

[1] *Çocuk Bakımı ve Gençlik Hizmetleri Bölümü / Sağlık Hizmetleri Meslek Yüksekokulu, Erzincan Binali Yıldırım Üniversitesi, Türkiye (e-mail:faydogdu@erzincan.edu.tr)*

Özet **–** Çocuklar hem sahip olma hem de kullanma açısından en hızlı artış gösteren akıllı telefon kullanıcılarıdır. Akıllı telefon kullanımı çocukların gelişimleri üzerinde olumsuz etkiler bırakabilmektedir. Bu etkilerinden biri de göz sağlığının bozmasıdır. Özellikle küçük çocuklarda göz ve görme gelişimi devam ettiği düşünüldüğünde çocukların akıllı telefona maruz kalması göz sağlığını daha çok tehlikeye sokmaktadır. Akıllı telefon kullanımına bağlı olarak ortaya çıkan en önemli göz sorunlarından biri ise dijital göz yorgunluğudur. Dijital göz yorgunluğu, dijital elektronik cihazların uzun süreli kullanımı nedeniyle ortaya çıkan görsel ve oküler semptomları kapsayan bir sorun olup kuru gözler, kaşıntı, yanma hissi, kızarıklık, yabancı cisim hissi, sulanma, görme bulanıklığı, çift görme ve baş ağrısı ile karakterizedir. Küçük çocuklar yetişkinlere göre daha düşük düzeyde öz kontrole sahip oldukları için dijital göz yorgunluğuna karşı daha savunmasızdırlar. Bu sonuçlar çocukların akıllı telefon kullanımı ile dijital göz yorgunluğu arasındaki ilişkilerin irdelenmesi gerekliliğini ortaya koymaktadır. Bu doğrultuda araştırmada çocukların akıllı telefon kullanımının dijital göz yorgunluğuna neden olup olmadığı ve dijital göz yorgunluğu üzerindeki etkili faktörlerin neler olduğu ilgili çalışmalar ışığında incelenerek rapor edilmiştir.

Anahtar Kelimeler – Akıllı telefon kullanımı, dijital bağımlılık, dijital göz yorgunluğu, çocuk

I. GİRİŞ

İyi gelişmiş teknolojik cihazlar, çocukların büyüme ortamının manzarasını büyük ölçüde değiştirmiştir. Dijital cihazların gelişimiyle çocuklar da dijital çağdan etkilenmekte olup dijital yerliler grubunda önemli bir paya sahip olmaktadır. Dijital yerliler doğumlarından itibaren çeşitli cihazlara maruz kalmaktadır ve konuşmayı veya okumayı öğrendikleri sırada cihazları kullanmayı da öğrenmektedirler [1]. Bu cihazlardan özellikle akıllı telefonların kullanımı çocuklar ve gençler arasında son on yılda dramatik bir biçimde artmıştır. Akıllı telefonlar, beyinlerindeki yüksek dopamin aktivitesi nedeniyle güçlü bir merak veya yenilik duygusuna sahip oldukları kritik gelişim aşamalarında olan çocuklar ve ergenler arasında yaygın olarak kullanılan bir ortam haline gelmiştir [2]. Almanya'da 12-19 yaş arasındakilerin %93'ünün bir akıllı telefona sahip oldukları ve %92'sinin akıllı telefonlarını günlük olarak kullandıklarını belirtmektedir [3]. 5-16 yaş aralığındaki Birleşik Krallık çocuklarının %66'sından fazlası ve 15 yaşına gelen ABD çocuklarının %83'ü akıllı telefona sahiptir. Benzer sahiplik eğilimleri Avustralya, Avrupa ve Güneydoğu Asya dahil olmak üzere dünya çapında okul çağındaki çocuklar arasında görülmektedir [4]. Türkiye'deki 14-18 yaş grubunu kapsayan bir çalışmada, araştırmaya katılan ergenlerin %89,4'ünün akıllı telefona sahip olduğu tespit edilmiştir [5]. Bu oranların daha küçük yaş grubunda da azımsanamayacak düzeyde çok olduğu görülmektedir. Amerika Birleşik Devletleri'nde ise üç ile beş yaş arasındaki çocuklar akıllı telefonlarda, tablet ve kişisel bilgisayarlarda günde 115,3 dakika zaman geçirmektedir [6]. 2006 yılında bile dünya çapında 24 aylıktan küçük çocukların %90'ının ekranlı medyaya maruz kaldığı belirtilmektedir [7].

Akıllı telefonlar iletişim, internet ve multimedya, erişim kolaylığı gibi özellikleri sayesinde bilgiye kolay ulaşma ve sosyal etkileşimler yoluyla eğlence aracı olarak yoğun bir şekilde kullanılmaktadır [8]. Ancak uygun bir şekilde kullanılmadığında sorunlu akıllı telefon kullanımı söz konusu olmaktadır.

Çocuklarda ve ergenlerde sorunlu akıllı telefon kullanımı yaygınlık oranları %5-50 arasında değişmekle birlikte sorunlu akıllı telefon kullanımı duyarlılığı genel olarak yüksek düzeyde seyretmektedir [9]. Sorunlu akıllı telefon kullanımının yaygınlaştığı yaş azalmaktadır, çünkü birçok küçük çocuk artık ebeveynlerinin akıllı telefonları da dahil olmak üzere medya cihazlarına erişme konusunda çeşitli fırsatlara sahiptir [10]. Buna ek olarak, çocukların sınırlı öz kontrolleri göz önüne alındığında sorunlu akıllı telefon kullanma olasılıklarının daha yüksek düzeyde olabileceği söylenebilir [11,12]. Sorunlu akıllı telefon kullanımı çocuklarda artan hareketsiz zaman nedeniyle azalan fiziksel aktivite, kilo alımı, görme bozukluğu, uyku kalitesinin düşmesi, sosyal aktivitelere katılımın azalması, bilişsel gelişim sorunları, uygunsuz ve güvensiz içeriğe maruz kalma, kimlik ifşası tehditleri, depresyon ve anksiyete riskinin artması dâhil olmak üzere çocukların sağlıklı büyümesi ve gelişimi üzerinde birçok soruna yol açabilir [13,14].

Çocuklarda akıllı telefon kullanımının neden olduğu birçok sorununun varlığıyla birlikte üzerinde durulması gereken en önemli sorunlardan biri görme bozukluğudur. Görme en baskın duyu olmakla birlikte görme işlevi, çocuklukta sağlıklı ve sonraki yaşam dönemlerindeki gelişim için çok önemlidir [15]. Görme işlevi, bir çocuğun genel sağlığının ve yaşam kalitesinin ayrılmaz bir parçasıdır ve çocukların fiziksel, entelektüel, sosyal ve duygusal gelişiminde önemli bir rol oynar [16]. Çocuklarda görme yetersizliğinin psikolojik etkileri çok geniş olup üzüntü, depresyon, suçluluk ve kaygıyı içerebilir. Görme kaybı hızla artmakta olup Uluslararası Körlüğü Önleme Ajansı'na göre dünyada 90 milyon çocuk ve gencin görme sorunu ile karşı karşıya geldiğini bildirmektedir [17]. Özellikle akıllı telefonların çocuklar tarafından yaygın bir şekilde kullanılmaya başlanmasıyla görme sorunu daha da artmaktadır. Akıllı telefonlar aşırı kullanıldığında göz sağlığını etkileyebilecek en önemli elektromanyetik dalga kaynaklarından biridir [18]. Bunun bir sonucu olarak göz ve görme yetisi ile ilgili birçok sorun ortaya çıkmaktadır. Akıllı telefon kullanımına bağlı olarak ortaya çıkan en önemli göz/görme işlevi sorunlardan biri dijital göz yorgunluğudur. Amerikan Optometri Derneği'nin tanımına göre, "dijital göz yorgunluğu" terimi, dijital cihazların uzun süreli kullanımıyla oluşan bir dizi görme ve göz bozukluğunu ifade eder. Uzun süre ekrana odaklanılması sonucu ortaya çıkan en yaygın dijital göz yorgunluğu semptomlarının kuru gözler ve bununla ilişkili semptomlar olan gözyaşı, akomodatif stresle ilişkili semptomlar olan göz yorgunluğu, baş ağrısı ve boyun veya omuz ağrısı olduğu olduğu bildirilmiştir [11]. Dijital göz yorgunluğu, çocukların fiziksel, sosyal ve psikolojik sağlıklarını olumsuz yönde etkileyebileceği gibi diğer görme sorunlarının ortaya çıkmasına da neden olabilir. Bu nedenle çocuklar özelinde dijital göz yorgunluğu ile ilişkili faktörlerin incelenmesi önemli görülmektedir. Bu kapsamda araştırmada akıllı telefon kullanımı ile dijital göz yorgunluğu arasındaki ilişkilere ve dijital göz yorgunluğunu etkileyen faktörlere odaklanılmış, konuyla ilgili araştırmalardan elde edilen sonuçlar doğrultusunda öneriler sunulmuştur.

Akıllı Telefon Kullanımı ve Dijital Göz Yorgunluğu

Dijital göz yorgunluğu, dijital elektronik cihazların uzun süreli kullanımı nedeniyle ortaya çıkan görsel ve oküler semptomları kapsayan bir varlıktır. Bu sorun kuru gözler, kaşıntı, yabancı cisim hissi, sulanma, görme bulanıklığı ve baş ağrısı ile karakterizedir. Göz yorgunluğuyla ilişkili oküler olmayan semptomlar arasında ense sertliği, genel yorgunluk, baş ağrısı ve sırt ağrısı bulunur [19]. Dijital göz yorgunluğu akıllı telefon kullanımının etkisine de bağlı olarak yakın çalışma mesafesi, yoğun ışığa aşırı ve daha küçük yazı tipi boyutuna maruz kalma sonucu düzeltilmemiş refraktif hata (presbiyopi dahil), akomodatif ve yakınsama anomalileri, değişmiş göz kırpma düzeni (azalmış hız ve eksik göz kırpma) gibi sorunların ortaya çıkmasına neden olabilir [20].

Chu ve ark., [11], Hong Kong'da okul çağındaki çocuklarda akıllı telefonlarda geçirilen zaman ile dijital göz yorgunluğu arasındaki ilişkiyi inceledikleri araştırmalarında 8-14 yaş aralığındaki çocukların bir yıllık takibi sonucunda en sık bildirilen semptomların göz yorgunluğu (n = 804, %53,3), bulanık görme (n = 586, %38,9) ve tahriş olmuş veya yanan göz (n = 516, %34,2) şikayetleri olduğunu bildirmişlerdir. Akıllı telefon kullanan çocukların bir yılın sonunda dijital göz yorgunluğu puanlarının arttığını, başlangıç akıllı telefon kullanımı günde 241+ dakika olan çocukların başlangıç toplam dijital göz yorgunluğu puanının, başlangıç akıllı telefon kullanımı günde 0-60 dakika olanlara kıyasla önemli ölçüde daha yüksek olduğunu; başlangıç akıllı telefon kullanımı günde 181-240 dakika olan çocukların bir yıllık takip sonucu toplam

dijital göz yorgunluğu puanının, başlangıç akıllı telefon kullanımı günde 0-60 dakika olanlara kıyasla önemli ölçüde daha yüksek olduğunu tespit etmişlerdir.

Mohan ve ark. [21], Hindistan'da yaptıkları çalışmalarında COVID-19 salgını sürecinde dijital göz yorgunluğunun yaygınlığını, semptom sıklığını ve ilişkili risk faktörlerini belirlemeyi amaçlamışlardır. Ebeveynlerin (n=217) çocuklarını (yaş ortalaması: 13 ± 2,45) değerlendirdikleri araştırmalarında dijital göz yorgunluğu ile ilişkili bildirilen en yaygın semptomların kaşıntı (*n* = 117, %53,9) ve baş ağrısı (*n* = 117, %53,99) olduğu; çift görme (*n* = 24, %11,1) ve gözde uçuşan cisimler görmenin (*n* = 44, %20,27) ise en az görülen semptomlar olduğu belirlenmiştir. Dijital göz yorgunluğu yaygınlığı %50,23(109/217) olup bunlardan %26,3'ünün hafif dereceli (*n* = 57), %12,9'unun orta dereceli (*n* = 28) ve %11,1'inin şiddetli dereceli (*n* = 24) dijital göz yorgunluğu puanlarına sahip olduğu saptanmıştır. Tek değişkenli analizde dijital göz yorgunluğunun erkek cinsiyeti, akıllı telefon kullanımı, dijital cihaz kullanım süresi (>5 saat), dijital cihaz mesafesi (< 18 inç) ve mobil oyun oynama (>1 saat) ile önemli ölçüde ilişkili olduğu bulunmuştur.

AlHarkan, Alazmi veAl-Mutairi [22], Suudi Arabistan'daki çocukların (n= 704, yaş=8+) ebeveynleri ile yaptıkları araştırmalarında sanal öğrenmeden bir yıl sonra ebeveynlerin dijital göz yorgunluğu sendromu algılarının yaygınlığını ve risk faktörlerini ortaya koymayı amaçlamışlardır. Araştırma sonucunda çocuklarda dijital göz yorgunluğunun yaygınlığı % 59,4 olup %24'ü şiddetli ve %14'ü orta dereceli semptomlar göstermiştir. Baş ağrısı (%20,9), görme bozukluğu (%14,5), odaklanma zorluğu (%12,5), göz sulanması/yaşlanması (%10,1) ve bulanık görme (%10,8) dijital göz yorgunluğunun başlıca semptomları olarak kaydedilmiştir. Kızlar, ortaokul öğrencileri, gözlük kullananlar, günde dört saatten fazla ekran süresi olanlar veya cihazları gözlerinden 25 cm veya daha az uzağa yerleştirenler ve sanal sınıfa günde dört saatten fazla katılanların önemli ölçüde şiddetli dijital göz yorgunluğu derecelerine sahip olduğu bulunmuştur.

Taylan'da 8-18 yaş aralığındaki çocukların ebeveynleri (n=782) ile dijital cihazlar kullanan çocuklarda dijital göz yorgunluğu yaygınlığı, göz semptomlarını ve özelliklerinin incelendiği araştırmada COVID-19 salgını sırasında dijital cihazları kullanmanın en yaygın süresi >8 saat (%39,90), öncesinde ise yalnızca 2-4 saat(%36,70) olarak tespit edilmiştir. Dijital göz yorgunluğu prevalansı %42,2 (330/782) olup, hafif (%29,8), orta (%8,1) ve şiddetli (%4,3) semptomlar olarak belirlenmiştir. Dijital göz yorgunluğunun en yaygın semptomları gözlerde yanma hissi (%55,24), görme yeteneğinin kötüleşmesinden korkma (%53,07) ve gözleri aşırı kırpma (%48,33) olarak rapor edilmiştir. Dijital göz yorgunluğu ile ilişkili özelliklerin ise ileri yaş, düzeltmeli-düzeltmesiz refraktif hata ve bilinmeyen refraktif hata olduğu saptanmıştır [23].

Wartiningsih [24], Endonozya'da 9-12 yaş grubu (n=62) üzerinde yaptığı çalışmasında, Ekran Tabanlı Aktivite ile dijital göz sendromu insidansı arasındaki ilişkinin ve etkinin tahminini belirlemeyi amaçlamıştır. Bu çalışmada kullanılan analiz tekniği, SmartPLS (v3.2.9) gibi yazılımlar kullanılarak test edilen Kısmi Leas Kare (PLS) modelleme tekniğidir. Araştırma sonucunda Ekran Tabanlı Aktivitenin dijital göz yorgunluğu üzerinde etkili olduğunu; Ekran Tabanlı Aktivite ne kadar yüksekse dijital göz yorgunluğu riskinin de o kadar yüksek düzeyde seyrettiğini tespit etmiştir. Ayrıca cep telefonu kullanımının çocuklarda dijital göz yorgunluğu oluşumunu etkileme konusunda en yüksek korelasyona sahip olduğunu saptamıştır.

Chidi-Egboka, Jalbert veGolebiowski [4], 6-15 yaş aralığındaki 36 çocuğun bir saat boyunca sürekli olarak akıllı telefonda oyun oynadığı prospektif bir müdahale çalışması yapmışlardır. Araştırmada oyun oynamadan önce ve sonra gözyaşı, göz kırpma ve kuru göz düzeyleri incelenmiştir. Göz kırpma hızı ve göz kırpma arası aralık, oyun oynamadan önce ve oyun sırasında sürekli olarak bir göz izleme başlığı kullanılarak ölçülmüştür. Araştırma sonunda çocuklarda akıllı telefon kullanımı, kuru göz semptomlarına ve göz kırpmanın ani ve sürekli yavaşlamasına neden olmuştur, ancak gözyaşı fonksiyonunda bir saate kadar belirgin bir değişiklik gözlenmemiştir.

Ojaghi ve ark. [25], İran'daki bir hastanenin göz kliğine başvuran 4-18 yaş arasındaki çocuklarda (n=110) dijital göz sendromunun şiddetini ve risk faktörlerini araştırmışlardır. Klinik semptomlara göre dijital göz sendromunun varlığını ve şiddetini değerlendirmek için bir anket kullanılmıştır. Araştırma sonucunda dijital göz yorgunluğu sendromunun şiddeti ile birden fazla elektronik cihaz kullanımı, elektronik ekran kullanım süresi, karanlık odalarda dijital ekran kullanım süresi, sürekli/aralıklı ekran kullanımı, refraktif kusurların varlığı ve dijital ekran kullanım yılı gibi faktörler arasında anlamlı ilişkiler bulunmuştur. Ancak cinsiyet, ekran parlaklığı, dijital ekran kullanım zamanlaması (gündüz/gece) ve daha önce teşhis edilmiş kuru göz hastalığı ile dijital göz sendromunun şiddeti arasında doğrulanmış bir ilişki bulunamamıştır.

Sonuç

Bu araştırmada akıllı telefon kullanımı ile dijital göz yorgunluğu arasındaki ilişkiler incelenmiş ve dijital göz yorgunluğu üzerinde hangi faktörlerin etkili olduğu konuyla ilgili yapılan çalışmalardan elde edilen sonuçlarla rapor edilmiştir. Çalışmalar çocuklar akıllı telefon kullandığında bulanık görme, tahriş olmuş veya yanan göz, kaşıntı, baş ağrısı, çift görme, gözde uçuşan cisimler görme, odaklanma zorluğu, göz sulanması/yaşlanması, yanma hissi, görme yeteneğinin kötüleşmesinden korkma, gözleri aşırı kırpma ve kuru göz gibi dijital göz yorgunluğuyla ilişkili semptomların ortaya çıktığını kanıtlamıştır. Bu sonuçlar akıllı tefon kullanımının çocukların göz sağlığı üzerinde birçok olumsuz etki bıraktığını göstermektedir. Amerikan Pediatri Akademisi'nin önerisine göre, beş ile dokuz yaş arasındaki çocukların ekran süreleri günde iki saatle, iki ile beş yaş arasındaki çocukların ise bir saatle sınırlandırılmalıdır. 18 ile 24 aydan küçük çocuklara ise hiç ekran süresi (görüntülü sohbet hariç) önerilmemektedir [26]. Akıllı telefonla 10 dakika zaman geçirmek bile dijital göz yorgunluğuyla ilişkili semptomların ortaya çıkmasına neden olmaktadır [27]. Çocukların dijital elektronik alet kullanımındaki son artış nedeniyle ebeveynleri, bakıcıları ve gençleri ekran süresi sınırları koyma ve riskleri azaltmaya yönelik uygulamaları kullanma konusunda bilinçlendirmeye acil ihtiyaç duyulmaktadır [28]. Ayrıca araştırmalardan elde edilen sonuçlar farklılık gösterse de dijital göz yorgunluğu üzerinde cinsiyet, yaş, dijital cihaz kullanım süresi, dijital cihaz kullanım mesafesi, mobil oyun oynama, gözlük kullanma, refraktif kusurların varlığı, sanal sınıfta ders alma süresi, açık hava aktivesi süresi, birden fazla elektronik cihaz kullanımı, karanlık odalarda dijital ekran kullanım süresi, sürekli/aralıklı ekran kullanımı, dijital ekran kullanım yılı, kullanılan dijital cihaz türü (akıllı telefon, tablet, bilgisayar vs.) gibi faktörlerin etkili olduğu söylenebilir. Bu sonuçlar dijital göz yorgunluğunu hafifletmek için çocuklar dijital cihazlarla zaman geçirirken optimum bir ortam yaratılması, sık sık mola verilmesi ve günlük ekran süresinin sınırlanmasının önemine işaret etmektedir. Göz sağlığı uzmanları tarafından danışmanlık/kamuoyu farkındalığı çalışmalarının yapılması, öğretmenlerin ve ebeveynlerin duyarlı hale getirilmesine yönelik uygulamalara yer verilmesi de önemli görülmektedir [29]. Çalışma saatleri arasında uygun dinlenmenin sağlanması, göz kırpma hızının uygun tutulması ve ekran kullanımıyla ilgili sorunların azaltılması için 20-20-20 kuralı (mola verme) uygulanarak günlük rutin oluşturulabilir, ekran başında kalma süresinin neden olduğu göz yorgunluğu ve rahatsızlığı önemli ölçüde azaltabilir ve daha iyi göz sağlığına katkıda bulunabilir. Ek olarak, olası göz sorunlarının izlenmesi ve ele alınması açısından bir göz uzmanıyla düzenli göz muayeneleri yapılabilir [30]. Sonuç olarak çok küçük çocukların bile akıllı telefonlarla meşgul oldukları dijital dünyada çocukları akıllı telefondan tamamen uzak tutmak mümkün görünmemektedir. Ancak çocukların akıllı telefon kullanım süresinin sınırlandırılması, telefonu kullanırken sık sık mola verilmesi, telefonu göze çok yaklaştırmadan kullanması, düzenli olarak göz muayenelerinin yapılması, açık hava aktivitelerine yönlendirilmesi konusunda ebeveynlerin bilinçlendirilmesine yönelik çalışmalar yapılması önerilebilir.

Emerging Ecologies and the Nascent Paradigm: Reconceptualizing Architectural Design in the Current Interregnum. The New that cannot be Born

Valerio Perna*

[1]*INNOVATION_Factory (IF), Faculty of Research and Development, POLIS University, Albania*

**valep.arch@gmail.com*

Abstract – Since the mid-1960s, global discussions in philosophy, epistemology, science, and technology have engaged in a critical examination of the concepts and applications of anthropocentrism [1], [2], [3]. This scrutiny has subsequently stimulated new discussions on how various fields of knowledge, spanning from science to humanism, should grapple with the inclusion of external agents that were previously excluded or overlooked.

In the last decades, philosophical circles represented by thinkers such as Braidotti [4] and Delanda [5] have raised inquiries into the operational value of the concept of "progress." This concept, central to the ideologies and practices of Modernity, has been scrutinized for its role in perpetuating a worldview founded on binary oppositions and polarities—the typical "black or white" litany.

The scope of challenging anthropocentric thought extends beyond considerations of species other than humans; it encompasses, perhaps above all, the sustainability of our planet intricately interwoven with its political and economic dimensions. Concepts like assemblage, emergence, difference, agency, affect, immanence, sympathy, ecology, and symbiosis, among others, have undergone a gradual migration into various subject areas and realms of contemplation. These terms are now intricately interlinked, establishing new ecologies, connections, and continuities across diverse academic domains. Indeed, we find ourselves immersed in what can be described as a Gramscian interregnum, characterized by the simultaneous decline of established paradigms and the hesitant emergence of new ones. This transitional phase is marked by the poignant sentiment that "the old is dying and the new cannot be born." The challenge lies in determining the nature of novelty we should advocate for the creation and identification of specific forms, materials, styles, and substances that should be attributed to the emerging paradigm to distinguish it from the outgoing one.

Keywords – architectural design, interregnum, new ecologies, ontology, Gaia

I. INTRODUCTION

The last decades have seen an ever-growing criticism regarding the notion of anthropocentrism and the incidence of this 'belief' in the contemporary world. If we focus on the word's etymology, it denotes a human-centred perspective and assumes paramount significance in philosophical discourse, particularly concerning ethics, wherein it signifies the doctrine that assigns exclusive intrinsic worth to the human species [6], [7]. Therefore, the idea of "Human" implied in the field of "Humanities", where the man is the chosen animal endowed with the capacity of the language, goes along with a set of spiritual, discursive and mental values that have no other comparison in the animal world [8], [9].

Permeating this man-centric discussion and vision of the world stands the concept of 'intelligence', considered for centuries as a specific prerogative of humankind and something not to be argued to the

supremacy of our species fostered by art, science and philosophy at the same time. Nevertheless, more and more we have seen the rise of different and related considerations that refute these assumptions. The first concerns the ontological shift in the conceptualization of intelligence, transitioning from its historically human-centric characterization as solely emanating from the human brain to its reconceptualization as an emergent quality arising from specific contextual conditions applicable to both human and non-human entities, including artificial systems [10]. This evolution signifies a departure from the traditional notion of intelligence as exclusively tied to human cognition. Secondly, intelligence is no longer perceived as the product of a solitary organ or centre but rather as an emergent property arising from the dynamic interplay among a "brain" (whether human or non-human), a corporeal entity, and the encompassing environmental milieu [11]. This reconceptualization underscores the inseparable interconnectedness between cognitive faculties and their embodied instantiation, as well as their reciprocal interaction with the surrounding environment. In light of this, we should reconsider the presence of man as an interconnected part of a new worldview, not as the master of a piece of an entangled reality in an extended and interconnected technological world. Such a paradigmatic shift affects also all the different activities and fields of creation related to humans. Therefore, in light of contemporary challenges, the architectural domain confronts a significant epoch of turmoil, as it endeavours to navigate a complex terrain marked by the gradual obsolescence of entrenched architectural conventions and the incipient emergence of novel design paradigms. This transitional phase can be likened to a Gramscian interregnum, denoting a period characterized by the concurrent decline of established architectural frameworks and the tentative emergence of nascent ones [12]. Architecture, as a discipline deeply intertwined with societal and cultural dynamics, finds itself grappling with the task of discerning elements undergoing obsolescence from those poised to shape future architectural discourse. This entails a critical reflection on the evolving needs, values, and aspirations of contemporary society, as well as an exploration of innovative approaches that respond adeptly to emerging challenges and opportunities [13]. Moreover, this period of architectural flux underscores the imperative for architects and urban planners to adopt a forward-thinking and adaptive mindset, capable of embracing ambiguity and uncertainty while fostering creative experimentation and interdisciplinary collaboration [14]. By engaging in a reflective dialogue with the shifting socio-cultural landscape, architects can play a pivotal role in catalyzing transformative architectural practices that resonate with the evolving ethos of the 21st century. To shed light on these changes, and position ourselves as architects in these major changes the discipline is undertaking, this paper aims to scrutinize the shift from a human to a post-human ecology [4] and includes a critical examination of the integration of novel technologies and tools, such as AI and neural networks, disrupting the traditional perception of 'design' as an exclusive realm of human intellect. To do so, a series of examples and critical reflections will be presented to the reader to assess our capabilities to design for Gaia moving away from an approach initially centered only on human intellect and refocusing toward a broader perspective beyond the exclusive interests of humanity.

II. From the Human to the Post-human Ecology: Questioning the Concepts of Predominance and Evolution

The subtle notion of human dominance over the Earth has pervaded history and various domains of knowledge and practice since ancient times [4] Protagoras famously asserted that "man is the measure of all things," encapsulating this perspective [15]. This belief was further enshrined in the arts during the Italian Renaissance, notably exemplified by Leonardo da Vinci's Vitruvian Man. Da Vinci's depiction symbolizes the embodiment of mental, discursive, and spiritual ideals within an archetypal human form [16]. The Humanistic ideal turned into a hegemonic cultural model with Heidegger and his philosophy of history where he conveys the message that Europe is not just a mere geo-political location but a proper intellectual device – and reflection of the human mind – that can lend its quality on every object while orbiting around it. This flattering vision of the Human is more than a question of attitude: it is a structural element of our intellectual practice and it permeates our consciousness reverberating on the big to the small scale, giving birth to extreme distortions and tendencies such as nationalism and totalitarian regime fueled

by the idea of a main position that a population should gain on the other thanks some unclear ‘divine’ attribution. Furthermore, this idea is not just man-centric but also male-centric. The predominance of the masculine gender and "otherness" is delineated by its negative and mirrored opposite irrationality, immorality, femininity, and non-Westernness. When difference is perceived as synonymous with inferiority, it assumes essentialist and potentially harmful implications for those categorized as "others." These individuals, often sexualized, racialized, or naturalized, are relegated to a dehumanized status, viewed as disposable bodies to be moved and abused from a masculine predominant counterpart [17]. The death of Man, anticipated by Michel Foucault in his book, *The Order of Things* [18] claims for a self-criticism on the part of men and a critical study of the actions carried out by him from a universal and interconnected perspective into the void the disappointment and depression of an evolutionary condition that is increasingly elusive and a progressive failure of a now Marxist materialist logic unable to contemplate the complexity of the story. Man is therefore no longer seen in a predominant position as a precedent established by Renaissance and socialist humanism but seen as a component shaped by places and history where he is not the one to impose values but rather to absorb them and be influenced by them.

In his *The Post-Human Condition* [19], Robert Pepperell states that the demarcation between the body and the external world constitutes a fundamental aspect deeply ingrained within our conventional understanding of personal existence. This conceptual partition, prevalent in philosophical and cultural discourses, delineates the perceived boundary between the embodied self and the surrounding environment. Such a dichotomy shapes not only individual perceptions but also societal constructs and behavioural diverse realms ranging from psychology to social theory. According to him, we should overcome this reminiscence of a Cartesian dichotomy and look at an inseparable interconnection between man and the environment. Even when we sleep, we are stimulated by a series of contextual agents (light, dust, sounds) that form and influence our perception in a continuum localized in space and time. For this reason, it is difficult to consider the end of human experience and the beginning of external experience and vice versa [20]. Consequently, as already stated previously by Foucalt, it is impossible to consider man as split and predominant concerning a context that continually stimulates him but which is also stimulated by his presence. Recalling *Complexity Theory*, the Post-Human assumption is then a non-linear model where dispersed factors collectively generate sensation and consciousness. Complexity theory [21] posits that the collective behaviour of a complex system transcends the explanatory scope of its components. While it may be feasible to dissect a system into its constituent parts, such an approach fails to elucidate the holistic behaviour of the system as a whole. This principle underscores the inherent interconnectedness and emergent properties inherent within complex systems, necessitating an integrative perspective to comprehend their dynamics effectively [22]. Expanding upon this premise, contemporary scholarship within complexity theory explores the dynamics of diverse complex systems, ranging from biological ecosystems to social networks and economic structures. By adopting a transdisciplinary approach, researchers seek to unravel the underlying principles governing the self-organizing, adaptive, and nonlinear behaviours exhibited by complex systems [23].

All these mutations and theories show how man must be understood more and more strongly as one of the individual portions of a more complex system. This completely dismantles the centuries-old relationships and hierarchies and the marginalization of certain groups, human and otherwise, which have always been relegated to a subordinate condition compared to ours. As the hegemony of anthropocentrism wanes, it paves the way for the recognition and empowerment of diverse human experiences and identities. This emancipatory process not only challenges conventional notions of identity and agency but also fosters greater inclusivity and equity within society.

What needs to be highlighted at this point is that the post-human question is not relegated only to gender, racial, cultural factors, etc. The emergence of new types of intelligence, and the non-predominance of man in a complex ecology like the one we live in, also puts into crisis a system, that of architecture, linked to design and representation. If previously a total prerogative of the sphere of our intellect, the emergence of new types of intelligence - of a non-biological nature – gives us the possibility to assimilate, exploit and turn into practices the cognitive possibilities opened up by any technological innovation that question the precedent paradigm [24]. The evolving understanding of intelligence significantly impacts the

contemporary discourse surrounding the design of the built environment across various scales and stages of the design process. This conceptual shift necessitates reevaluations and implementations of novel conceptualizations on innovation, creativity, and imagination—integral components that propel the design endeavour forward. This transformative trajectory in design thinking is underscored by the interdisciplinary insights garnered from fields such as cognitive science, neuroscience, and psychology. As scholars delve deeper into the complexities of human cognition and creativity, they offer fresh perspectives on the conceptual underpinnings of design theory and practice [25]. Moreover, this evolving understanding of intelligence necessitates a reexamination of conventional design methodologies and pedagogical approaches within architectural education [26]. By integrating insights from cognitive psychology and neuroscience into design pedagogy, educators can cultivate a more nuanced understanding of the cognitive processes underpinning design thinking, thereby fostering the development of innovative and imaginative design solutions [27]. In essence, the evolving conception of intelligence engenders a reimagining of design as a dynamic and iterative process that harnesses the full spectrum of human cognitive capacities to address complex challenges and catalyze transformative change within the built environment. The automation of creativity has been one of the major fields of interest of scholars over the last two centuries. The idea of being able to open processes to different and non-human intelligences has permeated the minds of scholars since the appearance of the first software dedicated to design and the possibility of delegating certain tasks to new combinatorial and creative systems. One of the first attempts to implement artificial intelligence into a design process was made by the English architect and artist Cedric Price in 1976 [28]. This intricate project, supported by numerous drawings and diagrams, constituted a modular system comprising cubelike elements designed for adaptability and versatility. These elements could be repositioned and interconnected, either with each other or with supplementary components, to fabricate temporary structures suitable for diverse purposes such as rehearsal or performance spaces, habitation, or quiet contemplative areas set amidst verdant natural surroundings.

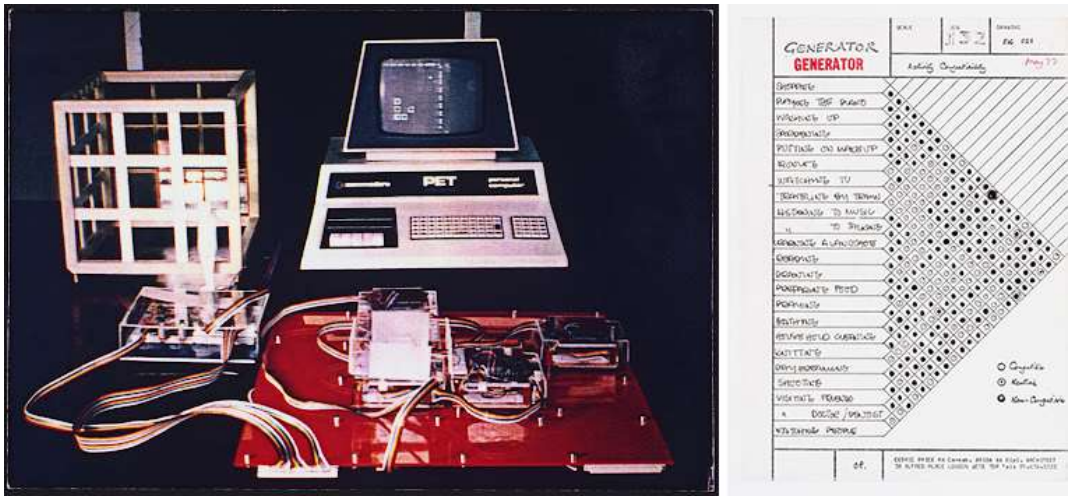

Figure 1 Cedric Price (1970). Generator: the device and the card underlying the operation of the device

The operational framework of this system revolved around a central computer interface, through which visitors could manipulate a selection of 150 fully equipped, four-by-four-meter cubes along with ancillary components such as walls, screens, walkways, and communication channels to configure personalized structures. The computer interface was programmed to guide users in iterative refining and enhancing their designs. Central to the ethos of the Generator project were notions of change and artistic autonomy, deemed essential prerequisites. Accordingly, the computer system was designed to autonomously introduce alterations to the framework in instances where stagnation was detected, thereby fostering an environment conducive to ongoing innovation and creative expression. The project remained a sort of folie for the architect but it represented one of the first combinatorial possibilities of two different intelligences within the same context where neither of the two possessed the exclusive decision-making capacity to direct the choices of others.

The unpredictability underlying the device also demonstrated the possibility of a non-predictive relationship with the machine itself where the response, influenced by the components of space and time, remained uncertain and linked to a series of emerging behaviours [29] dependent not only on the machine itself but also from human interaction with the latter. This discussion on creativity finds in post-human design a close relationship with the very concept of intelligence. If intelligence is based on a series of abstractions (pattern recognition and categorizations) and hierarchical classification (association), creativity is the possibility of generating new patterns and associations starting from pre-established and pre-memorized ones. In the context of the interplay between human and non-human intelligence within the mind-body-environment continuum, the presence of abstractions facilitated by non-human agents assumes significance as a catalyst for novel associations of creative intelligence [30]. This entails recognizing the capacity of non-human entities to contribute to creative processes without being influenced by human biases or value judgments. After this theoretical excursus on overcoming the anthropocentrism prevalent in society and also in the classical notion of design, we will analyze the new directions undertaken in this research thanks to the diffusion, in the last decade, of neural networks and diffusion models in contemporary architectural practice. By doing this, we will analyze some of its theoretical components and focus on some examples capable of shedding light on what a synergy between two intelligences means: the human one and the artificial one in the present unfinished interregnum in which we find ourselves.

III. Diffusion Models in Architecture. Venturing in the realm of AI

Since the early 90's, the advent of digitalization heralded profound transformations in our society [31] We found ourselves immersed in a landscape where an abundance of digital objects reshaped our interactions with the environment, rendering our experiences increasingly intangible and virtual. The role of the designer has undergone significant evolution. In addition to adhering to traditional principles of aesthetics and practicality, contemporary designers integrate concepts such as communication, multimedia, and virtuality into their toolkit. This expanded skill set enables designers to create immersive and interactive experiences that resonate with modern audiences and adapt to the digital landscape. This transformation reflects broader shifts in design theory and practice, where the boundaries between disciplines blur, and interdisciplinary collaboration becomes increasingly prevalent [32]. Designers draw inspiration from diverse fields such as psychology, sociology, and technology, leveraging insights from these domains to inform their creative process [33].

In the last 5 years, we have seen the natural prosecution of this very discourse in the spreading of AI-based tools or AI visual generative media that captured the attention of the architectural community and have found a large space of debate among practitioners and scholars. Neural networks are used today as a kind of speculative tool in almost every creative field: from architecture to design; from music to video; from photography to editing. They are trained on an infinite database made of images collected from the web and from which the model is trained to generate new abstractions and associations. Whether we refer to *diffusion models, text-to-image models, generative adversarial networks (GAN), and transformers*, the core is always the same: the creator or the artist, more precisely the *intelligence* behind the work is everything but physical. It is a huge unstructured constellation of cultural content stored somewhere in a structure that resembles our brain and activates our synapsis thanks to the collaboration with the human being that requests its help. While having had their pros: they are fast in computing, they estrange components from some of their datasets to mix them with others upon our request; they paraphrase and reshape what we write (text-to-image tools are among the most diffused ones); they simulate new cultural artefacts as we do throughout our life with the incremental knowledge we develop; they also have some limitations: they rely on what they know and they cannot immediately invent something that they do not process into the atoms or particles they have trained with. They do not deal with the uncommon and, for such reasons, they need the human intelligence to guide them on what we are looking for. In a few words, they the know *subject* and *style*, but they are not able to come out with a new *crasis* of pre-existing datasets even though maybe this is not the right question we should be asking them [34]. Therefore, we are

confronted with the imperative to augment both our individual and collective cognitive capacities through active engagement in diverse intellectual collaborations. These collaborations serve as crucibles for the invention, innovation, and creation of a novel human reality within the evolving landscapes of the 'new reterritorialized agora' of cyberspace and the techno-cultural milieu of the post-human era. This contemporary challenge underscores the transformative potential inherent in collective endeavours aimed at reshaping human cognition and societal structures. Drawing inspiration from the interdisciplinary perspectives of scholars and practitioners, we navigate the complex interplay between technology, culture, and human agency in shaping our shared reality [35], [36]. In this context, the notion of the 'new reterritorialized agora' in cyberspace serves as a metaphor for the dynamic spaces of digital interaction where diverse voices converge, interact, and negotiate meaning. These virtual arenas offer fertile ground for the cultivation of collective intelligence, where individuals from diverse backgrounds collaborate in the co-creation of knowledge and cultural artefacts [37]. The explosion of the tools we are discussing did not create just a bunch of beautiful images to be admired on the web but provoked theoretical inquiries within the realm of the architectural discipline shaking from the foundation the consolidated relation between the human and the non-human in the creative act. Furthermore, after a long time, they reintroduced again into the architectural community a linguistic attitude towards the design. This linguistic turn[34], as it has been called, grounds the work of thinkers such as Wittgenstein, De Saussure, Merleau-Ponty, and Austin; as it happened during the 70s when we had the explosion of linguistic studies in the architectural panorama, through this critical lens we can create associate among different styles and times, we decompose the architectural body in a series of predicates to be placed side by side without any superstructure or cultural imposition (the work of Eisenman on Terragni – 1971, 2004 - it is still exemplary in this sense). In such context, considering still the uncertainties around the further evolution of AI in architecture for the years to come, we want to interpret them at the current stage as a tool following Koyre's vision where: "*an instrument, or something that - as the ancient thought had rightly observed - extends and strengthens the action of our limbs, of our sensory organs, is something that belongs to the world of common sense. And it can never lead us beyond it. This is instead the proper function of the tool, which is not an extension of the senses, but in the strongest and most literal sense of the term, an embodiment of the spirit, a materialization of thought*." It is still unclear where this venture into the realm of AI will conduct us in the years to come. Even if it disappears as it never happened, it will help us to dwell towards more informed human design categories even though assimilating, exploiting, and translating the cognitive possibilities unleashed by technological innovations could be a long and time-consuming endeavour, we can already start discussing with a specific focus on fostering novelty of sustainability, resilience and style combination in architectural production to design for Gaia (Planet Earth) in a more comprehensive human perspective. In pursuit of this objective, our inquiry will pass through the analysis of some case studies where the design process is orchestrated by the synergy of two intelligences: human intellect and artificial intelligence based on neural networks.

IV. DATALAND – LNM | LARGE NATURE MODEL

The Studio Refik Anadol is currently working on the first Large Language Model (LLM) based on nature that was provocatively defined as LNM – Large Nature Model. In a few words, the work is presented as the inaugural open-source, generative AI model meticulously crafted to immerse itself in the wonders of nature. DATALAND stands apart as a monumental stride towards leveraging artificial intelligence for the preservation and exploration of our planet's biodiversity. At its core lies a vast reservoir of ethically sourced data, meticulously curated to encapsulate the splendor of the natural world. Following experiences such as GPT-3 (Generative Pre-trained Transformer) by OpenAI and BERT (Google) DATALAND claims to open a new era of AI-driven innovation tailored specifically for nature enthusiasts, conservationists, and researchers alike. The studio aims to blend art, technology, and nature, raise awareness about environmental issues and inspire innovative solutions by finding connections among isolated archives. Topics such as resilience and sustainability have been always part of the studio's work and this dataset is their effort the

push the boundaries of post-human design towards more responsible and inform-ed solutions. Also, one of their previous works *Artificial Realities: Coral* used approximately 100 million coral images as raw data to raise awareness of climate change. The model was trained on data from National Geographic, the Smithsonian Institute, CornellLab, the Natural History Museum in London, and the Conservation Research Foundation Museum, as well as data his team has personally collected at locations around the world, including deep in the Amazon rainforest.

Figure 2 DATALAND - one of the images generated with the datasets mixing different natural elements and environmental conditions

The applied philosophy behind the work is common to some other image generators: you can merge the tropical forest with a more temperature one or you can mix different flowers in the same environment and check their modification according to some language insertion within the requested prompt. At the same time, it is enriched by a full set of real-time data about weather and environmental conditions in real-time from forests around the world giving full control to the generated environments within the experimentations. The idea behind the dataset created by Anadol claims also to advocate more conscient behaviour towards the environmental crisis with the active engagement of the people visiting the exposition where the digital realm is showcased. According to him, engaging the people through multi-sensory levels the outputs generated by the DATALAND model serve as a bridge between the abstract concept of environmental conservation and tangible action. By harnessing the power of generative AI, DATALAND breathes life into complex ecological data, transforming raw information into vivid simulations, visualizations, and narratives that resonate with people on a deeply human level.

Through immersive virtual environments, DATALAND paints a vivid picture of our planet's delicate ecosystems, allowing individuals to explore and interact with virtual representations of diverse habitats and species. These simulations not only educate but also instill a sense of wonder and appreciation for the natural world, fostering a deeper connection with nature and a heightened awareness of its fragility. For a full coherence with the purposes of this work, together with Google engineers, the team has developed a platform to see the environmental impact their model has and claimed that it is has been trained only using renewable energy.

V. SPAN Architects – Urban Fictions

Founded by professionals and scholars, Matias Del Campo and Sandra Manninger, SPAN Architects has always been one of the studios at the forefront of technological advancement in architecture. With an

Austrian/American education, since their earliest works the studio has always been pushing the boundaries of the discipline thanks to the implementation of the latest tool. Their architectural style is defined by blending sophisticated methods with philosophical exploration, questioning the fundamental nature of existence and knowledge generation within a framework focused on advanced technology's role in shaping culture. Their work covers the range from text, installations, industrial design to buildings and urban concepts

Even before the major diffusion of Creative AI in architecture, the duo has been experimenting with custom-trained datasets and intelligent enzymes in their projects. Urban Fictions is their contribution in the field of AI-speculative design and it is intended as an exploration of the combination of real scenarios and patterns created by the studio. Urban Fictions can also be interpreted as a response to contemporary critiques of urban life in the context of the ongoing Covid-19 crisis. Rather than echoing the widespread sentiment favouring rural living as a solution to social distancing measures, Urban Fictions celebrates the vitality and density of urban environments as a potential, even essential, direction for the future. The rationale behind this perspective is multifaceted, but in essence, architects recognise that cities, besides being emblematic of human culture, play a crucial role in promoting sustainable resource consumption. Rather than presenting a bleak dystopian vision dominated by pathogens, Urban Fictions embraces the prospect of praising urban life and advocating for a reassessment of cities, leveraging the potential of machine learning technologies. In this specific application, created by Del Campo, Manninger and Alexandra Carlson, the system is based on a neuron that mathematically calculates the total amount of the inputs weights and applied a threshold to understand if it has been activated or not. All the info filtered from the neurons through the applied threshold is then sent to the next layer for different values and the following inputs to be used by each neuron. Since each one of the latter is activated in subsequent phases, according to what they receive they can also independently decide do erase, recombine and modify information during the process in a continuous communication with the other knots of the network. Urban Fictions then explores the potential of employing AI technologies for generating design processes, specifically focusing on the use of style transfers with neural networks. This method not only scrutinizes the distinct role of the human mind in creative endeavors but also challenges notions of creativity in planning procedures. In a design landscape where the lines between human and computational cognition are becoming increasingly indistinct, the proposed process merges the capacity of neural networks to interpret and identify features of a style image and integrate them with a target image.

The conveyed result, besides questioning the possibility of AI inventing and discussing again the fundamentals of architecture – and its ontology – from a given dataset of information also challenges the post-COVID idea of sustainability and resilience of isolation and depolarization of urban center following the opposite directions. It proposes an AI-based approach to investigate the possibility of density with the injection and the mix of external green and nature-based patterns to be over-imposed on the existing layers. The result is a set of hallucinated urban landscapes where the different pixels are enriched by new semantic layers to be questioned in further architectural design implementations.

VI. When Machines Hallucinate – A Pedagogy Design Process

The last case study presented comes from a teaching experience carried out during the Master in Digital Architecture at POLIS University in Tirana, Albania. During the educational program, students are exposed to the presence of novel technologies in the field of architecture and design not so much from an instrumental point of view but from a conceptual one. The software is seen not as a pre-compiled response package but as an investigation tool capable of opening new ontological directions for the development of design know-how. In the last two years, thanks to its explosion on a global scale, creative AI has also become part of the educational program. Through a reverse engineering process, students during the dedicated module start with the elaboration of a design brief to be then developed with the help of neural networks which can then be re-modelled using more consolidated technologies. The challenge for students is not only to generate good-looking images but, above all, to push the limits of the various text-to-image tools to the point of generating hallucinations capable of transcending the limits of the pre-compiled dataset. The idea is that of creative error, already present in the design practice of Bruno Munari and Gianni Rodari [38], to challenge AI to do 'something that was not previously possible'.

In the proposed exercise, the class was challenged in the construction and deconstruction of a specific architectural typology - specifically the cause - and through the practice of estrangement of inserting external components from the natural world into the prompt. The basic idea was to challenge the pre-established spatiality in the archetype of the home and to test its versatility when an emerging component from the natural world emerges. The software used was different and the opportunity for the students was to test the performance of different datasets and their response to different prompt-engineering methods.

Figure 4 First results obtained from Dall-e 2. Prompt: "Photography of a private living room in a wooden model of a building that looks like a tree, in the style of abstract and conceptual sketches, fantastical machines, floating structures, intricate webs"

After an initial phase in Dall-e 2 and Stable Diffusion, the final choice fell on the productions obtained from the interaction and dialogue with Midjourney AI. Not only that, among the various versions (to date Midjourney has 6 different versions) the choice fell on number 3. To date the one that is even more dreamlike and capable of hallucinating more convincingly when it works on heteronomies coming from different fields.

In undertaking this endeavour, we aimed to emphasize the significance of the semantic aspect of architecture by harnessing the potential of learning to extrapolate from a curated pre-trained dataset. Through this approach, we sought to enable students to discern and articulate the features they aspire to achieve while envisioning future scenarios that address contemporary architectural imperatives and crises. By engaging with this process, students not only develop a deeper understanding of architectural semantics but also cultivate the ability to envision innovative solutions that respond effectively to the evolving needs of our built environment. The final result is a corollary of speculative images in which the very essence of the architectural typology has been questioned and merged with elements external to it. Although the images may seem excessively dreamlike, the original idea was to question the possibility of neural networks to extrapolate elements from both datasets (the house and the tree) and fusing them under the aegis of a non-uniform architectural spatiality present but potential.

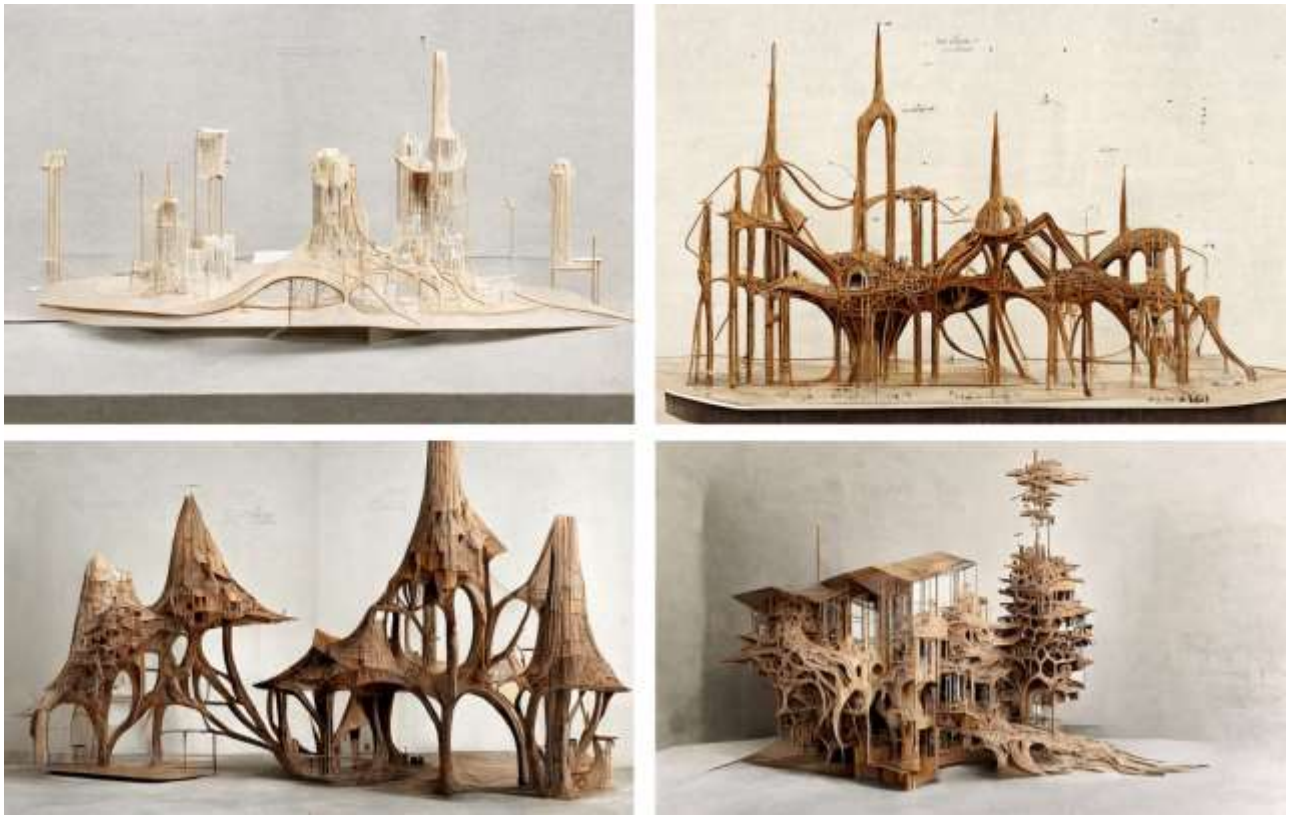

Figure 5 Midjourney v3: a wooden model of a building that looks like a tree, in the style of abstract and conceptual sketches, fantastical machines, floating structures, intricate webs, columns and totems, organic forms, muted tones, panoramic scale

In the end, some quick tests were also done with version 5 of Midjourney. Certainly more inclined to results aimed at a more defined spatiality in terms of semantic components. With a series of inpaintings and blends from the original drawings, the results obtained represent a series of architectural ideas aimed at the possibility of construction inspired by nature and in whose DNA there may be more sustainable solutions.

In the end, the process was structured into several distinct phases. Initially, students engaged in an analytical analogical phase, wherein they formulated their prompts through concise written texts. These prompts served as the foundation for subsequent experimentation. In the second phase, students incrementally implemented their drafted prompts, gradually increasing the complexity of their explorations. This iterative approach allowed them to validate the efficacy and feasibility of their concepts. Subsequently, the outputs generated were subjected to interpolation and blending using a variety of digital techniques, which facilitated the refinement and enhancement of the diffusion model itself. Through this multifaceted process, students were able to iteratively refine their ideas, experiment with diverse methodologies, and ultimately produce sophisticated and nuanced architectural solutions.

Figure 6 The last case study presented comes from a teaching experience carried out during the Master in Digital Architecture at POLIS University in Tirana, Albania. During the educational

VII. CONCLUSIONS AND FURTHER DISCUSSION

The last case studies presented comes from a teaching experience carried out during the Master in Digital Architecture at POLIS University in Tirana, Albania. During the educational path, the class had been exposed to several AI-based technology and tried to find its own way to master and use them in an architectural design process.

Many of the students seemed triggered by the possibility of having novel technologies at-hand that empowered them in quickly visualize and analyze what their mind was thinking. The possibility of inserting again a linguistic nuance into the architectural process makes AI technologies an interesting facilitator to push the boundaries of the discipline over the tradition tools for drafting and modeling. More than 100 students have attended the class and 80% of them completed successfully while a 30% started using the above-mentioned tools daily into their academic and professional engagement. What we discussed in this paper is just the beginning of a possible turning point for architects, designers, and creative actors, thanks to the emergence and diffusion of artificial intelligence through platform that make them comprehensible and usable from a broader number of users. The next steps of this research will focus on how it is possible to guarantee a better adherence between the drawings produced during a traditional design phase and their upload into AI-based platform to generate endless possibilities and opportunities without losing the connection with the original inputs. This represents at the moment one of the main challenges of this approach: while many platforms offer a wide number of results – even though very heterogeneous among them – a few of them allow the designer to completely control the generation in each of its steps. The classes of 2023 and 2024, have focused more a typology of tools that could enlarge the creative opportunities rather that guarantee a so-called consistency among the results. Researches were done by the teaching staff in this direction and updates in the curricula have prepared the next cycle for a better and more fruitful experience in terms of design.

Abstract – Monitoring of freshwater quality is important for water quality assessment and good quality objective. This study deals on water quality assessment of Shkumbini River. It is focused on the distribution and level of physical-chemical parameters and nutrient along the Shkunbini River. The study is performed on March 2022 by applying in-situ mesurements of water quality parameters combined with chemical analysis. The results showed that the geographical position, the related urbanization and human activity, as well as weather variation along the river catchment affect the changes in river water quality. Although the number of sampling sites is small (N=4), it is noted that the measured results for all parameters obey the normal distribution (tested by Anderson-darling test, $p > 0.05$) and were characterized by low variation (CV% < 25%), with the exception of TSS which shoed a moderate variation (CV% = 49%). The investigated water quality parameters resulted in lower level than the permitted values, by indicating good water quality of Shkumbini River. It is confirmed by WQI index which showed a good water quality ($71 < WQI < 90$) for all monitoring stations, which is probably related to low water temperatures and a rainy period of March. The obtained results demonstrate the efficiency of the water quality parameters and the model used for water quality classification.

Keywords – river water, sampling, water quality, physical-chemical parameters, nutrient.

I. INTRODUCTION

The surrounding environment is a complex system that consists of land, water, air, and living organisms that are influenced by various natural and human factors, establishing certain balances between them. As a result of intense human activity, these balances have changed, which has caused the destruction of natural ecosystems. Pollution is a serious problem as it passes into the soil, water, and air and then passes into the food chain, posing a risk to human health and living organisms. Water is a key resource for the development of every human activity and is the most important natural resource of life throughout the world. The world's freshwater resources are very unevenly distributed, compared to the world population density [17]. Regional and seasonal differences in the study area, land use and erosion processes, the spatial scale of sampling sites, the extent and type of human activities in the catchment, and the time of sampling all affect river water quality [16],[13]. Urban areas with intensive human activity and rapid land use change are vulnerable to water degradation [4]. As a result of human activity in the downstream regions of most river

basins, the water quality of these basins exhibits significant changes that have a detrimental impact on the rivers' health, particularly in terms of their water supply for daily life, industry, and agriculture [18].
Limited water resources and water quality have become major problems throughout the world, resulting in a global water crisis for billions of people [14], [17]. Water quality monitoring following the Water Framework Directive (WFD) shows that the study of the environmental situation and water quality is complex, including various biological, chemical, and physical-chemical parameters. The balance between water demands, water quantity, and water quality is a critical problem in many regions of the world, increasing the demand for a sustainable water resources management approach [14]. Waste disposal and the use of various chemicals in urban, industrial, and agricultural processes can cause serious water pollution. Water eutrophication is an important environmental issue in surface water, groundwater, and marine systems that is strongly related to the increase of nutrient content in water, mainly affected by human activities and atmospheric deposition [2].
The presence of macronutrients like carbon, nitrogen, and phosphorus is essential for the growth of aquatic life in freshwater [15], but high levels are dangerous for aquatic life. In addition to natural sources, manmade inputs and erosion carried out by runoff are the main sources of nutrients in fresh water [15]. Changes in nutrient flux in heavy populated areas can induce spatial and temporal variations in nutrient and physical-chemical parameters in water. The level and the technology used for sewage treatment and nutrient removal are significant factors contributing to the fluctuations in nutrient and physical-chemical parameters in water [4] that cause the eutrophication of water ecosystems. Eutrophication of waters is associated with the enrichment of nitrogen (N) compounds like nitrite (NO_2^-), nitrate (NO_3^-), ammonium (NH_4^+), and phosphate (PO_4^{3-}) content in water that can cause the presence of algal blooms and macrophytes in certain waters, depletion of dissolved oxygen in water, degradation of aquatic ecosystems, and loss of key aquatic species. EPA water quality standards [7] include several parameters, such as chemical, physical, and biological parameters, that directly affect the water quality.
This study is focused on the water quality of the Shkumbini River, an important river located in the central part of Albania. Water quality assessment was based on water physico-chemical parameters such as temperature, pH, dissolved oxygen (DO), TSS, nutrients ($N\text{-}NO_2^-$, $N\text{-}NO_3^-$, $N\text{-}NH_4^+$, $P\text{-}PO_4^{3-}$).

II. Materials and Method

A. *Level 2 - General view of Shkumbini River*

The Shkumbini River i is positioned in central Albania, originating from the mountainous area of Valmara (Korce), and flows into the Adriatic Sea near the Karavasta Lagoon. Since it passes through areas with high chrome, nickel, and iron minerals, the industrial area of Elbasan with high industrial activity of chrome, nickel, and iron metallurgy, as well as cement, as well as urban and industrial area of Elbasan, it is affected by various manmade factors.
Four monitoring sites along the Shkumbini River were selected in this study (Fig. 1) . The selection of the monitoring sites was carried out taking into account the geographical position, urban, industrial, and agricultural pollution factors, erosion conditions, etc. The hydrological parameters of the Shkumbini River are shown in Table 1, and the map of the area and sampling positions are shown in Figure 1.

Level 3 – Water sampling method

Sampling was performed based on the standard methods "Standard Methods for the Examination of Water and Wastewater" with the APHA standard method [1] and ISO Standard 5667-1: 2006 [12]. The samples were filtered with 0.45 μm Millipore nitrocellulose filters. To clean the membrane, the initial part of the filtered water was poured. Water samples for metal analysis were taken in 0.5 PET bottles pre-cleaned in the laboratory. Water samples for nutrient analysis were taken in 100 ml glass bottles. For metals, the PET bottles were washed with 10% v/v nitric acid, and then rinsed several times with pure deionized water. The samples were transported during the same day to the laboratory using cold boxes to maintain the temperature of +4 ° C. The samples were stored under standard conditions until analysis. During

transportation, the water samples were treated with chemicals to maintain the stability of the parameters taken in the study, as shown in Table 2.

Level 4 - Determination of physico-chemical parameters

Physico-chemical parameters such as water temperature, pH, dissolved oxygen (DO), total dissolved solids (TDS), salinity and electrical conductivity were measured in situ using a portable multiparameter apparatus (HACH type sension156). Suspended solids (TSS) were determined by filtration on a pre-weighed filter with a pore size of 0.42 μm. The filter was weighed again after drying at 105° C for 2 hours to constant weight. Nutrient content ($N\text{-}NO_3$-, $N\text{-}NO_2$-, $N\text{-}NH_4$ +, $P\text{-}PO_4^{3-}$) was determined according to standard APHA (1998) procedures using UV-Vis spectrophotometric methods using Specord 40 spectrophotometer.

Level 5 - Data analysis

Water quality monitoring is essential for assessing and controlling water quality and protecting human and environmental health. We used water quality index to predict the water quality classification. WQI) is calculated by averaging the individual index values of some water quality parameters used. In order to measure the pressures of natural and anthropogenic effects to water bodies, the aquatic classification system, which covers rivers, estuaries, coastal and groundwater bodies [11], is used. Classification of water quality means the categorization of water bodies based on water quality parameters, which have a certain effect to the pollution level of water bodies. Classification takes in consideration two main criterias such as the destination of use like as drinking water, for aquatic life, agricultural, or industrial use, and commercial, industrial, navigational, recreational, wildlife conservation and aesthetic purposes, and the second taking into consideration the environmental lealth of water bodies. Simple water quality index (WQI), which is based at five water quality parameters, temperature, biological oxygen demand (BOD), total suspended sediment (TSS), dissolved oxygen (DO), and conductivity, is used in this study. A higher value of WQI indicates better water quality. Surface water bodies are classified using a system of five quality classes that varies from 0 to 100, with five different ranges from 91 to 100 as excellent water quality, 71 to 90 as good water quality, 51 to 70 as average water quality, 26 to 50 as fair water quality, and 0 to 25 as poor water quality [11]. WQI is calculated by the following equation [3]:

$$WQI = \frac{\sum qn * Wn}{\sum Wn}$$

Where, qn = Quality rating of n^{th} water quality parameter. Wn= Unit weight of n th water quality parameter. All WQI data of this study were calculated through the online simple index calculator.

III. RESULTS

The experimental results of the chemical-physical parameters of the Shkumbini River samples are presented in Table 6.

Temperature

The temperature level depends mainly on the temperature of the environment and the speed of the water flow. The temperature of the samples taken in the study ranged from 13.7 to 17.8 °C. The minimum temperature (13.7 °C) was measured at station St1 followed by station St2 (16.4° C). Both of these stations are located in mountainous areas with different geographical heights, which has affected the temperature of the environment in these areas, as well as the speed of water flow in these areas. The other two stations (St3 and St4) positioned in plain areas and closer to the Adriatic Sea, show higher temperatures. Changes in the temperature values of water systems are caused by changes in various chemical processes in water, such as the dissolution of oxygen in water, in various chemical reactions, or in the activity of organisms or microorganisms in water that affect the fermentation of pollutants and the eutrophication of natural waters. With all that, the level of temperature variance is low (CV % = 12 %), which is not the main reason for the level of pollution of the Shkumbin River during the spring season when the monitoring was carried out.

pH

Monitoring the pH of water systems is of particular importance as it is a very important parameter which mainly depends on the nature of the ions dissolved in them, with a tendency of basic values mainly in carbonate areas. On the other hand, pH is an indicative parameter of the degree of eutrophication of waters when it goes to acidic values, indicating the presence of urban discharges, urban waste, industrial discharges, or biological processes of plants or aquatic algae such as photosynthesis or respiration of algae. The pH values of the samples taken in the study fluctuate in a fairly narrow range (7.8 to 8.2) with values within the range of normal values (6 to 9) recommended by the EPA for surface waters [7].

Alkalinity

The alkalinity of Shkumbin river samples fluctuated from 187 to 265 mg/l (CaCO3). The minimum value was observed at station St1 and the maximum value at station St4. The alkalinity of natural water samples is related to the presence of carbonate salts, hydrogen carbonate, or oxide-hydroxides in the water. It indicates the presence of carbonate, bicarbonate, or hydroxide in water. It shows how able the water is to neutralize the acids.

Electrical Conductivity (EC)

The EC values of the samples taken in the study fluctuate in a fairly narrow range, from 315 µS/cm (St4) to 348 µS/cm (St2) accompanied by a very low variation (CV% = 5%), showing a stable situation during the monitoring period. High conductivity values are thought to be influenced by industrial, agricultural, and rural activities. The conductivity value in water is affected by the presence of dissolved solids such as anions or cations, and higher salinity in water indicates higher water conductivity.

Total suspended matter (TSS)

The TSS values of the samples taken in the study fluctuate in a wide range, from 37.2 mg/l (St1) to 137 mg/l (St3), associated with a very high variation (CV% = 49%). The TSS values in the samples taken in the study are higher than the values recommended by the European Community (< 10 mg/L). Such a situation can be caused by different conditions of erosion in different areas, by different parameters of the speed of water flow in areas with high slopes, as well as by the conditions of anthropogenic pollution in areas where spills can be identified as solid in water.

Disolved oxygen (DO)

The DO content in Shkumbini river water varies from 8.9 mg/l in summer (S4) to 10.6 mg/l (ST1). The content of DO in surface waters is related to the dissolution of oxygen present in the air and the process of photosynthesis in water. The level of DO in surface waters depends on a number of factors, such as water temperature (the amount of DO increases with increasing temperature), the speed of water flow, which

positively affects the values of DO, the level of pollution, which negatively affects the values of DO, etc. The DO level is essential for the survival of aquatic creatures and an important indicator of surface water pollution or eutrophication. The highest levels of DO were found in the first station (St1), which is favored by a high flow rate due to the area's fraction as well as by low levels of pollution as it is located far from urban and rural areas.

Biological oxygen demand (BOD)

The content of BOD in the Shkumbini River water varies from 3.5 mg/l to 5.1 mg/l. The lowest BOD content was found at station St1, near the source of the Shkumbin River, which is associated with a fairly low level of pollution in it. The highest value of BOD was found in station St4 (Rrogozhina), a rural area with high agricultural activity.

Nutrients

The content of nutrients (mg/l) in the water of the Shkumbin River is given in Table 5, while the results of the statistical analysis in "descriptive statistics" are given in Table 6.

From the results of the statistical analysis, it is noted that the average values of each parameter are quite close to the median values, accompanied by relatively low variation for NO_3—N and $P\text{-}PO_4^{3-}$ (CV % = 29 %) and moderate for NH_4^+-*N* and NO_2—*N* (CV % resulted 60 % and 52 % respectively). This shows that the values of NO_3—N and $P\text{-}PO_4^{3-}$ are more stable than those of NH_4^+-N and NO_2^- —N.

Nitrate ($N\text{-}NO_3^-$)

The concentrations of NO_3^- - N (mg/l) in the samples taken in the study varies from 0.230 mg/l to 0.450 mg/l with an average value of 0.320 mg/l. The content of nitrates in water is related to the oxidized form of nitrogen compounds in it. Higher levels of nitrates resulted in stations St3 and St4 which may be related to the discharge of urban waste and livestock waste in this area. Nitrates themselves are quite well assimilated by plants as a nutrient for them, but in high content it can stimulate the proliferation of phytoplankton or macrophytes.

Nitrite ($N\text{-}NO_2^-$)

The concentration of NO_2^- - N (mg/l) in the Shkumbini river water samples is relatively low and fluctuates in the levels from 0.004 mg/l to 0.014 mg/l with an average concentration of 0.0088 mg/l. According to the results shown in Table 5 it turns out that the profile of the change in the concentration of NO_2^- - N increases by passing from the source (St1) with minimum content to other stations which for the same reason as for nitrates may have been influenced by levels of different discharges of urban waste and livestock waste in these areas. Another possible source of nitrites could be hydroplankton and sewage discharges, which are also related to the degree of urbanization of the areas where the samples were taken. On the other hand, nitrites in fresh waters are found as intermediate compounds obtained through the microbial reduction of nitrates or from the process of ammonium oxidation. The level of nitrites in unpolluted waters is usually lower than 0.01 mg/l (www.epa.ie/pubs/…) expressed as nitrogen (N) content. The level of NO2- — N content in the water samples of stations St1 and St2 was lower than 0.01 mg/l, while in stations ST3 and St4 it was higher than this level. As expected, this shows different levels of pollution of these stations, Stations St3 and St4 located in urban and urban-rural areas present a higher level of pollution than stations St1 and St2 located in residential areas.

Ammonium ($N\text{-}NH_4^+$)

Ammonium present in water systems originates from the microbiological decomposition of nitrogenous compounds, organic matter and from secretion by various aquatic organisms. Ammonium also derives from

anthropogenic sources, such as industrial processes, urban sewage discharge, animal stables or fermentation of urban waste discharged into the environment. Unpolluted natural waters contain relatively small amounts of ammonium, usually at a level lower than 0.02 mg/l NH_4^+ - N (www.epa.ie/pubs/...). Ammonium content in Shkumbini river water ranges from 0.062 mg/l to 0.386 mg/l NH_4^+ - N. The lowest level was found at stations ST1 and the highest level was found at station S4. The profile of the change of ammonium content in the station obtained in the study varies according to the order NH_4^+ - N (ST1) NH_4^+ - N (S2) < NH_4^+ - N (S3) < NH_4^+ - N (S4) which is related to the degree of urban emissions and livestock in these areas. The levels of NH4+ - N in the samples taken in the study are several times higher than normal values, which indicates a high level of pollution. This can be caused by eutrophication of water.

Phosphate (PO_4^{3-}-P)

The content of phosphates in the studied stations along the Shkumbin River varies in values from 0.023 to 0.048 mg/l PO_4^{3-}—P. All measured values are lower than the recommended level (0.1 mg/l PO_4^{3-}—P) (www.epa.ie/pubs/...). The phosphate concentration values show a low variation (CV % = 29 %), which indicates a stable state along the Shkumbin River. Phosphates in water come mainly as a result of human activity, among the main sources of phosphates in the environment we can mention sewage discharges in urban areas, urban water discharges with phosphorus content from the use of different detergents, etc. The monitoring period (March) is characterized by abundant rainfall, therefore pollution from areas with high agricultural activity is another factor of anthropogenic phosphate pollution. Likewise, the erosion or washing away of soils and rocks in the areas where the river passes are another source of phosphates in the water. Mention that the two extremes of minimum and maximum phosphate values were found respectively in stations St1 (clean area near the source of the Shkumbin river) and St4 (rural area with agricultural and industrial activity).

IV. DISCUSSION

As the number of sampling sites is small (N=4), it is noted that the measured results for all parameters obey the normal distribution (tested by Anderson-darling test, $p > 0.05$). With the exception of TSS (CV% = 49%), all other parameters result in a fairly low variation (CV% < 25%), and vary in a narrow range. Quite important are the results of the WQI index, which show a good water quality (71 < WQI < 90) for all monitoring stations, which is probably affected by low water temperatures and a rainy period of March.
Discussion of water quality is strongly related with population and land use along the water bodies [5]. It is verified in our result which consisted with higher WQI values near the river spring in mountain area with scarce population, and an increase in lowland characterized by relatively high population and industrial, agricultural, and daily life.

V. CONCLUSION

This study shows that the parameters taken in the study are the basis for the environmental assessment of surface waters.
Parameters such as temperature, pH, electrical conductivity, BOD and nutrients are mostly varied according to the position of the stations in relation to urbanization and human activity in them.
The investigated water quality parameters resulted in lower levels than the permitted values. The concentrations of nitrate and nitrite were generally lower than the level established by WHO (2004) for surface water (50 mg/l for nitrates and 1.0 mg/l for nitrites). On the other hand, ammonium has high concentration levels, which exceed the recommended level of surface water (0.3 mg/l) set by WHO (2004).
Statistical analysis can be successfully used in the interpretation of environmental data as it highlights the phenomena that lead to the classification of the environmental status of the studying object.

WQI index showed a good water quality (71 < WQI < 90) for all monitoring stations, which is probably affected by low water temperatures and a rainy period of March. The method usedin this study for fresh water quality monitory is a simle, effective and low cost method. The obtained results demonstrate the efficiency of the water quality parameters and the model used for water quality classification.

Integrating Haar Cascade, CNN and SVM for Advanced Facial Recognition

Fayek Maarfi*

Faculty of technology, University Mohamed Boudiaf of M'sila, M'sila, Algeria

fayek.maarfi@univ-msila.dz

Abstract – Facial recognition systems have become integral in various applications, ranging from security and access control to user authentication. This study presents a robust facial recognition system leveraging the combined strengths of Haar Cascade, Convolutional Neural Networks (CNN), and Support Vector Machines (SVM). The system begins with face detection using Haar Cascade, a well-established technique for identifying facial regions in images. Following detection, the detected faces are processed through a CNN, specifically the VGG16 model, for feature extraction. The high-level features extracted by the CNN are then classified using an SVM, which excels in handling high-dimensional data and providing precise classification.

The proposed system undergoes rigorous training and evaluation using a comprehensive dataset of facial images organized by individual directories. The dataset is split into training and testing sets to validate the model's performance. Experimental results demonstrate the efficacy of this approach, with the SVM classifier achieving high accuracy in facial recognition tasks.

In addition to evaluating the system's performance, the study includes a visual inspection of the results through plots of test images, showcasing actual and predicted labels. This highlights the model's ability to accurately identify and verify individuals based on facial features.

The integration of Haar Cascade, CNN, and SVM in this facial recognition system underscores the importance of combining different methodologies to enhance accuracy and reliability. This study contributes to the development of advanced facial recognition technologies, providing a valuable tool for applications requiring precise identification and verification.

Keywords – Face Recognition, Support Vector Machine (SVM), Haar Cascade, Convolutional Neural Network (CNN), Feature extraction

I. INTRODUCTION

Facial recognition technology has become a cornerstone in modern biometric systems, providing a non-intrusive and efficient means of identifying and verifying individuals [1]. The advancement of this technology over the past two decades has been driven by the need for improved security and convenience across various applications such as surveillance, access control, and personal device authentication. Despite significant progress, achieving high accuracy in facial recognition under diverse conditions including variations in lighting, pose, and facial expressions remains a primary challenge [2].

To address these challenges, we propose an advanced facial recognition system that integrates Haar Cascade, Convolutional Neural Networks (CNN) [3][4], and Support Vector Machines (SVM). This hybrid approach leverages the strengths of each method to create a robust and reliable system.

The Haar Cascade classifier, developed by Paul Viola and Michael Jones, is a proven method for rapid and accurate face detection. It uses a cascade of simple classifiers based on Haar-like features, allowing for real-time face detection. Once the face is detected, the system employs a Convolutional Neural Network (CNN) for feature extraction. CNNs are highly effective in learning and representing complex patterns in images, making them ideal for capturing the unique characteristics of a face.

Following feature extraction, a Support Vector Machine (SVM) classifier is utilized for the final classification. SVMs are well-known for their ability to handle high-dimensional data and establish optimal decision boundaries between different classes. By combining Haar Cascade for detection, CNN for feature extraction, and SVM for classification, the proposed system aims to achieve superior accuracy and reliability in facial recognition tasks.

The performance of the proposed system was tested using the Labeled Faces in the Wild (LFW) dataset, which comprises over 1,800 images of celebrity faces collected from the internet, each labeled with the individual's name. The dataset's diversity in lighting, pose, and expressions makes it an ideal benchmark for face recognition systems. Experimental results demonstrate the effectiveness of the integrated approach, showcasing its potential for enhancing security and user interaction in various domains.

This paper will delve into the implementation details, experimental setup, and performance evaluation of the integrated system, highlighting the advantages and potential applications of combining Haar Cascade, CNN, and SVM for advanced facial recognition.

II. Materials and Method

A. Dataset

Images were sourced from celebrity Face image dataset [6]. This dataset contains images of 18 Hollywood celebrities with 100 images of each celebrity. The dataset includes variations in lighting, pose, and facial expressions, providing a comprehensive testbed for evaluating face recognition systems.

Fig 1. Samples from the celebrity faces images in the used datasets

B. Face Detection

The Haar Cascade Classifier was employed for face detection. Haar Cascade is a machine learning object detection method used to identify objects in an image or video. OpenCV's pre-trained Haar Cascade model (haarcascade_frontalface_default.xml) was utilized due to its effectiveness in real-time face detection [5]. The classifier scans the image and identifies regions where a face is likely present, allowing for efficient extraction of facial regions for further processing [7].

C. Feature Extraction

For feature extraction, the VGG16 Convolutional Neural Network (CNN) model was used. VGG16 is a deep learning model pre-trained on the ImageNet dataset. The model's weights are fine-tuned for feature extraction, focusing on the 'fc1' layer to capture deep features from the facial images [8]. This process involves the following steps:

1. *Image Preprocessing:* Each face image is resized to 224x224 pixels and converted to an array suitable for input into the VGG16 model.
2. *Normalization:* Images are normalized using the preprocess input function to ensure consistency with the VGG16 training process.
3. *Feature Extraction:* The VGG16 model processes each image and outputs a feature vector representing high-level features of the face.

D. Classification

A Support Vector Machine (SVM) classifier with a linear kernel was employed for the classification task. SVMs are effective in high-dimensional spaces and are well-suited for face recognition tasks. The extracted feature vectors from the CNN model serve as input to the SVM classifier, which is trained to differentiate between the faces of different individuals [9][10].

E. Training and Evaluation

The dataset was split into training and testing sets, with 80% of the images used for training and 20% for testing. The training process involved the following steps:

1. *Feature Extraction:* Features were extracted from all images in the training set using the VGG16 model.
2. *SVM Training:* The SVM classifier was trained on the extracted features and corresponding labels.
3. *Evaluation:* The trained SVM classifier was evaluated on the testing set. Performance metrics such as accuracy, confusion matrix, and classification report were computed to assess the model's effectiveness.

F. Results Visualization

To visualize the results, the program plots the confusion matrix and sample predictions. The confusion matrix provides a summary of prediction accuracy across different classes, while sample predictions help in understanding the model's performance on individual test images. *Matplotlib* and *Seaborn* libraries were used for plotting.

Implementation Details

The implementation was carried out using Python, with the following libraries:

- *OpenCV:* For image processing and face detection.
- *TensorFlow/Keras:* For utilizing the VGG16 model.
- *Scikit-learn:* For SVM classification, model evaluation, and performance metrics.
- *Matplotlib and Seaborn:* For visualization of results.

The main steps of the implementation are as follows:

1. *Loading Dataset:* Reading and preprocessing images from the dataset.
2. *Face Detection:* Detecting faces using Haar Cascade.
3. *Feature Extraction:* Extracting features using VGG16.
4. *Training SVM:* Training the SVM classifier on extracted features.
5. *Evaluation and Visualization:* Evaluating the model and visualizing results.

III. Results

A. Dataset and Training

The dataset used for this study comprised a diverse set of facial images organized into subdirectories based on the individual's name. The dataset was split into training and testing sets with an 80-20 split. The training set was used to train the Support Vector Machine (SVM) classifier on the features extracted by the VGG16 model

B. Performance Metrics

The performance of the face recognition system was evaluated using several metrics, including accuracy, classification report, and confusion matrix. The following results were obtained:

1. *Accuracy:* The accuracy of the SVM classifier on the testing set was found (100%). This indicates the percentage of correctly classified images out of the total number of test images.
2. *Classification Report:* The classification report provides detailed insights into the precision, recall, and F1-score for each class (individual). The report is summarized as follows:
    - *Precision:* Measures the accuracy of the positive predictions.
    - *Recall:* Measures the ability to find all the positive samples.
    - *F1-score:* The harmonic means of precision and recall.

Table 1. Performance evaluation to f-score on the LFW dataset.

Classification Report:

	precision	recall	f1-score	support
Nicole Kidman	1.00	1.00	1.00	27
Sandra Bullock	1.00	1.00	1.00	23
Tom Hanks	1.00	1.00	1.00	26
Scarlett Johansson	1.00	1.00	1.00	52
Megan Fox	1.00	1.00	1.00	23
Leonardo DiCaprio	1.00	1.00	1.00	22

Accuracy: 100.00%

3. *Confusion Matrix:* The confusion matrix shows the number of correct and incorrect predictions for each individual. It provides a visual representation of the classifier's performance.

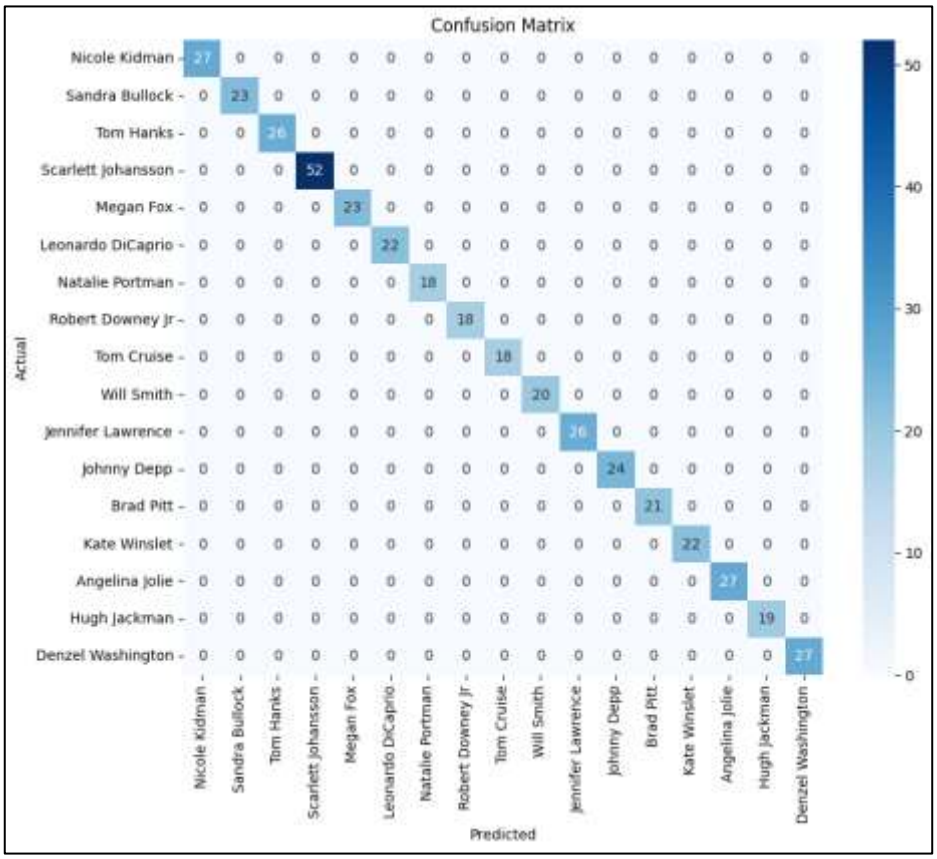

Fig 2. Confusion Matrix for Performance of the Facial Recognition System

4. *Visualizing Results:* To better understand the model's performance, the results were visualized using *Matplotlib* and *Seaborn* libraries. The following visualizations were created:

Fig 3. Samples from tested images alongside their actual and predicted labels

IV. Discussion

The integration of Haar Cascade, Convolutional Neural Networks (CNN), and Support Vector Machines (SVM) in facial recognition system has shown promising results in both accuracy and reliability. This

section delves into the implications of our findings, the strengths and limitations of our approach, and potential future work.

- *Strengths and Implications*

1. *Effective Face Detection:* The use of Haar Cascade for face detection proved efficient, demonstrating real-time performance in locating faces within various image contexts. Its ability to quickly detect faces makes it suitable for applications requiring immediate responses, such as surveillance and security systems.
2. *Robust Feature Extraction:* CNNs, particularly the VGG16 model used for feature extraction, have shown significant strength in capturing intricate details and variations in facial features. This deep learning model effectively handles variations in lighting, pose, and facial expressions, which are critical for accurate face recognition.
3. *High Classification Accuracy:* The SVM classifier, trained on features extracted by the CNN, exhibited high accuracy in distinguishing between different faces. This combination leveraged the high-dimensional feature space provided by CNNs and the effective decision boundaries established by SVMs.

- *Limitations*

1. *Dataset Size and Diversity:* Although our system performed well on the given dataset, the diversity and size of the dataset are crucial factors. A more extensive and varied dataset would provide a better evaluation of the system's generalizability and robustness.
2. *Computational Complexity:* The CNN-SVM approach, while accurate, is computationally intensive. Real-time applications may require optimization strategies or the use of more efficient models to reduce processing time without sacrificing accuracy.
3. *Environmental Variations:* While our system handles common variations in lighting and pose, extreme conditions (such as very low light or severe occlusions) can still pose challenges. Further enhancements in preprocessing steps or additional training on such variations might be necessary.

- *Future Work*

1. *Dataset Expansion:* Future work could involve expanding the dataset to include more diverse and challenging images. This would help in further testing and improving the system's robustness and accuracy.
2. *Model Optimization:* Exploring model optimization techniques, such as pruning or quantization, could make the system more efficient, enabling real-time applications on resource-constrained devices.
3. *Hybrid Approaches:* Combining our current approach with other emerging techniques, such as facial landmark detection or generative adversarial networks (GANs), could further enhance performance, especially under challenging conditions.
4. *Cross-Domain Evaluation:* Testing the system across different domains (e.g., different demographic groups, various environments) would provide a more comprehensive understanding of its strengths and weaknesses, guiding future improvements.

V. CONCLUSION

In this research, we introduced a novel facial recognition system that integrates Haar Cascade for face detection, Convolutional Neural Networks (CNN) for feature extraction, and Support Vector Machines (SVM) for classification. Our approach demonstrated high accuracy and reliability, making significant strides in addressing the challenges associated with facial recognition under diverse conditions.

The results of this study demonstrate the potential of this method for practical applications, and future work will aim to further enhance its performance and broaden its applicability in the field of biometric identification.

Facial Recognition: Employing Histogram of Gradients and Support Vector Machines

Fayek Maarfi*

Faculty of technology, University Mohamed Boudiaf of M'sila, M'sila, Algeria

fayek.maarfi@univ-msila.dz

Abstract – An innovative face recognition system is introduced in this research. It integrates Histogram of Oriented Gradients (HOG) for feature extraction with Haar Cascade Classifier for face detection and Support Vector Machine (SVM) for classification. The system starts off by using Haar Cascade Classifier which is a pre-trained model capable of real-time and effective face detection using HOG post detection to extract important facial features that are structural as well as gradient-based and help differentiate between faces. The SVM classifier is then trained based on these features; SVM is suitable for handling high-dimensional data and establishing optimal decision boundaries among classes. The system's performance was tested on a large dataset consisting of images of celebrities and it has shown high accuracy and reliability in tasks related to recognizing faces. The Haar-like feature selection combined with the Histogram of Oriented Gradients (HOG) ensures precise extraction of characteristics, and a strong identification of the face's location. The SVM classifier is capable of providing high performance in applications, since it is known to be one of the most accurate classifiers. Tests show that this system can work well for finding celebrities as well as verifying their identity, meaning it could be successfully applied in practical tasks related to security, social media or show business.

Keywords – Face Recognition, Histogram of Oriented Gradients (HOG), Haar Cascade Classifier, Support Vector Machine (SVM), Feature Extraction, Face Detection, Image Processing, Machine Learning, Computer Vision.

1. INTRODUCTION

Face recognition technology plays a pivotal role in modern biometric systems, providing a non-intrusive and efficient means of identifying and verifying individuals. This technology has seen significant advancements over the past two decades, driven by the need for improved security and convenience in various applications such as surveillance, access control, and personal device authentication [1].

The primary challenge in face recognition lies in achieving high accuracy under diverse conditions, including variations in lighting, pose, and facial expressions. To address these challenges, we propose a face recognition method that combines histogram of oriented gradients (HOG) for robust feature extraction [2], Haar Cascade classifier for precise face detection, and support vector machine (SVM) for effective classification.

2. MATERIALS AND METHOD

2.1 MATERIALS

2.1.1 HARDWARE

The development and testing of the face recognition system were carried out on the following hardware setup:

- Computer**:** Laptop with Intel Core i7- 8650U processor 1.90 GHz Base Frequency, 8 GB DDR4 RAM, Intel UHD Graphics 620 GPU and 512 GB SSD.

2.1.2 DATASET

Celebrity images were sourced from a labeled Faces in the Wild (LFW) dataset was utilized for training and testing. It comprises over 1,800 images of faces collected from the internet, each labeled with the individual's name. The dataset's diversity in lighting, pose, and expressions makes it an ideal benchmark for face recognition systems.

Fig 1. Samples from the celebrity faces images in the used datasets [3].

2.1.3 SOFTWARE AND LİBRARİES

- Operating System: Windows 11 Pro
- Python: Version 3.8
- OpenCV: Version 4.5.1 for image processing and Haar Cascade face detection
- Scikit-learn: Version 0.24.1 for SVM implementation
- Scikit-image: Version 0.18.1 for HOG feature extraction
- Numpy: Version 1.20.1 for numerical computations
- Matplotlib: Version 3.3.4 for plotting and visualization

2.2 METHOD

The proposed face recognition system comprises three main stages: face detection, feature extraction, and classification.The first step in the recognition process is face detection. We utilize the Haar Cascade Classifier, a machine learning-based approach that employs Haar-like features to detect objects. This classifier is trained on a large dataset of positive and negative images to identify faces accurately. The Haar Cascade algorithm efficiently scans the input image, identifying regions with significant intensity changes that typically correspond to facial features [4] .

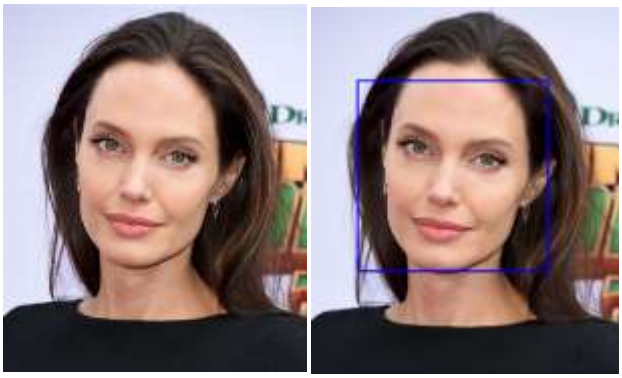

Fig 2.Face detected using Haar Cascade face detection algorithm**.**

Following face detection, the next critical step is feature extraction. We employ the Histogram of Oriented Gradients (HOG) method, which has proven highly effective in capturing the structural and appearance-related characteristics of faces. HOG works by dividing the image into small cells, computing gradient directions for each pixel within the cells, and forming histograms of these gradient orientations. These histograms are concatenated to form a feature vector that robustly represents the face's visual information[5].

Fig 3. Face detected using Histogram of Oriented Gradients (HOG).

The final stage is classification, has been shown in figure 4, where the extracted HOG features are used to train a Support Vector Machine (SVM) classifier. SVM is a powerful supervised learning model that constructs a hyperplane in a high-dimensional space to separate different classes. It is particularly effective for binary classification tasks and can handle high-dimensional data efficiently. In this study, we employ a linear SVM to classify the HOG features of faces, ensuring high accuracy in distinguishing between different individuals [6].

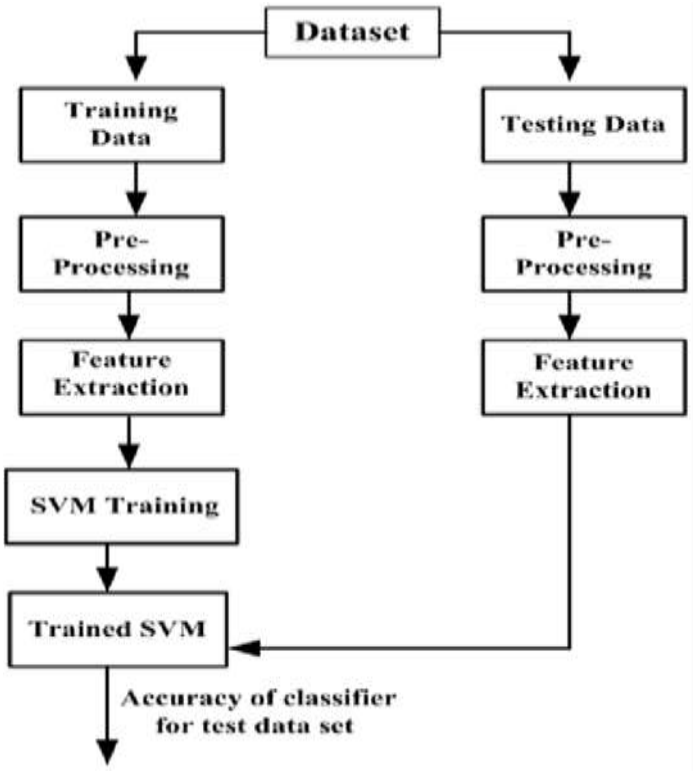

Figure 4. Different stages of SVM classification [7].

2.3 IMPLEMENTATION STEPS

1. Data Preparation: Load the LFW dataset, resize images, and convert them to grayscale.
2. Face Detection: Use Haar Cascade Classifier to detect faces in images.
3. Feature Extraction: Extract HOG features from detected faces.
4. Model Training: Train the SVM classifier with HOG features from the training set.
5. Evaluation: Test the SVM model on a separate set of images and evaluate performance using accuracy, precision, recall, and F1-score metrics.

3. EXPERIMENTAL RESULTS

To evaluate the performance of our proposed face recognition system, we conducted extensive experiments using the Labeled Faces in the Wild (LFW) dataset. This dataset provides a diverse collection of face images, making it an ideal benchmark for testing the robustness and accuracy of face recognition algorithms.

3.1 DATASET

Celebrity images were sourced from a labeled Faces in the Wild dataset. This dataset contains images of 18 Hollywood celebrities with 100 images of each celebrity. The dataset includes variations in lighting, pose, and facial expressions, providing a comprehensive testbed for evaluating face recognition systems.

3.2 PERFORMANCE METRICS

The assessment performance of this face recognition system using metrics such as accuracy, precision, recall, and F1-score. These metrics provide a detailed evaluation of the classifier's effectiveness in identifying and verifying individuals.

3.3 RESULTS AND DISCUSSION

Table1 presents the proposed method achieved an accuracy of 80% on the LFW dataset. The use of HOG features provided a robust representation of facial structures, while the Haar Cascade Classifier ensured

precise face detection. The SVM classifier effectively separated different individuals, demonstrating the system's high classification capability.

Table 1. Performance evaluation to f-score on the LFW dataset.

SVM Classification report with face detection:

	precision	recall	f1-score	support
Nicole Kidman	0.76	0.76	0.76	25
Sandra Bullock	0.68	0.85	0.76	20
Tom Hanks	0.79	0.93	0.85	28
Scarlett Johansson	0.79	0.95	0.86	59
Megan Fox	0.77	0.71	0.74	24
Leonardo DiCaprio	0.88	0.82	0.85	34
Natalie Portman	0.83	0.77	0.80	26

Jennifer Lawrence	0.94	0.61	0.74	28
Johnny Depp	0.69	0.76	0.72	29
Brad Pitt	0.93	0.86	0.89	29
Kate Winslet	0.85	0.57	0.68	30
Angelina Jolie	0.69	0.80	0.74	25
Hugh Jackman	0.96	0.85	0.90	27
Denzel Washington	0.83	0.80	0.82	25
accuracy			0.80	471
macro avg	0.81	0.80	0.80	471
weighted avg	0.82	0.80	0.80	471

4. Conclusion

This paper presents an effective method for face recognition that integrates HOG features, Haar Cascade Classifier, and SVM. The experimental results on the LFW dataset demonstrate that our proposed approach achieves high accuracy and reliability. Future work will focus on optimizing the system for real-time applications and exploring the integration of deep learning techniques to further enhance performance.

Özet **–** Biyopolimerler, son yüzyılda önemli hale gelmiştir. Özellikle petrol türevli termoplastiklerin kullanım yaygınlığı çevresel kaygıları da beraberinde getirmiştir. Bu sebeple araştırmacılar daha çevreci polimerler üzerine araştırmalar yürütmektedir. Biyopolimerler çevre dostu ve sürdürülebilir malzemeler olması sebebiyle son yıllarda ümit vadeden polimerler haline gelmiştir. Biyopolimerler, çevre dostu özelliklere sahip olup doğal kaynaklardan türetilen fonksiyonel malzemelerdir. Bu polimerler genellikle biyolojik materyallerden kimyasal yollarla sentezlenir veya canlı organizmalar tarafından biyosentezlenir. Geliştirilme amaçları arasında çevresel etkileri azaltmak ve fosil yakıtlara olan bağımlılığı düşürmek yer alır.

Biyopolimerler üç ana sınıfa ayrılır: polinükleotidler, polipeptidler ve polisakkaritler. Bu sınıflar, yapı taşlarının türü, aralarındaki bağlar ve konformasyonel ilkeler gibi özelliklere göre incelenir. Biyopolimerler, geniş bir endüstri yelpazesinde kullanılır. Gıda endüstrisinde ambalaj malzemesi olarak, tıbbi alanda ise yara iyileştirici malzemeler, ilaç taşıyıcıları ve biyomedikal hidrojel yapımında kullanılırlar. Çevre dostu ve biyobozunur özellikleri, biyopolimerleri sentetik polimerlere kıyasla daha cazip kılar.

Biyopolimerlerin üretim yöntemleri çeşitlilik gösterir. Bu yöntemler arasında mikrobiyal üretim, organik atıklardan üretim, enzimatik ve metabolik mühendislik, alglerden üretim, çift biyopolimer üretim stratejileri, elektro-kimyasal sistemler ve ışınlama teknikleri bulunur. Bu yöntemler, biyopolimer üretiminde maliyetleri düşürürken çevresel sürdürülebilirliği de artırmaktadır. Bu çalışmada biyopolimerler hakkında genel bilgiler verilerek önemi vurgulanmıştır.

Anahtar Kelimeler – Biyopolimer, çevre dostu, kimyasal sentez, fosil yakıt, biyobozunur

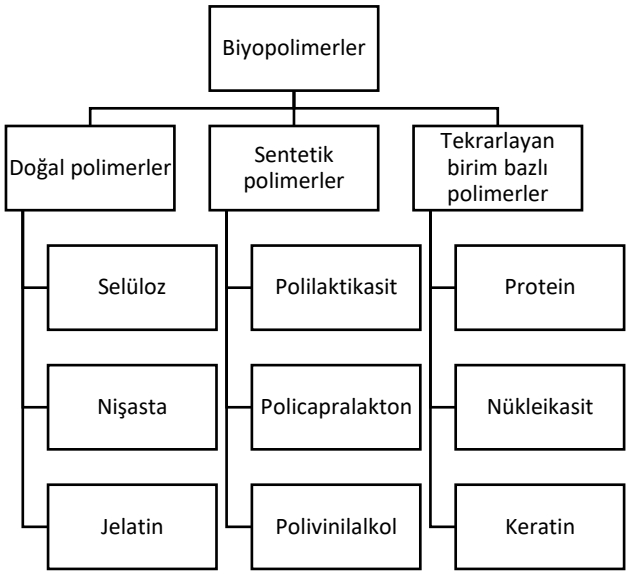
I. GİRİŞ

Biyopolimerler, doğal kaynaklardan üretilen ve yüksek değerli uygulamalar için uygun olan fonksiyonel malzemeler sınıfının önde gelen örneklerindendir. Genellikle biyolojik materyallerden kimyasal olarak sentezlenirler veya tamamen yaşayan organizmalar tarafından biyosentezlenirler (Tablo 1) [1]. Biyopolimerler, çevresel etkileri azaltmak ve fosil yakıtlara olan bağımlılığı azaltmak amacıyla sentetik polimerlerin yerini almak üzere geliştirilmiştir (Şekil 1) [2].

Biyopolimerler genel olarak üç ana sınıfa ayrılır: polinükleotidler, polipeptidler ve polisakkaritler. Bu polimer sınıfları, yapı taşlarının doğası, aralarındaki bağlar, konformasyonel ilkeler ve tekrar eden (sekonder) yapı türleri gibi temel özellikler açısından incelenir [3]. Polinükleotidler, DNA ve RNA gibi genetik materyallerden oluşurken; polipeptidler, proteinlerin temel yapı taşlarıdır. Polisakkaritler ise selüloz, nişasta ve kitin gibi karbonhidratlardan meydana gelir [4].

Biyopolimerler, gıda, tıp ve eczacılık gibi çeşitli endüstrilerde geniş bir kullanım yelpazesine sahiptir. Gıda endüstrisinde biyopolimerler, ambalaj malzemeleri olarak kullanılırken, tıbbi alanda yara iyileştirici malzemeler, ilaç taşıyıcıları ve biyomedikal hidrojel yapımında kullanılırlar [5], [6].

Biyopolimerlerin sürdürülebilirliği ve çevre dostu özellikleri, onları fosil yakıtlara dayalı polimerlere göre daha cazip kılar. Bu özellikleri, biyopolimerlerin yenilenebilir kaynaklardan elde edilebilmesi ve biyobozunur olmaları ile ilişkilidir [7]. Ayrıca, biyopolimerlerin çeşitli kimyasal modifikasyonlar ile işlevselliği artırılabilir ve bu da onları daha geniş uygulama alanları için uygun hale getirir [8].



Şekil 1. Orijinlerine göre biyopolimerlerin sınıflandırılması [1]

Tablo 1. Örnek bir tablo

Biyopolimerler	Avantajları	Dezavantajları	**Referans**
Doğal Biyopolimerler	Biyolojik olarak yenilenebilir, biyolojik olarak parçalanabilir, biyouyumlu, toksik olmayan, biyoyapışkan malzeme, biyofonksiyonel	Daha az kararlı, düşük erime noktası, yüksek yüzey gerilimi, yapısal olarak daha karmaşık.	[9]
Sentetik Biyopolimerler	Biyouyumluluk, daha yüksek tekrarlanabilirlik, daha iyi mekanik ve kimyasal kararlılık	Daha az kararlı, düşük erime noktası, yüksek yüzey gerilimi, yapısal olarak daha karmaşık.	[10]

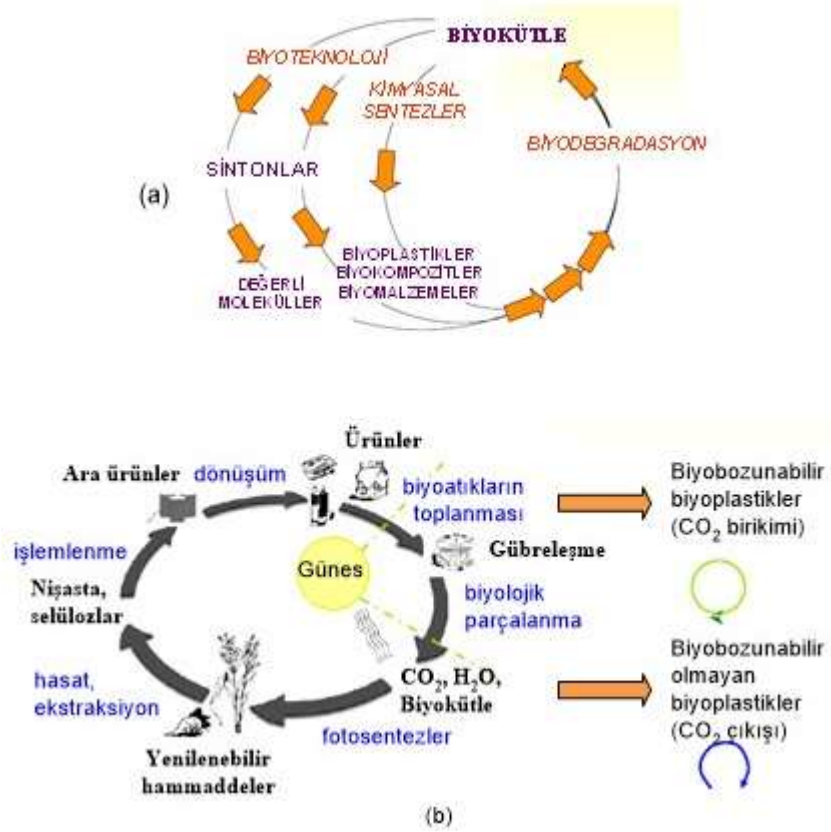
II. BİYOPOLİMERLERİN ÜRETİM YÖNTEMLERİ

Biyopolimerler, doğal kaynaklardan elde edilen ve biyolojik olarak parçalanabilen polimerlerdir. Bu polimerlerin üretim yöntemleri, kimyasal sentezden mikrobiyal fermantasyona kadar çeşitli teknikler içermektedir.

A. Mikrobiyal Üretim

Mikrobiyal üretim, biyopolimerlerin elde edilmesinde yaygın bir yöntemdir. Mikroorganizmalar, polihidroksialkanoatlar (PHA) gibi biyopolimerleri sentezleyerek enerji ve karbon depolama bileşenleri olarak kullanırlar. Bu biyopolimerlerin üretim süreci, genetik mühendislik ve biyoteknolojik yöntemlerle optimize edilebilir [11]. Aynı şekilde, Rhizobium türleri gibi mikroorganizmalar, düşük mannitol konsantrasyonları ve düşük karıştırma ve havalandırma koşulları altında biyopolimer üretebilirler [12].

Biyokütle ve biyoplastikler arasındaki döngü ve biyobazlı plastiklerin yaşam çevrimi Şekil 2'de gösterilmiştir.



Şekil 2. Ürünlerin yaşam çevrimi, (b) biyobazlı plastiklerin yaşam çevrimi [13]

B. *Organik Atıklardan Üretim*

Organik atıklardan biyopolimer üretimi hem çevresel sürdürülebilirliği artırır hem de maliyetleri düşürür. Örneğin, deri ve kürk endüstrisinden gelen organik atıklardan biyopolimer üretimi, teknolojik döngüyü optimize ederek üretim süresini önemli ölçüde kısaltabilir [14].

C. *Enzimatik ve Metabolik Mühendislik*

Enzimatik ve metabolik mühendislik, mikrobiyal biyopolimerlerin üretiminde önemli bir rol oynar. Bu yöntemler, mikroorganizmaların metabolik yollarını değiştirerek yeni ve işlevsel biyopolimerlerin üretilmesini sağlar [15]. Ayrıca, rekombinant cationic biyopolimerlerin üretiminde genetik mühendislik teknikleri kullanılmaktadır [16].

D. *Alglerden Üretim*

Algler, biyopolimer üretiminde önemli bir kaynak olarak görülmektedir. Algler, yüksek büyüme hızı ve atık su içinde yetiştirilebilme avantajları ile dikkat çekerler. Alglerden biyopolimer üretimi, geleneksel solvent ekstraksiyon yöntemlerine kıyasla daha verimli olan mikrodalga destekli ve ultrasonik ekstraksiyon gibi yenilikçi yöntemler kullanılarak gerçekleştirilebilir [17].

E. *Çift Biyopolimer Üretim Stratejileri*

Çift biyopolimer üretim stratejileri, maliyetleri düşürmek amacıyla geliştirilmiştir. Örneğin, Bacillus subtilis kullanılarak hem P(3HB) hem de γ-PGA üretimi, tek bir partiden iki biyopolimerin elde edilmesini sağlar [18].

F. Elektro-kimyasal Sistemler

Biyo-elektro-kimyasal sistemler, biyopolimer üretiminde yenilikçi bir yaklaşımdır. Bu sistemler, atık suyu işleyerek elektrik üretir ve aynı zamanda değerli kimyasallar ve biyopolimerler elde eder (Tablo 2) [19].

Tablo 2. Biyo elektrokimyasal yöntem ile üretilen biyoplastikler

G. Işınlama Teknikleri

Işınlama teknikleri, biyopolimerlerin üretimi ve modifikasyonu için kullanılan bir diğer yöntemdir. Bu yöntem, polimerlerin kimyasal saflığını artırır ve biyolojik işlevselliğini geliştirir [28].

III. KULLANIM ALANLARI GELECEĞİ VE GELİŞİM POTANSİYELİ

Biyopolimerler, çevre dostu ve biyolojik olarak parçalanabilir özellikleri nedeniyle geniş bir uygulama yelpazesine sahiptir. Günümüzde biyomedikal, gıda ambalajı, enerji depolama, su arıtma ve tarım gibi birçok alanda kullanımları artmaktadır. Biyopolimerler, biyouyumluluk ve düşük toksisite özellikleri sayesinde doku mühendisliği, yara iyileşmesi ve ilaç taşıma sistemlerinde yaygın olarak kullanılmaktadır [29]. Polimer kaplamalar, biyomedikal cihazların yüzey özelliklerini iyileştirerek hücre proliferasyonunu ve doku büyümesini teşvik etmektedir [30]. Biyopolimerler, gıda endüstrisinde geleneksel plastiklerin yerine geçerek çevresel etkiyi azaltmakta ve gıda güvenliğini artırmaktadır [31]. Ayrıca, bu polimerler gıda paketleme malzemeleri olarak kullanıldığında antimikrobiyal ve antioksidan özellikler sunmaktadır. Biyopolimerler, lityum ve çinko bazlı bataryalar ile kapasitörlerde sürdürülebilir malzemeler olarak kullanılmaktadır [32]. Bu polimerler, enerji yoğunluğunu artırmak ve toksik metallerin sızıntısını önlemek için kullanılır. Biyopolimerler, su arıtma ve atık su arıtma süreçlerinde koagülant ve flokülant olarak kullanılmaktadır [33]. Bu polimerler, biyobozunur ve çevre dostu olmaları nedeniyle tercih edilmektedir. Biyopolimerler, tarımda gübreler, su tutucu maddeler ve biosensörler olarak kullanılmaktadır [34].

Biyopolimerlerin geleceği, çevresel sürdürülebilirlik ve yenilikçi teknolojilerle birleştiğinde parlak görünmektedir. Mikroalgler ve bakteri kaynaklı biyopolimerler gibi yenilikçi kaynaklar, biyoplastik

üretiminde büyük potansiyele sahiptir [35]. Ayrıca, biyopolimerler için iyonik sıvıların kullanımı, ilaç ve gen taşıma sistemlerinde yeni çözümler sunmaktadır [36].

3D baskı teknolojisi, biyopolimerlerin karmaşık yapılar oluşturmasını sağlayarak tıbbi ve gıda alanlarında kullanım potansiyelini artırmaktadır [37]. Sonuç olarak, biyopolimerlerin geniş kullanım alanları ve çevre dostu özellikleri, gelecekte daha fazla araştırma ve uygulama alanı bulacaklarını göstermektedir.

IV. SONUÇ VE ÖNERİLER

Biyopolimerler, doğal kaynaklardan türetilen ve çevre dostu özellikleriyle öne çıkan fonksiyonel malzemelerdir. Sentetik polimerlere sürdürülebilir bir alternatif sunan biyopolimerler, kimyasal sentez, mikrobiyal fermantasyon, enzimatik ve metabolik mühendislik gibi çeşitli yöntemlerle üretilebilir. Biyopolimerlerin üretim yöntemleri, çevresel sürdürülebilirlik ve ekonomik verimlilik açısından önemli avantajlar sunmaktadır. Özellikle organik atıklardan üretim ve mikroalgler gibi yenilikçi kaynakların kullanımı, bu polimerlerin üretiminde maliyetleri düşürmekte ve çevresel etkileri azaltmaktadır.

Biyopolimerlerin geniş kullanım alanları, onların fonksiyonel ve sürdürülebilir özellikleriyle doğrudan ilişkilidir. Tıp ve eczacılık alanında biyopolimerler, biyouyumluluk ve düşük toksisite özellikleri sayesinde yara iyileşmesi, ilaç taşıma sistemleri ve doku mühendisliği gibi uygulamalarda yaygın olarak kullanılmaktadır. Bu alandaki araştırmalar, biyopolimerlerin biyomedikal cihazlar için yüzey kaplaması olarak kullanılabileceğini ve hücre proliferasyonunu teşvik edebileceğini göstermektedir. Gıda endüstrisinde ise biyopolimerler, geleneksel plastiklerin yerine geçerek ambalaj malzemesi olarak kullanıldığında antimikrobiyal ve antioksidan özellikler sunmaktadır. Bu da gıda güvenliğini artırmakta ve çevresel etkileri azaltmaktadır.

Enerji depolama ve su arıtma gibi alanlarda da biyopolimerlerin kullanımı giderek artmaktadır. Lityum ve çinko bazlı bataryalarda biyopolimerler, enerji yoğunluğunu artırmak ve toksik metallerin sızıntısını önlemek için kullanılmaktadır. Su arıtma süreçlerinde ise biyopolimerler, koagülant ve flokülant olarak görev alarak çevre dostu ve biyobozunur çözümler sunmaktadır. Tarımda biyopolimerler, gübreler, su tutucu maddeler ve biosensörler olarak kullanılarak bitki büyümesini ve verimliliği artırmaktadır.

Biyopolimerlerin geleceği, yenilikçi teknolojiler ve sürdürülebilirlik hedefleri doğrultusunda parlak görünmektedir. 3D baskı teknolojisi, biyopolimerlerin karmaşık yapılar oluşturmasını sağlayarak tıbbi ve gıda alanlarında kullanım potansiyelini artırmaktadır. Mikroalgler ve bakteri kaynaklı biyopolimerler gibi yenilikçi kaynaklar, biyoplastik üretiminde büyük potansiyele sahiptir. Ayrıca, biyopolimerlerin kimyasal modifikasyonları ve iyonik sıvıların kullanımı, ilaç ve gen taşıma sistemlerinde yeni çözümler sunmaktadır.

Sonuç olarak, biyopolimerler çevresel sürdürülebilirlik, ekonomik verimlilik ve geniş uygulama alanları açısından büyük bir potansiyele sahiptir. Bu nedenle, biyopolimerler üzerine yapılan araştırmaların ve geliştirilen teknolojilerin artarak devam etmesi, daha çevre dostu ve sürdürülebilir bir geleceğe katkıda bulunacaktır. Biyopolimerlerin kullanımının yaygınlaşması, fosil yakıtlara bağımlılığı azaltarak çevresel etkileri minimize edecek ve yenilikçi çözümler sunacaktır. Biyopolimerlerin gelecekte daha fazla araştırma ve uygulama alanı bulacağına şüphe yoktur, bu da onların sürdürülebilir kalkınma ve çevre koruma hedeflerine katkı sağlayacağını göstermektedir.

TEŞEKKÜR

Kütüphane araştırma imkanlarını sunan Mudurnu Süreyya Astarcı Meslek Yüksekokulu çalışanlarına teşekkür ederiz.

[*]*(senarozcan@gmail.com)*

Özet **–** Nüfus artışına bağlı olarak gerekli gıda ihtiyacını karşılamak için her yıl tarımsal verimliliği artırmak için pestisit kullanımı da artmaktadır. Bitki ve ürünleri korumak için yirmi bin pestisit ve karışımlarından oluşan ticari ürün mevcuttur. Düşük dozlarda dahi uzun süre pestisitlere maruz kalmak olumsuz sağlık etkilerine neden olabilir. Kısa sürede mide bulantısı ve baş ağırsı gibi etkileri bulunan pestisitler kronik maruziyet durumunda nörotoksisite, sitogenetik hasar, kısırlık, endokrin bozulması ve kanser oluşumuna neden olabilir. Gıdalardaki pestisit kalıntılarının insan sağlığı açısından kabul edilemez bir risk oluşturmamasını sağlamak için pestisitlerin kullanımı sıkı bir şekilde düzenlenmektedir. Ülkemizde de Türk Gıda Kodeksi Pestisitlerin Maksimum Kalıntı Limitleri Yönetmeliği kapsamında belirli gıdalarda yasal olarak izin verilen maksimum pestisit kalıntısı konsantrasyonları belirlenmiştir. Ülkemizde meyve ve sebzelerde pestisit kalıntıları üzerine birçok araştırma gerçekleştirilmiştir. Ancak özellikle çocukların sıklıkla tükettiği meyve sularında pestisit kalıntıları ve sağlık riski üzerine sınırlı sayıda araştırma vardır. Meyve yetiştiriciliğinde verim ve ürün kalitesini artırmak için yaygın olarak kullanılan pestisitler doğal yollarla parçalanmaz ise meyve posası ve meyve suyunda kalmaktadır. İçecek sektöründe sıklıkla tüketilen meyve suları özellikle çocuklar tarafından daha çok tüketilmektedir. Meyve suyunda bulunan pestisitler yetişkinler ve özellikle çocuklar için potansiyel sağlık riski sergilemektedir. Çalışma kapsamında piyasada satışa sunulan farklı markalara ait karışık meyve suyu örneklerinde 325 pestisitin kalıntısı araştırılmıştır. Tespit edilen pestisit kalıntı değerleri Türk Gıda Kodeksi Pestisitlerin Maksimum Kalıntı Limitleri Yönetmeliği göre değerlendirilmiştir. Tespit edilen pestisitlerin yetişkin ve çocuk için sağlık risk değerlendirmesi gerçekleştirilmiştir. Karışık meyve suyu örnekleri QuEChERS (Quick, Easy, Cheap, Effective, Rugged, and Safe) metoduna göre ekstrakte edildikten sonra LC-MS/MS ve GC-MS/MS cihazları ile pestisit okumaları gerçekleştirilmiştir. Analizleri gerçekleştirilen meyve sularında insektisit ve fungisit grubunda beş farklı pestisit türü tespit edilmiştir. Tespit edilen pestisitler yetişkinler için akut ve kronik sağlık riski oluşturmazken, chlorpyrifos pestisitinin çocuklar için akut ve kronik sağlık riski sergilediği tespit edilmiştir.

Anahtar Kelimeler – Pestisit, meyve suyu, gıda, insan sağlığı, sağlık riski.

I. GİRİŞ

Pestisit meyve ve sebzeleri yetiştirirken bakteri, virüs ve haşerelerin zararlı etkilerinden korumak amacıyla kullanılan kimyasal maddelerdir. Pestisitler yetiştirilen ürünlerin zararlılar ve bitki hastalıklarından korunması, ürün kalite ve miktarının artırılması amacıyla modern tarım uygulamalarında yaygın olarak kullanılmaktadır. Pestisitler kullanıldıkları alana göre gruplandırılabilir. Böcek ve haşerelere karşı kullanılanları insektisit, istenmeyen ot ve bitkilere karşı kullanılanları herbisit, kemirgenlere karşı kullanılanları redontisit, bakterilere karşı kullanılanları ise bakterisit olarak isimlendirilir. Pestisitler tarım ürünleri ve gıdalarda yanlış uygulamalar neticesinde kalıntı olarak kalabilir ki bu durum istenilmeyen insan sağlığı ve çevre kirliliği problemlerine neden olabilir. Pestisitlere maruz kalmanın sağlık riskleri arasında akut zehirlenmeler, mide bulantısı, baş ağrısı, alerjik reaksiyonlar,

kronik maruziyetlerde ise nörotoksisiteye, sitogenetik hasara, kısırlığa, endokrin bozulmasına ve kanser oluşumuna neden olabilir. Pestisitlerin uygulamaları esnasında toprak, hava ve su kirliliği problemlerine neden olabilir. Ayrıca pestisitler doğal yaşam alanlarının kirlenmesi ve bazı canlı türlerinin yok olmasına neden olarak biyoçeşitliliğin azalmasına neden olabilir [1], [2].

Gıda da pestisit kalıntıları, risk değerlendirmesi açısından yüksek öncelikli gıda kaynaklı tehlikeler olarak tanımlanmaktadır. Bu amaçla gıdalarda kalıntı pestisitler mevzuata uygunluk açısından izleme çalışmaları gerçekleştirilmektedir. Kanserojen olmayan etkiler için maruziyet toksikolojik referans değerlere göre değerlendirilir. Akut toksisite akut referans doza (ARfD), kronik toksisite ise kabul edilebilir günlük alım miktarına (ADI) göre değerlendirilir. Birden fazla kimyasala maruz kalma kümülatif toksisiteye neden olabilir [3]. Gıdalardaki pestisit kalıntılarının insan sağlığı açısından kabul edilemez bir risk oluşturmamasını sağlamak için pestisitlerin kullanımı sıkı bir şekilde düzenlenmektedir. Pestisit ürünlerinin piyasaya sürülmesi için ruhsatlı olması ve aktif maddelerin sağlık ve çevresel risk değerlendirmelerini de içeren yoğun bir değerlendirme yoluyla onaylanması gereklidir. Bu amaçla Avrupa Komisyonu (EC), 1107/2009 sayılı yönetmeliği kabul etmiş olup, belirli gıdalarda yasal olarak izin verilen pestisit kalıntılarının maksimum konsantrasyonları (MRL) 396/2005 sayılı Yönetmelik kapsamında belirlenmiştir [1], [4]. Ülkemizde bitkisel ve hayvansal ürünler ile bu ürünlerden elde edilen ürünlerde pestisit kalıntılarının maksimum limitlerine ilişkin usul ve esaslar ise Türk Gıda Kodeksi (TGK) Pestisitlerin Maksimum Kalıntı Yönetmeliği 25 Kasım 2016 yılında yayınlanarak yürürlüğe girmiştir [5].

Ülkemizde pestisit kullanım miktarları ile ilgili gerçekleştirilen derleme çalışmasında 2020 yılına ait TÜİK pestisit kullanım verileri kullanılarak değerlendirmelerde bulunulmuştur. 2020 yılı TÜİK verilerine göre ülkemizde 53000 ton pestisit kullanılmaktadır. Bunun yaklaşık %38'i fungisit, %25'i herbisit, %23'ü insektisit, %4'ü akarisit, kalanı ise diğer pestisitlerdir. Ülkemizde en çok pestisit kullanımının Akdeniz Bölgesinde ve Antalya ilinde en az ise Karadeniz Bölgesinde Ardahan ilinde gerçekleştiği tespit edilmiştir. En çok kullanılan pestisit grubunun ise fungisit, herbisit ve insektisit grubu pestisitler oluşturmuştur. Konya'da en yoğun pestisit kullanılan ilk on il arasında yer alıp, Konya ilinde ise en yoğun kullanılan pestisit grubunun herbisitler %42.3) olduğu bunun sebebinin ise yoğun hububat üretimi olduğu düşünülmektedir. Sebze ve meyve üretiminin yoğun gerçekleştiği Antalya, Manisa, Mersin, Aydın, Malatya ve Çanakkale illerinde ise en yüksek pestisit kullanımı fungisit grubunda görülmektedir [6].

Tözün ve Akar [7] tarafından 2010 yılı sonrasında ülkemizdeki gıda numunelerinde tespit edilen pestisit kalıntıları ile ilgili çalışmalar derlenmiştir. Toplamda 35 çalışma gerçekleştirildiği, 16 çalışmada pestisit kalıntısı tespit edildiği ve tespit edilen değerlerin TGK Pestisitlerin Maksimum Kalıntı Yönetmeliği'nde belirtilen MRL değerini aştığı; 10 çalışmada pestisit kalıntısı bulunduğu ancak MRL değerlerinin aşılmadığı tespit edilmiştir. Çalışmada üzüm, çilek, turunçgiller ve sık tüketilen bazı sebzelerde pestisit kalıntısı fazlaca çalışılmıştır ve pestisit kalıntısına rastlanmıştır. Şeftaliden elde edilen meyve sularında bazı organik fosforlu pestisitlerin araştırıldığı çalışmada deterjanla meyvelerin kısa ve uzun süre yıkama işleminin kalıntı azalması sağladığı, haşlama işleminin ise %22-90 arasında kalıntı azaltımı sağladığı, gushation, malathion, malaoxon, dipterex pestisitlerinin içtiğimiz meyve sularında tolerans değerlerinin altındaki miktarlarda tespit edildiği rapor edilmiştir [8]. Ege Bölgesinde yetiştirilen çilek, kiraz, şeftali, üzüm meyvelerinde en az bir pestisit tespit edilmiştir [9]. Konya'da market ve pazarlardan toplanan üzüm, çilek, elma, armut, ayva, portakal, mandarin, altın top, muz, kivi, incir, nar, altın çilek, pepino, pasifulora meyvelerinde pestisit kalıntısı araştırılmış ve kullanımı yasak olan chlopyrifos'un portakal, mandarin, altın topun birer örneklerinde tespit edilmiştir. Aynı altın top örneğinde kullanımı yasaklanmış diazinon, pyrimippos ethylin'in tespit edildiği, mandarin örneklerinden birinde kullanımı yasak olan chlorpyriphose, diazinon ve primiphos ethyl'in olduğu tespit edilmiştir. Muz örneklerinin üç tanesinde kullanımı yasaklanmış thiabendazol'ün olduğu tespit edilmiştir. Elma, armut ve ayva örneklerinde kullanımı yasak olan thiabendazol, chlorpyrifos, amitraz kalıntısı tespit edilmiştir. Yaş üzüm örneklerinde ülkemizde kullanımı yasak olan acetamiprid, çilek örneklerinde chlorpyrifos, kirazda monocrotophos, şeftalide chlorpyrifos kalıntısı tespit edilmiştir [10], [11], [12] – [13].

Gıdalarda pestisit kalıntısının sağlık riski oluşturması sebebiyle Sırbistan'da satışa sunulan 139 meyve suyu örneğinde araştırılan 69 pestisit türünden 19 aktif madde tespit edilmiştir. Carbendazim, acetamiprid ve pyrimethanil pestisitleri sıklıkla tespit edilmiştir. Numunelerin yaklaşık %3'ünde onaylanmamış pestisit kalıntısı tespit edilirken, izin verilen maksimum limit değerine uymayan numune yüzdesi yaklaşık %2'dir. Meyve suyunda kanserojenik pestisitlerden kaynaklanan yaşam boyu kanser riski tahmini yılda toplam 0.0.13 ek kanser vakasına karşılık gelmektedir [14].

Ülkemiz önemli miktarda meyve ve sebze üretiminin yapıldığı bir tarım bölgesidir. TÜİK verilerine göre 2023 yılında Türkiye yaş meyve üretiminde 24 milyon ton ile dünyada meyve üretiminde dördüncü sırada yer almıştır. Üzüm, muz, incir, kivi, avakado, portakal, mandalina, limon, turunçgil, armut, erik, kiraz, çilek, nar bu üretimde önemli miktarda yer almaktadır [15]. Ülkemizde elma, kayısı, vişne, kayısı/şeftali, narenciye, üzüm, nar ve havuç meyvelerinden meyve suyu üretilmektedir. Bunlar %100 meyve suyu, meyve nektarı, meyveli ve aromalı içecekler olarak satışa sunulmaktadır. 2010 yılı verilerine göre kişi başına ülkemizde meyve suyu ve benzeri ürün tüketimi 12 litre civarında olup bunun yaklaşık 9 litresini %100 meyve suyu ve nektarı oluşturmaktadır [16]. Özellikle çocukların meyve suyu tüketim oranının yetişkinlere göre daha yüksek olduğu tahmin edilmektedir. Bu çalışmanın amacı ülkemizde marketlerde karışık meyve suyu adı altında satışa sunulan meyve sularında farklı pestisit türlerinin kalıntı düzeyini araştırmak, tespit edilen miktarlar için TGK Pestisitlerin Maksimum Kalıntı Yönetmeliği'ne göre değerlendirmelerde bulunmak ve elde edilen sonuçların yetişkin ve çocuk için risk değerlendirmesini gerçekleştirmektir.

II. MATERYAL VE YÖNTEM

A. Meyve Suyu Örneklerinin Temini

Ülkemizde meyve suyu üretimi TGK Meyve Suyu ve Benzeri ürünler Tebliği'ne göre üretilmektedir [17]. Tebliğ kapsamında yer alan ürünlerdeki pestisit kalıntıları miktarları ile ilgili TGK Pestisitlerin Maksimum Kalıntı Limitleri Yönetmeliğinde yer alan hükümlere uygun olmalıdır şartı vardır. Çalışmada incelenmek üzere marketlerden karışık meyve suyu olarak satışa sunulan 13 farklı meyve suyu örneği temin edilmiştir.

B. Pestisit Kalıntı Analizi

Meyve sularının ekstraksiyonu QuEChERS (Quick, Easy, Cheap, Effective, Rugged, and Safe) metoduna göre gerçekleştirilmiştir. QuEChERS metodu çoklu kalıntı pestisit analizi için kullanılan bir numune hazırlama tekniğidir. Numunede doğal olarak bulunan pigment, yağ ve diğer istenmeyen maddelerin numune matriksinden uzaklaştırılması ve pestisitler için daha düşük dedeksiyon limitlerine ulaşılmasını sağlar. Meyve suyu örneklerinden 5 g alınarak 7.5 g su ile homejen hale getirildikten 15 mL %1 asetik asit ihtiva eden asetonitril ilave edilerek ve 1 dk süresince kuvvetlice çalkalanmıştır. Böylece numunenin asetonitril içinde %1 asetik asit içeren bir çözücü ile çekilmesi sağlanmıştır. Karışım üzerine 6 g magnezyum sülfat ve 1,5 g sodyum asetat ilave edilerek, 1 dk süresince çalkalanmıştır ve 4000 rpm'de 5 dk santrifüjlenmiştir. Daha sonra, örneklerin üst fazından 4'er ml alınarak, magnezyum sülfat ve sodyum asetat eklenmesi ile oluşturulan sıvı-sıvı partisyon ile temizleme işlemi gerçekleştirilmiştir. Bunun için alınan kısım 15 ml'lik falkon tüplerine aktarılarak, üzerine 0.6 g magnezyum sülfat, 0,2 g primer sekonder amin ilave edilerek 1 dk süresince kuvvetlice çalkalama işlemi sonrasında 4000 rpm'de 5 dk santrifüjlenmiştir. Daha sonra üst faz viallere aktarılarak 325 pestisit kalıntısı için LC-MS/MS ve GC-MS/MS cihazları ile pestisit okumaları gerçekleştirilmiştir [18].

C. Risk Değerlendirmesi

Meyve sularında buluna pestisit kalıntılarının potansiyel tehlikenin belirlenmesi amacıyla risk değerlendirmesi gerçekleştirilmiştir. Bu amaçla tespit edilen pestisit kalıntıları için uzun süreli/kronik tüketici sağlık riski (Hazard Quotient, HQ) ve kısa süreli/akut tüketici sağlık riski (aHI) değerleri hesaplanmıştır. HQ değeri tahmini günlük alım (estimated daily intake, EDI) ve kabul edilebilir günlük alım (acceptable daily intake, ADI) kullanılarak hesaplanmıştır. EDI değeri ise günlük meyve suyu

tüketim miktarı, pestisit kalıntı miktarı ve tüketici ortalama vücut ağırlığı kullanılarak hesaplanmıştır [18].

EDI = (Pestisit kalıntı seviyesi x Meyve suyu tüketim miktarı) / (Tüketici vücut ağırlığı)
HQ = (EDI / ADI) x 100

aHI tahmini kısa vadeli alım (estimated short term intake, ESTI) ve akut referans doz (ARfD) değerleri kullanılarak bulunuştur. ESTI değeri ise günlük meyve suyu tüketim miktarı, pestisit kalıntı miktarı ve tüketici ortalama vücut ağırlığı kullanılarak hesaplanmıştır [18].

ESTI = (Pestisit kalıntı seviyesi x Meyve suyu tüketim miktarı) / (Tüketici vücut ağırlığı)
aHI = (ESTI / ARfD) x 100

Tespit edilen pestisitler için ARfD ve ADI değerleri Tablo 1'de verilmiştir.

Tablo 1. Pestisitler için ARfD ve ADI değerleri

Pestisit ismi	**ARfD**	**ADI**
Cypermethrin	0.04	0.02
Carbendazim	0.02	0.02
Chlorpyrifos	0.005	0.001
Imidacloprid	0.4	0.06
Pyriproxyfen	0.04	0.1

Hesaplamalarda ortalama yetişkin ağırlığı 73 kg, çocuk ağırlığı ise 32.7 kg alınmıştır. Günlük meyve suyu tüketim miktarı ise 0.345 kg alınmıştır [18].

Kanserojen olmayan risk (target hazardous quotient, THQ) EDI ve ADI değerlerinin oranıyla hesaplanmaktadır. THQ'nun toplamı toplam pestisit kirliliğinin karışımı tehlike indeksi (hazard indeks, HI) olarak tanımlanmaktadır.

THQ = EDI / ADI

$$HI = \sum_{k=1}^{i} THQ_n$$

THQ ve HI değerlerinin 1'den büyük olması riskin kabul edilemez olduğu göstermektedir.

III. BULGULAR

Tablo 2'de karışık meyve suyu örneklerinde tespit edilen pestisitlerin kalıntı miktarları, pestisit ismi ve türü verilmiştir. 7 numunede pestisit kalıntısı tespit edilmez iken 6 numune de ise insektisit ve fungisit sınıfında 5 farklı türde pestisit tespit edilmiştir. Tespit edilen pestisitler ile ilgili TGK Pestisitlerin Maksimum Kalıntı Limitleri Yönetmeliğinde MRL değeri bulunmamaktadır. Tespit edilen Cypermethrin değerleri 0,010±0,005 mg/kg ile 0,013±0,007 mg/kg aralığında tespit edilirken, Chlorpyrifos 0,010±0,005 mg/kg, Imidacloprid 0,043±0,022 mg/kg, Pyriproxyfen 0,010±0,005 mg/kg, Carbendazim 0,017±0,009 mg/kg olarak tespit edilmiştir. 10 nolu meyve suyu örneğinde tespit edilen toplam pestisit miktarı 0.0.93 mg/kg'dır [18].

Cypermethrin, Chlorpyrifos, Imidacloprid, Pyriproxyfen pestisitleri insektisit iken Carbendazim ise fungisit sınıfındadır. Cypermethrin tüm numunelerde tespit edilmiştir. Cypermethrin piretroid insektisit sınıfında bir insektisit olup böcek ve haşereleri öldürmek veya kontrol etmek amacıyla kullanılmaktadır. Ayrıca veterinerlik alanında da kullanımı vardır. Tarım ilaçlarında farklı konsantrasyonlarda etken madde olarak kullanılmaktadır.

Tablo 2. Karışık meyve sularında tespit edilen pestisit miktarları, pestisit ismi ve pestisit türü

Numune ismi	Kalıntı miktarı (mg/kg)	Pestisit ismi	Pestisit türü
Meyve suyu 1	0,010±0,005	Cypermethrin	İnsektisit
Meyve suyu 2	-	-	-
Meyve suyu 3	0,010±0,005	Cypermethrin	İnsektisit
Meyve suyu 4	-	-	-
Meyve suyu 5	-	-	-
Meyve suyu 6	0,011±0,006	Cypermethrin	İnsektisit
Meyve suyu 7	0,010±0,005	Cypermethrin	İnsektisit
Meyve suyu 8	-	-	-
Meyve suyu 9	-	-	-
Meyve suyu 10	0,017±0,009 0,010±0,005 0,013±0,007 0,043±0,022 0,010±0,005	Carbendazim Chlorpyrifos Cypermethrin Imidacloprid Pyriproxyfen	Fungisit İnsektisit İnsektisit İnsektisit İnsektisit
Meyve suyu 11	-	-	-
Meyve suyu 12	0,010±0,005	Cypermethrin	İnsektisit
Meyve suyu 13	-	-	-

- Dedeksiyon limitinin altında

Chlorpyrifos tarım ilaçlarında etken madde olarak kullanılan bir insektisit türü olup yaygın kullanılmaktadır. Avrupa Birliği tarafından ihraç edilen yaş ve kuru üzümlerde sağlık riski içerdiği için kalıntı limiti 50 kat daha düşürülmüştür. Imidacloprid haşerenin sinir sistemine zarar veren nitrometilen bazlı bir insektisit olup, bahçelerde ve hayvanlarda zararlıların kontrolünde kullanılmaktadır. Pyriproxyfen özellikle sivrisinek larvalarının kontrolünde kullanılan geniş spektrumlu bir insektisittir. Carbendazim pekçok bitki hastalığını kontrol için özellikle de külleme, yaprak lekeleri gibi mantar hastalıkları ile mücadelede kullanılan bir fungisittir. Meyve, sebze ve hububat üretiminde yaygın kullanılır. Hayvancılıkta bazı enfeksiyonların tedavisinde de kullanılmaktadır.

Tablo 3'de risk hesaplamaları sonucunda çocuk ve yetişkin için tespit edilen ESTI, EDI, aHI, HQ ve THQ değerleri verilmiştir. Tablo 3 incelendiğinde yetişkin için aHI ve HQ değerlerinin 1'den küçük çıktığı ve akut ve kronik risk içermediği görülmektedir. Çocuk için yapılan hesaplamalarda ise Chlorpyrifos pestisit için aHI değerinin 2.1101 HQ değerinin ise 1.0550 olduğu görülmektedir. Bu durumda tüketilen meyve sularında bulunan bu pestisitin çocuklar için hem akut hem de kronik risk sergilediği görülmektedir [18].

Tablo 3. Karışık meyve sularında çocuk ve yetişkin için risk değerlendirme sonuçları

Pestisit türü	Çocuk					Yetişkin				
	ESTI	EDI	aHI	HQ	THQ	ESTI	EDI	aHI	HQ	THQ
Cypermethrin	1,37E-04	6,75E-05	0,3429	0,3376	0,0034	6,14E-05	3,03E-05	0,1536	0,1512	0,0015

IV. TARTIŞMA VE SONUÇLAR

Ülkemizde ve uluslararası alanda gerçekleştirilen birçok çalışmada meyvelerde pestisit kalıntıları tespit edilmiştir. Ayrıca sınırlı sayıda gerçekleştirilen araştırmada da meyve suyunda pestisit kalıntıları tespit edilmiştir. Güney Kore'de üretilen taze omija meyveleri ve omija sularında 33 farklı pestisit kalıntı analizi yapılmış ve EDI ve ADI değerleri hesaplanarak pestisitlerin risk değerlendirmesi gerçekleştirilmiştir. Ethoprophos, pendimethalin ve hexaconazole pestisitleri sıklıkla tespit edilmiş olup tespit edilen miktarların insan sağlığına zarar vermediği sonucuna varılmıştır. Bu çalışmada taranan pestisit sayısı bizim çalışmamıza göre düşük olup ayrıca çocuklar için risk değerlendirmesi sonuçları

yetişkinlere göre daha hassas olduklarından daha yüksek çıkabilir [19]. Berrak ve bulanık elma suyu üretimi ve depolama sırasında carbendazim, thiamethoxam, imidacloprid, acetamiprid, prochloraz ve difenoconazole pestisitlerinin kalıntı davranışları değerlendirilmiştir. Bulanık ve berrak elma meyve suyu üretiminde farklı proseslerin farklı etkilere sahip olduğu tespit edilmiştir. Yıkama ve presleme işlemlerinin pestisit kalıntısını %36 ile %89 arasında azalttığı tespit edilmiştir. Berrak meyve suyu üretiminde enzim, pastörizasyon, süzme işlemleri de kısmen pestisit kalıntısını azaltmıştır [20].

Konya da pazarlar ve marketlerden toplanan domates, biber, patlıcan örneklerinde 203 adet pestisit kalıntı düzeyinin belirlenmesine yönelik yapılan çalışmada patlıcan ve domates örneklerinde yasaklanmış oxamyl, 3 farklı patlıcan örneğinde inidiacloprid, biber örneğinde üç farklı pestisit türünün bulunduğu, 120 ug/kg benomyl-carbendazim'in TGK'nın tolerans değeri olan 100 ug/kg değerinin üzerinde olduğu tespit edilmiştir [21]. Konya bölgesinde yetiştirilen buğdaylarda klorlu ve fosforlu pestisit bulaşmış buğdaylarda tüketimin neden olduğu sağlık riski değerlendirilmiş, buğday örneklerinde yasaklanmış pestisitler tespit edilmiş ve buğday tüketimi nedeniyle akut ve kronik insan sağlığını etkileyici risk bulunduğu görülmüştür [22]. Konya bölgesindeki ticari sütlerde bulunan organoklorlu pestisit kalıntılarının incelendiği araştırmada 24 örneğin hemen hepsinde dieldrin, BHC bileşikleri, endosülfan bileşikleri, DDT bileşikleri ve aldrin olduğu tespit edilmiştir [23]. Konya da market ve pazarlardan toplanan kuruyemiş örneklerinde 227 adet pestisitin kalıntı düzeyleri araştırılmıştır. 162 numunenin 47'sinde en az 1 adet pestisit kalıntısına rastlanılmıştır. Pestisitlerin %25'inin yetişkinler için hem akut hem de kronik risk oluşturduğu görülmüştür. %35'inin çocuklar için hem akut hem de kronik risk oluşturduğu belirtilmiştir [24].

Tüm araştırma sonuçları gösteriyor ki biz pek çok gıda ile pestisit kalıntısını vücudumuza almaktayız. Bu nedenle sadece bir gıdada alınan miktar üzerinden yapılan değerlendirmeler yetersizdir. Tüm tüketilen gıdalar ile alınan pestisit kalıntısının kümülatifi üzerinden risk değerlendirilmesi yapıldığında daha pestisitlere karşı daha yüksek risk altında olduğumuz söylenebilir. Ülkemizde geçerli olan mevzuat kapsamında bazı meyve ve meyve suları ile ilgili TGK Pestisitlerin Maksimum Kalıntı Limitleri Yönetmeliğinde limit değerler tanımlanmıştır. Ancak günümüzde özellikle çocuklar tarafından sıklıkla tüketin karışık meyve suyu ile ilgili de yasal düzenlemelerin yapılması uygun olacaktır.

Mathematical Modeling and Thin-Layer Drying Characteristics of Pre-Treated Breadfruit (*Artocarpus Altilis*) Chips

Waliu A. Adebayo*, Kehinde A. Taiwo and Onome Okeremeta

Dept. of Food Science & Technology, Obafemi Awolowo University, Ile Ife, Nigeria.

Email of the corresponding author: adebayow@oauife.edu.ng/adebayoadewale@ymail.com

Abstract – Drying operations reduce moisture content of food materials for avoidance of microbial growth and deterioration, for shelf life elongation, to minimize packaging and improving storage for easy transportation. Researches have shown that sole reliance on experimental drying practices without mathematical considerations for the drying kinetics, can significantly affect the efficiency of dryers, increase the cost of production, and reduce the quality of the dried product. The understanding of drying characteristics of food materials is very important for processing and adding value, and a thin layer drying study is a proven method for achieving this. In this study, changes in moisture content, moisture ratio, drying rate, effective diffusivity and shrinkage of pretreated breadfruit chips were investigated at three drying temperatures: 50, 60 and 70 °C following standard procedures. Five thin layer drying models suitable for predicting drying equation of high carbohydrate foods were selected for the study. Non-linear regression was used to establish the coefficient of determination (R^2), sum of square error (SSE) and root mean square error (RMSE) for each model to determine the model of the best fit. The logarithmic model was best suited in predicting the drying behaviour of pretreated breadfruit chips. The effective diffusivity and activation energy of pretreated breadfruit chips ranged from 0.106 x 10^{-6} to 9.910 x 10^{-6} m^2s^{-1} and 29.71 to 36.06 $kJmol^{-1}$, respectively. Thus, this study therefore provide information necessary for improved drying, processing and handling of breadfruit chips, thereby boosting the obtainable income from the value chain.

Keywords – Mathematical modeling; thin-layer drying; pre-treatment; breadfruit; chips

I. INTRODUCTION

Breadfruit, (*Artocarpus altilis*), belongs to the tree of the mulberry family (*Moraceae*) and bear an edible large fruit which serves as a staple food to the South Asia (Philippines, Malaysia, Singapore, Thailand and Vietnam) and the Pacific region [1]. Major producers of breadfruit are Canada, Peru, United States, Chiles, Netherlands and Mexico [2]. In Africa, its cultivation is mainly in West and Central Africa countries such as Tanzania, Zambia, Nigeria and Uganda [3]. However, the seedless and seeded plants (*Artocarpus communis and Artocarpus altilis*) are widely cultivated in the Southern Nigeria comprises of Lagos, Osun, Oyo, Ogun, Benin, Anambra, Abia and Cross River states for their seeds and fruits. In Nigeria, seedless breadfruit is regarded as the poor man's substitute for yam [4]. Breadfruits may be eaten ripe as fruit, fried, baked, steamed, boiled and made into pudding. It is a carbohydrate-rich staple food for centuries to many Islanders around the Oceania. It also contains other nutrients such as protein, minerals (calcium, phosphorus, iron, potassium) and vitamins though its nutritional composition changes with stages of ripening. Furthermore, breadfruit is gluten free and can be utilized in a variety of products to substitute or partially replace for wheat. Breadfruit yields in term of food have found to be superior to other starchy staples such as cassava and yam [5]. Despite the various uses of breadfruits, it is still regarded as

underutilized or neglected food due to social stigmatization (people believe it is food for slaves and the poor) [6]. Breadfruit deteriorates rapidly once harvested due to physiological changes, high moisture content and mechanical damage during its harvesting, transportation and handling. The very short storage life after harvest has been recognized as a great limitation to its cultivation. Due to its high level of perishability, growers prefer to convert the fruit into value-added products such as chips and flour so as to prolong the shelf life. Drying is one of the oldest means of food preservation. Recent advances in technology and competition among food processors have led to pre-treating of foods in order to conserve its nutrients during processing – blanching helps to inactivate enzymes that may lead to quality degradation and to improve the acceptability of the final product [7]. Blanching also leads to structural softening and hence facilitates moisture removal. Hot water blanching and the use of chemicals such as sulphur, methyl and ethyl ester emulsions or alkaline pre-treatment in aqueous solutions of sodium hydroxide, sodium chloride, potassium and sodium carbonate, calcium chloride have been applied to overcome the waxy or fibrous barrier on roots, fruits and vegetables [8]. Food is usually dried after being subjected to pre-treatment by cutting the fruit into slices and drying them in the open sun or in an air-dryer. Knowledge of the drying kinetics of biological materials is essential to the design, optimization and control of drying processes. Drying characteristics of some agricultural and food products such as tomato, yam, carrot, banana have been documented by many authors [9] In addition, several thin layer models have been proposed to explain the drying behavior of these agricultural and food products. These equations allow the prediction of the process parameter as a function of time at any point in the drying process based on the initial condition. Since industrial production of food products normally depend on artificial dryers, there is a need to investigate the drying kinetic of breadfruit slices under artificial dryer conditions. Therefore, this work focuses on drying kinetic of pretreated breadfruit slices under artificial dryer conditions in order to provide engineering data that will help in promoting its usage beyond present status.

II. Materials and Method

A. *Material Preparation*

Fresh and mature breadfruit used for this study was be obtained from *Iyanfoworogi* market, Ife East Local Government Area of Osun State and botanical classification was investigated at Herbarium Laboratory of Botany Department, Obafemi Awolowo University, Ile-Ife. The sample was washed in a plastic bowl to remove the sticky latex and dirt afterward; and peeled with the aid of stainless steel knife. Pulp obtained was sliced across its vertical dimension with thickness of about 5.0 mm using digital vennier caliper. The samples were divided into three portions: two of the samples were pretreated (blanching and dipping in sodium metabisulphite) before drying, while the third portion was used as the control (unpretreated sample).

B. *Sample Pretreatment*

The first portion of the sample was dipped in sodium metabisulphite ($Na_2S_2O_5$) solution (10g/1000ml) for 1 min. [10]; the second portion was steam-blanched for 1 min [11]; while the third portion was left untreated and serve as the control. After pretreatment, the samples were drained and spread in a thin layer form to dry the surface water at room temperature before drying. Afterward, the three samples were transferred into a dryer already set at different temperatures (50, 60, and 70 ºC) and the drying was monitored by gravity at an interval of 30 min till sample weight remained constant. Figure 1 shows the flow chart of breadfruit chips production.

Figure 1: Flow chart for production of breadfruit chips

C. *Thin Layer Drying*

The thin layer drying experiments were carried out at 50, 60 and 70 °C air temperature. Samples were spread in a thin layer form on a stainless steel drying trays and placed in the drying chamber. About 200 g of the sample on each tray was dried in a laboratory oven (SM 9023 Surgifriend Uniscope Laboratory digital oven). The dryer was allowed to run for 30 min. to reach the set drying air temperature. Prior to drying of sample, initial weights of the samples were measured by means of digital weighing balance (Mettler Toledo PB153 with an accuracy of $\pm$ 0.0001 g). Subsequently, the weight was monitored at interval of 30 min. until the sample weight remained constant. At this point, the sample was considered to have attained its equilibrium moisture content (EMC).

Moisture content determination: Moisture content of the sample was determined using [12]. Ground sample (10 g) was weighed using an electronic weighing balance (Mettler Toledo PB153 with an accuracy of $\pm$ 0.0001 g) and oven dry in a laboratory oven (SM 9023 Surgifriend Uniscope Laboratory digital oven) at 106 ºC for 6 h. and afterwards, allow to cool in a desiccator. The moisture content was determined using equation (1) and this was done in triplicate.

$$M.C_{(db)} = \frac{w_i - w_f}{w_f} \times 100 \qquad (1)$$

Where: $M.C\ (d.b)$ = Moisture content, %; w_i = initial sample weight before drying, g; w_f = final sample weight after drying, g.

D. *Determination of Drying Parameters:*

The drying parameters such as moisture loss at time t (%), moisture ratio, and drying rate (g/min) of the dried breadfruit chip were determined using standard procedures:

Moisture loss: Moisture loss at time t (%) of the breadfruit slices was determined from the weight loss data using equation 2 [13]:

$$M_t = \frac{W_i - W_f}{W_f} \quad (2)$$

Where: M_t (d.b) = moisture content at time t, (%); W_i = initial weight of sample, g; W_f = final weight of sample, g.

Moisture ratio: Moisture ratio (MR) of the breadfruit chips during the thin layer drying experiment was calculated using equation (3):

$$MR = \frac{M - M_e}{M_i - M_e} \quad (3)$$

Where: MR = Moisture ratio, dimensionless; M = moisture content of the sample, decimal d.b; M_i = initial moisture content of the sample, decimal d.b; M_e = equilibrium moisture content of the sample, decimal d.b

Drying rate: The drying rate which is the moisture loss in the breadfruit slices per the drying time was calculated by using equation 4 [13]:

$$DR = \frac{M_{t+dt} - M_t}{dt} \quad (4)$$

Where: DR = drying rate; M_t = mass at time t, M_{t+dt} = successive mass; dt = time interval.

The drying curves from the moisture ratio variation with drying time and drying rate curves from the drying rate variation with drying time of the different samples was obtained and used to explain the thin layer drying characteristics of the breadfruit slices.

E. *Model Fitting*

Five thin layer drying models (Table 1) suitable for predicting drying equation of high carbohydrate foods were selected.

Table 1: Mathematical models used for drying characteristic of pretreated breadfruit chips

Model name	Model equation	Reference
Newton	$MR = e^{-kt}$	Tongrul and Pehlivan, 2004
Page	MR = e^{-ktn}	Salau *et al.*, 2023
Logarithmic	MR = ae^{-kt} + c	Salau *et al.*, 2023
Henderson and Pabis	MR = ae^{-ktn}	Salau *et al.*, 2023
Modified page	MR = ne^{-kt}	Salau *et al.*, 2023

Modeling was exhibited through the regression wizard in the nonlinear regression drop down menu of the statistics tab of SigmaPlot for Windows Software Version 12.0 (Systat Software Inc., Chicago, IL, USA). The model which has the highest coefficient of determination (R^2) and the lowest root mean square error (RMSE) and sum of square error (SSE) values were selected as the best model for the prediction [14]. These criteria parameters were determined using equations 4 and 5:

$$\mathrm{SSE} = \frac{1}{N}\sum\left(\mathrm{MR}_{\mathrm{exp},i} - \mathrm{MR}_{\mathrm{pre},i}\right)^2 \quad (4)$$

$$RMSE = \left[\frac{1}{N}\sum_{i=1}^{N}(MR_{pre,i} - MR_{exp,i})^2\right]^{1/2} \quad (5)$$

Where $MR_{exp,i}$ is the ith moisture ratio observed experimentally; $MR_{pre,i}$ is the ith predicted moisture ratio; N and n represent the number of observations and constants, respectively. Multiple linear regression analyses were also performed on the constants and coefficients of the best model chosen to determine their effect on the drying temperature.

F. *Calculation of effective moisture diffusivity and activation energy*

The simplified Frick's law equation of moisture diffusion was adapted to determine the effective moisture diffusion from the samples during drying [15] which was represented by equation 6:

$$MR = \frac{M}{M_o} = \frac{8}{\pi^2}\sum_{n=0}^{n-1}\frac{1}{(2n-1)^2}exp\left(-\frac{(2n-1)^2\pi^2 D_{eff}\,t}{4L^2}\right) \quad (6)$$

Where: MR = moisture ratio; M = moisture content at any time (g water/g dry mater); M_o = initial moisture content (g water/g dry mater); t = time of drying (s); D_{eff} = effective moisture diffusivity (m^2/s); L = thickness of the chips (m).

For long drying periods as in the case of breadfruit chips, Equation (6) can be further simplified to only the first term of the series [15]. Thus equation (7) can be written in the logarithmic form as:

$$\ln(MR) = ln\left(\frac{8}{\pi^2}\right) - \left(\frac{\pi^2 D_{eff} t}{4l^2}\right) \quad (7)$$

The effective moisture diffusivity (D_{eff}) was calculated using the method of slope. The effective moisture diffusivity was determined by plotting experimental drying data in terms of ln (MR) versus drying time (t). The plot yields a straight line with a slope k as in equation (8), from which the effective diffusivity was computed.

$$k = \frac{\pi^2 D_{eff}}{4l^2} \quad (8)$$

Where: k = slope; D_{eff} = effective moisture diffusivity (m^2/s); L = thickness of the slice (m)

The activation energy was calculated using an Arrhenius type equation [16]:

$$D_{eff} = D_o \exp\left(-\frac{E_a}{RT_a}\right) \quad (9)$$

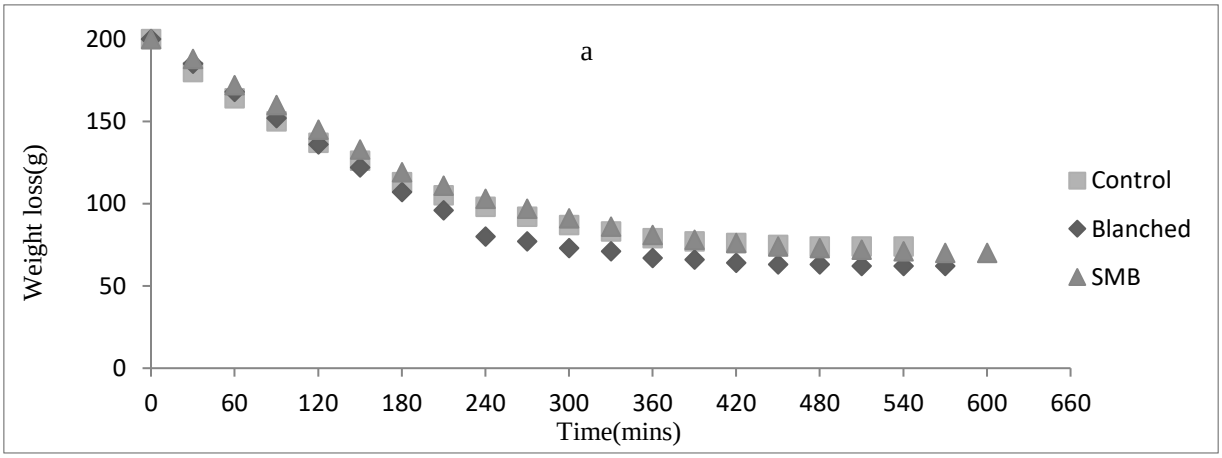
Where: E_a = energy of activation (kJ/mol) R = universal gas constant (8.3143kJ/mol K); T_a = absolute air temperature (K)**;** D_o = pre-exponential factor of the Arrhenius equation (m^2/s)

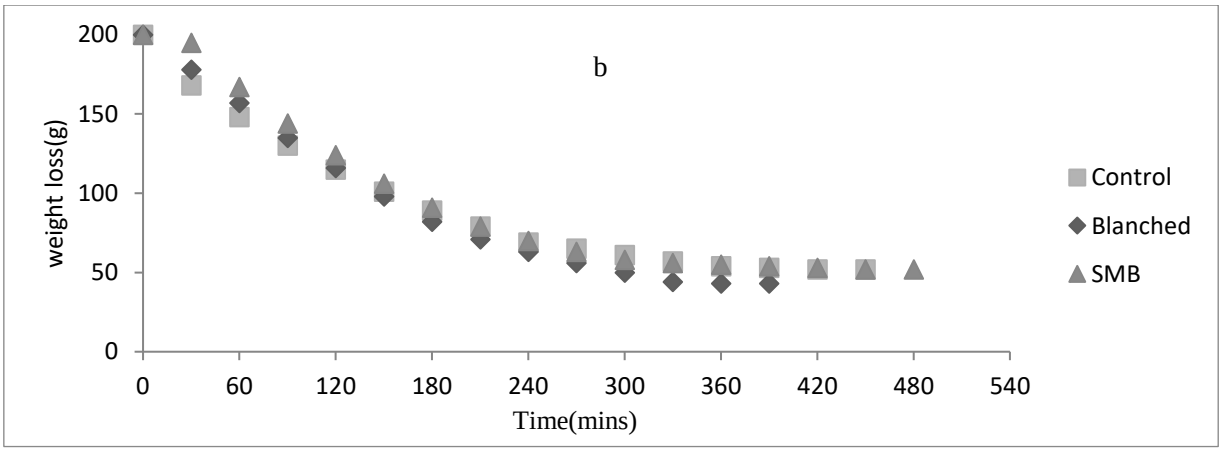
From Equation (9), the plot of natural logarithm of D_{eff} against inverse of the absolute temperature gives a straight slope of K_1 from which E_a was computed using equation 10.

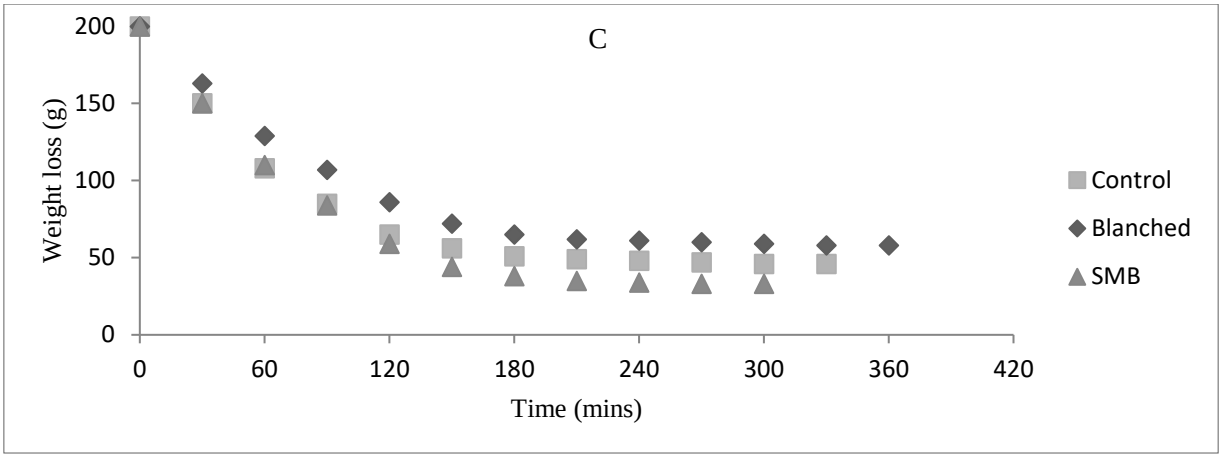
$$K_1 = \frac{E_a}{R} \quad (10)$$

III. RESULTS AND DISCUSSION

The pretreatment effect on thin layer drying of breadfruit slices is presented in Figure 2. The blanched sample exhibited greatest drying rate in comparison to metabisulphite treated and control samples (Figure 2). Furthermore, all the three samples exhibited non-linear relationship between instantaneous drying weight and drying time. The figure also showed that as drying time increases, there is corresponding decrease in drying weight. Similar trends were reported for sweet potato slices [17]. However, during the initial stages of drying, there was a rapid decrease in drying weight of the samples, which later reduced as drying time progressed. The sample thereafter exhibited falling rate period as a result of prevalence of diffusion mechanisms [18]. The rapid drying in the falling rate period could be associated with the material surface which was no longer saturated with water and drying rate being controlled by moisture diffusion from the sample interior to its surface. Thereafter, drying became slower as there was substantial reduction in the sample moisture content [17].

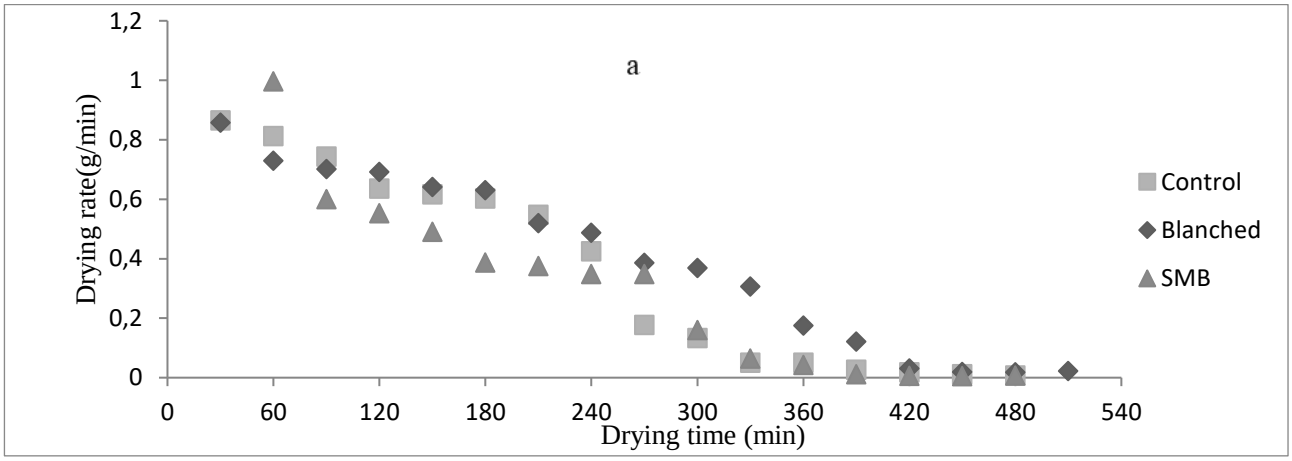


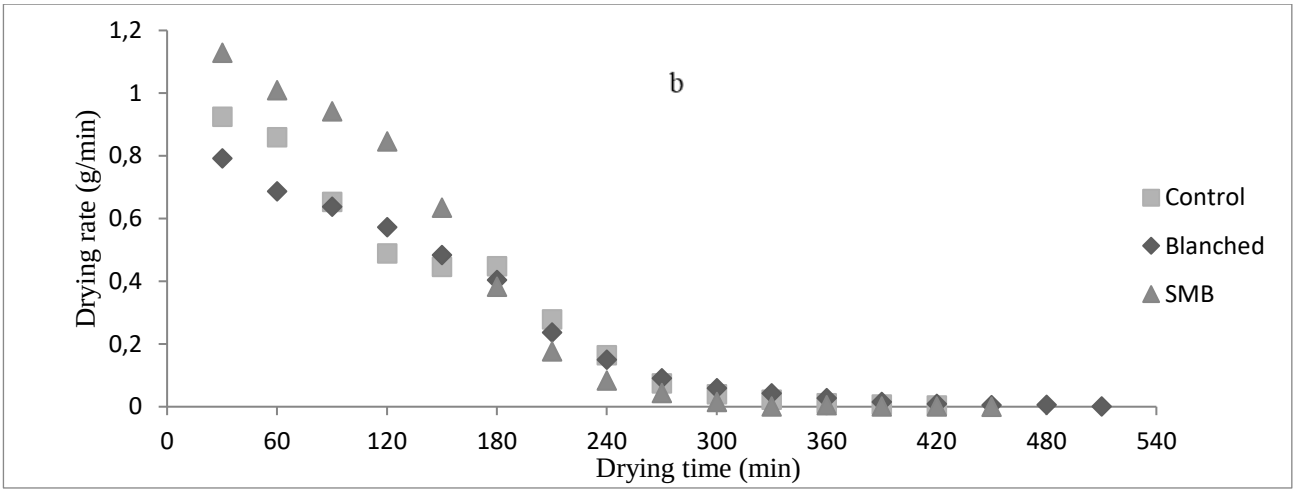


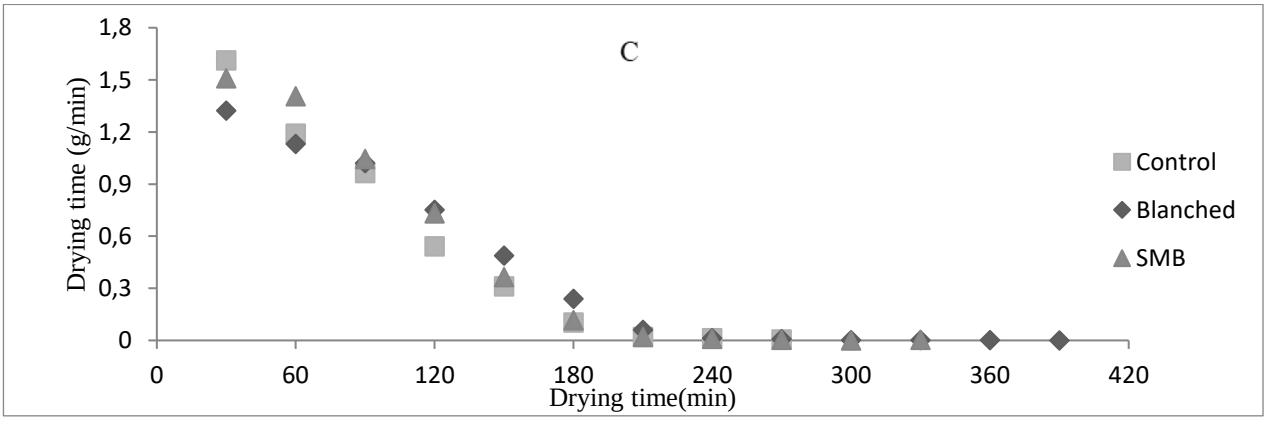


(a) weight loss against time at 50 ºC; (b) weight loss against time at 60 ºC; (c) weight loss against time at 70 ºC
Figure 2: Curve of Weight loss against time of breadfruit slices at different temperatures

Effect of pretreatment on drying time of thin layer breadfruit slices is presented in Figure 3. The Figure showed that as temperature increased from 50 to 70 ℃, drying time for metabisulphite-treated sample decreased from 480 to 330 min., likewise blanched and control samples. This showed that as temperature increased, drying time rate decreases. A slightly different trend was documented for sweet potato slices [17]. This may be due to longer blanching time for the yam samples as blanching disrupt cells and softening tissues thereby facilitating the transport of water to the surface of the sample where it is being evaporated this in turn led increase in moisture content.



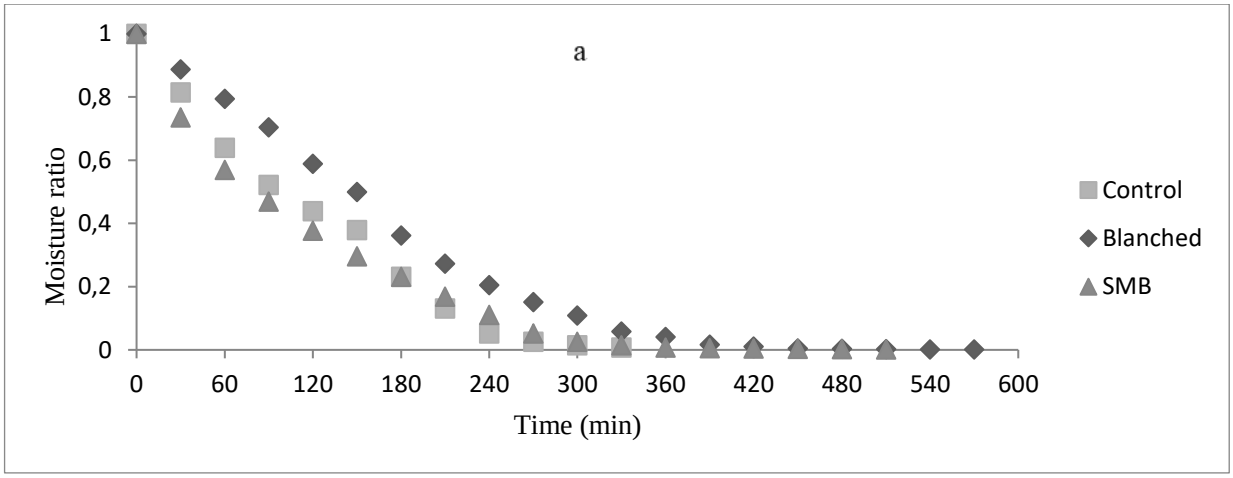


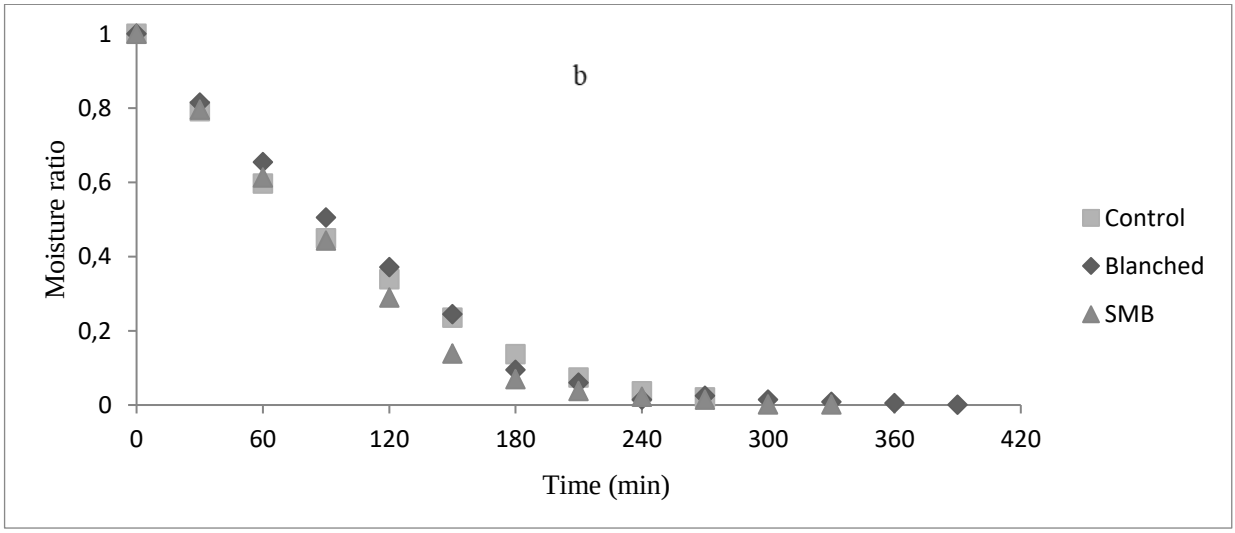


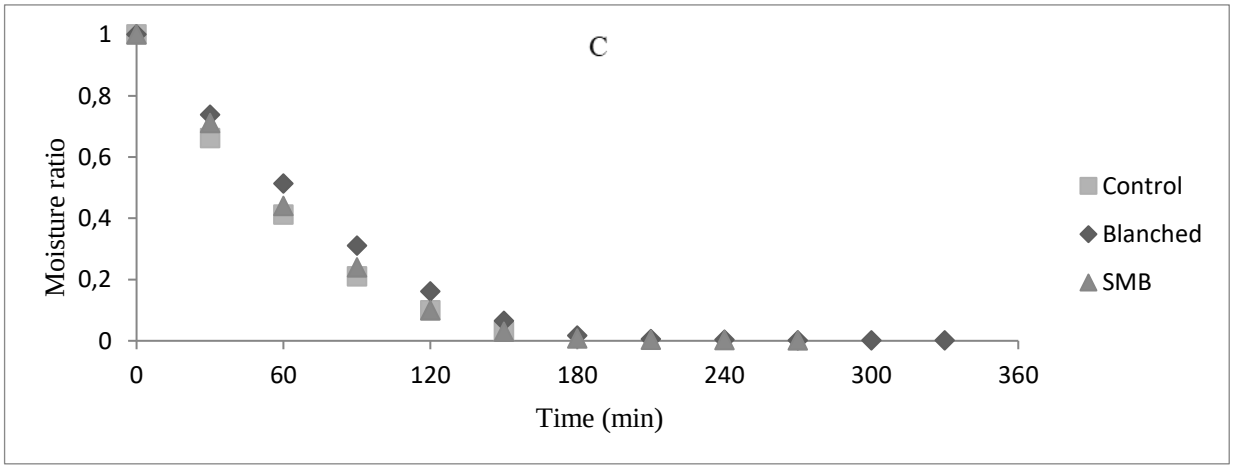
(a): Drying rate curve at 50 °C, (b) Drying rate curve at 60 °C, (c) Drying rate curve at 60 °C

Figure 3: Drying rate against time of breadfruit chips at different temperatures

Effect of drying temperature on moisture ratio of thin layer breadfruit chips is presented in Figure 4. The figure showed that moisture ratio decreases as temperature progressed from 50 to 70 °C. Furthermore, all the three samples exhibited non-linear relationship between moisture ratio and drying time. As seen from Figure 4, it indicated that the drying behavior of the breadfruit slices was governed by diffusion process as there was no constant rate period, but a long falling rate period in all drying air temperature [17]. Afterwards, with less free water available on the surface of the breadfruit slices, the drying rate started to decrease. The drying process occurred mainly in the falling rate period, during which most of the water was removed. Similar results were obtained for sweet potato slices [17].







(a) Moisture ratio against time at 50 ºC; (b) Moisture ratio against time at 60 ºC; (c) Moisture ratio against time at 70 ºC

Figure 5: Curve of moisture ratio against time of breadfruit chips at different temperatures

Effect of drying air temperature on shrinkage of breadfruit slices is presented in Figure 5. The shrinkage values ranged from 3.109 to 2.73 mm; 3.194 to 2.790 mm and 3.556 to 2.830 mm for control, blanched and metabisulphite treated samples respectively as drying air temperature progressed from 50 to 70 °C. The result showed that as drying air temperature increases, there is corresponding decrease in shrinkage. The results further showed that pretreatments influenced shrinkage as blanching caused greater damage to cell

structure, resulting in more moisture removal and increased contraction stresses in the material [18]. Also, the soaking of breadfruit slices in sodium metabisulphite caused a high intake of water before drying.

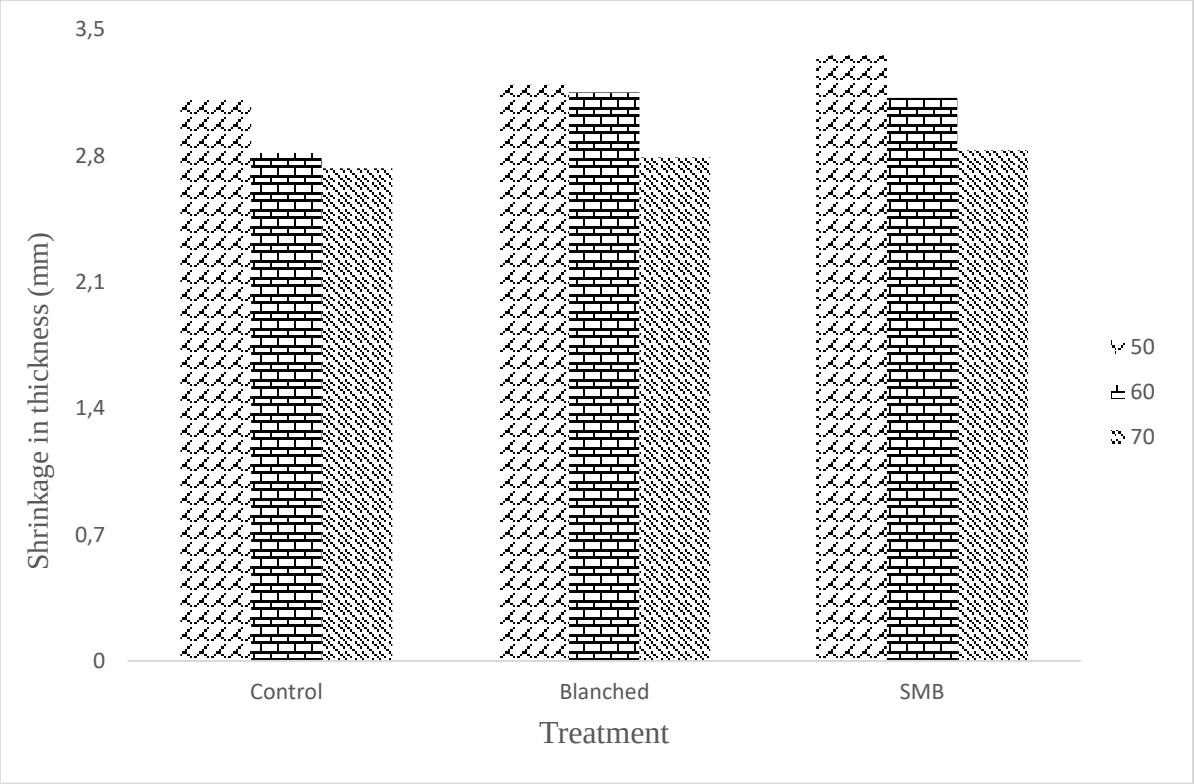


Figure 5: Shrinkage in pre-treated and untreated breadfruit chips thickness dried at different temperature

Fitting of thin layer drying data to models

A non-linear regression analysis was carried out and the acceptability of the model as the best describing the thin layer dry characteristics of breadfruit slices based on the coefficient of determination (R^2), sum of square error (SSE) and root mean square error (RMSE) is presented in the Table 2. Page model best described the thin layer drying characteristics of untreated breadfruit slices at 50 ℃ based on its highest COD value of 0.9939; lowest SSE value of 0.00073 and RMSE value of 0.0270. Although, logarithmic model best described the thin layer drying characteristics of the sample based on its highest COD values of 0.9960 and 0.9915, lowest SSE value of 0.00026 and 0.00054 and RMSE value 0.0162 and 0.0235 at temperature 60 and 70 ℃, respectively. Page model best described the thin layer drying characteristics of blanched breadfruit slices based on its highest COD values of 0.9970 and 0.9763, lowest SSE value of 0.00016 and 0.00269 and RMSE value 0.0126 and 0.0519 at temperature 50 and 70 ℃, respectively. Although, logarithmic model best described the thin layer drying characteristics of the sample based on its highest COD values of 0.9971, lowest SSE value of 0.00021 and RMSE value 0.0145 respectively at temperature 60 ℃. Logarithmic model best described the thin layer drying characteristics of sodium metabisulphite treated breadfruit slices based on its highest COD values of 0.9960, 0.9970, and 0.9922, lowest SSE value of 0.00044, 0.00026 and 0.00049 and RMSE value 0.0209, 0.0161 and 0.0223 at temperature 50, 60 and 70 ℃, respectively.

Effective moisture diffusivity and activation energy of thin layer breadfruit chips

The graph of effective diffusivity of breadfruit slices for thin layer breadfruit slices is shown in Figure 6. From the figure, it showed at high temperature the water molecules were loosely bound to the breadfruit slices, thus requiring less energy to remove than at lower temperature. The drying rate curves shown in Figure 6 indicated that the drying of breadfruit slices took place predominantly in the falling rate period and as such liquid diffusion controls the process. During the falling rate period, the internal resistance governs the mass transfer; hence, Fick's second law can be used to estimate the effective diffusivity using equation 9. Table 2 shows the effective diffusivity ranges from 0.106 x 10^{-6} to 9.910 x 10^{-6} m^2/s and are found to be within the general range of 10^{-12} to 10^{-6} m^2/s for food materials and agricultural crops [18]. Moisture diffusivity, which is related to the quantity of heat passing normally through a unit area per unit time is also affected by drying temperatures, as increasing in drying air temperature resulted in higher effective moisture diffusivity as shown in Table 3. This result is similar to the findings for finger millet [19]. Figure 7 showed effect of influence of temperature on the effective diffusivity against reciprocal of temperature.1/T for control, blanched and pre-treated samples. From the slope of the graph, the activation energy was observed to be 36.06 kJ/mol, 29.71 kJ/mol and 33.24 kJ/mol for control, blanched and pre-treated samples respectively. From the result, it was clearly observed that there was lower activation energy for the sodiummetabisulphite treated and blanched samples than for the untreated sample. This indicates that it was easier to induce the water release process in the blanched and sodiummetabisulphite treated samples compared to the untreated sample.

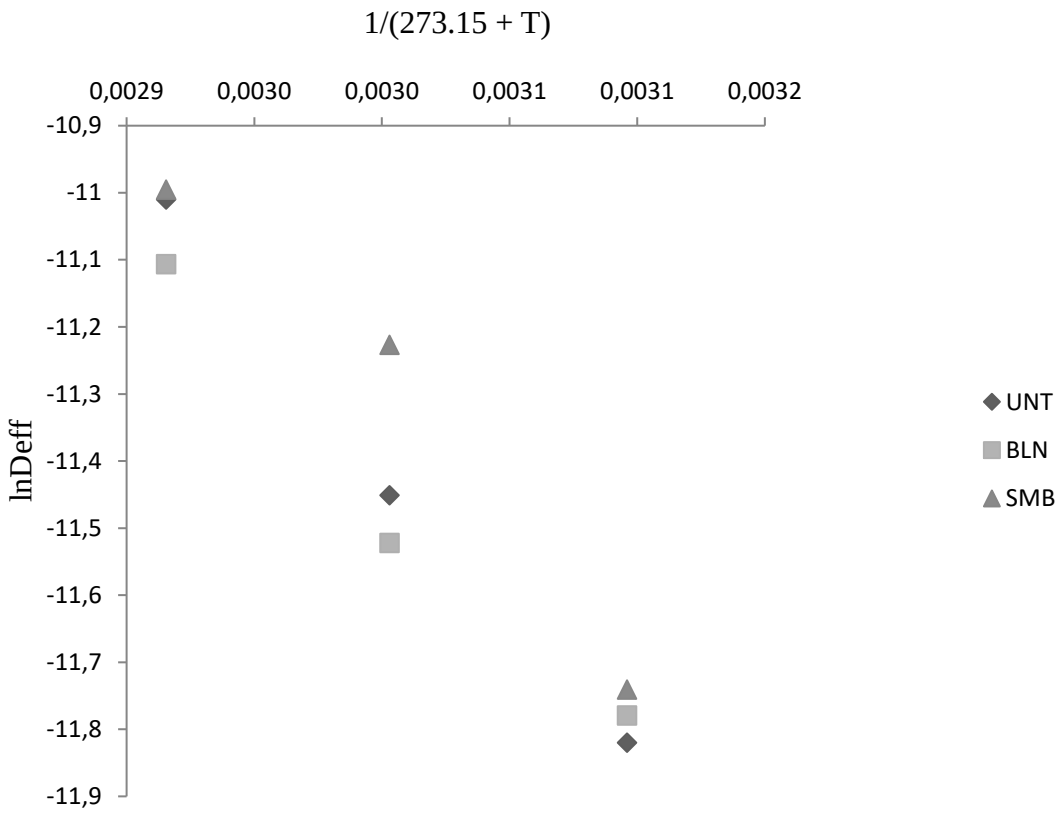

Figure 7: Influence of drying air temperature on effective diffusivity of breadfruit slices

IV. CONCLUSION

This research work generated engineering data needed for understanding thin layer drying characteristics of breadfruit slices. Therefore, the following conclusion can be drawn from the results obtained:

a) drying air temperature increased significantly the drying rate of breadfruit slices;
b) Logarithmic model was judged to have performed best in describing the drying curves of treated and untreated breadfruit slices, respectively;
c) The effective moisture diffusivity values of pre-treated, blanched and controlled breadfruit slices the ranged from 0.106×10^{-6} to 9.910×10^{-6} m^2/s; and
d) There was lower activation energy for the pre-treated and blanched than for the control sample. The result of the activation energy was found to be 36.06kJ/mol, 29.71kJ/mol and 33.24kJ/mol for control, blanched and pre-treated samples respectively. This indicates that it was easier to induce the water release process in the blanched and pre-treated samples compared to the untreated samples.

Özet – Çevre eğitimi, günümüzde önemli bir konu haline gelmiştir. Bu konu alanında eğitim sağlayacak olan öğretmen adaylarının öz yeterliklerinin yüksek olması, öğrencilere çevre konularını doğru ve etkili bir şekilde aktarabilmeleri açısından son derece önem arz etmektedir. Eğitim sürecinde yapay zekâ ve dijital materyallerin kullanımı büyük bir avantaj sağlamaktadır. Özellikle öğretmen adaylarının çevre eğitimini daha ilgi çekici ve etkili bir şekilde aktarabilmeleri için yapay zekâ destekli dijital materyallerden yararlanabilirler. Bu bağlamda araştırmanın amacı, 4.sınıf fen bilgisi öğretmen adaylarının yapay zekâ ve dijital materyaller ile desteklenmiş çevre eğitimi dersinin fen bilgisi öğretmen adaylarını çevre eğitimi öz yeterliliklerine etkisinin incelenmesidir. Araştırma, 2022-2023 eğitim öğretim yılının güz döneminde İç Anadolu bölgesinde bulunan bir devlet üniversitesinin fen bilgisi öğretmenliği programında 4. Sınıf çevre eğitimi dersini alan 20 fen bilgisi öğretmen adayı ile gerçekleştirilmiştir. Araştırmada, fen bilgisi öğretmen adaylarının çevre eğitimi öz yeterliklerini belirlemek için "Çevre Eğitimi Öz-Yeterlik Ölçeği" kullanılmıştır. Elde edilen veriler, SPSS.26 paket programı kullanılarak Wilcoxon İşaretli Sıralar Test ile analiz edilmiştir. Araştırmada elde edilen verilerin sonuçlarına göre, yapay zekâ ve dijital materyaller desteklenen çevre eğitimi dersinin fen bilgisi öğretmen adaylarının çevre eğitimi öz yeterliklerini olumlu etkilediği görülmektedir. Bu sonuçlar doğrultusunda, çevre eğitimi alanında yapay zekâ uygulamalarının ve dijital materyallerin kullanımının yaygınlaştırılması büyük önem taşımaktadır.

Anahtar Kelimeler –Çevre eğitimi, öz yeterlilik, yapay zekâ, dijital material.

I. GİRİŞ

İnsanlar doğumundan ölümüne kadar doğa, kültür ve yaşadığı çevre ile etkileşim içindedir. Bu etkileşim, insanın yaşamı boyunca önem arz etmektedir [1]. İnsan yaşamının hızla değişmesi ve gelişmesi sonucunda çevreye karşı olumsuz etkiler ortaya çıkmaktadır [2]. Bu olumsuz etkiler çevre sorunlarına sebep olmaktadır. Yaşanan çevre sorunlarının çözülebilmesi ve önlenmesi için; bireylerin çevre sorunlarına dair bilinç sahibi olup, çözümler bulmaya ve yeni fikirler üretmeye yönelmeleri gerekmektedir [3]. Çevre bilincinin kazanılması çevre eğitimi ile mümkündür. Çevre eğitimi, bireylerin çevre sorunlarına karşı daha duyarlı olmalarına, çevre bilinci geliştirmelerine katkı sağlayacaktır [4,5]. Çevre bilinci sayesinde bireyler, çevrelerini daha iyi anlayabilir, çevre sorunlarına karşı bilinçli yaklaşabilir ve çevreyi korumaya yönelik yaklaşımlarda bulunabilirler [6]. Çevreye karşı duyarlı, çevre bilincine sahip bireyler yetiştirecek olan öğretmenler ve öğretmen adaylarına önemli bir rol düşmektedir. Öğretmenler ve öğretmen adayları, çeşitli öğretim materyalleri ve yöntemleri kullanarak çevre eğitimi derslerini işleyerek bireylerin çevreyi korumaya ve çevre bilincine sahip olmalarını sağlayacak nitelikte kişilerdir. Bu açıdan bakıldığında ilk olarak öğretmen ve öğretmen adaylarının çevre bilincine sahip, çevreyi koruyabilen bireyler olması gerekmektedir.

Kılıçoğlu [7] sosyal bilgiler öğretmen adaylarının çevre eğitimi konusundaki öz-yeterlilik algılarının farklı değişkenler tarafından etkisini [7], Fradila ve arkadaşları [8] biyoloji eğitiminde yüksek lisans yapan öğrencilerin Problem Bazlı Öğrenme (PBL) temelli E-modül yöntemi ile işlenen ekoloji ve çevre eğitimi derslerinin öğrencilerin duyusal ve psikomotor öğrenme becerileri üzerine etkisini [8], Monus [9] okulların çevre eğitimi ve sürdürülebilirlik eğitiminin ortaokul öğrencilerinin çevresel tutumlarına etkisini [9], Karakoyun ve Uzun [10] 2011-2022 yılları arasında yayımlanan çevre eğitimi ile ilgili olan lisansüstü tez çalışmalarının incelemesini [10], Kayaer ve Çiftçi [11] siyaset bilimi ve kamu yöntemi dördüncü sınıf öğrencilerin aldığı çevre eğitiminin öğrencilerin çevre bilincine etkisini [11], Yalçın Çelik ve arkadaşları [12] çevre eğitimi derslerinin üniversite öğrencilerinin çevre ile ilgili değer, davranış ve etik görüşlerine etkisini incelemiştir [12]. Akay ve Cakir [13] çalışmasında Web 2.0 araçlarından Powtoon 'u video oluşturmak ve Wordwall'u eğitsel oyun tasarlamak amacıyla kullanarak, okul öncesi öğrencilerin çevreye karşı tutumlarını incelemiştir [13].

Bu çalışmanın amacı 4.sınıf fen bilgisi öğretmen adaylarının yapay zekâ ve dijital materyaller ile desteklenmiş çevre eğitimi dersinin fen bilgisi öğretmen adaylarını çevre eğitimi öz yeterliliklerine etkisinin incelenmesidir.

II. MATERYAL VE YÖNTEM

Araştırmada, nicel araştırma yöntemlerinden tek gruplu öntest-sontest deneysel desen tercih edilmiştir. Bu desende, araştırmanın uygulama sürecinden önce ön test, uygulama sürecinin sonrasında ise son test uygulanarak veriler toplanmıştır. Elde edilen veriler incelenerek sonuç çıkarılmaktadır [14].

III. BULGULAR

Yapılan araştırma 2023-2024 eğitim öğretim yılında İç Anadolu bölgesinde bulunan bir devlet üniversitesinin fen bilgisi öğretmenliği programında 4. Sınıf çevre eğitimi dersini alan 20 fen bilgisi öğretmen adayı ile yürütülmüştür. Araştırmada fen bilgisi öğretmen adaylarının çevre eğitimi öz yeterliklerini belirlemek için Özlü ve arkadaşları [15] tarafından geliştirilen "Çevre Eğitimi Öz-Yeterlik Ölçeği" kullanılmıştır. Ölçek, 2 alt boyut içermekte olup, toplamda 24 maddeden oluşmaktadır. Ölçeğin ölçeklendirilmesinde 10 birimlik değişim olacak şekilde 0-100'lük ölçeklendirme tercih edilmiştir. Ölçeğin güvenilirliği, Cronbach Alpha katsayısı ile değerlendirilmiş ve güvenirliği 0,97 olarak hesaplanmıştır [15].

Araştırmanın uygulaması, fen bilgisi öğretmen adaylarının çevre eğitimi dersinin 12 haftasında gerçekleştirilmiştir. Uygulama sürecinde her hafta fen bilgisi öğretmen adayları ile birlikte Magicschool.ai, Tome.app, WEKA, Diffit.me, Canva.ai, ChatGPT, Conker.ai, Gamma.app gibi yapay zeka araçlarını ve Canva, Google Classroom, Learning Apps, Animaker, Padlet, Edpuzzle, Mentimeter, Mindomo, Socrative gibi Web 2.0 uygulamalarını kullanarak çevre konuları ile ilgili poster, soru oluşturma, sunum hazırlama, ders planı hazırlama, kavram ağı hazırlama, animasyon hazırlama, eğitici oyunlar geliştirme, araştırma yapma gibi çalışmalar yapılmıştır.

Araştırmada elde edilen veriler SPSS.26 paket programı kullanılarak Wilcoxon İşaretli Sıralar Test ile analizi sağlanmıştır. Araştırmaya katılan fen bilgisi öğretmen adaylarının "Çevre Eğitimi Öz-Yeterlik Ölçeği" anketine vermiş oldukları cevaplara ilişkin Wilcoxon İşaretli Sıralar Test analizi Tablo 1'de görülmektedir.

Tablo 1.Fen Bilgisi Öğretmen Adaylarının Ön Test-Son Test Wilcoxon İşaretli Sıralar Test Sonuçları

Ön Test- Son Test	n	Sıra Ort.	Sıra Top.	z	p
Negatif Sıralar	2	2,50	5,00	3,73	,000
Pozitif Sıralar	18	11,39	205,00		
Eşit	0				

*p< .05

Tablo 1 incelendiğinde fen bilgisi öğretmen adaylarının yapay zekâ ve dijital materyaller ile desteklenmiş çevre eğitimi dersi öncesi ve sonrası fen bilgisi öğretmen adaylarının çevre eğitimi öz-yeterlikleri arasında istatistikî açıdan bir fark olup olmadığını ortaya koymak için Wilcoxon İşaretli Sıralar testi ile analiz edilmiştir. Analiz sonucuna göre, fen bilgisi öğretmen adaylarının yapay zekâ ve dijital materyaller ile desteklenmiş çevre eğitimi öncesi ve sonrası çevre eğitimi öz-yeterlikleri arasında istatistiksel olarak anlamlı bir fark görülmüştür. (z=-3,73; p<,00). Elde edilen sonuca göre, yapay zekâ ve dijital materyaller ile desteklenmiş çevre eğitimin fen bilgisi öğretmen adaylarının çevre eğitimi öz-yeterlik düzeylerinde etkili olduğunu göstermektedir.

IV. SONUÇ

"Çevre Eğitimi Öz-Yeterlik Ölçeği" ile elde edilen verilere dayanarak, yapay zekâ ve dijital materyaller desteklenen çevre eğitimi dersinin fen bilgisi öğretmen adaylarının çevre eğitimi öz yeterliklerini olumlu etkilediği görülmektedir. Bu açıdan bakıldığında, teknolojinin eğitim süreçlerinde aktif kullanılmasının fen bilgisi öğretmen adaylarının öz-yeterliklerini artırabileceği görülebilir. Özellikle çevre eğitimi derslerde, bu teknolojilerin kullanımı öğrencilerin konuya olan ilgisini artırarak, öğrenme motivasyonlarını yükseltmesini sağlayabilir. Ayrıca gelecek nesillere çevre bilincini aktaracak olan öğretmen adaylarının çevre eğitimi konusundaki bilgi ve becerilerin geliştirilmesinde yapay zekâ ve dijital materyallerin kullanımı çevre eğitimi öz-yeterliklerine katkı sağlayabilir. Bu sayede, gelecek nesiller çevreye daha duyarlı ve sorumlu bireyler olarak yetiştirilebilecektir.

Sonuç olarak, çevre eğitimde yapay zekâ ve dijital materyallerin kullanımı ve yenilikçi yöntemlerin benimsenmesi, öğretmen adaylarının çevre eğitimi öz-yeterliklerini artırmak açısından önem taşımaktadır.

[*](ecerenozer@harran.edu.tr) Başlıca yazarın mail adresi

Özet – Fen eğitimi, öğrencilere doğa bilimleri konularında temel bilgileri öğretmeye, öğrencilerin bilimsel düşünme becerilerini geliştirmelerine ve çevrelerindeki dünyayı daha iyi anlamalarına olanak sağlamaktadır. Yapay zekâ, insan zihninin işlevlerini taklit eden bilgisayar sistemlerini oluşturan bir bilim dalıdır. Yapay zekâ, makine öğrenmesi ve yapay sinir ağları gibi teknikler kullanılarak geliştirilmektedir. Bu yapay zekâ teknolojileri, birçok alanda insanlara yardımcı olmak için kullanılmaktadır. Fen eğitimi ve yapay zekâ, birbirinden farklı alanlarda olsalar da fen eğitiminde yapay zekâ teknolojisinin kullanımı eğitim ortamlarına önemli fırsatlar sağlayabilmektedir. Yapay zekâ, fen eğitiminde öğrencilere interaktif ve kişiselleştirilmiş bir öğrenme deneyimi sunarak öğrencilerin konuları daha iyi anlamalarına yardımcı olmakta, öğrencilerin performansını değerlendirmede ve öğrencilerin zayıf ve güçlü yönlerini belirlemede kullanılabilmektedir. Gelecekte yapay zekâ teknolojisinin fen eğitiminde daha yaygın bir şekilde kullanılması ve farklı eğitim alanlarına uygun uygulamaların geliştirilmesi beklenmektedir. Bu araştırmada, fizik, kimya ve biyoloji gibi fen eğitimi alanlarında yapay zekânın rolü ve fen eğitiminde yapay zekânın kullanımı incelenmiştir. Araştırma, yapay zekânın fen eğitiminde nasıl etkili olduğunu ve fen eğitiminde kullanılabilecek bazı yapay zekâ araçlarından bahsedilmiştir.

Anahtar Kelimeler – Fen eğitimi, yapay zekâ, teknoloji, yapay zekâ uygulamaları

I. GİRİŞ

Fen bilimi, insanlık tarihi boyunca doğa olaylarını anlamaya ve açıklamaya yönelik önemli bir role sahip olmuştur. Fizik, kimya, biyoloji gibi alanları kapsayan fen bilimi; doğanın işleyişini anlamamızı, bu bilgiyi kullanarak çeşitli sonuçlara ulaşmamızı, gelecekteki keşifler için temel oluşturmamızı sağlamaktadır [1]. Fen bilimi, gözlem yapma, deney yapma, hipotez oluşturma ve teori geliştirme gibi yöntemlerle doğal dünyayı anlamaya çalışır. Fen eğitimi ise gözlem yapma, deney yapma, hipotez kurma gibi bilimsel süreç becerilerini kullanarak bireye yaşadığı çevreyi anlamak, bilimsel düşünme ve problem çözme becerileri kazanmak konularında yardımcı olmaktadır [2]. Ancak hayatımızda teknoloji kullanımının hızlı entegrasyonuyla birlikte, fen eğitiminde yapay zekâ gibi yeni teknolojilerin kullanımı da önem kazanmaya başlamıştır.

Yapay zekâ; insanlar tarafından geliştirilen bilgisayar sistemlerinin veri analizi, öğrenme ve karar verme gibi süreçleri otomatikleştirmesi ile insanlara daha hızlı ve etkili karar verme imkânı sunan bir teknolojidir [3, 4]. Derin öğrenme, makine öğrenmesi ve doğal dil işleme gibi çeşitli çalışma alanlarında yaşanan teknolojik gelişmeler, günümüzde yapay zekâ uygulamalarının etkili bir şekilde kullanılmasına olanak sağlamaktadır [5].

Eğitim alanında yapay zekâ ile ilgili yapılan araştırmalar, son yıllarda giderek artmaktadır. Bu çalışmalar, yapay zekânın eğitimdeki avantajları ve dezavantajlarıyla birlikte, eğitim süreçlerindeki potansiyel kullanım alanlarını da incelemektedir [6-14]. Ancak bu çalışmaların konu başlıkları incelendiğinde, fen eğitiminde yapay zekâ kullanımı alanında yoğunlaşılmadığı görülmektedir. Bu bağlamda bu araştırmanın amacı; fizik, kimya ve biyoloji gibi fen eğitimi alanlarında yapay zekânın etkisi ve fen eğitiminde yapay zekâ kullanımının incelenmesidir.

II. MATERYAL VE YÖNTEM

Araştırma modeli olarak literatür taraması tercih edilmiştir. Araştırmada literatür taraması sonucunda elde edilen kaynaklar kullanılmıştır.

III. BULGULAR VE TARTIŞMA

A. Yapay Zekâ

Yapay zekâ, insan zihninin işlevlerini taklit edebilen bilgisayar sistemlerini oluşturan bilim dalıdır [15]. Bu bilgisayar sistemleri, insan zihninde olduğu gibi öğrenme, problem çözme, muhakeme yapma ve karar verme gibi bilişsel işlevleri yapabilmektedir [16].

Yapay zekânın tarihi eski zamanlara dayanmakta olup, 1956 yılında ilk kez yapay zekâ kavramı, McCarty tarafından ortaya çıkmıştır. McCarty yapay zekâyı "insana benzeyen zeki makineler ve bilgisayar programları geliştirebilen bir disiplin" olarak ifade etmiştir [17]. Bu tanımdan yola çıkarak yapay zekâyı bilgisayarların öğrenme, karar verme, dil işleme ve algılama gibi insan benzeri yeteneklere sahip olması olarak açıklayabiliriz. Yapay zekâ ile bilgisayarlar karmaşık verilerin analizini sağlayabilir, bir durum hakkında öngörülerde bulunabilir ve insanlar için yapması zor ve riskli görevleri yapabilmektedir [15].

Yapay zekâ, günümüzde pek çok alanda kullanılmaya başlamasıyla birlikte günümüz teknolojisinin en önemli ve etkileyici alanlarından biri haline gelmiştir [18]. Örneğin, sağlık sektöründe yapay zekâ, hastalıkları teşhis etmek ve tedavi planları oluşturmak için kullanılmaktadır. Otomotiv endüstrisinde ise sürücüsüz araçlar yapay zekâ sayesinde güvenli ve etkili bir şekilde hareket edebilmektedir. Güvenlik sektöründe, suç analizi ve terörle mücadele için yapay zekâ teknolojileri kullanılmaktadır.

Ünlü ve arkadaşları [19] tarafından gerçekleştirilen çalışmada, yapay zekâ teknikleri kullanarak Cleveland ve Z-Alizadehsani veri kümelerinin, kalp hastalığının teşhisindeki etkisini, Chai ve Nizam [20] otomotiv endüstrisindeki otonom araçlar ve akıllı fabrikalar gibi alanlarda yapay zekâ kullanımının etkisini, Ak [21] ise çalışmasında güvenlik ve kolluk kuvvetinin suç önleme faaliyetlerinde yapay zekâ kullanımının etkisini incelemiştir.

Yapay zekâ alanındaki bu gelişmelerin hızlanması ve yaygınlaşması, son yıllarda yapılan çalışmalar ile gerçekleşmektedir. Özellikle uzman sistemler, bulanık mantık, algoritmalar, yapay sinir ağları ve makine öğrenmesi gibi tekniklerin gelişmesi, yapay zekânın önemini artırmaktadır [22].

Yapay zekâ alanının bir parçası olan uzman sistemler, belirli bir alandaki uzman kişilerin bilgi ve deneyimlerini kullanarak karşılaşılan karmaşık problemleri çözmek için tasarlanmış uzman kişiler olmadan kararlar alabilen bilgisayar sistemleridir [23]. Uzman sistemler, genellikle tıp, mühendislik ve finans gibi pek çok alanlarda kullanılabilen ve karar verme süreçlerini optimize etmeye yardımcı olan yapılardır [19].

Bulanık mantık, geleneksel mantık kurallarının dışında kalan bir kavram olup, kesin sınırların bulunmadığı durumların analiz edilmesi için kullanılan matematiksel modelleme yönetimidir. Bu yöntem, belirsiz ve karmaşıklık içeren sistemlerde kullanılarak daha gerçeğe yakın sonuçlar elde etmeyi amaçlamaktadır [24].

Algoritma, kısaca belirli bir problemi çözmeye giden yoldaki basamakların belirlendiği bir süreç olarak tanımlanmaktadır. Algoritmalar bilgisayar biliminde genellikle veri işleme, sıralama veya arama gibi işlemleri gerçekleştirmek için kullanılmaktadır [25].

İnsan beyninin sinir hücrelerinden esinlenilerek geliştirilen yapay sinir ağları, veri setlerini işleyerek öğrenme, karmaşık problemi çözebilme ve tahmin yapma gibi yeteneklere sahip olup geniş veri setleri üzerinde kullanılmaktadır [26,27].

Makine öğrenimi, veri analizi ile bilgisayar sistemlerinin öğrenme becerisine sahip olmasına olanak sağlamaktadır [23]. Bu teknoloji sayesinde bilgisayar sistemleri, algoritmaların karmaşık veri setlerinin analizini sağlayarak örüntüler belirlenmektedir [25]. Makine öğrenmesi, çeşitli endüstrilerde kullanılarak hem verimliliği artırabilir hem de karar alma süreçlerini optimize edebilmektedir[28].

B. Fen Eğitiminde Yapay Zekâ

Yapay zekâ, son yıllarda farklı birçok alanın gelişimine katkı sağladığı gibi eğitim alanında da kullanılması ile öğrencilerin daha etkili ve verimli bir şekilde öğrenmelerine, yapay zekâya dayalı değerlendirme sistemlerine, otomatik test oluşturma gibi pek çok eğitim ortamına katkı sağlamıştır [6, 25]. Bu eğitim alanlarından biri olan fen eğitimi de yapay zekâ teknolojisi ile derslerinin daha ilgi çekici hale gelmesine ve öğrencilerin konuları daha iyi anlamalarına yardımcı olmaktadır. Yapay zekâ teknolojileri, fen eğitiminde öğrencilere interaktif ve kişiselleştirilmiş bir öğrenme deneyimi, öğrencilerin ilgi ve yetenekleri doğrultusunda özel olarak tasarlanmış eğitim materyalleri, öğrencilerin konuları daha kolay anlamaları ve öğrenmeleri gibi eğitim sürecine katkı sağlanmaktadır. Yazıcı ve Erkoç [29] tarafından yürütülen araştırmada, 44 fen grubu (fizik, kimya, biyoloji, fen bilimleri) öğretmenlerinin yapay zekâ kullanım durumlarını incelemiştir. Araştırma, öğretmenlerin yapay zekâ araçlarını tercih etme nedenlerinin kişiselleştirilmiş öğrenme, öğrencilerin ilgisini çekme ve derse daha aktif katılımlarını sağlama gibi eğitim sürecinin önemli unsurlarında etkili olduğunu ortaya çıkarmıştır. Ek olarak Darayseh [30] tarafından yürütülen çalışmada ise, 83 fen bilgisi öğretmenin yapay zekâ uygulamalarının kullanımını etkiyen faktörlerin belirlenmesi amaçlanmıştır. Araştırma sonucunda, yapay zekâ uygulamalarını tercih eden fen bilgisi öğretmenlerin yapay zekâ araçlarının kolay kullanılabilir olmasından dolayı tercih ettikleri görülmüştür [30].

Ayrıca yapay zekâ uygulamaları, öğrencilerin öğrenme süreçlerinin takip edilmesiyle birlikte süreç içerisindeki zayıf ve güçlü yönlerinin belirlenmesine katkıda bulunmakta, öğrenme sürecinin değerlendirilmesini sağlamaktadır. Bu değerlendirmeye dayanarak, öğretim materyalleri düzenlenmektedir. Sanca ve arkadaşlarının [24] yürüttüğü çalışmada, bulanık mantık yaklaşımının fen eğitimindeki kullanım amaçları, yöntemleri ve gerekliliği incelenmiştir. Araştırma sonuçlarında, bulanık mantık yaklaşımının performans değerlendirmesi, akademik başarı tahmini, akademik başarı tespiti ve başarıyı etkileyen faktörlerin belirlenmesi gibi etkili olduğunu ortaya koymuştur. Yorgancı ve Işık [26] tarafından yürütülen çalışmada, yapay sinir ağlarının kullanımıyla fen bilgisi öğretmen adaylarının genel not ortalamalarının sınıflandırılması amaçlanmıştır. 4.sınıf 30 fen bilgisi öğretmen adayının çalışma alışkanlıkları, baskın zekâ alanları, yaş ve cinsiyet gibi değişkenlerin genel not ortalamalarına etkisi incelenmiştir. Yapılan araştırma sonucunda, çok katmanlı algılayıcı ağ modelinin kullanılarak elde edilen verilerle en az hata yapılan ağ yapısının belirlenmiştir. Ayrıca bu sisteminin genel not ortalamalarını sınıflandırmada başarılı olduğu sonucuna varılmıştır [26].

Fen eğitiminde yapay zekânın bir diğer önemli faydası ise öğrencilerin problem çözme ve eleştirel düşünme becerilerini geliştirmesine yardımcı olmasıdır [31, 32]. Yapay zekâ destekli simülasyonlar ve deneyler sayesinde öğrenciler, teorik bilgilerini pratikte uygulama fırsatı bulmakta ve gerçek hayattan örneklerle karşılaşarak konuları daha iyi kavramaktadırlar [33, 34].

Gün geçtikçe değişen ve gelişen yapay zekâ teknoloji ile farklı eğitim alanlarında kullanım potansiyeli artmaktadır. Yapay zekâ teknolojisinin fen eğitim alanında kullanımı, gelecekte daha da yaygınlaşacak ve her eğitim alanına uygulanabilir uygulamalar bulunacaktır.

C. Fen Eğitiminde Kullanılan Bazı Yapay Zekâ Uygulamaları

Gün geçtikçe değişen ve gelişen yapay zekâ teknoloji ile farklı eğitim alanlarında yapay zekâ teknolojisinin kullanım potansiyeli artmaktadır. Yapay zekâ teknolojisinin fen eğitim alanında kullanımı, gelecekte daha da yaygınlaşacak ve her eğitim alanına uygun uygulamalar bulunacaktır.

Diffit for Teachers

Diffit for Teachers, öğretmenlerin okuma metni ve soru hazırlama gibi eğitim materyalleri oluşturma sürecini kolaylaştıran bir platformdur. Diffit for Teachers uygulamasında yer alan yapay teknolojisi ile her sınıf düzeyi ve her konu alanına uygun eğitim materyali hazırlanabilmektedir [35].

MagicSchool.ai

MagicSchool AI, öğretmenlerin iş yükünü hafifletmek ve daha verimli olmalarına yardımcı olmak için tasarlanmış bir yapay zekâ (AI) platformudur. MagicSchool.ai, tarayıcı ve masaüstü için tasarlanmıştır. Bu yapay zekâ aracı sayesinde ders planı oluşturma, öğrenci değerlendirme, soru oluşturma ve deney hazırlama gibi pek çok özelliği bulunmaktadır [36].

PictoBlox

PictoBlox, Scratch gibi blok tabanlı kodlamayı içeren ve yapay zekâ eğitimi için geliştirilmiş bir platformdur. Uygulama içinde veri görselleştirme, nesne tanıma, konuşma tanıma, yapay sinir ağları gibi yapay zeka teknolojilerini içermektedir. Uygulama Windows, MacOS, Linux, Android gibi işletim sistemlerin ücretsiz olarak desteklemektedir. PictoBlox ile öğrenciler, kodlama öğrenmeyi eğlenceli ve ilgi çekici hale getiren blok tabanlı bir eğitimsel kod yazmalarına olanak sağlamaktadır. Bu kodlama uygulaması, öğrencilere projelerini programlama yetenekleri kazandırma, disiplinler arası çalışmalar hazırlama ve projeler üzerinde işbirliği yapma fırsatı sunar [37].

Chat GPT

Chat GPT, Gemini gibi bir yapay zekâ tabanlı bir dil modelidir. OpenAI tarafından geliştirilmiş bir yapay zekâ aracı olup, Gemini gibi metin oluşturma, soru oluşturma veya cevaplandırma, dil çevirisi yapmaktadır [38]. Bu yapay zekâ aracının iki farklı versiyonu bulunmaktadır. ChatGPT 3.5 ücretsiz iken, ChatGPT 4 ücretli olarak kullanılmaktadır.

PlantSnap

PlantSnap, bitkilerin fotoğraflarını çekerek veya galerinizden yükleyerek bitki türlerini tanımanıza yardımcı olan bir mobil uygulamadır [39]. Uygulamaya yüklediğiniz bitki görseli veya uygulama üzerinden çektiğiniz bitki fotoğrafı, uygulamanın veri tabanında bulunan geniş bir bitki türü koleksiyonuyla karşılaştırılır ve uygun olan tür bu şekilde bulunmaktadır. Ayrıca uygulama bitkilerin adlarını, özelliklerini, bakım ipuçlarını ve bitkiyi yetiştirme hakkında bilgi sağlamaktadır.

Labster

Labster, STEM müfredatına uygun olarak tasarlanmış bir sanal laboratuvar simülasyonlarını içeren web tabanlı bir platformdur. Labster, genel biyolojiden organik kimyaya kadar çeşitli konuları kapsayan 289 simülasyon içeren bir kütüphaneye sahip olup, içinde yer alan simülasyonlar lise seviyesinden üniversite düzeyine kadar çeşitli eğitim seviyelerine hitap etmektedir [40]. Simülasyon birinci şahıs deneyimi olarak tasarlanmış ve kullanıcılara rehberlik etmesi için Dr. One adlı bir asistan içermektedir. Simülasyon boyunca Dr. One kullanıcıya görevi talimatları vermekte, rehberlik etmekte ve gerektiğinde kullanıcıyı doğru yola yönlendirmektir. Ek olarak simülasyonun içinde çalışma ile ilgili kısa sınavlar bulunmaktadır. Bu şekilde kullanıcının simülasyondaki eğitim süreci takip edilmektedir [40].

Khan Academy

Khan Academy, çeşitli özelliklere sahip ücretsiz bir çevrimiçi öğrenme platformudur. Öğrencilerin bilgi birikimlerini desteklemeye yönelik tasarlanmış olan bu uygulama, 5.5000'den fazla eğitici videoya ve soru içermektedir. Ek olarak uygulama içinde eğitim sürecinin takibi ve rehberlik sağlamak için koçluk özelliği bulunmaktadır [41].

Gamma.App

Gamma.app, yapay zeka teknolojisinden faydalanan bir sunum, web sayfası ve belge hazırlama platformudur. Kullanıcıların, tasarım gibi teknik ayrıntıları hazırlamalarına gerek kalmadan, sadece fikirlerine odaklanarak çarpıcı içerikler oluşturmalarını olanak sağlamaktadır [42].

IV. SONUÇ

Bu çalışmanın amacı, yapay zekanın fen eğitimi üzerindeki etkisini ortaya koymaktır. Yapay zeka, son yıllarda eğitim alanında önemli bir rol oynamaya başlaması ile fen eğitiminde, yapay zeka teknolojileri öğrencilerin öğrenme sürecini destekleyebilir ve daha etkili bir öğrenme ortamı sağlayabilir. Ancak, fen

eğitiminde yapay zeka teknolojilerinin kullanımını doğru bir şekilde yönetmek önem arz etmektedir. Yapay zeka, fen eğitiminde sadece bir araç olarak kullanılmalıdır. Bu çalışma, yapay zekanın fen eğitimindeki etkisine ve nasıl kullanılabileceğine yönelik çalışma olup, yapay zekanın fen eğitimindeki potansiyelini daha iyi anlamamıza yardımcı olacaktır.

Assessing Turkey's Sustainable Competitiveness with Border Neighbors: An Integrated LODECI-ARTASI Approach

Ahmet Çalık*

[1] *Department of Business Administration, Faculty of Economics and Administrative Sciences, Balıkesir University*

**ahmetcalik51@gmail.com*

Abstract – Sustainable competitiveness, which incorporates natural capital, economic Sustainability, and social capital, is widely recognised as critical for long-term economic stability and prosperity in nations worldwide. This paper assesses Turkey's long-term competitiveness with its border neighbours using a new integrated methodology that incorporates the Logarithmic Decomposition of Criteria Importance (LODECI) and the Alternative Ranking Technique based on Adaptive Standardised Intervals (ARTASI). Using variables from the Global Sustainable Competitiveness Index (GSCI) as defined in the Sustainable Competitiveness Report, this study first evaluates the value of these factors using LODECI. Following that, ARTASI is used to rank the countries, providing a sophisticated picture of Turkey's position in relation to its neighbours as well as strategic recommendations for policymakers looking to improve the region's long-term competitiveness. When we review the results of the provided approach, the most influential criterion for determining sustainability competitiveness is governance efficiency, and Bulgaria has the highest score.

Keywords – ARTASI, LODECI, Sustainable competitiveness.

I. INTRODUCTION

Competitiveness is more than just a country's economic success; it also includes its environmental and social performance [1]. Sustainable competitiveness is increasingly recognized as crucial for nations' long-term economic stability and growth [2], integrating environmental stewardship, social inclusion, and economic development. This holistic approach underscores the importance of integrating sustainability into the core of national competitiveness strategies, extending beyond traditional economic metrics to encompass long-term viability and intergenerational equity. Turkey, situated at the strategic crossroads of Europe and Asia, faces unique competitive pressures and opportunities from its border neighbors. The dynamic socio-economic landscape of the region makes the evaluation of competitiveness a complex, multidimensional challenge, necessitating a refined understanding for effective policy-making and strategic planning.

Numerous studies in the literature have been done to analyse countries' long-term competitiveness using a variety of indices. The European Regional Competitiveness Index [3], the Global Competitiveness Index [1], and the Global Sustainable Competitiveness Index [4] are some of the most used indexes. Notably, the World Economic Forum's Global Sustainable Competitiveness Index (GSCI) is a widely long-term approach in these investigations [5].

The assessment of sustainable competitiveness inherently involves multiple criteria, making it a quintessential multi-criteria decision-making (MCDM) problem [6]. Recent advancements in MCDM methodologies have led to the development of innovative approaches such as the Logarithmic Decomposition of Criteria Importance (LODECI) [7] and the Alternative Ranking Technique based on

Adaptive Standardized Intervals (ARTASI) [8]. These methods offer refined tools for analyzing the intricate aspects of competitiveness. Despite the critical importance of these metrics, there has been limited investigation into Turkey's position relative to its neighbors, highlighting a significant research gap that this manuscript aims to address.

This study employs the LODECI and ARTASI methods to evaluate Turkey's sustainable competitiveness with its border neighbors, introducing a novel integrated MCDM approach that contributes both methodologically and empirically. By providing a deeper insight into the competitive dynamics at the regional level, this research aims to assist policymakers and stakeholders in developing strategies that not only enhance Turkey's economic outputs but also its environmental and social footprints. The primary purpose of this study is to rigorously analyze and offer actionable strategies for enhancing Turkey's sustainable development and economic relations with neighboring countries, thereby supporting sustainable growth and regional stability.

II. Literature Review

Several authors have assessed the sustainable competitiveness of countries with MCDM methods. Lu et al. [9] identified the most effective sustainable improvement strategies with the DEMATEL-based ANP and VIKOR methods. Kiseľáková et al. [10] evaluated the objectivity and consequent value variations of the Global Competitiveness Index (GCI) and World Competitiveness Index (WCI) composite indices among the EU (24) countries from 2006 to 2016. Kiseľáková et al. [6] examined the relationship between global competitiveness, business environment, and human development in 28 EU nations from 2006 to 2017. [3] measured the competitiveness of the NUTS 2 (Nomenclature of Units for Territorial Statistics) regions of the 28 European Union Member States using the TOPSIS method. Despotovic et al. [11] utilised panel data linear regression analysis based on a sample of 30 European countries for the social dimension of sustainable competitiveness. Činčikaitė and Meidutė-Kavaliauskienė [12] evaluated the competitiveness of Baltic capitals by SAW and TOPSIS evaluation methods in 2016–2019. Cheba et al. [13] examined the ability of the economies of selected countries to compete in a sustainable way using selected statistical approaches. Činčikaitė and Meidute-Kavaliauskiene [14] applied the SAW and COPRAS methods for competitiveness assessment of the Baltic capitals in the period 2014–2019. (Bilbao-Terol et al. Ghag et al. [15] offered a combination of fuzzy Delphi and neutrosophic DEMATEL for identifying and determining cause-and-effect relationships between international sustainable competitiveness determinants for small and medium enterprises. Štilić et al. [16] applied Entropy and MARCOS (Measurement Alternatives and Ranking according to the Compromise Solution) methods for the evaluation of the competitiveness of Balkan countries for the year 2022 investigated the relative importance of GSCI pillars towards GSCI while considering their interdependence in a probabilistic network context using a Bayesian Belief Network model. Kara et al. [17] investigated Turkey's sustainable competitiveness with border neighbours by developing an integrated methodology consisting of MEREC-AROMAN.

Some research in the literature focused on long-term competitiveness to better understand a country's standing among others. In addition, other authors concentrated on this topic and employed statistical analysis. While Kara et al. [17] attempted to assess Turkey's status using a hybrid MCDM approach based on GSCI indicators, they used the MEREC-AROMAN method for the year 2022. However, as far as we know, no study in the available literature has investigated Turkey's sustainable competitiveness using the LODECI-ARTASI technique using 2023 GSCI indicators.

III. Research Methodology

The proposed approach for evaluating sustainability competitiveness levels to Turkey and its neighbouring countries includes the LODECI and ARTASI methods with the following steps:

A. LODECI Method

Step 1: Develop the decision matrix.
Step 2: Normalize the decision matrix.
Step 3: Calculate the Decomposition Value (DV) of each decision matrix element.

Step 4: Compute the Logarithmic Decomposition Value (LDV) of each criterion.
Step 5: Obtain the importance levels of the criteria.

B. ARTASI Method

Step 1: Construct the decision matrix.
Step 2: Find absolute minimum and maximum values.
Step 3: Normalize the decision matrix.
Step 4: Determine the degree of usefulness of alternatives.
Step 5: Specify aggregated degrees of utility of alternatives.
Step 6: Calculate of final utility functions and rank the alternatives.

IV. APPLICATION OF THE LODECI-ARTASI APPROACH TO EVALUATE THE SUSTAINABLE COMPETITIVENESS

In this study focusing on Turkey's sustainable competitiveness with border neighbours in 2023, six criteria were used: natural capital, resource intensity, social capital, intellectual capital, economic sustainability, and governance efficiency. The scores for these criteria were from the GSCI 2023 report. The investigation covered seven countries: Greece, Bulgaria, Turkey, Georgia, Armenia, Azerbaijan, and Syria. The decision matrix is given in Table 1.

Table 1. The decision matrix

	Natural capital	Resource intensity	Social capital	Intellectual capital	Economic sustainability	Governance efficiency
Greece	38.80	43.90	51.10	45.50	52.10	62.70
Bulgaria	50.10	35.60	49.00	38.80	47.10	66.20
Turkey	45.90	26.80	39.40	58.60	50.30	51.00
Georgia	49.30	29.40	50.90	41.60	40.40	56.90
Armenia	39.90	28.70	60.70	39.30	39.10	58.20
Azerbaijan	42.00	27.70	44.60	42.00	33.50	44.70
Syria	40.40	33.60	33.00	35.40	32.40	33.50

The research application progressed in two independent levels. Initially, criterion weights were determined using the LODECI approach in the first step. Later, in the second step, the countries were rated using the ARTASI technique. The research methodology section explains the steps of this application in a systematic manner.

The criterion weight was derived and shown in Fig. 1 as part of the computation process.

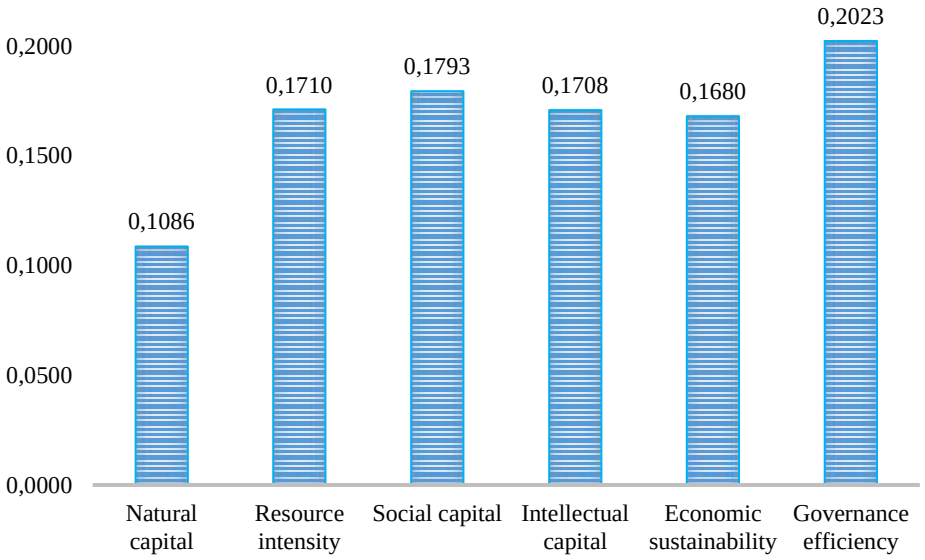

Fig. 1. The weights of criteria

The utility functions matrix was constructed with stated parameters $\psi = 0.5$ and $\tau = 1$ for each country. The final country rankings are shown in Table 2.

Table 2. The ranking of countries

	The final utility function values	Rank
Greece	50.0414	2
Bulgaria	52.7874	1
Turkey	45.3303	4
Georgia	47.3374	3
Armenia	40.9462	5
Azerbaijan	33.5664	6
Syria	15.1248	7

This study suggests that governance efficiency is the most significant factor influencing Turkey's and its neighbouring countries' long-term competitiveness. Social capital emerged as the second-most important factor. The sustainable competitiveness rankings are as follows: Bulgaria, Greece, Georgia, Turkey, Armenia, Azerbaijan, and Syria.

V. CONCLUSION

This study provides a comprehensive assessment of Turkey's sustainable competitiveness in relation to its border neighbors using an integrated approach with the LODECI-ARTASI approach. Our findings reveal that governance efficiency stands as the most significant factor influencing the long-term competitiveness of Turkey and its neighboring countries. This underscores the pivotal role that effective and transparent governance plays in fostering a competitive environment that is sustainable and conducive to economic growth. Social capital emerged as the second-most important factor, highlighting the crucial impact of social networks, cultural norms, and trust in promoting economic development and resilience. The importance of social capital in this context illustrates how social structures and relationships can drive or hinder the economic performance and sustainability of nations.

The sustainable competitiveness rankings derived from our study place Bulgaria at the top, followed by Greece, Georgia, Turkey, Armenia, Azerbaijan, and Syria. These rankings not only reflect the current state of sustainable competitiveness but also offer insights into the potential areas where each country can improve by addressing their specific challenges related to governance and social capital.

The implications of these findings are significant for policymakers and stakeholders in the region. By understanding the critical factors that drive sustainable competitiveness, strategies can be formulated to strengthen governance structures and enhance social capital, thereby improving the long-term economic prospects and stability of these countries. In conclusion, this research highlights the necessity of focusing on governance and social capital to enhance the sustainable competitiveness of Turkey and its border neighbors. It provides a strategic framework that can guide future initiatives aimed at promoting economic stability and sustainable growth across the region.

Abstract **–** The current study employs Lagrangian particle tracing to investigate the impact of fracture orientation on particle transport, a critical factor in various geological and engineering applications. Understanding how different fracture orientations affect particle movement is essential for optimizing processes such as pollutant transport in groundwater and oil recovery in fractured reservoirs. The simulation models particle motion by solving Newton's second law and force balance equations, tracking their trajectories through fractures with orientations of vertical (90°), inclined (45°), horizontal (0°), and downward (-45° and -90°). The findings reveal distinct trends in particle transport based on fracture orientation. Vertical fractures (90°) demonstrate the highest recovery rates, indicating the most efficient pathways for particle movement. Inclined fractures (45°) also show relatively high recovery rates, while horizontal fractures (0°) exhibit moderate recovery rates. Downward-oriented fractures (-45° and -90°) present the lowest recovery rates, suggesting increased gravitational resistance and path complexity. Hence, optimizing fracture orientation, particularly favoring vertical and positively inclined fractures, is essential for enhancing particle recovery in systems where transport through fractures is crucial.

Keywords – Fracture, Particule, Transport, Orientation, Angle.

I. INTRODUCTION

Fractures are defined as geological discontinuities that play a critical role in various fields, such as hydrogeology and petroleum engineering. These naturally or artificially induced joints significantly impact and enhance the permeability of host rocks, thereby influencing fluid flow and particle circulation within the subsurface. In hydrogeology, fractures serve as primary pathways for groundwater movement [1], affecting aquifer recharge and contaminant migration. In the petroleum industry, understanding fracture networks is essential for optimizing hydrocarbon extraction, particularly in unconventional reservoirs like shale gas and tight oil [2].

Stress fields, tectonic movements, and thermal expansion can create fractures with various orientations and shapes [2]. Hence, considering fracture orientation is imperative in particle transport because it dictates the available pathways for movement. Renner et al. (2009) [3] studied the effect of particle orientation on composite strength, emphasizing the importance of orientation and distribution. Furthermore, Dandekar (2020) [4] analyzed the response of HMX-Sylgard samples to impact and vibration, considering crystal orientation and cleavage planes. Ding et al. (2021) [5] developed a methodology to simulate reactive particle transport in randomly oriented rough fractures, examining the effect of dominant factors on particle transport behavior. Overall, these studies collectively contribute to understanding the influence of fracture

orientation on particle transport and retention in fractured media. The orientation of fractures affects not only the distance that particles can travel but also their deposition patterns. This study aims to investigate the impact of fracture orientation on particle transport in fractured media through a combination of numerical modeling and sensitivity analysis. By systematically varying the orientation of fractures and analyzing the resulting transport behavior, this research seeks to identify the key mechanisms driving particle movement and quantify the sensitivity of transport parameters to fracture orientation. The findings of this study will contribute to a better understanding of particle transport in fractured media.

II. METHODOLOGY

To examine the effect of fracture orientation on particle transport in fractured media, this study employs a Lagrangian particle tracing module using COMSOL Multiphysics software. A 3D parallel plate fracture with dimensions of 50×100 mm² and an aperture of 1.5 mm is constructed. A sensitivity analysis is then developed by varying inclination angles to analyze the impact of fracture orientation (Figure 1).

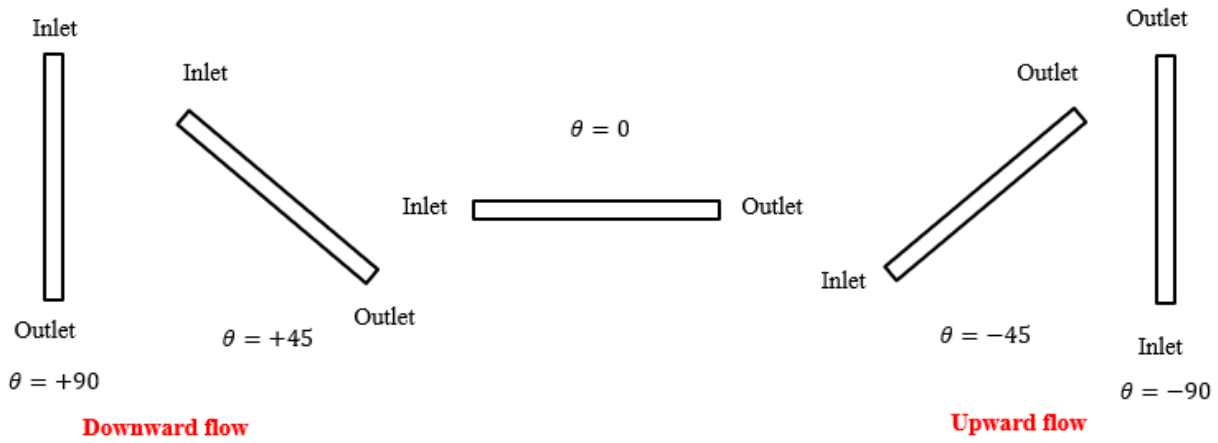

Fig 1. Fracture inclination scenario adopted in this study.

A. *Fluid flow*

The fluid flow is governed by the incompressible Navier-Stokes equations [2] :

$$\rho_f \frac{\partial u_f}{\partial t} + \rho_f (u_f \cdot \nabla) u_f = \nabla \cdot [-pI + K] + F \quad (1)$$

$$\rho_f \nabla \cdot u_f = 0 \quad (2)$$

With ρ_f is the fluid density, u_f is the fluid velocity, ∇p is the pressure gradient, F denote the momentum exchange term, and K is the liquid stress tensor.

B. *Particle trajectory*

A Lagrangian particle tracing simulation is employed to simulate the motion of particles and analyze their trajectories in detail. This method involves solving Newton's second law and force balance equations, allowing for precise tracking of individual particle movements. The simulation accounts for various forces acting on the particles, including gravitational forces, drag forces, and interaction forces between particles and boundaries as follows:

$$m \frac{d\,U}{dt} = \sum F_t \quad (3)$$

Where m and U are the particle masse and velocity respectively, and F_t denote the sum of F_g the gravity and F_d the drag forces.

The gravity force is given as [6]:

$$F_g = \frac{4}{3}\,\pi\, d_p^3(\rho_p - \rho_f).\, g \tag{4}$$

The drag force on a spherical particle is determined by Stokes' law:

$$F_d = \frac{C_D\, {u_f}^2 \rho_f \pi d_p^2}{8} \tag{5}$$

$$C_D = \begin{cases} \dfrac{24}{Re_p} & Re_p \le 0.5 \\ \dfrac{24\left(1 + 0.15{Re_p}^{0.687}\right)}{Re_p} & 0.5 < Re_p < 1000 \\ & Re_p > 1000 \end{cases} \tag{6}$$

$$Re_p = \frac{\rho_f u_f d_p}{\mu} \tag{7}$$

with $d_p$and $\rho_p$are the particle diameter and density, $\rho_f$and μ are the water density and viscosity, C_D is the drag coefficient and Re_p is the particle Reynolds number.

To resemble the phenomena of particle injection, N_0 Particles have been generated with uniform assigned initial positions starting from the inlet of the fracture. particle and fluid properties are represented in Table 1.

Fracture orientation angles are varied within a specified range (e.g., 0° to 90°) while keeping other parameters constant. This allows for the isolation of the effect of orientation on transport.

Table 1. Simulation parameters

Particles property		
Injected particle number at the inlet	10000	
Particle diameter	1	10^{-6} m
Particle density	2200	kg/m^3
Fluid property		
Water density	1000	kg/m^3
Water viscosity	0.001	Pa.s
Water inlet velocity	0.30	10^{-2}m/s

III. RESULTS AND DISCUSSION

The results of the numerical simulations and sensitivity analysis provide valuable insights into the impact of fracture orientation on particle transport.

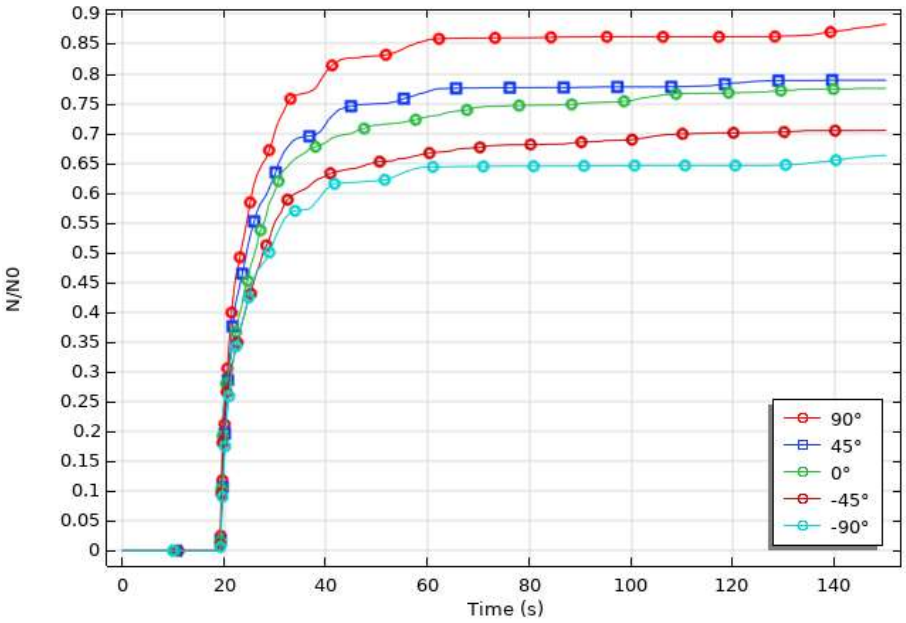

Figure 2. The normalized particle numbers at different fracture orientations.

Figure 2 shows the impacts of fracture orientation on the normalized number of recovered particles (N/N0) over time. Initially, all fracture orientations exhibit a rapid increase in particle recovery within the first 20 seconds, indicating that particles quickly begin to move through the fractures, regardless of orientation.

As time progresses, the differences in recovery rates become more pronounced, highlighting the significant impact of fracture inclination angles. Upward flow in vertical fractures (90°) achieves the highest recovery rates, demonstrating that they provide the most efficient pathways for particle movement. The upward orientation of these fractures likely minimizes resistance and offers direct pathways for particles, leading to efficient recovery.

Inclined fractures at 45° also show relatively high recovery rates, although they are slightly less efficient than vertical fractures. The upward inclination of these fractures still facilitates effective particle transport, albeit with added complexity compared to vertical pathways.

Horizontal fractures (0°) exhibit moderate recovery rates, as their orientation presents more obstacles and longer paths for particles, which can slow down recovery rates.

Downward-oriented fractures (-45° and -90°) show the lowest recovery rates. The downward inclination likely increases gravitational resistance and path complexity, hindering particle movement and reducing recovery efficiency.

IV. CONCLUSION

The study examined the impact of fracture orientation on particle transport with varying fracture inclination angles. The findings suggest that optimizing fracture orientation is crucial for maximizing particle recovery in systems where particle transport through fractures is a key process. Upward-oriented fractures, particularly vertical (90°) and inclined (45°) fractures, are preferable for enhancing recovery efficiency. In contrast, downward-oriented fractures are less effective and should be minimized to improve particle recovery rates.

[*]*(seydayildirim50@gmail.com)*

Özet **–** Özel eğitim öğretmenliği müfredatında yer alan Özel Eğitimde Aile Eğitimi dersinin içeriğine bakıldığında ailelere öğretme becerilerinin kazandırılması, aile eğitim programlarının hazırlanması, uygulanması ve değerlendirmesine yönelik ifadeler yer almaktadır. Bu doğrultuda Gaziantep ilinde yer alan bir üniversitenin özel eğitim bölümünde eğitim gören öğretmen adaylarından gönüllü olanlar ders kapsamında özel gereksinimli çocuk ailesiyle aile eğitimi oturumu uygulaması yapma deneyimi yaşamıştır. Bu araştırmada özel eğitim öğretmen adaylarının Özel Eğitimde Aile Eğitimi dersi kapsamında gerçekleştirdikleri aile eğitimi oturumuna yönelik ve derse yönelik deneyimlerinin belirlenmesi amaçlanmaktadır. Araştırmanın katılımcılarını dört özel eğitim öğretmen adayı oluşturmaktadır. Araştırma verileri yarı yapılandırılmış görüşme formunun Google Formlar aracılığıyla katılımcılara iletilmesiyle toplanmıştır. Elde edilen verilerin analizi içerik analiziyle gerçekleştirilmiştir. Analiz sonrasında üç ana tema ve 10 alt tema ortaya çıkmıştır. Araştırma sonucunda elde edilen bulgulara bakıldığında özel eğitim öğretmen adaylarının bu derse yönelik hazırlık yapmayı ve sorumlulukların zorlayıcı olduğunu düşünmelerine rağmen yerine getirerek bilgi sahibi olduklarını düşündükleri görülmektedir. Öğretmen adayları aile eğitim oturumu sürecinde makale okumaları ve materyal hazırlığı yaptıklarını, hazırlık yaparken öğretim elemanlarından destek aldıklarını, uygulama sürecinin olumlu deneyim sağladığını ve yeterlilik düşüncelerini arttırdığını ifade etmişlerdir. Görüş ve önerilerine bakıldığında ise, bu deneyimin aile eğitimine yönelik teorik bilgilerini anlamlandırmada faydalı olduğu ve kendilerine katkı sağladığını vurgulamışlardır. Yanı sıra gelecek dönemlerde dersi alacak diğer öğretmen adaylarının da aile eğitimi oturumunu bir aileye uygulama yaparak deneyimlemelerinin onlara katkı sağlayacağını düşündüklerini belirtmişlerdir.

Anahtar Kelimeler – Özel eğitim, *Öğretmen adayları, Aile eğitimi, Aile eğitimi oturumu, Fenomenoloji,*

I. GİRİŞ

Özel eğitim özel gereksinimli bireylerin akranlarından gelişim ve akademik alanlarda geride seyir gösteren bireylere alanında uzman kişiler tarafından bireyselleştirilmiş eğitim programları doğrultusunda sunulan eğitimdir [1]. Bu eğitim sürecinde özel gereksinimli bireye bire bir eğitim sunulması oldukça önemli görülmesinin yanı sıra ailelerinin de çocuklarının eğitim süreçlerine dahil edilerek onları desteklemeleri ilerlemenin sağlanması, kalıcı olması ve günlük yaşam alanlarına da genellemelerinde etkili olmaktadır [2]. Bu doğrultuda aile eğitimi, özel gereksinimli bireylerin ailelerinin bilgi sahibi olması ve onları beceri öğretmeye hazır hale getirmek için oluşturulan, sistematik, uzmanlar tarafından sunulan ve bilimsel temeli olan eğitimlerdir [3]. Aile eğitimleri oturumlar halinde gerçekleştirilmektedir. Bu oturumlar genellikle hazırlık yapılması, eğitim oturumunun uygulanması ve eğitim oturumu sonrasında değerlendirme yapılması olarak gerçekleştirilmektedir [4].

Özel eğitim öğretmenliği bölümünde eğitim gören öğretmen adayları meslek yaşantılarına adım atmadan önce aile eğitimine yönelik eğitim almaktadır. Bu bağlamda geliştirilen müfredatlara

bakıldığında da özel gereksinimli çocukların ailelerinin eğitilmesine yönelik dersin yer aldığı görülmektedir. Yüksek Öğretim Kurumu (YÖK) tarafından 2018 yılında hazırlanan ve hala üniversitelerin ilgili bölümlerinde okutulmaya devam edilen müfredatta da bu ders "Özel Eğitimde Aile Eğitimi" adıyla yer almaktadır. Bu dersin içeriğinde ailelere öğretme becerilerinin kazandırılması, aile eğitim programlarının hazırlanması, uygulanması ve değerlendirmesine yönelik ifadeler yer almaktadır [5]. Yanı sıra 2018 yılı öncesinde YÖK tarafından hazırlanan müfredatta da bu dersin "Aile Eğitimi ve Rehberliği" adıyla yer aldığı görülmektedir.

Alanyazında gerçekleştirilen araştırmalara bakıldığında Yıldırım Parlak (2023) araştırmasında özel eğitim öğretmen adaylarının hazırladıkları aile eğitim programları ve el kitapçıklarının incelenmesini amaçlamıştır. Araştırmada 25 aile eğitim programı ve el kitapçığı incelenmiştir. İnceleme sonucunda kavram öğretimi ve günlük yaşam becerileri çoğunlukta olmakla birlikte farklı becerilerin hedeflendiği, yanlışsız öğretim yöntemleri çoğunlukla olmakla birlikte doğrudan öğretim ve video model öğretim yönteminin ailelere öğretilmesinin hedeflendiği görülmektedir. Öğretmen adaylarının aile eğitim programını uygun olarak hazırladıkları görülürken kaynaklardan yararlanma konusunda desteklenmeleri gerektiği ortaya çıkmıştır [6]. Vural Batık ve Bayrakdar (2017) tarafından yapılan araştırmada 2018 öncesi müfredatta yer alan Aile Eğitimi ve Rehberliği dersini alan son sınıf öğretmen adaylarının görüşlerinin incelenmesi amaçlanmıştır. Öğretmen adaylarının sınıf içerisinde gerçekleştirilen aile eğitimi uygulamalarına yönelik olumlu kazanımlara sahip oldukları, algılarında ve tutumlarında da değişiklikler olduğu ortaya konmuştur. Yanı sıra öz yeterlik algılarında da olumlu artış olduğu belirtilmiştir [7].

Gerçekleştirilen araştırmalar kapsamında özel eğitim öğretmen adaylarının aile eğitimi dersi ve bu kapsamda özel gereksinimli çocuk ailesiyle gerçekleştirilen uygulamalara yönelik deneyimlerinin belirlenmesi ihtiyacı ortaya çıkmıştır. Bu doğrultuda bu araştırmada "Özel Eğitimde Aile Eğitimi" dersini alan ve özel gereksinimli çocuk ailesiyle aile eğitim oturumu deneyimi gerçekleştiren özel eğitim öğretmen adaylarının deneyimlerinin incelenmesi amaçlanmıştır.

II. MATERYAL VE YÖNTEM

Araştırmanın Modeli

Araştırmada Özel Eğitimde Aile Eğitimi dersini almış özel eğitim öğretmen adaylarının bu derse ve ders kapsamında özel gereksinimli çocuğu olan aileyle gerçekleştirdikleri aile eğitimi oturumuna yönelik deneyimlerinin belirlenmesine yönelik nitel araştırma desenlerinden biri olan fenomenoloji (olgubilim) yöntemi kullanılmıştır. Fenomenoloji, bireylerin yaşadıkları deneyimlerin özünü tanımlamayı sağlayan ve bu deneyimlerin "neyi" ve "nasıl" sorularını kullanarak derinlemesine betimlenmesini içeren bir desendir [8]. Araştırmada öğretmen adaylarının deneyimlerine yönelik bilgiler yarı yapılandırılmış görüşme formundaki sorular aracılığıyla elde edilmiştir.

Katılımcılar

Araştırmanın katılımcıları Gaziantep ilinde yer alan bir üniversitenin özel eğitim öğretmenliği bölümünde eğitim gören ve Özel Eğitimde Aile Eğitimi dersini alan öğretmen adaylarından oluşmaktadır. Katılımcıların belirlenmesi sürecinde 2023-2024 eğitim öğretim yılı bahar döneminde aile eğitimi dersi alan 37 özel eğitim öğretmen adaylarıyla yürütülen ders kapsamında geliştirecekleri aile eğitim programını özel gereksinimli çocuğu olan bir anneyle uygulama deneyimi sağlayabilecekleri ve araştırmanın amacı, onam süreci, elde edilen verilerin araştırma dışında farklı bir amaçla kullanılmayacağı vb. açıklanmıştır. Yanı sıra araştırma süreci boyunca çekilme hakları olduğu da belirtilmiştir. Gönüllü olan dört öğrenci araştırmaya katılmayı kabul etmiştir. Öğretmen adaylarına ilişkin bilgiler Tablo 1'de gösterilmektedir.

Tablo 1. Öğretmen Adaylarına İlişkin Bilgiler

Öğretmen Adayı	Yaş	Cinsiyet	Sınıf Düzeyi	Oturum Sorumluluğu
Lale	27	Kadın	3.sınıf	Hedef beceriye yönelik bilgi sunma
Süeda	23	Kadın	3.sınıf	Belirlenen yönteme yönelik bilgi sunma
Sedat	22	Erkek	3.sınıf	Yöntemin hedef beceriyle uygulanmasına yönelik bilgi sunma
Sertap	24	Kadın	3.sınıf	Aileyle birlikte sırasıyla rol oynama

Tablo 1'de yer aldığı üzere katılımcı özel eğitim öğretmen adaylarının 22-27 yaşları arasında olduğu görülmektedir. Katılımcıların üçü kadın ve biri erkektir. Tüm katılımcılar eğitimlerinin üçüncü sınıf düzeyindedir.

Veri Toplama Aracı

Araştırmada özel eğitim öğretmen adaylarının görüşlerine yönelik veri toplanması amacıyla yarı yapılandırılmış görüşme sorularının yer aldığı form hazırlanmıştır. Görüşme formu hazırlanırken öncelikle alanyazında yer alan kavramlar ve benzer araştırmalar incelenmiştir. Ardından görüşme sorularına yönelik bir havuz oluşturulmuştur. Bu sorular özel eğitim alanındaki üç uzmana gönderilerek görüşleri alınmıştır. Uzman görüşü sonrası görüşme formuna son hali verilmesiyle dokuz açık uçlu sorudan oluşmuştur.

Verilerin Toplanması ve Analizi

Özel eğitimde aile eğitimi dersi 2023-2024 bahar döneminde gerçekleştirilmiştir. Ders haftada iki saat olmak üzere 15 hafta boyunca gerçekleştirilmiştir. Dersin sorumlulukları arasında aile eğitim programı ve el kitapçığı hazırlama sorumlulukları bulunmaktadır. Araştırmanın yürütüldüğü üniversiteye bağlı olan özel eğitim uygulama ve araştırma merkezinde çocuğu (Down Sendromu tanısı, 7 yaş, kız) eğitim alan bir annenin çocuğuyla var olan olay doğrultusunda duyguları yansıtma becerisini çalışmaya gereksinimi olması üzerine öğretmen adaylarına gönüllü katılımlarıyla uygulama deneyimi gerçekleştirebilecekleri bildirilmiştir. Gönüllü katılımcı olmak isteyen dört öğrenciye araştırmacı tarafından aile eğitimi oturumunda hedeflenen beceri, kullanılması planlanan yöntem (zihin kuramı) ve oturumlardaki sorumluluklar aktarılmıştır. Ardından oturumdaki sorumluluklar kura yapılarak öğrencilere dağıtılmıştır. Hedeflenen beceri ve yönteme yönelik çalışmaları ve deneyimi olan öğretim elemanına öğrenciler yönlendirilerek aileyle çalışılma sürecinde nasıl uygulama yapacakları hakkında bilgi sahibi olmaları sağlanmıştır. Yanı sıra aile eğitim oturumu gerçekleştirilmeden üç gün önce araştırmacıyla katılımcılar bir araya gelerek hazırlıklarını tamamlamışlar ve dönütler verilmiştir. Aile eğitimi oturumunun uygulanmasına 10.05.2024 tarihinde başlanmıştır. Uygulama sürecinde hedef beceriye yönelik bilgi sunma, belirlenen yönteme yönelik bilgi sunma, yöntemin hedef beceriyle uygulanmasına yönelik bilgi sunma ve aileyle birlikte sırasıyla rol oynama olmak üzere dört oturum özel eğitim öğretmen adayları tarafından gerçekleştirilmiştir.

Öğretmen adaylarının aile eğitim oturumlarına yönelik görüşlerine dair veri toplama sürecinde eğitim öğretim döneminin sonuna gelinmesi ve yüz yüze gelinememesi nedeniyle görüşme formu Google Formlar uygulamasıyla açık uçlu sorular halinde iletilmiştir. Formun ilk maddesi olarak araştırmaya gönüllü katılımlarına yönelik onay maddesi yer almıştır ve tüm katılımcılar bu maddeyi "evet" olarak yanıtlamıştır. Verilerin toplanması katılımcıların görüşlerini detaylı bir şekilde yazmalarını içermesi nedeniyle 08.07.2024-12.07.2024 tarihleri arasındaki beş gün içerisinde gerçekleşmiştir. Google formlardan veriler indirilip kontrol edildiğinde 20 sayfa veri elde edilmiştir.

Elde edilen verilerin analizine yönelik içerik analizi gerçekleştirilmiştir. İçerik analizinde verilerin açıklanmasına imkan tanıyan kod, alt tema ve temaların ortaya konulmasını içermektedir [9]. Bu doğrultuda elde edilen veriler okunmuş ve tekrarlı olarak geçen ifadeler belirlenerek kodlar ortaya çıkmıştır. Birbirleriyle ilişkili olan kodlar bir araya getirilerek alt tema ve temalar ortaya çıkarılmıştır.

III. BULGULAR

Özel eğitim öğretmen adaylarının görüşme formundaki sorulara verdileri yanıtların analizi sonucunda elde edilen bulgular bu başlık altında yer almaktadır. Elde edilen bulgular, Özel Eğitimde Aile Eğitimi dersini alan ve aile eğitimi oturumu deneyimi yaşayan özel eğitim öğretmen adaylarının deneyimlerine yönelik görüşlerini içermektedir. Elde edilen bulgular üç ana tema ve 10 alt temadan oluşmaktadır. Bu başlık altında ana temalar ve alt temalar tablolaştırılarak sunulmuştur.

Tablo 2. Özel Eğitimde Aile Eğitimi Dersine Yönelik Görüşler

Ana Tema	Alt Tema
Özel Eğitimde Aile Eğitimi Dersine Yönelik Görüşler	Dersin işlenişi
	Derse hazırlık
	Kendilerinden beklenen sorumluluklar

Özel eğitim öğretmen adayları, Özel Eğitimde Aile Eğitimi dersinin işlenişine yönelik hem teorik hem de uygulama sürecine yönelik bilgilerin verilerek işlendiğine yönelik görüş belirtmişlerdir. Öğretmen adayı Sertap, *"..Bir beceriyi öğretirken aileye nasıl öğretileceği, hangi yöntemin kullanılacağını, ailelerin pekiştireçleri nasıl kullanılacağını, aile ile toplantıların nasıl düzenlenir, el kitabı hazırlanışını öğrenmiş bulunuyorum."* ifadesiyle dersin içeriği hakkında görüşünü belirtmiştir. Lale ise, *"...keyifli ve verimli geçmesinin önemli bir kısmının öğretim elemanının bu dersin içeriğini örneklerle daha da somutlaştırarak anlatmasıdır."* diyerek dersin işlenişi esnasında örnekler sunulduğunu ifade etmiştir.

Derse hazırlığa yönelik olarak Sedat, "*Bu derse hocamızın da isteği üzere verimli bir şekilde not alarak hazırlandım, ders başlamadan önce hocamızın önceki haftalarda araştırmanızda ve okumanızda fayda var denilen makaleleri okudum derste bunları yorumladık.*" ifadesiyle notlar aldığını ve ders sürecinde makale okuyarak hazırlık yapıldığını belirtmiştir. Ders esnasında kendilerinden beklenen sorumluluklar hakkında ise Sertap "*Sorumluluklarımız derste not alma, verilen makaleyi okuma, okuduğumuz makale hakkında sınıfta düşüncelerimizi paylaşma, ilgili ödevleri yapmak oldu. Görevlerimiz bizim için verimli olduğunu düşünüyorum.*" ve Süeda, *"...ileride çalışacağımız ailelere faydalı olabilmek için dersin sorumluluklarını yerine getirmemiz gerekiyor."* diyerek dersin sorumluluklarının kendileri için verimli olduğunu ve meslek yaşantısında kullanmaları için lazım olacağını belirtmişlerdir.

Tablo 3. Aile Eğitimi Oturumuna Yönelik Görüşler

Ana Tema	Alt Tema
Aile Eğitimi Oturumuna Yönelik Görüşler	Oturumdaki sorumluluklar
	Alınan destek
	Uygulama yapmaya yönelik düşünceler
	Ailelerle çalışmaya yönelik yeterlilik

Araştırmanın ikinci ana teması olan aile eğitimi oturumuna yönelik görüşlere bakıldığında özel eğitim öğretmen adaylarının oturumda farklı sorumluluklara sahip oldukları, süreçte destek aldıkları, uygulama yapmanın kendileri için aile eğitimine yönelik bilgilerini pekiştirdiğini ve kendilerindeki yeterlilik düşüncesini olumlu etkilediği ortaya çıkmıştır. Oturumdaki sorumluluklarına yönelik Lale, "*Bu oturumda duygu nedir, ne işe yarar, duyguların amacı, duyguları tanıma neden önemli, duyguları anlamak*

neden önemli, çocuklara duyguları öğretiminin faydaları nelerdir gibi başlıklar üzerinde bu konuyla ilgili makalelerden faydalanarak aileye bu konuda bilgi verdim." diyerek aileye hedef beceriye yönelik bilgi vermeye yönelik hazırlık yaptığını ifade etmiştir.

Aile eğitim oturumu sürecinde alınan desteğe yönelik Sertap, "*Dersimizin hocasından beceri ile ilgili ailelere daha iyi nasıl anlatabiliriz diye fikir alışverişinde bulunduk. Hocamız bizlerin hazırlamış olduğu slaytı ve kartları kontrol ederek yönlendirmeler yapmıştır."* ve Lale "*Sorumlu olduğum oturumla ilgili dersi aldığım öğretim elemanı ve bölümde olan farklı öğretim elemanından da destek aldım.*" diyerek hem dersin öğretim elemanı hem de konuyla ilgili çalışması ve deneyimi olan farklı bir öğretim elemanından destek aldığını belirtmişlerdir.

Öğretmen adaylarının uygulama yapmaya yönelik düşüncelerine bakıldığında Sedat, "*Gerçekleştirdiğim aile eğitimi oturumu gerçek bir öğrencinin ailesiyle yaptığım ilk buluşmaydı bu yüzden çok heyecanlıydım ve mesleğimi daha çok benimsememe yardımcı oldu bu oturum."* Diyerek özel gereksinimli çocuk ailesiyle ilk defa eğitim gerçekleştirme fırsatı bulduğunu belirtmiştir. Ailelerle çalışmaya yönelik yeterlilik konusunda Lale, "*Aileyle çalışmam ilk tecrübeydi öncesinde herhangi bir deneyimim olmadığı için yeterli yeterliliğe sahip değildim. Aile ile oturum gerçekleştirdikten sonra bu konuda daha fazla tecrübeyle gerekli yeterliliğe sahip olacağımı düşünüyorum.*" ifadesiyle kendisinin ailelerle çalışma konusunda öncesine göre daha yeterli olacağını düşündüğünü belirtmiştir.

Tablo 4. Görüş ve Öneriler

Ana Tema	**Alt Tema**
Görüş ve Öneriler	Dersi alacak öğretmen adaylarının deneyimlemesini isteme
	Katkı sağladığına inanma
	Aile eğitimiyle ilgili bilgilerini pekiştirme

Araştırmanın son ana teması olan görüş ve önerilerde, bu dersi gelecekte alacak öğretmen adaylarının da deneyimlemesini istedikleri, bu deneyimin kendilerine katkı sağladıklarına inandıkları ve aile eğitimiyle ilgili bilgilerini pekiştirdiği görülmüştür. Sertap, "*Hocamız seneye bu dersi tekrardan verecek olursa sınıftaki herkesi uygulama merkezinde gerçek aileler ile bu deneyimi yasamalarına imkan sağlamalarını isterdim.*" ifadesiyle gelecek yıllarda dersi alacak diğer öğretmen adaylarının da özel gereksinimli çocuk ailesiyle aile eğitim oturumu deneyimi olmasını istediği görülmektedir. Katkı sağladığına inanmaya yönelik Sedat, "*…o aileye çocuğun hayatını kolaylaştırmayı etkileyecek bilgi vermek mükemmel bir his.*" diyerek görüşünü belirtmiştir. Aile eğitimiyle ilgili bilgilerini pekiştirmeye yönelik Süeda, "*Derste öğrendiğimiz konuları aileyle uygularken tek tek hatırladım. Teorik olarak okumak farklı ama uygulama yapmak teorik bilgimizi pekiştirdi.*" Diyerek gerçekleştirdiği oturumda aile eğitimine yönelik bilgilerini pekiştirdiğini belirtmiştir.

IV. TARTIŞMA

Bu araştırmada, özel eğitim öğretmen adaylarının Özel Eğitimde Aile Eğitimi dersine ve deneyimlemiş oldukları aile eğitimi oturumuna yönelik görüşleri derinlemesine betimlenmiş ve incelenmiştir. Bu doğrultuda öğretmen adaylarının aile eğitimi dersine yönelik işleniş açısından teorik ve uygulamaya yönelik bilgilerin birlikte verildiğini ve dersin yaşantılarla somutlaştırılarak aktarıldığını belirttikleri ortaya konmuştur. Alanyazında yer alan araştırmada pozitif öğretmen davranışları arasında konuşarı somutlaştırarak açıklamanın da yer aldığı görülmektedir [10]. Yanı sıra özel eğitim öğretmen adaylarının dersin sorumluluklarına yönelik ders esnasında not alma, makale ödevlerini okumak ve sınıfta tartışmak olarak belirtmişlerdir. Bu sorumluluklara yönelik olarak da kendi gelişimleri için gerekli olduğu görüşünde oldukları ortaya çıkmıştır. Gerçekleştirilen araştırmada başarılı öğrencilerin derslere yönelik sorumluluklarının farkında olarak akademik başarılarının arttığı belirtilmekle birlikte öğretim üyelerinin öğrencilerine kendilerinden beklenen sorumlulukları, verimli çalışmayı ve başarıyı nasıl edinebileceklerine yönelik açıklamalar yapmasının faydalı olabileceği belirtilmiştir [11].

Özel eğitim öğretmen adaylarının aile eğitimi oturumuna yönelik görüşlerine bakıldığında makale okuma, sunum hazırlama ve materyal hazırlama gibi farklı sorumluluklar alarak kendilerini aile eğitimi oturumuna hazırladıkları görülmektedir. Gerçekleştirilen bir araştırmada özel eğitim öğretmen adaylarının aile eğitim oturumuna yönelik farklı sorumluluklar edindikleri, sunum ve materyal hazırladıkları görülmesi bu bulguyla paralellik göstermektedir [7].

Aile eğitimi oturumuna hazırlık ve uygulama sürecinde öğretmen adayları hem dersin öğretim elemanı hem de hedef beceriye yönelik çalışmalar yapan öğretim elemanından destek aldıklarını bildirmiştir. Gerçekleştirilen araştırmada öğretmen adaylarının öğretim elemanlarından karşılaştıkları sorunlar ve çözümlerine yönelik dönüt aldıklarını ve bu dönütlerin kendi gelişimleri için faydalı olduğunu ifade etmeleri açısından benzerlik göstermektedir [12]. Alanyazında da öğretmen adaylarına yapılan danışmanlığın onların öğrenmelerine ve zorluklarla başa çıkmalarına yönelik gelişmelerine katkı sağlayacağı vurgulanmaktadır [13].

Özel eğitim öğretmen adaylarının uygulama sürecinin kendileri için ailelerle bir araya gelmelerinde ilk fırsat olduğunu belirtmeleri alana yönelik deneyim kazanmaları açısından katkı sağlamıştır. Yanı sıra daha öncesinde böyle bir deneyime sahip olmadıkları için kendilerinden emin olamazlarken aile eğitimi oturumu sonrasında ailelerle çalışma yeterliliğini hissetmeleri konusunda kendilerinde olumlu ilerlemeler olduğunu düşünmektedirler. Özel eğitim öğretmen adaylarına özel gereksinimli öğrencilerle gönüllü uygulama yapma deneyimi sunulan araştırmada da katılımcıların mesleki deneyime yönelik olumlu kazanımları olduğunu ve kendilerini öğretmen gibi hissettiklerini ifade ettikleri görülmektedir [12].

Öğretmen adaylarının görüş ve önerilerine bakıldığında bu dersi gelecek yıllarda alacak diğer öğretmen adaylarının da özel gereksinimli çocuk ailesiyle uygulama deneyimi kazanmaları gerektiğini belirtmeleri önemli bir bulgu olarak görülmektedir. Öğretmen adaylarının bu süreci öğretmenlik mesleğine adım atmadan önce kendilerine katkı sağlayan bir deneyim olarak gördüğü ortaya çıkmaktadır. Alanyazın incelendiğinde öğretmen adaylarının mesleklerine yönelik ders almaları ve uygulamalara dahil olmalarının mesleklerine bakışlarıyla ilgili değişikliğin önemli unsurları olduğu belirtilmektedir [14, 15]. Özel eğitim öğretmen adaylarının gerçekleştirdiği deneyimle hem özel gereksinimli çocuğa hem de ailesine katkı sağladıklarını düşündükleri görülmüştür. Bu hususta öğretmen adaylarına yapacakları mesleğe yönelik deneyim kazandırılması ve hem aileye hem de çocuklarına olumlu katkı sağlayacakları konusunda inanca sahip olmaları önemli bir husus olarak düşünülmektedir. Nitelikli bir özel eğitim öğretmeni yetiştirmeye yönelik öğretmen yeterlilikleri arasında teorik bilginin yanı sıra öğretim işlem süreçlerine hâkim olma yani uygulamayı da gerçekleştirebilmek yer almaktadır [16]. Bu doğrultuda özel eğitim öğretmen adaylarına teorik bilgilerin sunulmasının yanı sıra bu bilgileri uygulama sürecinde deneyimlemelerini sağlamak ve dönütler sunmak önem arz etmektedir. Aile eğitimi oturumu deneyiminde ders esnasında edindikleri teorik bilgilerin pekişmesine katkı sağladığını ve bu bilgileri uygulama esnasında kullanabildiklerini belirtmişlerdir. Bu hususta teorik bilgilerin edinilmesinin hemen ardından uygulama fırsatı sunulması özel eğitim öğretmen adaylarının aile eğitiminin uygulanmasına yönelik olumlu kazanımlar sağlamıştır. Alanyazında yer alan araştırmalarda da özel eğitim öğretmenliği programının en büyük eksikliğinin uygulama alanında yetersiz kalması olarak görülmektedir [17, 18, 19].

V. SONUÇLAR

Araştırmanın sonuçlarına bakıldığında, özel eğitim öğretmen adaylarının aile eğitimi dersine, derse yönelik sorumluluklara ve bu ders kapsamında gerçekleştirdikleri aile eğitimi oturumu deneyimine yönelik zorlayıcı olduğunu düşünmelerine rağmen mesleğe yönelik gelişimlerinde olumlu katkıları olduğunu düşündükleri görülmektedir. Özel eğitim öğretmen adaylarının derse ve aile eğitimi oturumuna hazırlık yapma sürecinde sahip olduğu sorumlulukların farkında oldukları ve bu sorumlulukları gerçekleştirmenin gelecekteki meslek yaşantılarına katkı sağlayacağını düşündükleri görülmektedir. Ders ve aile eğitimi oturumu esnasında öğretim elemanlarından destek aldıklarını belirttikleri görülmektedir. Bu hususta özel eğitim öğretmen adaylarına sunulan desteği önemli buldukları görülmektedir. Yanı sıra aile eğitimi oturumu deneyimini diğer öğretmen adaylarının da yaşamasının onlara katkı sağlayacağını düşünmektedirler. Alanyazında öğretmen adaylarının meslek yaşantısına geçmeden önce hem ailelerle hem özel gereksinimli öğrencilerle uygulamalar yapmasına yönelik çalışmalarda da benzer bulgular

olduğu görülmektedir. Bu bağlamda öğretmen adaylarına mümkün olan tüm fırsatlarda uygulama deneyimi sunulması ve bu konuda çalışmalar gerçekleştirilmesi önerilmektedir. Bu araştırmanın sınırlılığı uygulamayı gerçekleştiren dört özel eğitim öğretmen adayıyla kısıtlı tutulması ve yarı yapılandırılmış görüşme sorularına ait formun Google Formlar aracılığıyla iletilerek yazılı olarak görüşlerinin alınmış olmasıdır. Gelecek araştırmalarda farklı derslerdeki uygulamalara, farklı özelliklere sahip öğretmen adaylarına yönelik araştırmaların gerçekleştirilmesi ve gerçekleştirilen görüşmelerin yüz yüze yapılması önerilebilmektedir.

Abstract **–** This study examines changes in crystalline quality within polycrystalline Bi2.1+xSr2.0Ca2.1Cu3.0Oy high-temperature structures (Bi-2223) due to the addition of bismuth impurity ions using experimental powder X-ray diffraction measurements conducted. Bi2.1+xSr2.0Ca2.1Cu3.0Oy materials with mole ratios ranging from 0.000 to 0.100 are synthesized under ambient conditions. Analysis of the experimental data from partial diffraction peaks indicates that each polycrystalline material retains desired Bi-2223 superconducting phase but with a reduction in the characteristic high superconducting phase fraction depending on the addition amount. For the high-Tc Bi-2223 characteristic superconducting phase, the pure sample has the volume fraction level of 76.8% whereas the Bi5* sample prepared by the highest bismuth ions shows the minimum Bi-2223 phase of 27.0%. This decrease is primarily attributed to the incorporation of bismuth impurity addition into the Bi-2223 crystal system. Furthermore, significant correlations are established among various characteristic features such as reflection intensities of diffraction peaks, Lotgering index, average grain sizes, and lattice cell parameters. In summary, all experimental findings and associated calculations reveal that bismuth impurities cause a decline in the characteristics of the Bi-2223 superconducting phase, c cell parameter, and grain growth.

Keywords – Bi-2223 superconductors; Bismuth impurities; powder X-ray diffraction; Phase volume fraction; grain size

I. INTRODUCTION

High-temperature ceramic materials with their layered structures present superconductivity at temperatures above 77 K [1]. Similarly, these types of the ceramic compounds possess greater critical current carrying capability and larger critical magnetic field magnitude carrying ability. That is exactly why researchers have widely preferred the high-temperature superconducting ceramic materials in several application fields such as accelerators, energy storage, motors, medical diagnosis, heavy industry technology, and advanced engineering applications [2-5]. Of the ceramic superconductors, Bi-containing superconductors, which feature well-aligned superconducting grains adjacent stacked plates and excellent inter-grain contact, are strong candidates for larger magnetic field and energy storage fields [6]. Furthermore, the crystal system's double BiO layers ensures that the grains in Bi-based advaced superconductors align in the preferred directions during fabrication or physical distortions. Moreover, the ceramics show low-angle grain boundaries based on the presence of three components together in their crystal structure. This traditional parent inheritance results in an atomically smooth crystal structure, allowing BSCCO superconductors to be easily crystallographically aligned, making the materials suitable

for winding cables/coils/tapes used in fabrication for generators, motors, magnets, transformers, and medical equipment under deformation [7, 8]. The Bi-containing parents with three main different characteristic superconducting phases show the superconductive temperatures between Tc≈20 K (for the very low-Tc Bi-2201) and Tc≈110 K (for the high-Tc Bi-2223) [9-11]. Among the phases, the last one is mostly preferred in the potential application fields due to its higher critical superconductive temperatures, greater critical current carrying capability, and extremely larger critical magnetic field magnitude carrying capacity. All these features are completely related to the crystal structure of the Bi-containing superconducting parents. With the development in the crystallinity quality of the ceramic compounds, the materials can find a place in many more application areas. In this respect, we analyze the change of the crystallization quality for the extra bismuth impurity added (intervals $0.00 \leq x \leq 0.10$) $Bi_{2.1+x}Sr_{2.0}Ca_{2.1}Cu_{3.0}O_y$ systems with the impurity addition mechanism with the aid of the powder X-ray diffraction measurements. The XRD curves obtained enable us to determine the variation of crucial crystallinity features including lattice cell constants, crystal texturing, grain size, Lotgering indices, phase compositions/purities, and the idea of grain alignment distributions/orientations through the superconductive layers. The experimental results observed reveal that the presence of and augmentation of bismuth ions addition level (until the bismuth molar ratio of x=0.10) disturb considerably the fundamental crystallinity features.

II. Materials and Method

Present study extends the systematic characterization of high-temperature compounds with added bismuth. In our previous publication [12], we detailed the fabrication process, including powder impurities, solid-state reaction, and conditions for calcination medium and main annealing treatments. We also outlined the experimental setups and methods, and investigated the impact of adding extra bismuth impurity ions to the Bi-2223 crystal lattice (at various molar proportions of x = 0.00, 0.01, 0.02, 0.04, 0.08, and 0.10) on mechanical properties such as fracture toughness, elastic hardness coefficient, brittleness indices, and yield strength parameters. These properties were measured using Vickers hardness tests under applied forces for 10 seconds. The Bi-added high-temperature crystal structures prepared are referred to as Bi0*, Bi1*, Bi2*, Bi3*, Bi4*, and Bi5*, respectively. In this part of identification studies, we extensively examine the variation of crystallographic features pertaining to high-temperature structures with bismuth impurity addition in the main system. On this basis, X-ray diffraction (XRD) patterns are measured using a Rigaku Multiflex+XRD 2kW diffractometer with CuKa radiation (1.54 Å wavelength). The measurements are conducted at 36 kV and 26 mA power, with experimental data recorded over a 2θ range from 3° to 60° in 0.02° steps at room temperature, with a counting time of approximately 10 seconds per step. JCPDS index cards with numbers 41-0317 and 41-0374 were used to index the diffraction peaks in the XRD diffractograms, utilizing a tetragonal unit cell and P4/mmm space group. The diffraction peaks intensities in the XRD diffractograms for the Bi-added high-temperature crystal structures enable the determination of key structural parameters such as Lotgering indices, lattice cell constants, crystal texturing, grain size, phase compositions/purities, and grain alignment distributions/orientations through the superconductive layers.

III. Results and Discussion

A. *Differentiation of basic crystallinity parameters for $Bi_{2.1+x}Sr_{2.0}Ca_{2.1}Cu_{3.0}O_y$ structures*

Powder X-ray diffraction (XRD) diffractograms pertaining to different bismuth added high-temperature crystal structures are measured in the 2θ angles intervals 3°-60° under atmospheric pressure in the case of room temperature, one can observe the partial XRD diffractograms for the pure, Bi1*, and Bi2* Bi-2223 ceramic compounds are provided in Fig. 1 graphically. Similarly, the partial XRD diffractograms belonging to the Bi3*, Bi4*, and Bi5* materials are also given in Fig. 2. The differentiation in the peak point places, the disappearance, and occurrence in the XRD diffraction peaks indicates the successful

addition of extra bismuth foreign ions in the bulk Bi-2223 advanced ceramic compounds. In addition, we sign the characteristic and impurity diffraction occurred in Fig. 1 and 2 by using the related Miller indices such as * for the impurity characteristic phase of Bi2O3 phase, (hkl) VL for very low-Tc phase, (hkl)L for low-Tc characteristic phase, and (hkl)H for high-Tc characteristic superconducting phases. The characteristic superconducting phases (appeared in XRD diffractograms) mentioned in the current work are related to the tetragonal crystal phase.

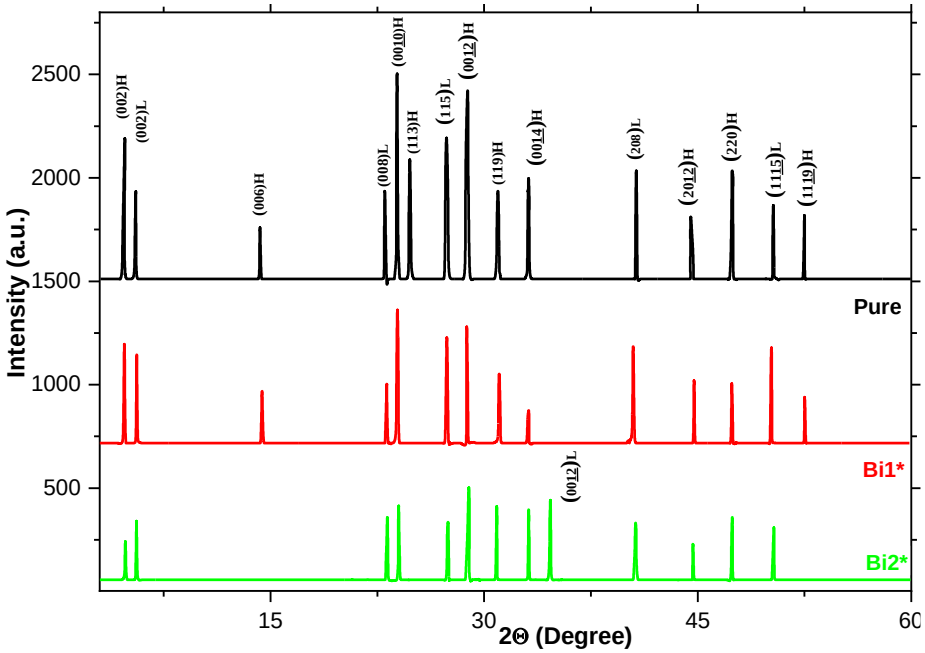

Figure 1 XRD patterns for pure, Bi1*, and Bi2* Bi-2223 ceramic compounds. Notations of "*VL*", "*L*", "*H*" and "*" show low-T_c and high-T_c characteristic superconducting phases, respectively.

At the same time, in Fig. 2 for the polycrystalline Bi4* and Bi5* superconducting materials there appear new diffraction peaks intensities points related to the Bi_2O_3 characteristic phases. The occurrence of the new impurity diffraction peaks indicates that the electron-phonon coupling formations are harmed so does the superconductivity in the crystal system. Additionally, according to both Fig. 1 and Fig 2, the diffraction intensities peaks are generally reflected from the (001) planes, pointing out that the crystal planes are aligned towards the *c*-axis orientation [13].

B. *Change of diffraction peak intensities in XRD diffractograms for different different bismuth added high-temperature crystal structures*

Addition of extra bismuth ions in Bi-2223 matrix is recorded to impair significantly both the low and especially high characteristic superconducting main phases.

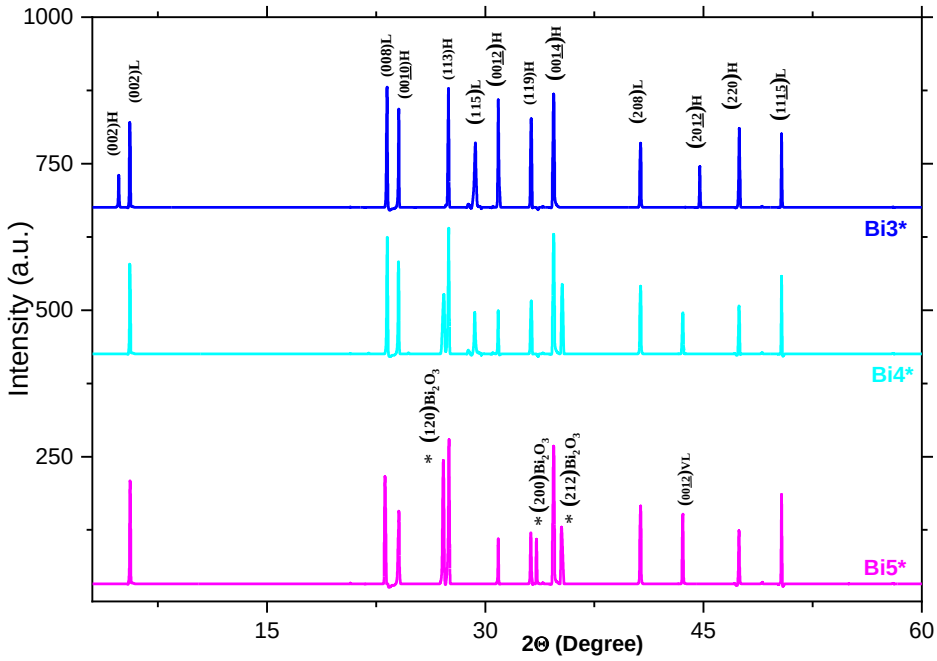

Figure 2 XRD patterns for Bi3*, Bi4*, and Bi5* materials. Notations of "*VL*", "*L*", "*H*" and "*" show very low-T_c, low-T_c, high-T_c characteristic superconducting and Bi_2O_3 impurity phases, respectively.

Specifically, the bismuth ions impurities in the copper oxide layers triggers to accelerate the formation of the very low-Tc superconducting and characteristic impurity phase as much as possible. As a result, the stabilizations of the superconducting Bi-2223 and Bi-2212 phases are affected detrimentally while the especially superconducting Bi-2201 phase becomes more stabilized in the $Bi_{2.1+x}Sr_{2.0}Ca_{2.1}Cu_{3.0}O_y$ main matrix with increasing bismuth impurity addition levels. This indicates that the presence of bismuth ions impurities embedded in the crystal matrix leads to strongly degradation in the fundamental crystallinity quality. Similarly, the diffraction peaks for the superconducting Bi-2212 and Bi-2223 phases obtained from the reflated beams are noted to systematically diminish based on the increase in bismuth impurity additions amounts. As for the numerical parameters, only the pure, Bi1*, Bi2*, and Bi3* superconducting sample have the (002)H diffraction peak at about a 2θ angle of 4.60°. The peak is found to disappear for the other superconducting Bi4* and Bi5* compounds. Relative phase volume fractions are also calculated in the following section. Likewise, the diffraction peak belonging to the (113)H is observed at approximately a 2θ angle of 23.24° for only the pure sample. The other has no longer the (113)H diffraction peak in their XRD diffractograms. Besides, the diffraction peak named as (006)H at nearly a 2θ angle of 14.88°. are observed for only the pure and Bi1* superconducting samples whereas the peak disappears for the other materials. The vanish of the characteristic high superconducting phase results in the Bi-2223 phase volume fraction in the crystals system. Similarly, the XRD peak occurred at nearly 53.04° ascribes to the (11$\underline{19}$)H diffraction peak and is observed for only the XRD patterns of pure and Bi1* superconducting materials. Furthermore, the superconducting (20$\underline{12}$)H peak appeared at nearly a 2θ angle of 44.66° is noted to disappear for the Bi4* and Bi5* crystal structure. The decreased diffraction peaks are singed as (00$\underline{10}$)H, (00$\underline{12}$)H, (00$\underline{19}$)H, and (220)H, respectively. The (119)H peak intensity observed at nearly a 2θ angle of 31.82° is found to decrease for the Bi1* sample, but then a very little increase for the Bi2* material. Then, the peak intensity belonging to the (119)H diffraction peak is observed to reduce regularly with the increase of the bismuth impurity ions in the crystal system. As for the low characteristic superconducting phase intensities, similar to those of Bi-2223 superconducting phase intensities, there appears a systematic decrease. There appears no appearance of new impurity peaks in the XRD diffractograms expect for the (00$\underline{12}$)L diffraction peak. On this basis, the peak immediately appears at 2θ = 35.22° for the polycrystalline Bi2*, Bi3*, Bi4*, and Bi5* samples. However, the characteristic peak of (008)L at 2θ = 22.84° is noted to disappear completely in the XRD pattern for the bulk polycrystalline Bi1*, Bi2*, Bi3*, Bi4*, and Bi5* samples. Additionally, the appears a new peak formation for the very low-T_c characteristic phase assigned as (00$\underline{12}$) VL at 2θ angle of 43.48° for the

bulk Bi4* and Bi5* compounds. Thus, the intensity reaches the highest point for the Bi5* ceramic sample. This is in correspondence to the stabilization of the superconducting Bi-2201 characteristic phase. Furthermore, the Bi4* and Bi5* materials has the impurity phases (signed as *) related to the (120)Bi_2O_3 at 2θ angle of 27.12°.and (212)Bi_2O_3 at 2θ angle of 35.22°. Besides, the phase assigned as (200)Bi_2O_3 impurity peak observed at 2θ angle of 33.52° ascribes to only the Bi5* sample (See in Fig. 1). To sum up, it is obtained that the solubility limit for the bismuth impurity in the bulk superconducting Bi-2223 structure is around x=0.07 [13].

All in all, the bismuth ions impurities addition to Bi-2223 ceramic structure is recorded to diminish remarkably the quality of crystallinity and the superconducting structure by damaging both the low and high phases in the system. Despite this, the characteristic XRD diffraction peak formations indicate that the low Bi-2212 phase remained dominant across all substitution ranges compared to the other phases, depending on the level of extra bismuth ions impurity.

C. *Computation for relative phase volume fractions for Bi2.1+xSr2.0Ca2.1Cu3.0Oy crystal structure*

The relative phase percentages or phase volume fractions of the different characteristic superconducting phases (Bi-2223 high-T_c, Bi-2212 low-T_c, Bi-2201 very high-T_c, andBi_2O_3) present in the bulk polycrystalline Bi-2223 ceramic system are determined using classic calculation equations (Eqs. 1-4). The numerical findings are clearly listed in Table 1.

$$f_{(Bi-2223)}=\frac{\sum I_{Bi-2223(hkl)}}{\sum I_{Bi-2223(hkl)}+\sum I_{Bi-2212(hkl)}+\sum I_{Bi-2201(hkl)}+\sum I_{Bi2O3(hkl)}}x100\% \quad (1)$$

$$f_{(Bi-2212)}=\frac{\sum I_{Bi-2212(hkl)}}{\sum I_{Bi-2223(hkl)}+\sum I_{Bi-2212(hkl)}+\sum I_{Bi-2201(hkl)}+\sum I_{Bi2O3(hkl)}}x100\% \quad (2)$$

$$f_{(Bi-2201)}=\frac{\sum I_{Bi-2201(hkl)}}{\sum I_{Bi-2223(hkl)}+\sum I_{Bi-2212(hkl)}+\sum I_{Bi-2201(hkl)}+\sum I_{Bi2O3(hkl)}}x100\% \quad (3)$$

$$f_{(Bi2O3)}=\frac{\sum I_{Bi2O3(hkl)}}{\sum I_{Bi-2223(hkl)}+\sum I_{Bi-2212(hkl)}+\sum I_{Bi-2201(hkl)}+\sum I_{Bi2O3(hkl)}}x100\% \quad (4)$$

in the relations provided, the abbreviation of I shows the XRD peak intensity for the characteristic superconducting phases.

Table 1 Phase percentages, grain (average) sizes, Lotgering indices, lattice cell (*a* and *c*) deduced from XRD diffraction peaks intensities

Compounds	***Average grain size (nm)***	***Lotgering index, F***	***Volume fraction (≈%)***				***c (Å)***	***a (Å)***
			2212	***2223***	***2201***	***Bi_2O_3***		
Pure	65.42	0.430	23.2	76.8	0	0	37.08	5.41
Bi1*	61.18	0.396	32.5	67.5	0	0	36.92	5.43
Bi2*	60.54	0.354	38.3	62.7	0	0	36.55	5.45
Bi3*	57.38	0.325	44.5	55.5	0	0	36.28	5.46
Bi4*	52.15	0.295	46.0	37.4	10.4	6.2	35.84	5.47
Bi5*	46.94	0.264	49.3	27.0	14.8	8.9	35.66	5.48

The discussions based on the table show that both the bulk pure compound and $Bi_{2.1+x}Sr_{2.0}Ca_{2.1}Cu_{3.0}O_y$ matrices exhibit a combination of characteristic Bi-2212 low-T_c and Bi-2223 high-T_c superconducting phases. However, the Bi4* and Bi5* ceramics also present the characteristic Bi-2201 very low-T_c superconducting and Bi_2O_3 impurity phases. Numerically, the pure ceramic material had phase volume fractions of 23.32% for the Bi-2212 low-T_c phase and 76.8% for the Bi-2223 high-T_c superconducting

phase. As the bismuth ions impurities amounts enhance in polycrystalline $Bi_{2.1+x}Sr_{2.0}Ca_{2.1}Cu_{3.0}O_y$ high-temperature structures, the characteristic high superconducting phase decreases sharply. With bismuth impurity addition increasing to a maximum of x=0.100, both the low and high-T_c superconducting phases decrease steadily. On this basis, the high-T_c superconducting phase reaches its lowest fraction, approximately 27.0%, at x=0.100 due to the emergence of other superconducting and impurity fraction phases in the Bi-2223 structure. In this respect, the sample shows very low-T_c superconducting phase of 14.8% while the impurity phase of Bi_2O_3 impurity is obtained to be about 8.9%. For the bulk Bi4* superconducting ceramic sample, the high-T_c Bi-2223, low-T_c Bi-2212, and vey low-T_c Bi-2201 phases are obtained to possess the percentages of 37.4%, 46.0%, and 10.4%, respectively. The impurity phase appears about 10.4% in $Bi_{2.1+x}Sr_{2.0}Ca_{2.1}Cu_{3.0}O_y$ matrix. As for the polycrystalline superconducting Bi3* compound, the Bi-2223 and Bi-2212 superconducting phases are noticed to be about 55.5% and 44.5%, respectively. Moreover, the Bi2* sample has the Bi-2223 superconducting phase of 67.5% and Bi-2212 superconducting phase of 32.5%. The presence and increase of bismuth impurity ions in the bulk Bi-2223 crystal lattice significantly impair the formation of both the low/high phases [14]. This disruption in the low and high phases significantly affects the formation of copper pairs in the superconducting pathway of the crystal system [15].

D. *Lattice cell constants pertaining to bulk polycrystalline bismuth added high-temperature crystal structures*

Fig. 1 and Fig. 2 show that the powder X-ray diffraction peaks exhibit shifts correlating with increased bismuth impurity additions in Bi-2223 matrices, reflecting changes in lattice cell parameters. Specifically, the 2θ diffraction peaks along the *c*-axis, such as (00<u>1</u>0)H, (00<u>1</u>2)H, (00<u>1</u>4)H, (002)L, (008)L, (0010)L, and (00<u>1</u>2)L associated with the high and low superconducting phases, are noted to shift towards larger angles. This indicates a decrease in the *c*-axis length of the Bi-2223 ceramic system. Conversely, peaks corresponding to the *a* and *b*-axis orientations shift towards smaller angles, suggesting an increase in the *a* and *b* lattice cell constant parameters. Here, the lattice constants (*a*-axis and *c*-axis length) of the bulk polycrystalline $Bi_{2.1+x}Sr_{2.0}Ca_{2.1}Cu_{3.0}O_y$ high-temperature structures are found by using the lattice spacing (d) values and specific diffraction planes (hkl) for the tetragonal unit cell structure. The relevant formula (5) is provided below.

$$\frac{1}{d^2} = \left(\frac{h^2}{a^2} + \frac{k^2}{b^2} + \frac{l^2}{c^2}\right) \quad (5)$$

One can encounter all the numerical calculations for the *a* and *c*-axis lengths for the pure and extra bismuth added bulk polycrystalline $Bi_{2.1+x}Sr_{2.0}Ca_{2.1}Cu_{3.0}O_y$ high-temperature ceramic structures in Table 1. The table shows a systematic decrease in the *c*-axis length (the maximum one belongs to the pure sample whereas the minimum value is attributed to the Bi5* sample) and an increase in the *a* lattice cell (the smallest one belongs to the pure sample whereas the highest value is attributed to the Bi5* sample) with increasing bismuth impurity ions levels. For pure Bi-2223 ceramic material, the *a* and *c* lattice cells are computed to be approximately 5.41 Å and 37.08 Å, respectively. However, with the addition of bismuth ions impurities up to x=0.100, the *a* lattice parameter increases rapidly to a maximum of 5.48 Å while the *c* lattice parameter decreases significantly to value of 35.66 Å. This indicates that the *c*-axis length is directly affected by distortions in the copper oxide layers.

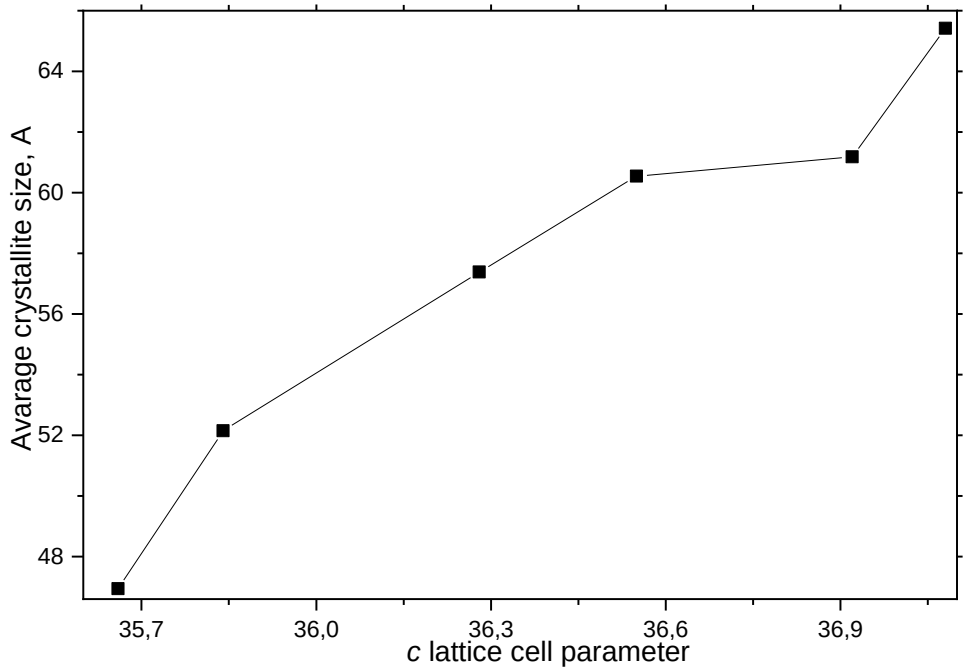

Figure 3 Change in average crystallite size against *c* lattice cell parameters

Consequently, the presence and increment trend in the bismuth ions in the crystal lattice of Bi-2223 materials disrupts the formation of strong electron-phonon coupling, which is essential for superconductivity. In addition, we examine the relationship between c-axis length and average grain size growth for both pure and extra bismuth-added Bi-2223 structures as depicted in Fig. 3. The figure guarantees a linear relationship between these parameters. According to the experimental findings, the presence and increase in the bismuth impurity addition in the system deteriorates significantly the crystallinity and superconducting properties of the Bi-2223 advanced superconducting materials.

E. *Decrement trend in average crystallite size of Bi-2223 superconducting depending on the extra bismuth impurity addition in the crystal system*

The changes in average crystallite size in the advanced Bi-2223 ceramic lattice with the addition of bismuth ions impurities are numerically determined using the Scherrer–Warren approach, which is based on the full width at half maximum (FWHM) calculations of the characteristic diffraction peaks [16]. The formula is shown below.

$$t = 0.941\lambda / B\cos\theta_B \quad (6)$$

in the relation, t reveals the crystal thickness and λ shows incident X-rays wavelength. Furthermore, the Bragg angle, denoted by θ_B, is determined using the FWHM value. According to Eq. 6, all calculations are presented numerically in Table 1. From the table, the crystal growth is calculated to decrease significantly from 65.42 nm to 46.94 nm with increasing amounts of cadmium oxide impurity. This observation strongly indicates a substantial suppression of crystalline quality and the superconducting characteristics associated with effective electron-phonon coupling probabilities.

F. *Lotgering indices for bulk polycrystalline Bi2.1+xSr2.0Ca2.1Cu3.0Oy high-temperature structures*

Concluding section for study examines the influence of bismuth ions impurity levels on the *c*-axis orientation, specifically the Lotgering index related to superconductivity, within the crystal structure [17, 18]. Table 1 also details the Lotgering index parameters for both pure and bulk polycrystalline $Bi_{2.1+x}Sr_{2.0}Ca_{2.1}Cu_{3.0}O_y$ high-temperature structures. Table reveals that, similar to previous observations,

the Lotgering index values are calculated to reduce from 0.430 for the pure Bi-2223 superconducting ceramic to 0.264 for the superconducting Bi5* compound with increasing bismuth impurity ions addition. This decline in the Lotgering index underscores the disruptive effect of bismuth impurities on the crystalline quality of superconducting particle connections and alignment of crystal planes within the Bi-2223 superconducting crystal structure.

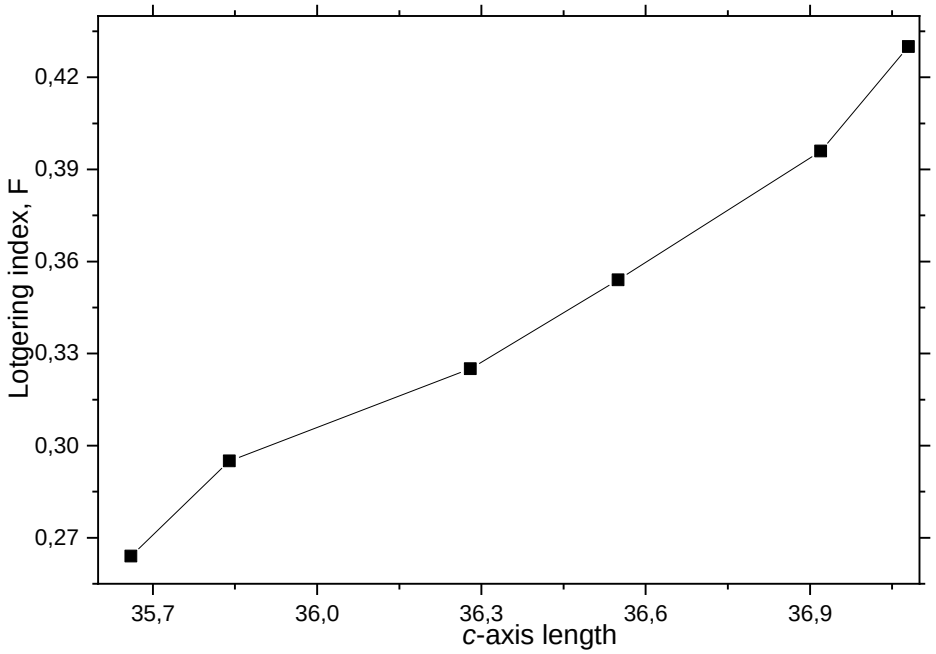

Figure 4 Change of Lotgering indices against *c* lattice parameters

Moreover, in order to examine the impact on crystallinity and effective electron-phonon coupling probabilities, we explore the correlation between the *c*-axis length and the *c*-axis orientation angles in Fig. 4. The figure reveals that the *c*-axis length is significantly more influenced by the amount of bismuth impurity added compared to the *c*-axis orientation angles. This suggests that the addition of bismuth impurity ions has a much stronger adverse effect on the effective electron-phonon coupling probabilities than on the crystalline quality itself.

IV. CONCLUSION

The present study focuses on investigating the effects of bismuth ions impurities addition to polycrystalline Bi2.1+xSr2.0Ca2.1Cu3.0Oy high-temperature structures, exploring key properties such as crystalline quality, texture of superconducting grain connections, and effective electron-phonon coupling probabilities through experimental powder X-ray diffraction measurements. The summarized findings based on XRD diffractograms are as follows:

It is found from the experimental XRD measurements that the presence and increment trend of bismuth impurity ions addition in the bulk Bi-2223 lattice lead to the emergence of characteristic impurity peak positions associated with characteristic Bi2O3 impurity phase, indicating a degradation in crystalline quality and superconducting behavior. This deterioration is further evidenced by a decrease in average crystallite size, which decreases steadily from 65.42 nm to 46.94 nm with increasing Bi2O3 impurity ions addition. Additionally, the study determines that the solubility limit of bismuth impurities in the Bi2.1Sr2.0Ca2.1Cu3.0Oy superconducting crystal system is approximately x=0.07.

Analysis of peak intensity changes for relative volume phase fractions indicates that both high and low superconducting phases exhibit a monotonic degradation with increasing Bi2O3 impurity ions addition concentration. This degradation correlates with a rapid decrease in copper pair formation probabilities and superconductivity in the system. Similarly, changes in lattice cell parameters demonstrates a regular decrease in the c-axis length and an increase in the a-axis length with Bi2O3 impurity ions addition.

Moreover, Lotgering index parameter results highlight that texture formation significantly depends on the concentration of Bi2O3 impurity ions addition, showing a notable decrease as impurity levels increases. Specifically, the unmodified sample exhibits a maximum Lotgering index of 0.430 while the Bi5* ceramic sample shows a minimum value of 0.264. This underscores the disruptive effect of Bi2O3 impurity ions addition on the crystalline quality and texture of superconducting grain connections.

Furthermore, the combined analysis of lattice cell constants and Lotgering index parameters indicates that Bi2O3 impurity ions addition in the Bi2.1Sr2.0Ca2.1Cu3.0Oy crystal structure has a more pronounced detrimental impact on effective electron-phonon coupling probabilities than on crystalline quality itself.

CNC Program Development: Principles and Practices for Programming a Clutch Hub Turning Process

Violeta Krcheva

Faculty of Technical Sciences, University St. Kliment Ohridski - Bitola, Republic of North Macedonia

*(violeta.krceva@uklo.edu.mk)

Abstract – This paper presents a systematic approach to the fundamental principles and practices essential for developing CNC programs, specifically for the clutch hub turning process. The process involves the turning operation necessary to machine a clutch hub from an initial workpiece, a forged clutch hub. CNC programming is pivotal in creating precise instructions that control the motions and operations of CNC machine tools for precise and efficient clutch hub machining. Key aspects highlighted in this study include the selection of appropriate cutting tools, the incorporation of cutting conditions (such as cutting speed, feed, and depth of cut), and the optimisation of cutting strategies during program development. The paper provides a practical framework for CNC program creation, from initial design through final implementation, emphasising both theoretical foundations and practical completion. The discussion primarily focuses on the integration of G-codes and M-codes into CNC programming, ensuring constant monitoring and control over manufacturing operations. Furthermore, the paper evaluates how advanced technologies such as CAD/CAM integration facilitate CNC programming by improving precision and efficiency. By analysing functional CNC programs, this research serves as a valuable resource for engineers and machinists aiming to deepen their expertise in CNC programming, particularly in the development of effective and dependable CNC programs for manufacturing processes.

Keywords – G-codes, M-codes, CNC Machine Tool, Cutting Tools, CAD/CAM

I. INTRODUCTION

In the contemporary context of manufacturing processes, precision and consistency are imperative in achieving optimal product quality and operational efficiency. The constant monitoring and control over dimensional tolerances, surface finish quality, and workpiece dimensions throughout the machining processes ensure compliance with design specifications, thereby enhancing product durability and reliability. This consistent practice promotes early detection and correction of dimensional imperfections, minimising waste and repairs while maintaining the quality of manufactured workpieces [1].

The advent of CNC (Computer Numerical Control) machine tools has revolutionised modern manufacturing, offering superior accuracy and repeatability in comparison with conventional machine tools. These machine tools are particularly designed for complex and demanding machining processes where precision is paramount. Central to the operation of CNC machine tools is CNC programming, a discipline focused on the transformation of design specifications into executable commands that direct the movements and actions of CNC machine tools [2].

CNC programming refers to the principles used to generate the instructions that drive the CNC machine tools. These instructions are structured into a program, which consists of G-codes and M-codes (Fig. 1a). G-codes, or geometric codes, control the motion of the CNC machine tool. They are standard commands

that begin with the letter "G" followed by a two-digit number, indicating various movements and positions of the machine tool's moving components. The commands dictate the precise geometric positions based on a coordinate system, enabling the machine to move the components and cutting tools accurately in a specified direction and position them precisely in 3D space (Fig. 1b) [3].

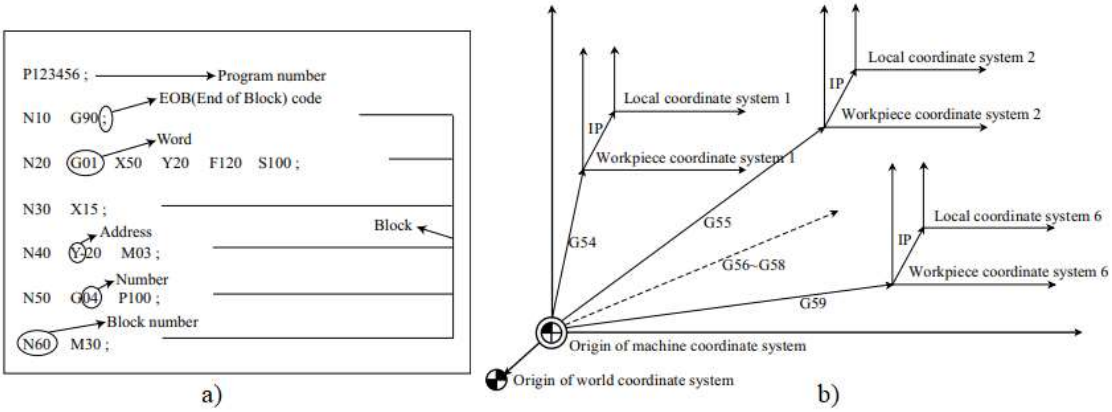

Fig. 1 a) Program structure; b) Machine, workpiece, and local coordinate systems [3]

In addition to G-codes, CNC programming encompasses M-codes, which regulate specific functions of the CNC machine tool, including spindle rotation speed, cutting tool feed rate, tool changes, and coolant application. The M-codes also adhere to an alphanumeric format, beginning with the letter "M" and being followed by two digits. These codes are essential for the operation control of the machine tool and ensure that each workpiece of the manufacturing process is machined correctly and efficiently [4].

The G-code, in the role of a programming language, facilitates the development of specific programs through Computer-Aided Manufacturing (CAM) systems that utilise Computer-Aided Design (CAD) information. These advanced systems play a crucial role in contemporary machining processes, effectively synchronising design with manufacturing. Specifically, CAM systems utilise CAD data to create precise instructions for CNC machine tools, which significantly improves both the design and productivity of machining processes. This integration of CAD and CAM systems facilitates the transition from design to production, thereby enhancing overall manufacturing efficiency and product quality [5].

The principle of developing CNC programs involves a sequence of steps that convert design specifications into commands readable by machine tools. These commands direct and control the movement of the machine tool's moving components and cutting tools during the machining process [6].

Initially, the process commences with designing and modelling the workpiece utilising Computer-Aided Design (CAD) software. This involves developing a detailed two-dimensional or three-dimensional model wherein all features, such as contours, holes, slots, and pockets, are identified and designed. The designed CAD model provides a precise representation of the workpiece to be manufactured [7].

The CAD model is then utilised to develop CNC programs of instructions that define the cutting tools' toolpaths. The toolpaths are the specific paths that the cutting tool traverses in order to machine the workpiece. During this step, the appropriate cutting tools are selected according to material and design requirements. Machining parameters, including spindle speed, rotation direction, feed, depth of cut, and coolant activation, are also defined in the programs of instructions [8].

When the toolpaths are created, they can be visualised as a continuous connection between a series of coordinates that correspond to specific data points. Each coordinate indicates a particular position in the machine tool's working space, defining the precise location of the cutting tool at the determined trajectory. As the machining process progresses, the cutting tool traverses from one coordinate to the next, ensuring precise material removal and shaping of the workpiece [9].

Prior to implementing the G-code on the actual CNC machine tool, the toolpaths can be simulated and verified by utilising the CAM software. This simulation facilitates the visualisation of the machining process and the identification of potential issues, such as collisions, tool breakage, or excessive material removal, which can be anticipated, detected, and eliminated [10].

Upon verification, the program is transferred to the CNC machine tool, typically through USB, network, or other communication protocol. The CNC machine tool is then prepared by securing the workpiece, setting up the workholding, cutting, and control tools, and calibrating the machine tool by setting zero points, which serve as reference points for machining. Once the machine tool is setup, the program is loaded into the CNC machine tool's controller. A dry run, without any actual cutting, is typically performed to ensure the complete accuracy of the toolpaths and the absence of any unexpected movements. When the verification process is completed, the machining process commences, with the CNC machine adhering to the G-code instructions to machine the workpiece [11].

In this context, the development of CNC programs is based on the principle of creating a sequence of coded instructions to guide the CNC machine tools in performing precise machining processes using CAD software to design the workpiece and generate the trajectory of the cutting tools, terms that are reviewed in relevant literature (e.g., [1]–[11]). The paper is structured into five sections: an introduction, an explanation of the research, a presentation of the results, a discussion, and a conclusion with potential applications.

II. Materials and Method

This research illustrates a part of the clutch hub machining process implemented on a CNC turning centre `Hitachi`. The clutch hub is a vital component of a vehicle's clutch system. It plays a crucial role in manual transmission vehicles, functioning as the central component of the clutch disc assembly.

To precisely analyse the machining process, two-dimensional drawings have been created using a CAD system, specifically AutoCAD software. These drawings illustrate details of the machining process and the sequence of the machining operations intended to realise the process. The process involves the turning operation necessary to machine the clutch hub (Fig. 2b) from the initial workpiece, a forged clutch hub (Fig. 2a). In addition to turning, the machining process includes machining operations that relate to turning, such as drilling, facing, boring, and chamfering.

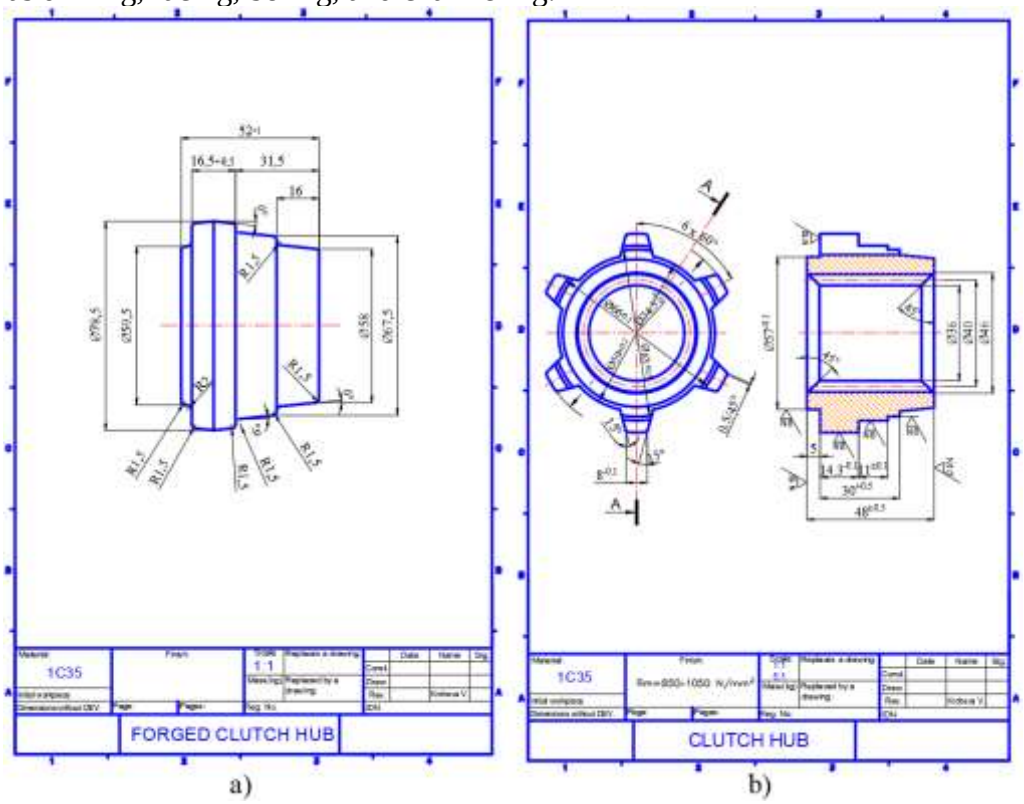

Fig. 2 a) Forged clutch hub; b) Clutch hub

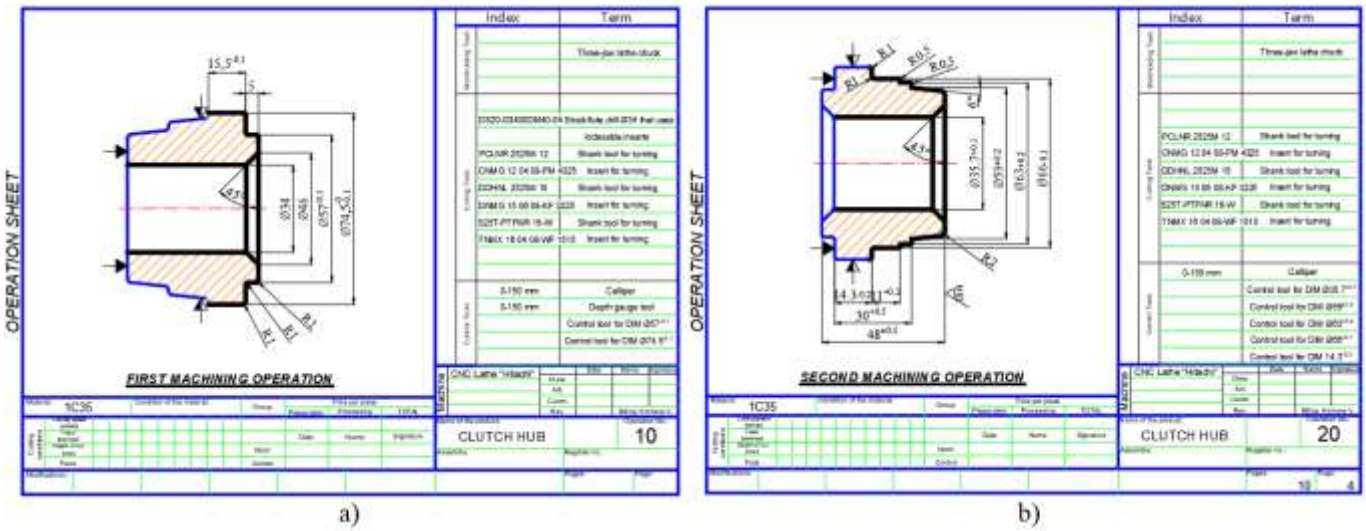
Depending on which side of the clutch hub is machined, two phases in the context of two machining operations are defined. The first machining operation refers to the shorter side of the forged clutch hub (Fig. 3a), while the second refers to the longer side (Fig. 3b).



a) b)

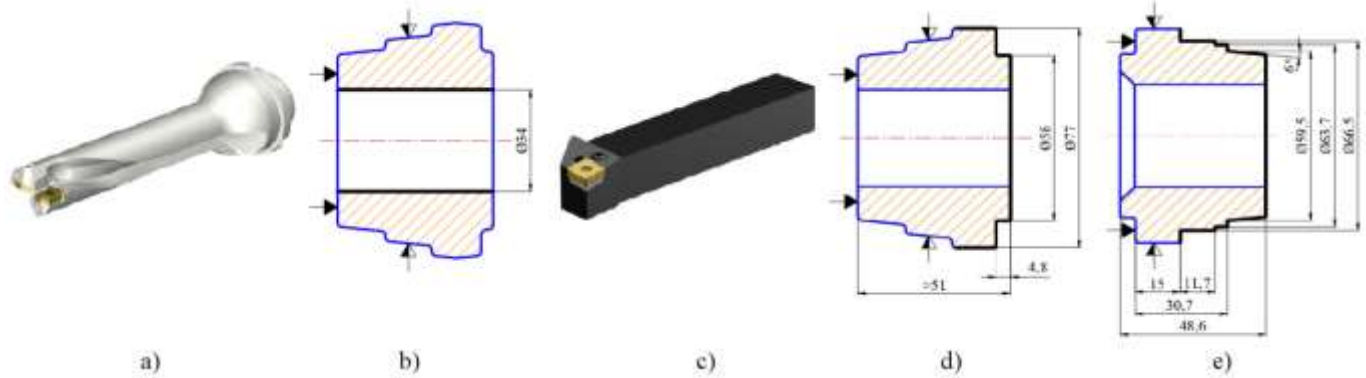
Fig. 3 a) First machining operation; b) Second machining operation

The first machining operation (Fig. 3a) comprises four passes. The first pass (Fig. 4b) involves drilling. The second (Fig. 4d) and third passes (Fig. 5b) involve turning and facing, respectively. The fourth pass (Fig. 6b) includes chamfering.

The second machining operation (Fig. 3b) comprises three passes. The first pass (Fig. 4e) involves turning and facing. The second pass (Fig. 5c) similarly includes turning and facing. The third pass (Fig. 6c) entails chamfering and boring.

The contours of the workpiece illustrated in the drawing play a crucial role in defining the geometry of the cutting tool for each machining pass. The shape and complexity of these contours directly influence the selection of cutting tool parameters such as cutting edge angle, tool lead angle, inclination angle, nose radius, etc. Each specific contour determines the required type of cutting tool holder and indexable insert shape that must precisely match the profile of the workpiece.

Specifically, for the first pass (in the first machining operation), the determined cutting tool is the DS20-D3400DM40–04 straight-flute drill with indexable inserts DS20-0508-P and DS20-0508-C, manufactured by Sandvik Coromant (Fig. 4a). The cutting tool geometry is characterised by a cutting edge angle of 81°, an inclination angle of 0°, and indexable insert corner radii of 0.8 mm and 0.35 mm.



a) b) c) d) e)

Fig. 4 a) Strait-flute drill; b) First pass; c) Shank tool for turning; d) Second pass; e) Second pass

For the second pass (in the first and second machining operations), the determined cutting tool is the PCLNR 2525M 12 shank tool for turning (Fig. 4c) that uses a CNMG 12 04 08-PM 4325 indexable insert, manufactured by Sandvik Coromant. The cutting tool geometry is characterised by a cutting edge angle of 95°, a lead angle of -5°, an inclination angle of -6°, an orthogonal rake angle of -6°, a corner radius of 0.8 mm, an effective length of the cutting edge of 12 mm, and a rhombic 80º insert shape.

The determined cutting tool for the third pass (in the first and second machining operations) is the DDHNL 2525M 15 shank tool for turning (Fig. 5a) that uses a DNMG 15 06 08-KF 3225 indexable insert, manufactured by Sandvik Coromant. The cutting tool geometry is characterised by a cutting edge

angle of 107.5°, a lead angle of -17.5°, an inclination angle of -7°, an orthogonal rake angle of -6°, a corner radius of 0.8 mm, an effective length of the cutting edge of 14.7 mm, and a rhombic 55º insert shape.

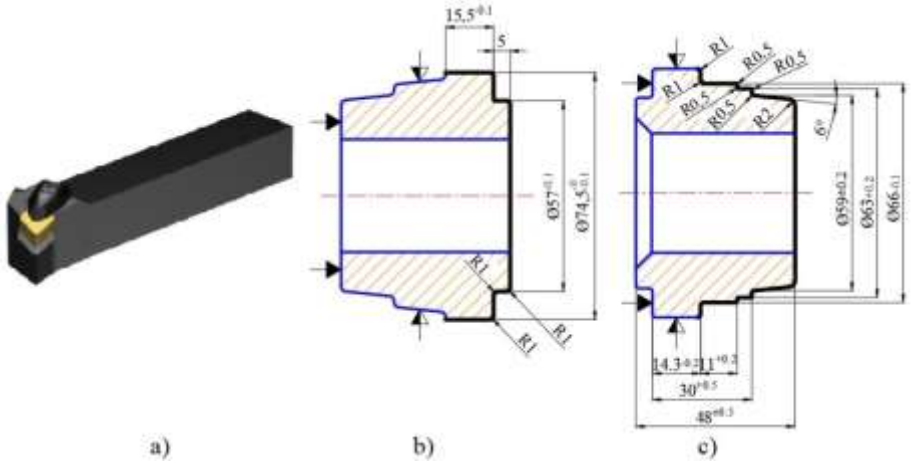


Fig. 5 a) Shank tool for turning; b) Third pass; c) Third pass

And for the last, fourth pass (in the first and second machining operations), the determined cutting tool is the S25T-PTFNR16 16-W shank tool for turning (Fig. 6a) that uses a TNMX 16 04 08-WF 1515 indexable insert, manufactured by Sandvik Coromant. The cutting tool geometry is characterised by a cutting edge angle of 91°, a lead angle of -1°, a corner radius of 0.8 mm, an effective length of the cutting edge of 15.7 mm, and a triangular insert shape.

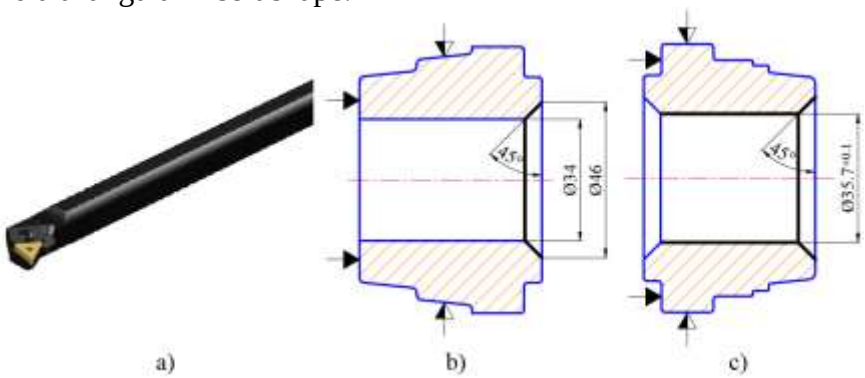

Fig. 6 a) Shank tool for turning; b) Fourth pass; c) Fourth pass

This CAD model has been meticulously developed to enable a precise analysis of turning operations, including all relevant passes. It serves as the essential foundation for providing coordinates from annotations and for the subsequent development of CNC programs. Through detailed examination, this model ensures accuracy in translating design intentions into executable CNC programs.

III. RESULTS

The development of the CNC programs involved a series of detailed steps to ensure the desired geometry and contour of the workpiece were followed by the cutting tool. The process began with understanding the workpiece CAD model design through two-dimensional design specifications, which included all dimensions, tolerances, and surface finish requirements.

Next, appropriate cutting tools were selected based on the material of the workpiece and the number and type of passes required. The geometry of the cutting tools, including diameters, linear and radial lengths, and shape, was considered as it directly affects the programming of the tool paths.

The workpiece coordinate system (WCS) was then established on the CNC turning centre `Hitachi`, with the origin point (X, Y, and Z coordinates) defined as the reference for all dimensions. The origin (0,0,0) was defined at the highest point and centre of the workpiece's surface.

Fig. 8 CNC program for the second turning operation

The CNC programs were developed using G-code that primarily control the movement of the CNC turning centre `Hitachi` along the axes (X, Y, and Z) and specify the type of motion to be performed. Additionally, M-codes were used to control various auxiliary functions of the CNC turning centre, such as tool changes, spindle speed, spindle control, feed rate, and other functions.

The developed CNC programs were specified for each machining operation and included all passes. For space conservation, these programs are presented as figures.

The program of instructions for the first turning operation (including four passes) is depicted in Fig. 7. and the second turning operation (including three passes) is depicted in Fig. 8.

IV. DISCUSSION

The first CNC program is structured to drive and control the CNC turning centre through a detailed series of instructions to shape the shorter side of the clutch hub. Each section of the program represents a specific phase of the turning process, referred to as a "pass". The program starts (and ends) with a command `%` to signal the beginning (and the end) of the program and the identifier `O77` is used to give the CNC program a unique identification number.

This program starts by preparing the CNC turning centre for the drilling operation. The code `T0900` is used to select the straight-flute drill that is placed in a designated position within the CNC turning centre's tool carousel and the code `S450` to set the spindle speed to 450 RPM. Rapid traverses (G00 commands) are used to quickly position the cutting tool to the initial cutting point at X0, Z30, and Y0. This initial position ensures precise alignment before the drilling pass is begun. Once in position, this pass is initiated by the program. Linear interpolation (G01) is used to slowly lower the cutting tool to the Z-56 coordinate at a feed rate of 0.07 units per revolution, ensuring a controlled penetration into the material. The spindle is rotated in the clockwise direction (M03), maintaining a consistent cutting speed. After the pass is completed, the cutting tool is rapidly moved to Z10, and the spindle is stopped (M09). To prepare for the next pass and cutting tool change, a return to the machine's reference point (G28 U0 V0 W0) with a spindle stop (M05) is commanded by the program.

In the second pass, the code `T0100` is used to select the determined cutting tool by the program, and the code `S750` is used to adjust the spindle speed to 750 RPM in the counterclockwise direction (M4). A rapid traverse to the defined point with coordinates X82, Z10, and Y0 is initiated to begin the actual pass. Then, linear interpolation (G01) is implemented in the program to make precise cuts at varying depths and contours. For instance, the cutting tool is moved from Z-5.7 to Z-1.1 while turning along the X-axis. A rapid movement to X33 is then implemented, and the process is repeated, demonstrating the ability of the CNC turning centre to perform complex machining tasks. Circular interpolation (G03) is used to facilitate curved cuts, which are essential for creating intricate geometries on the workpiece. Similar to the first pass, the second pass is finished with a command to return to the turning centre's reference point (G28 U0 V0 W0 M5) and preparation for the subsequent pass.

For the third pass, the determined cutting tool `T0500` is selected, with the spindle speed set to 800 RPM in a counterclockwise direction (M04). The turning process is accelerated by this higher spindle speed, which is suitable for machining tougher materials or achieving finer surface finishes. Rapid traverses and linear interpolations are commanded by the program to cut along designated paths, with adjustments made to the feed (F) and depth of cut (Z-axis) to meet turning requirements. Circular interpolations (G03) are utilised again to create fillets and curved surfaces, with movements exemplified by shifts from X53 to X70.5 and corresponding changes in Z-axis coordinates. Upon completion of the third pass, the CNC turning centre is directed by the program to return to its reference point (G28 U0 V0 W0 M05), ensuring accurate positioning and readiness for the next pass.

The determined cutting tool `T0300` is activated for the fourth pass, with the spindle speed set back to 750 RPM in a clockwise direction (M03). Optimal cutting conditions are provided for the specific cutting tool and material combination by this return to forward rotation. The program's systematic approach is continued, with linear interpolations employed to achieve the specified contours. Efficient chamfering operation is ensured by rapid traverses between the defined points, while accuracy throughout the

machining process is maintained by the program's code of spindle stops (M05) and return to reference points (G28 U0 V0 W0).

The second CNC program is structured to drive and control the CNC turning centre through a detailed series of operations to shape the longer side of the clutch hub. Each section of the CNC program represents the distinct phases of the turning process, referred to as "passes". The command `%` is used to signal the beginning and end of the program and `O78` is the unique identifier for this particular program.

The initial setup commands ensure that the CNC turning centre is ready for machining. The spindle is started by the `N005 M40` command. The feed mode is set by the `N010 G99` command, and the XZ plane for turning operation is selected by the `N015 G18` command.

For the first pass, the determined cutting tool `T0100` is selected. The spindle is set to rotate at a maximum speed of 700 RPM, maintaining a constant surface speed of 700 RPM in a counterclockwise direction (M04). The cutting tool is rapidly moved to the initial position at coordinates X32, Z10, and Y0. Then, it is descended to Z0 with the same rapid traverse command. The cutting process begins with a linear interpolation command, `N060 G01 Z-1. F0.12 M08`, that moves the cutting tool to Z-1 at a feed rate of 0.12 units per revolution, with coolant on. Various linear and circular interpolation commands are continued in the program to shape the workpiece. For instance, the cutting tool is moved to X52 by the `N065 X52` command, and a clockwise arc to X57, Z-3.2 with a radius of 2.5, is created by the `N070 G03 X57. Z-3.2 R2.5` command. Linear movements to specified coordinates are defined by the subsequent commands `N075 G01 X59.5 Z-16.3` and `N085 Z-21.3`. The rapid traverse command to X75 is then used to quickly move the cutting tool to the new positions without cutting. After performing the necessary cuts, the cutting tool is returned to the reference position using the `N145 G28 U0 V0 W0 M05` command with the spindle stopped.

The second pass is initiated by changing the cutting tool with the `N150 T0500` command. The spindle speed is increased to a maximum of 900 RPM using the `N170 G50 S900` command and set to maintain a constant surface speed of 900 RPM with the `N175 G96 S900 M04` command in a counterclockwise direction. The cutting tool is rapidly positioned at the point of X30, Z1, and Y0 coordinates using the `N180 G00 X30 Z1 Y0` command. The turning process begins with `N185 G01 Z-3.9 F0.14 M08`, moving the cutting tool to Z-3.9 at a feed rate of 0.14 units per revolution with coolant on. Similar to the first pass, various linear and circular interpolation commands are followed to shape the workpiece according to the desired geometry. A clockwise arc is created by `N195 G03 X56.6 Z-5.2 R2`, while a linear cut is defined by `N200 G01 X58.8 Z-16.5`. The program is continued with these commands to achieve the specified contours and depths. After the necessary cuts are completed, the cutting tool is returned to the reference position with `N260 G28 U0 V0 W0 M05`, ensuring the spindle is stopped and the CNC turning centre is ready for the next pass.

The determined cutting tool for the third pass is selected with the `N265 T0300` command. The spindle speed is set to a maximum of 750 RPM, and a constant surface speed of 750 RPM is maintained in a clockwise direction (M03). The cutting tool is rapidly moved to the starting position of X46, Z0, and Y0 coordinates with the `N295 G00 X46 Z0 Y0` command. The turning process is initiated with the `N300 G01 Z-0.8 F0.12 M08` command, moving the cutting tool to Z-0.8 at a feed rate of 0.12 units per revolution with coolant on. Various linear interpolation commands are used by the program to perform precise cuts along the specified paths. Specifically, the cutting tool is moved to the position at coordinates X35.7 and Z-4.5 with the `N305 X35.7 Z-4.5` command, and the pass is continued to Z-50 with the `N310 Z-50.` command. After the pass is completed, the cutting tool is rapidly returned to the reference position using the `N325 G28 U0 V0 W0 M05` command, with the spindle stopped.

V. CONCLUSION

This paper presents a systematic approach to the fundamental principles and practices for the development of CNC programs specific to the clutch hub turning process. Through a detailed exploration of cutting tool selection and toolpath strategy optimisation, the study provides a practical framework for CNC program creation that spans from initial design to final implementation. The research highlights

methods to improve precision and efficiency in CNC programming by effectively integrating G-codes and M-codes and ensuring constant monitoring and control over machining operations.

The performance of optimising toolpaths and minimising errors underscores the importance of accuracy and reliability in CNC program development. Advanced technologies, such as CAD/CAM integration, are evaluated for their impact on improving precision and efficiency, demonstrating how modern technologies can significantly facilitate the CNC programming process. By analysing functional CNC programs, the paper serves as a valuable resource for engineers and machinists, contributing to the advancement of expertise in the creation of effective and dependable CNC programs for precise and efficient manufacturing operations.

In conclusion, this research not only demonstrates the theoretical foundations of CNC programming but also offers practical insights into the implementation of these principles. It underscores the critical role of well-structured and carefully chosen G-codes and M-codes in achieving high-quality CNC programs. As such, this paper is a valuable resource for those aiming to deepen their understanding and improve their skills in CNC programming, particularly in the context of developing robust programs for clutch hub turning processes.

Abstract – This study examines the impact of varying bismuth addition (0.00≤x≤0.10) on the artificial flux pinning capability, strength of coupled vortices, surface view, microstructure, and crystalline quality features of bulk polycrystalline Bi2.1Sr2.0Ca2.1Cu3.0OyOx ceramics. Using critical current density measurements at 77 K (Jc), electron dispersive X-ray (EDX), and scanning electron microscopy (SEM) findings, we observe that while the ceramic matrices are produced successfully, the increase in the bismuth impurity addition triggers a monotonic diminish of copper content and an incremental enhancement of the bismuth content. Correspondingly, EDX evidence guarantees that there is a sensitive link between surface appearance and bismuth ions levels. SEM images reveal significant deterioration in microstructural, surface morphology appearance, and crystalline quality based on the reduction in the formation of platelet-like stacked layers. This is attributed to increased micropores, microcrystal coalescence orientations, voids, melting regions, cracks, and particle size distribution. The critical current density measurements also indicate that additional bismuth significantly reduce he flux pinning capability, strength of coupled vortices, and elasticity due to weakened interaction strength between grains. All in all, the bismuth addition in the Bi2.1Sr2.0Ca2.1Cu3.0OyOx ceramic structures is not a good preference to increase the magnetic field-carrying ability and especially engineering current.

Keywords – Bi-2223 material; Bi impurity; Jc; SEM; EDX

I. INTRODUCTION

The discovery of the first superconductor in mercury metal with a critical transition temperature below 4.2 K dates back to 1911 [1]. Since then, researchers have focused on finding new materials that exhibit superconductivity. Over the years, a variety of materials have been discovered, including rare earth borocarbides, pure elements, nitrides, organic compounds, sulfides, oxides, A-15 inorganics, magnesium diboride, metal-based compounds, chalcogens, Chevrel phases, pyrochlorine oxides, heavy fermions, metals, semi-metal-containing materials, alloys, carbon/silicon-based compounds, fullerites, rutheno-cuprates, and cuprate-layered perovskites [2].

Among these, high-temperature superconducting cuprate-layered perovskite compounds (containing Bi, Tl, and Hg), particularly Bi-based superconducting ceramics, have garnered immense attention due to their exceptional characteristics. Notably, Bi-2212 (with a critical transition temperature of 85 K), Bi-2223 (100 K), and Bi-2201 (20 K) have been extensively studied [3]. The Bi-2223 superconducting ceramic comppunds, in particular, is favored for its superior thermodynamic stability, high superconductive temperatures, magnetic field carrying ability, dc current carrying capacity, electronic, and optical properties, resistance to humidity, simple chemical composition, and ease of

deformation/shaping/rolling into long cables. Its easy access to cooling systems, stabilization performance with oxygen content, and low energy losses make it widely applicable in various fields such as applied sciences, innovative energy infrastructure, energy-related industries, generators, electro-optics, sensitive process control, refrigeration systems, power transmission, and large-scale applications [4–14].

The presence of BiO layers with Van der Waals bonds in Bi-based compounds facilitates easy shaping, deformation, and rolling for long tape-casting and cable construction. Consequently, these Bi-containing superconducting components, particularly the Bi-2223 phase, have gained significant prominence in the literature. However, their practical utilization faces challenges due to inherent brittleness within the micaceous structure [15]. Additional issues include randomly oriented microcrystals, intergranular boundaries, characteristics of mobile carriers in space, layered anisotropic micaceous structure, high sensitivity to applied magnetic fields, multiple phase compositions, large penetration depth, coupling problems between layers, granular structure, stabilization of main phases, short coherence length, and mechanical stabilization. These challenges necessitate resolution through appropriate preparation methods such as doping mechanisms, metallic interfaces, cation or anion substitutions in crystal structures, transition metal evaporation/diffusion, multilayered structures, and chemical additions in crystal lattices [16, 17]. One preferred method to enhance crystallinity quality and grain connectivity while mitigating crystal structure problems, crack-initiating defects, and non-recoverable stress concentration regions involves doping mechanisms [19].

Here, we inspect the differentiation of basic artificial flux pinning capability, surface appearance, crystalline quality, and microstructural features by means of current density measurements taken at 77 K and scanning electron microscopy measurements (SEM) in detail. Furthermore, the elemental distributions for the ceramic material surfaces are extensively analyzed using by the EDX measurement tests.

II. Materials and Method

This research builds upon our previous work [20] by further characterizing bulk Bi-added Bi2.1Sr2.0Ca2.1Cu3.0OyOx ceramic materials. In Ref. [20], we described the fabrication process, including details on powder impurities, the solid-state reaction, and the calcination and sintering conditions. We also explained the measurement setups and methods used. The study focused on the impact of introducing additional Bi impurity ions at various molar ratios between 0.000-0.10 (0.00, 0.01, 0.02, 0.04, 0.08, and 0.100) on the general mechanical properties as regards brittleness index, elastic hardness coefficient, fracture toughness, and yield strength constants belonging to bulk Bi-2223 crystal lattice. The investigation utilized Vickers hardness tests with different loads.

In the present work the influence of extra bismuth ions doping on the change of the capability of the strength of coupled vortices for movements, vortex lattice period, artificial flux pinning centers, elasticity, the main microstructural, surface morphological, and crystalline quality features is examined by means of the critical current density at 77 K and scanning electron microscopy tests. In more detail, we conduct critical current measurements using a homemade system at 77 K in liquid nitrogen without applying any magnetic field strengths of the pure and various bismuth ions added Bi-2223 ceramics structures to find out the variation of artificial pinning regions, pinning capability, strength of vortices coupled for movements, interaction strength between grains, vortex lattice period, and elasticity.

Secondly, we are interested in the influence of extra bismuth addition on the surface morphology view, texturing, boundary coupling problems, micropores, grain size distributions and alignments, partial melting sites, and layered structure of typical Bi-2223 crystal systems using a FEI Quanta FE-SEM electron microscope measurements performed at 20 kV external accelerating voltage. The images are pictured at 30000X magnification under secondary electron image. Additionally, the element distributions on the local specimen surface for the ceramic systems are inspected with a SEM equipped with an Oxford X-ray micro-probe and IXRF System Model 550i analyzer. For clarity, the different Bi-added materials are referred to as pure, Bi1*, Bi2*, Bi3*, Bi4*, and Bi5*, respectively.

III. RESULTS AND DISCUSSION

A. *Microstructural and surface appearances for Bi-added Bi-2223 ceramic compounds*

The crucial influence of extra bismuth impurity addition on the surface morphology view, texturing, boundary coupling problems, micropores, grain size distributions and alignments, partial melting sites, and layered structure of Bi2.1Sr2.0Ca2.1Cu3.0OyOx ceramic samples produced are extensively analyzed by use of SEM measurements performed at 30000X magnification. It is observed that with the augmentation of bismuth impurity ratios, all the characteristic surface morphologic properties and crystalline quality are found to degrade regularly. Thus, we depict only the SEM pictures pertaining to the best (pure) and the worst (Bi5*) samples in Fig. 1 a and b. However, all SEM photographs will be given and discussed in detail in the oral presentation. It is visible that the bismuth impurity negatively affects the surface morphology view, texturing, boundary coupling problems, micropores, grain size distributions and alignments, partial melting sites, and layered structure of Bi-2223 ceramic system.

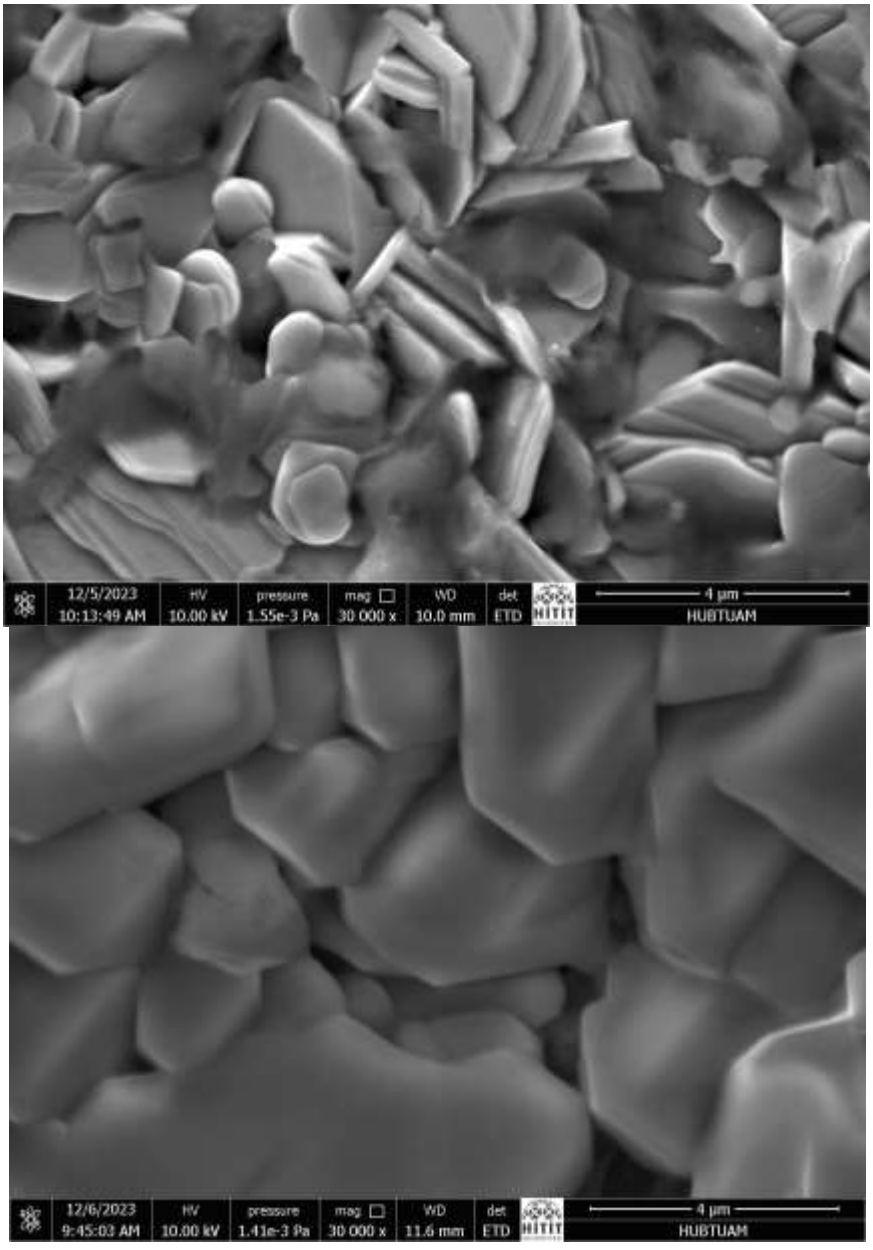

Figure 1 30000x magnified SEM images for a-) the bulk Bi0* ceramic structure and b-) the polycrystalline Bi*5 superconducting materials.

It is apparent that similar to the findings for the values of J_c parameters, the considerable change in surface morphology of Bi-2223 matrices doped with extra bismuth impurity stems from the successful addition of new bismuth ions in the crystal system. Moreover, Fig. 1a and b indicates that all the crystallinity quality and related surface view features diminish seriously. In more detail, the SEM images picture that these two (Bi0* and Bi5*) ceramic compounds possess the classic granular structure, stacked layers but in the randomly distributed superconducting layer alignments. Besides, SEM pictures reveal that the existence of extra bismuth ions in the $Bi_{2.1}Sr_{2.0}Ca_{2.1}Cu_{3.0}O_yO_x$ ceramic crystal system harms the formation of flaky, platelet-like layers in the grains. This disruption was due to the induction of different layer orientations, and the formation of melting regions, primarily resulting from the shrinkage of particle sizes of the samples. Hence, the pure sample including more homogeneous structure, more uniform surface view and more grain boundary couplings. At the same time, the bulk Bi0* compound with well-linked platelet shapes and crystal orientations indicates greater sample quality and larger grain sizes along Bi-2223 materials. In this respect, the workpiece possesses the densest/smoothest crystal morphology, attributable to minimum porous structure compared to the other workpieces (Fig. 1a). On the other hand, as for the highest bismuth impurity ion doped Bi-2223 superconductor there seems a strong increase in the partial melting sites and related boundary coupling problems in the main matrix. On this basis, there appearance a lot of irregular grain misorientations, cracks, voids, and micropores in the SEM image as seen in Fig. 1b. SEM images show that surface morphology view, texturing, and grain boundary couplings are strongly dependent upon the extra Bi impurity addition level.

B. *EDX inspections for Bi2.1+xSr2.0Ca2.1Cu3.0Oy systems*

The variations in local elemental composition distributions (Bi, Cu, Sr, Ca, and O) using typical EDX (energy dispersive X-ray) experiments for Bi2.1+xSr2.0Ca2.1Cu3.0OyOx crystal system are experimentally analyzed. Thus, we verify whether the desired bismuth impurity ions dopant is successfully incorporated along the materials produced. The numerical values for the distributions of elements are presented in Table 1. Hence, it is confirmed that every bulk ceramic system contains the required compositions [21].

Table 1. EDX results for $Bi_{2.1+x}Sr_{2.0}Ca_{2.1}Cu_{3.0}O_yO_x$ matrix

Component	**Line**	**Distribution Content (wt.%)**					
		Bi0*	**Bi1***	**Bi2***	**Bi3***	**Bi4***	**Bi5***
Bi	L_α	41.776	41.828	41.889	41.920	41.955	41.998
Sr	L_α	16.685	16.684	16.772	16.564	16.675	16.596
Ca	K_α	8.124	8.086	8.002	8.186	8.161	8.225
Cu	K_α	18.206	18.188	18.151	18.132	18.108	17.984
O	K_α	15.209	15.214	15.186	15.198	15.101	15.197

Moreover, it is observed that the elemental distributions of calcium, strontium, and oxygen are random whereas the distribution of bismuth ions increases systematically as intended. In contrast, the elemental distribution analyses of copper show a significant decrease with the increase in bismuth elements. Further, we also illustrate changes in atomic distributions with respect to bismuth ions doped as given in Fig. 2. The visuals indicate that the bismuth content increases significantly with the addition of bismuth ion impurities in Bi2.1Sr2.0Ca2.1Cu3.0OyOx compounds. Numerically, the bismuth composition is found to be approximately 41.776% for Bi0*, 41.828% for the Bi1* workpiece, 41.889% for the bulk

Bi2* crystal structure, 41.920% for the Bi3* material, 41.955% for the Bi*4 sample, and 41.998% for the bulk polycrystalline Bi5* material, respectively. In terms of copper composition in the Bi2.1+xSr2.0Ca2.1Cu3.0OyOx ceramic system, the value decreases from 18.206% in the pure material to 17.984% in the bulk Bi5* ceramic workpiece. The others exhibit the moderate ratios changing from 18.188% to18.108% for the Bi1* and Bi4* samples. Thus, the increase in bismuth ions addition leads to a dramatic decrease in the copper content.

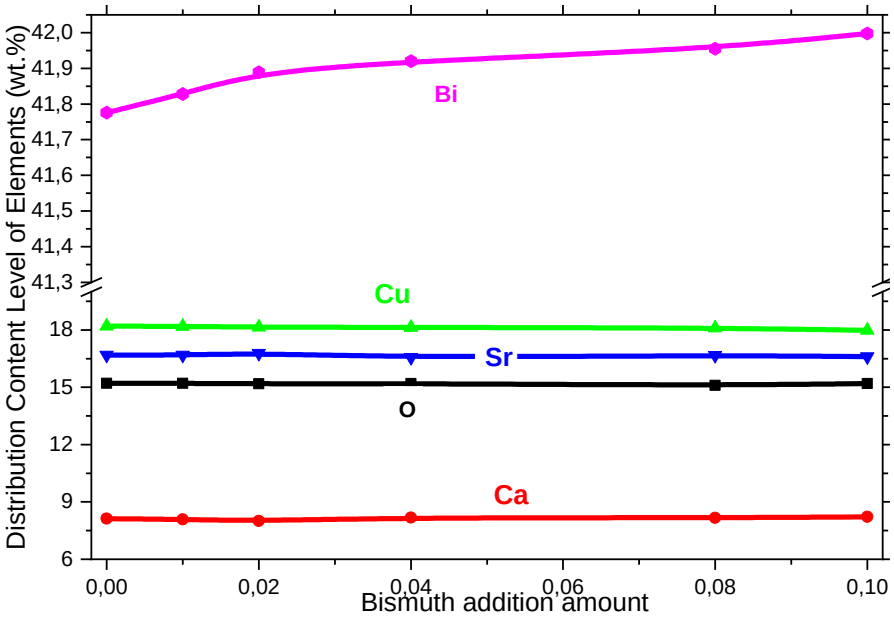

Figure 2 Local elemental distributions for Bi2.1+xSr2.0Ca2.1Cu3.0OyOx superconductors.

Additionally, the oxygen content is found to vary from 15.214% (for the bulk Bi2* workpiece) to 15.101% (for the bulk Bi4* material). The strontium elemental distribution shows the similar trend with the oxygen content. On this basis, the maximum strontium elemental distribution of 16.772% belongs to the Bi2* material whereas the minimum strontium distribution of 16.564% ascribes to the Bi3* crystal structure. At the same time, the calcium elemental distributions are observed to change from 8.002% for the Bi0* sample to 8.225% belonging to the Bi5* material, respectively. To sum up, the EDX results show that the reduction of microstructural, crystalline quality, flux pinning ability, and surface morphological features of Bi2.1+xSr2.0Ca2.1Cu3.0OyOx matrices depending on the bismuth ions stems from the considerable decrease in the copper contents.

C. *Transport critical current densities of Bi-added Bi2.1+xSr2.0Ca2.1Cu3.0Oy ceramic systems*

For the second part of paper, we sensitively focus on the determination of variation in the capability of the artificial flux pinning centers, strength of coupled vortices for movements, vortex lattice period, and elasticity related to the numerical critical current density parameters (Jc) for self-field transport at 77 K for polycrystalline bulk Bi2.1+xSr2.0Ca2.1Cu3.0Oy structures. In other words, the role of addition of impurity ions on the crystallographic misorientations and structural deformations present in the Bi-2223 crystal system is extensively examined by the experimental findings to develop the resistance of materials to applied magnetic field strengths. This is because the Bi-2223 ceramic with strong anisotropic and layered crystal structure is known to be weak to the applied fields depending on the thermally movements of flux vortices under any external magnetic field strength by easily overcoming the pinning barriers. This mechanism is called as copper pair-breaking for the adjacent multiple layers [22, 23].

Table 2 Change of Jc values of Bi2.1+xSr2.0Ca2.1Cu3.0Oy systems

Materials	Jc (A/cm2)
Pure	62
Bi1*	58
Bi2*	53
Bi3*	48
Bi4*	41
Bi5*	35

At the same time, the numerical Jc parameters obtained without any external magnetic field strengths applied for the pure and extra Bi-added Bi-2223 superconductors are depicted in Table 2. It is observed that the numerical values of Jc parameters are noted to vary harshly depending on the bismuth impurity addition level. This means that the addition idea of bismuth impurity ions in the bulk Bi-2223 crystal system is successfully performed as it should be. Besides, the table shows that as the bismuth impurity addition increases in the main system, the values of Jc parameters are found to decrease dramatically 62 A/cm² to 35 A/cm². In the current work, the maximum value belongs to the bulk Bi0* sample whereas the minimum value of 35 A/cm² ascribes to the Bi5* ceramic superconductor. The other extra Bi-added Bi-2223 ceramic compounds possess the values of Jc constants 58 A/cm², 53 A/cm², 48 A/cm², and 41 for the bulk Bi1*, Bi2*, Bi3*, and Bi4* superconducting compounds, respectively. It is obvious that the increase in the bismuth impurity ions in the system either damages seriously the formation of artificial flux pinning ability regions or increases the random distribution of pinning centers as seen in Fig. 3.

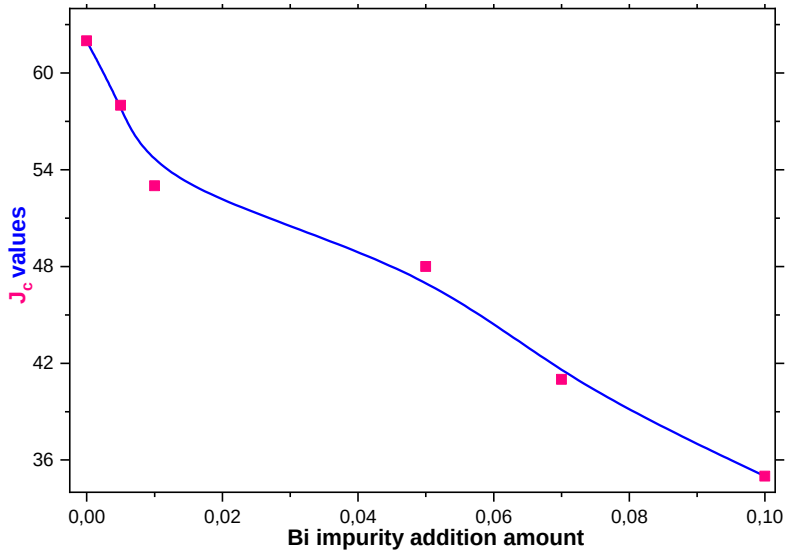

Fig. 3 Change of critical current densities values based on bismuth impurity addition amount.

In this respect, the pancake vortices begin to thermally move. This means the beginning of the energy dissipation based on the ohmic resistance in the superconducting system (transition of electrical energy to the heat energy [24, 25]. Correspondingly, the extra bismuth addition idea is not a good preference to develop magnetic field-carrying ability and especially engineering current depending on the decrease of the artificial flux pinning capability, strength of coupled vortices for movements, vortex lattice period, and elasticity. Besides, the degradation in the interaction strength between grains and crystal structure quality.

IV. CONCLUSION

In the current work, we investigate the serious changes in artificial flux pinning capability, strength of coupled vortices for movements, sample quality, microstructural features, and surface appearances of bulk polycrystalline Bi2.1+xSr2.0Ca2.1Cu3.0Oy structures with varying bismuth addition using Jc tests

and SEM experiments. It is gathered that the extra bismuth added Bi-2223 structures are successfully produced. At the same time, the elemental distribution for copper content is found to decrease monotonically with increasing bismuth impurity addition in the Bi-2223 superconductors. Local elemental content of bismuth impurity is measured to enhance incrementally with the addition mechanism. The EDX findings confirm a sensitive link between surface appearance and bismuth ions levels in the Bi-2223 crystal structure. Moreover, SEM images reveal that the microstructural, crystalline quality, and surface morphological features deteriorate significantly due to a reduction in the formation of flaky, platelet-like layers in the grains. This deterioration was attributed to an increase in micropores, microcrystal coalescence orientations, voids, melting regions, cracks, and particle size distribution. Finally, Jc measurements show that the extra bismuth addition idea leas to the reduction of the artificial flux pinning capability, strength of coupled vortices for movements, vortex lattice period, and elasticity due to the suppression in the interaction strength between grains.

Abstract **–** This study aims to evaluate the importance, measurement, and environmental impacts of carbon footprint (CF). CF is one of the most popular environmental indicators today. It is based on greenhouse gas emissions (GGE) as a measure of environmental impact. It is a concept that measures the amount of activities of individuals and businesses that lead to the GGE. Although it is usually measured by CO2 emissions (CE), other greenhouse gases can also be included. The CF is used to help reduce negative environmental impacts and take steps towards a sustainable future. The measurement of CF contributes to identifying and evaluating various environmental negative effects such as air pollution and deterioration of the natural ecosystem due to GGE in the fight against the threat of climate change. Thus, this measurement guides efforts to reduce negative environmental impacts, contributing to the adoption of more sustainable and environmentally friendly practices. These include measures such as increasing energy efficiency, switching to renewable energy sources, opting for sustainable transportation options, improving waste management, and opting for environmentally friendly products.

Keywords – carbon footprint, carbon footprint measurement, sustainable development, sustainable environment

I. INTRODUCTION

CF is a concept that is widely used and embraced in public debate on responsibility for the threat of global climate change and efforts to reduce environmental pollution (EP). Although there is no clear definition of this concept, the generally accepted basic understanding is that the CF represents significant GGE associated with climate change and occurs as a result of human production or consumption activities. In conclusion, the concept of CF is an important tool that helps us understand and reduce our personal and corporate environmental impact. Monitoring this can help us take steps towards a sustainable future [1].

Measuring the CF is very important in terms of environmental sustainability (ES). Namely, an accurate assessment of the CF is one of the key elements for assessing progress towards sustainable development (SD). Calculating the CF enables the determination of GGE of personal or corporate activities. This calculation includes various factors such as energy consumption, transportation, waste management, and shopping habits. CF calculation results help develop strategies to reduce GGE. Individuals and businesses can take various steps to reduce their CF.

CF in discussions in the context of SD; refers to GGE released into the atmosphere through consumption, food production, transportation, or other related processes originating from products, industrial activities, institutions, or individuals. Reducing the CF has become an integral part of the environmental agenda. The environmental commitments taken at COP27 state that all environmental policies must reduce GGE and ensure the protection of the natural environment [2].

Today, increasing CE is the main cause of global climate change, endangering natural ecosystems and human security. Approximately 70-80% of energy consumption and related CE originate from large cities. By 2050, more than 60% of the world's population is expected to live in cities [3]. Therefore, cities contribute to the issue of CE and energy consumption, and should also be part of the solution to this problem [4].

This study can contribute to the literature for a sustainable future by examining the importance of CF in the context of sustainable development goals (SDG) of countries, measurement methods, and its role in combating environmental impacts. In the second part of the study, after the introduction, SD and CF were conceptually evaluated. In the third part, the calculation of CF is evaluated with examples and the importance of this calculation in terms of ES is mentioned. The study was completed with conclusions and policy recommendations.

II. Sustainable Development and Carbon Footprint

A. Sustainable Development

The origin of the concept of SD is based on the report called "World Conservation Strategy" prepared by the International Union for Conservation of Nature and Natural Resources (IUCN) in 1980. However, the general acceptance and widespread use of the concept was realized with the report titled "Our Common Future" published by the World Commission on Environment and Development in 1987. In the report, SD is defined as "development that meets today's needs without compromising the ability of future generations to meet their own needs" [5].

In Environmental Law No. 2872, SD is defined as development and progress based on the principle of balancing environmental, economic, and social goals that ensure the healthy living environment of current and future generations [6]. The fundamental principles underlying SD are environmental integrity, social justice, and economic prosperity. These principles entail ensuring that human activities do not negatively impact the environment, ensuring equal access to natural resources, avoiding harm to irreplaceable resources, and simultaneously addressing global social injustices to ensure economic prosperity as part of SD [7], [8].

According to Munasinghe (2009), the approach proposed for SD outlines the fundamental components and their interconnections, as depicted in Figure 1. In this approach, the core elements of SD are economic, environmental, and social domains, each with distinct drivers and goals: (i) The economic domain focuses on enhancing human well-being by increasing consumption of goods and services. (ii) The environmental domain aims to preserve the integrity and resilience of ecosystems. (iii) The social domain emphasizes enriching and empowering human relationships and facilitating individuals/groups to achieve their goals. The interconnections and balance among these three domains form the foundation of SD [9].

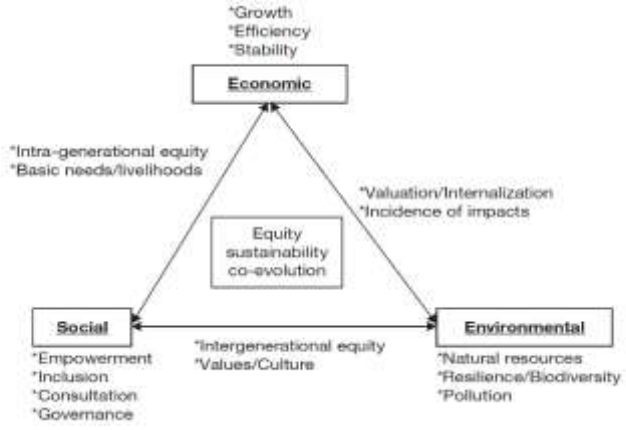

Figure 1. Sustainable Development Triangle

SD is a developmental model that aims to use natural resources effectively and efficiently to meet the needs of both current and future generations while maintaining environmental, social, and economic

balance. This model seeks the sustainability of economic growth, social welfare, and environmental protection simultaneously [10]. The primary goal of SD is to adopt an approach that meets today's needs while also considering the requirements of future generations to leave a livable world for them. This model aims to ensure the sustainable use of natural resources, enhance social justice and welfare, balance economic growth with environmental protection, and reduce global inequalities [11].

SD also encompasses a variety of principles and strategies to maintain the balance between the environment, economy, and society. The implementation of these principles and strategies includes work in areas such as reducing GGE, protecting natural habitats, increasing the use of renewable energy sources, adopting environmentally friendly technologies, reducing inequalities, and increasing well-being. As a result, SD is a development model that includes environmental, social, and economic dimensions and forms the basis of a livable future for the whole world [12].

B. Carbon Footprint

Factors such as rapid population growth, urbanization, economic activities, and changing consumption habits put increasing pressure on the environment and natural resources. This situation causes problems such as EP, climate change, desertification, deforestation, water scarcity, and global warming to maintain their place on the world agenda. To achieve SDG, the concept of a "green economy" is gaining more and more importance [13].

Various indicators are used for SD. One of these indicators is the ecological footprint (EF) [14]. The largest component of the EF is the CF with a rate of 46%. CF is the most important factor released into the atmosphere as a result of human activities and affecting the global warming process [15]. This process leads to negative changes in the climate with the increase in global warming and threatens natural life [16]. The increase in GGE in the atmosphere with the rise of industrialization has caused average temperatures to rise and unexpected changes in the climate.

Unconscious and inefficient use of fossil fuels triggers global warming by causing an increase in GGE in the atmosphere, especially CE. Countries needed an international convention because they could not set specific targets for reducing GGE and could not prepare the necessary infrastructure. In this context, the Kyoto Protocol, which entered into force in 2005, accelerated the determination of CF by establishing various mechanisms [17].

According to the Intergovernmental Panel on Climate Change (IPCC), there is a statistical confidence of 95% that climate change is caused by human activities [18]. The concept of CF quantifies the amount of CE and other GGE released into the atmosphere directly or indirectly through individual or organizational activities such as transportation, heating, energy consumption, and product purchases. These emissions significantly contribute to climate change. Therefore, CF is a crucial term for measuring human impact on the environment [1].

Another definition of CF is the measure of GGE, especially CE, emitted into the atmosphere as a result of human activities over a specified period. It serves as an indicator of the environmental harm caused by individuals and typically consists of primary and secondary components [19]. The primary footprint measures direct CE from activities like household energy consumption and transportation fueled by fossil fuels. The secondary footprint, on the other hand, measures indirect CE associated with the production, use, and disposal of products [20].

The CF definitions of some institutions are shown in Table 1.

Table 1. Various Carbon Footprint Definitions

Institutions	Definitions
British Petrol	A CF is the amount of CE emitted by your daily activities – from doing laundry to transporting children to school.
British Sky Broadcasting	The CF is calculated by measuring GGE from factors such as companies' activities, company vehicles, business trips, and waste disposal.
Carbon Trust	CF is a method that calculates the total carbon equivalent of GGE generated during the production, transportation, use, and disposal stages of a product. This calculation covers emissions during the raw material procurement, manufacturing, distribution, and decommissioning phases, but does not include emissions during the use of the product.
Energetics	These are direct and indirect CE resulting from business activities.
ETAP	CF is a measurement that represents the total amount of GGE released into the atmosphere as a result of the daily activities of people and organizations. This measurement is expressed in tons in CE equivalent.
Global Footprint Network	It is the need for biological capacity to capture CE from the burning of fossil fuels through photosynthesis.
Parliamentary Office of Science and Technology	CF refers to the total GGE released during the life cycle of a product or activity. This calculation involves the conversion of GGE other than CE into CE equivalent according to their global warming potential.

III. Calculating the Carbon Footprint and Its Importance for Environmental Sustainability

A. Calculating the Carbon Footprint

CE is the most common GGE released into the atmosphere as a result of human activities. The volumetric equivalent of CE released by individuals forms the numerical value of their CF Calculating the CF is crucial as it determines how much biocapacity we need and helps measure our environmental impact. Before starting efforts to reduce CF, calculating the current CF is of critical importance. CF calculation quantifies the amount of carbon released into the atmosphere by individuals through their transportation, heating, energy consumption, and product purchases. Initiatives to reduce CF are significant steps toward mitigating the effects of climate change and global warming [21], [22].

International agreements such as the Kyoto Protocol aim to minimize the human-induced impacts of global warming and climate change. In this regard, governments and organizations that are committed to reducing GGE calculate their CF and implement measures to mitigate these emissions. CF calculation serves as a crucial tool to quantify and mitigate the environmental impact of human activities [23].

The CF calculation process calculates the damage that individuals and companies cause to the earth. Normally, per capita biocapacity is expected to be greater than the EF per capita. The CF per person is usually about 4 tons. In this context, measures such as reducing electricity and water consumption, switching to electric or hybrid vehicles in transportation, adopting effective waste management, and reducing the use of plastics are effective steps in reducing CF [24].

Carbon calculations are now recognized as an important tool in assessing environmental impacts. These calculations are usually made to determine the GGE and CF of an organization, product, service, or activity throughout its vital cycle. CF refers to the sum of direct and indirect GGE and is used as an important indicator in terms of ES. In addition, CF calculation methods have been revealed as a result of various research and methodological development studies. These calculation methods are generally based on scientific principles and are considered an important tool in assessing environmental impacts [24].

Life Cycle Assessment (LCA) is one of the methodologies that underpin CF calculations. LCA systematically assesses the environmental impact of a product or service throughout its entire life cycle (ISO 14040, 2006). CE and other environmental impacts are calculated by taking into account the stages of production, use, and disposal. LCA is a widely used methodology for analyzing the ES performance of products and services [25].

The concept of CE equivalent plays an important role in standardizing the CF. This concept is based on the fact that different GGE (methane, oxides of nitrogen, etc.) It is converted to CE, making its effects on climate change comparable [26]. Global warming potentials (GWP) are determined for GGE and CE equivalent calculations are made. Scientific data and models are the cornerstones of CF calculations. The emission factors used in the calculations are usually determined based on regional or national energy production data and are updated continuously [1]. This data is obtained from scientific research and industrial databases, increasing the accuracy of the calculation.

National and international standards are important to ensure that CF calculations provide consistent and comparable results. For example, the ISO 14040 and ISO 14044 standards guide the implementation and reporting of LCA methods [27].

CF calculation is often used to assess the environmental impact of personal or corporate activities. These calculations provide a quantitative measurement of environmental impacts through factors such as electricity consumption. For example, the CF of an individual or organization from electricity use can be determined depending on the resources used to generate the energy and the regional electricity generation mix [28].

For example, when the annual electricity consumption of a home or workplace is determined as 10,000 kWh, the CF of this consumption can be calculated. Let's assume that electricity is obtained from 50% coal, 30% natural gas, and 20% renewable energy sources. In this case, the CF of electricity consumption can be calculated as follows:

Coal: 10,000 kWh * 50% * (emission factor)

Natural Gas: 10,000 kWh * 30% * (emission factor)

Renewable Energy: 10,000 kWh * 20% * (emission factor)

This calculation gives the total CF resulting from electricity consumption. Emission factors often vary according to the regional electricity generation mix, and standard values used in CF calculations can be obtained from national or international sources [29].

To give a simple example of personal energy carbon accounting, we can explain how to calculate an individual's CF based on their annual household electricity consumption using default emission factors and standard methods.

Step 1: Determining Electricity Consumption

Suppose the annual electricity consumption of an individual's home is set at 12,000 kWh.

Step 2: Determination of Emission Factors

Emission factors are determined according to the sources used in the production of electrical energy. Let's assume that the electrical energy used in this example is obtained from 60% coal, 30% natural gas, and 10% renewable energy sources.

Coal: 2000 g CO2e/kWh

Natural Gas: 1000 g CO2e/kWh

Renewable Energy: 0 g CO2e/kWh (assuming zero emissions)

In this case, if we calculate the average emission for 1 kWh of electrical energy:

Coal : 2000 g CO2e/kWh * %60 = 6000 g CO2e/kWh

Natural Gas : 1000 g CO2e/kWh * %30 = 300 g CO2e/kWh

Renewable Energy : 0 g CO2e/kWh * %10 = 0 g CO2e/kWh

Total average emission factor = (6000 + 300 + 0) g CO2e/kWh

= 6300 g CO2e/kWh

As a result of this calculation, the total average emission factor of the electrical energy used throughout the supply chain was found to be 6300 g CO2e/kWh or 6.3 kg CO2e/kWh. This value is used to determine emissions from electricity consumption in CF calculations.

Step 3: Carbon Footprint Calculation

CF calculation of annual electricity consumption:

Total carbon footprint = Electricity Consumption (kWh) * Average Emission Factor (g CO2e/kWh)

Example:

Electricity consumption = 2,000 kWh

Average emission factor = 6.300 g CO2e/kWh (6.3 kg CO2e/kWh)
Total carbon footprint = Electricity consumption × Average emission factor
= 2,000 kWh × 6.3 kg CO2e/kWh
= 12,600 kg CO2e (12.6 tons).

As a result of this calculation, the CF of this individual resulting from annual electricity consumption is calculated as 12.6 tons of CO2e. As a result, CF calculation methods are based on a scientific basis and maintain their importance as a field that is constantly being developed. These calculations help individuals and organizations assess their environmental impact, develop strategies to reduce EP, and set sustainability goals.

B. The Impact of Carbon Footprint Measurement on Environmental Sustainability

The relationship between carbon calculations and the environment can be examined from various aspects. First, these calculations provide a quantitative measurement of environmental impacts. For example, by calculating the CF of a product, GGE can be determined starting from the production process through the supply chain to transportation and the end user. In this way, the environmental impact of the product or service can be understood more clearly [30]. Secondly, carbon calculations allow for improved environmental performance. Once the CF in an organization or industrial process has been determined, steps such as reducing GGE or transitioning to alternative environmentally friendly technologies can be planned. This, in turn, can improve ES in the long run [31].

Third, carbon calculations contribute to environmental policymaking. A country's or region's CF data can help make science-based decisions in the creation of environmental policies. For example, tax incentives or restrictive regulations to reduce GGE can be designed based on the results of carbon calculations [32].

As a result, carbon calculations form the basis of environmental management and sustainability strategies. An accurate and comprehensive carbon accounting process allows for understanding, mitigating, and controlling potential impacts on the environment. This, in turn, can contribute to the conservation of natural resources by improving environmental quality in the long run [33].

IV. CONCLUSION

SD is one of the most important global goals of our time. This goal aims to observe environmental, economic, and social dimensions in a balanced way. The concept of CF plays a critical role in the SD agenda. CF refers to the total amount of GGE released into the atmosphere as a result of the activities of individuals, organizations, and products. The measurement of CF is used as an important indicator of climate change and ES. In summary, CF measurement includes the following elements: (i) Direct and indirect CE from daily activities, (ii) GGE from company activities, vehicles, business trips, and waste disposal, (iii) GGE during the production, transportation, use and disposal of products, (iv) Conversion of GGE other than CE into CE equivalent according to their global warming potential.

CF provides an important tool in combating this threat by measuring GGE that causes climate change. This measurement helps identify and assess environmental issues such as air pollution and natural ecosystem degradation. It also guides to reduction of negative environmental impacts and encourages the adoption of more sustainable practices. In conclusion, CF measurement has a critical role in achieving SDG. This measurement helps individuals, organizations, and products understand and reduce their environmental impact. Thus, it offers an important tool for building a more sustainable future. In this context, to reduce the CF, individuals and workplaces should take measures to reduce energy consumption and policy makers should be guided in this regard. More environmentally friendly options should be preferred in transportation and consumption habits should be reviewed.

Özet- Sirkülasyon kaybı olarak adlandırılan çamur kaçağı sondaj sırasında görülen en yaygın sorunlardandır. Kuyuya gönderilen çamurun formasyondaki çatlaklar içine kaybolmasına, zaman ve madde kaybına neden olur. Sirkülasyon kaybını gidermek ve azaltmak için çok sayıda yöntem üzerinde çalışılmaktadır. Bu yöntemler teknik olarak veya farklı malzeme kullanımı üzerine olabilmektedir. Sirkülasyon kaybını önlemek için önleyici tedbirler alınır ve devre kaybı oluştuğunda düzeltici teknikler uygulanır. Kuyu duvarını güçlendirme yöntemleri arasında, sondaj sıvısına kayıp önleyici malzemeler ekleyerek çamur ağırlığını artırmak veya çamur keki özelliklerini iyileştirmek yaygın ve iyi bilinen uygulamalardır. Son yıllarda atıkların petrol sektöründe kayıp önleyici malzeme olarak kullanılması, dikkat çeken bir konu haline gelmiştir. İyileştirici teknikler arasında, formasyondaki çatlakları kapatmak amacıyla sondaj çamuruna kayıp önleyici malzemeler (LCM) eklenmesi yaygın bir yöntemdir. Kayıp önleyici malzeme olarak birçok farklı malzeme kullanılmaktadır. Bu çalışmada, çeşitli tarımsal atıkların çamur kaybını önlemede kullanılabilirliği incelenmiştir. Çamur olarak, yaygın kullanılışı olan ve kuyu dayanıklılığı açısından sorun yaratmayan KCl çamuru tercih edilmiştir. Hazırlanan KCl çamurunun içine eşit miktarda limon kabuğu, fındıkkabuğu, siyah çekirdek kabuğu, ceviz kabuğu, yer fıstığı kabuğu, buğday samanı, Siirt fıstığı kabuğu ve kereviz sapı tozu eklendikten sonra, farklı malzemelerin çamurun reolojik ve filtrasyon özelliklerine etkisi incelenmiştir. Eklenen tüm malzemelerin çamur kaybını azaltmada etkin olduğu görülmüş, buğday samanı hariç diğer malzemelerin kek kalınlığını artırıcı etki gösterdiği görülmüştür. Ceviz kabuğu ve fındıkkabuğu dışındaki tüm maddelerin plastik veya görünür viskoziteyi artırdığı gözlemlenmiştir.

Anahtar Kelimeler – Tarımsal atık, sondaj çamuru, filtrasyon özellikleri, reolojik özellikler, kayıp önleyici malzeme, çamur kaçağı

I. GİRİŞ

Petrol sondajı, petrol ve doğal gaz gibi hidrokarbonların yer altındaki rezervuarlardan çıkarılması için yapılan işlemleri ifade eder. İlk olarak petrol rezervlerinin belirlenmesi için yer yüzeyinde jeolojik ve jeofizik araştırmalar yapılır. Bu çalışmalar, potansiyel petrol kaynaklarının varlığını ve yerini belirlemeye yöneliktir. Belirlenen petrol rezervuarlarının detaylı analizleri sonucunda bir sondaj planı hazırlanır. Bu plan, sondajın derinliği, yerleşim yeri, ekipman gereksinimleri ve çevresel etkiler gibi faktörleri içerir. Deniz üzerinde ise deniz tabanında sabitlenen veya yüzeyde yüzen platformlar kullanılır. Kara üzerinde ise mobil sondaj kuleleri veya derin delme makineleri kullanılır. Sondaj platformu üzerindeki ekipmanlarla delme işlemi başlatılır. Delme sırasında özel matkap uçları kullanılarak yeraltındaki kayalar delinir ve sondaj devam eder. Delme tamamlandıktan sonra delik içine bir tüp (kılavuz borusu) yerleştirilir ve bu tüp deliği korur. Ardından, delik çevresine çimento enjekte edilerek deliğin stabilizasyonu ve çevresinin

korunması sağlanır. Delme tamamlandıktan sonra, kuyunun üretim aşamasına geçilir. Bu aşamada, hidrokarbonların yeraltından çıkarılması için gerekli ekipmanlar (pompa, boru hatları vs.) kurulur ve üretim başlatılır.

Petrol sondajında kullanılan sondaj akışkanı, sondaj kulesinden yeryüzüne çıkan kuyu içindeki sıvı veya gaz akışkanıdır. Bu akışkanlar, sondaj işlemi sırasında çeşitli amaçlar için kullanılır ve çeşitli özelliklere sahip olabilir.

Genellikle petrol sondajında kullanılan ana sondaj akışkanları şunlardır:

Sirkülasyon Sıvısı (Drilling Mud): Sirkülasyon sıvısı, sondaj sırasında delme matkabından çıkan kırık taş, çamur ve diğer atıkları kuyu içinde tutmak ve yüzeye taşımak için kullanılır. Ayrıca, sondaj kuyusunun stabilitesini sağlar, sondaj deliğinin duvarlarını korur, basınç dengesini sağlar ve hidrokarbonların taşınmasını kolaylaştırır. Sirkülasyon sıvıları genellikle su bazlı veya petrol bazlı olabilir ve içlerinde kil, polimerler, kimyasal katkılar ve bazen ağırlıklandırıcılar bulunabilir.

Köpük Sıvısı (Foam): Köpük sıvısı, düşük yoğunluğa sahip olan ve genellikle gaz (örneğin, hava veya azot) ile karıştırılarak oluşturulan bir sondaj akışkanıdır. Köpük sıvısı, derin denizlerde veya çökmüş bölgelerde kullanılabilir ve sıvının yoğunluğunu düşürerek sondaj kuyusunun stabilitesini sağlar.

Hidrolik Akışkan (Hydraulic Fluid): Hidrolik akışkanlar, sondaj sırasında hidrolik sistemlerde kullanılır. Bu akışkanlar, hidrolik pompa ve silindirlerde basınç ve hareket kontrolü sağlar.

Sondaj akışkanları, kullanıldıkları ortama, sondaj derinliğine, sondaj kuyusunun jeolojik özelliklerine ve sondaj operasyonunun gereksinimlerine bağlı olarak seçilir ve uygulanır.

Sondaj sırasında çamurun kuyu duvarlarından sızması veya kaybolması durumunda "çamur kaybı" yaşanır. Bu durum, sondajın güvenliğini ve verimliliğini etkileyebilir ve gerektiğinde önlemler alınarak yönetilmesi gereken önemi bir durumdur.
